## AVANT-PROPOS

Dans le but de promouvoir la connaissance du potentiel minéral du Québec et de permettre une plus grande accessibilité de l'information géoscientifique à tous les agents de l'exploration, le ministère de l'Énergie et des Ressources, par le biais du Service de la promotion et de l'aide à l'exploration minière, publie le catalogue des gîtes minéraux du Québec recensant 5711 fiches de gîte.

Les fiches de gîte sont des synthèses de l'information géoscientifique disponible sur chaque minéralisation de substances métalliques, minéraux industriels et matériaux de construction du Québec. Plus spécifiquement, elles comportent les informations suivantes : localisation, historique, géologie locale et régionale, géologie et bibliographie des documents consultés qui ont servi à dresser les fiches.

Le catalogue se divise en trois parties :

### **PARTIE I**

La première partie comprend 96 cartes localisant tous les gîtes minéraux du Québec mis en fiches.

### **PARTIE II**

C'est un tableau des principales caractéristiques des gîtes. La présentation se fait par ordre alphanumérique du numéro des fiches de gîte à l'intérieur des quadrilatères SNRC de niveau III sur chacun des feuillets. Les titres de colonnes appellent les commentaires qui suivent :

#### **N° fiche**

Les fiches sont identifiées par un numéro composé de deux parties séparées par un tiret (12 L/06-003). La première réfère au découpage SNRC de niveau III (12 L/06, 12 L/07...). La seconde partie est un chiffre en progression arithmétique correspondant chacun à un gîte différent.

#### **Canton(s)**

Cette colonne identifie le canton dans lequel se trouve chacun des gîtes. Cette information est utile pour la localisation des gîtes à l'intérieur des divisions administratives et cadastrales. Les cantons sont dits proclamés ou projetés. Les premiers, qui portent un nom, sont des parcelles du territoire dont les côtés ont été arpentés ; ces divisions cadastrales couvrent généralement 256 km<sup>2</sup>. Les seconds, non arpentés, sont identifiés par des nombres correspondant à un balayage à l'intérieur de bandes qui ont des parallèles généralement tirés dans le prolongement des cantons arpentés au sud du 53<sup>e</sup> degré de latitude et tirés à tous les 10' au nord de ce degré.

Le symbole (s), rencontré parfois, signifie que le gîte se localise sur le territoire d'une seigneurie.

#### **Nom**

Il s'agit de l'appellation donnée à un gîte au moment de sa découverte ou plus tard. À noter que tous les gîtes portent un nom différent.

#### **Forme**

L'éventail des formes est limité à quelques dénominations : filon, dyke, lentille, amas, strate (couche ou lit), cheminée, stockwerk et placer. Les formes non déterminées sont signalées par l'abréviation N.D.

#### **Taille**

Les chiffres 1, 2, 3, 4 correspondent, respectivement, aux petites, moyennes, grandes et très grandes tailles. Le symbole N.A. signifiant non applicable est utilisé pour les matériaux de construction.

#### **État**

Ce mot réfère à l'état de développement des gîtes, lequel s'exprime par les lettres I, P, G, MA, CA, MF, CF.

I — INDICE: Minéralisation n'ayant fait l'objet d'aucun travail.

P — PROSPECT: Minéralisation ayant donné lieu à des travaux permettant de déterminer quelques paramètres dimensionnels, sans évaluation du tonnage.

G — GISEMENT: Minéralisation sur laquelle des travaux ont permis une évaluation du tonnage.

MA, CA, MF, CF — Mine (MA) ou carrière (CA) en exploitation. Les mines et carrières qui ont fermé leurs portes sont codées MF ou CF.

**Substance(s) principale(s)**

Les substances principales rencontrées dans chacun des gîtes minéraux. La signification des symboles et abréviations est fournie à la fin du document.

**Substance(s) secondaire(s)**

Les substances secondaires faisant partie de la minéralisation d'un gîte mais qui n'ont généralement pas d'importance économique. La signification des symboles et abréviations est fournie à la fin du document.

**Zone UTM**

**Coordonnées UTM Nord**

**Coordonnées UTM Est**

**PARTIE III**

La troisième partie du catalogue présente un tableau classant les gîtes minéraux par ordre alphabétique des noms attribués à chacun des gîtes.

Le tableau comprend, par ordre, les colonnes suivantes :

**Nom**

**N° fiche**

**MODE DE DISTRIBUTION**

L'acquisition des fiches de gîte se fait individuellement selon les numéros des fiches qui sont inscrits sur les réductions des cartes de localisation des gîtes minéraux mis en fiche apparaissant à la section I, ou selon les numéros des fiches inscrits sur le tableau de la section II du présent catalogue. Elles ne sont disponibles que sur papier seulement.

Pour plus de renseignements sur le catalogue, veuillez vous adresser à :

## DÉCOUPAGE SNRC

### NIVEAU I

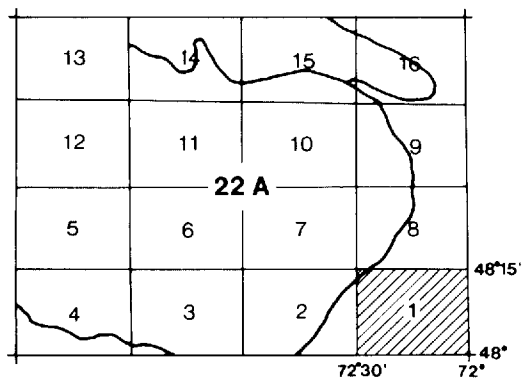

Le découpage de base est un feuillet de 4 degrés de latitude par 8 de longitude. Il est identifié par un nombre de deux chiffres, dont les unités augmentent du sud vers le nord et les dizaines de l'est vers l'ouest.

### NIVEAU II

Chacun des feuillets de niveau I est subdivisé en 16 feuillets de 1 degré de latitude par 2 degrés de longitude. Les lettres A à P identifient ces subdivisions. Les feuillets sont codés : 22A, 22B, etc. . .

Échelle couramment utilisée :  
1/250 000

### NIVEAU III

Chacun des feuillets de niveau II est subdivisé à son tour en 16 feuillets de 15 minutes de latitude par 30 de longitude, qui sont identifiés par les chiffres 1 à 16. Les feuillets sont codés : 22A/4, etc. . .

Échelle couramment utilisée :  
1/50 000

PAGE 1 DE LA FICHE DE GÎTE MINÉRAL

**IDENTIFICATION**

- le numéro de la fiche de gîte minéral
- le nom du gisement
- les détenteurs des terrains miniers
- les substances d'intérêt économique

**LOCALISATION**

- les renseignements nécessaires pour situer géographiquement le gîte

**HISTORIQUE**

- date et méthode de découverte
- tous les travaux effectués sur le gîte

**CONTEXTE GÉOLOGIQUE RÉGIONAL**

- éléments géologiques caractérisant la région environnante du gîte

**STRUCTURES LOCALES**

- éléments géologiques caractérisant la proximité immédiate du gîte

## PAGE 2 DE LA FICHE DE GÎTE MINÉRAL

## ROCHES ENCAISSANTES OU ASSOCIÉES

- identification complète des roches liées à la minéralisation

**ROCHES ENCAISSANTES OU ASSOCIÉES**

ROCHE 1: Nom: Cornélienne calcosilicatée  
 ÂGE GÉOLOGIQUE: max. Silurien moyen  
 RELATION AVEC LA ZONE MINÉRALISÉE:  coalesce  recoupe  contient  en contact  min.  sous-jacente  sus-jacente  indéterminée

NOM DE L'UNITÉ STRATIGRAPHIQUE: Pn West Point et Indian Point (St-Léon)

ROCHE 2: Nom: Cornélienne chertreuse  
 ÂGE GÉOLOGIQUE: max. Silurien supérieur  
 RELATION AVEC LA ZONE MINÉRALISÉE:  coalesce  recoupe  contient  en contact  min.  sous-jacente  sus-jacente  indéterminée

NOM DE L'UNITÉ STRATIGRAPHIQUE: Pn St-Léon

ROCHE 3: Nom: Porphyre (latite)  
 ÂGE GÉOLOGIQUE: max. Dévonien supérieur  
 RELATION AVEC LA ZONE MINÉRALISÉE:  coalesce  recoupe  contient  en contact  min.  sous-jacente  sus-jacente  indéterminée

NOM DE L'UNITÉ STRATIGRAPHIQUE: Pn St-Léon

FORME DU GÎTE:  Mon  amas  
 DIMENSION: Longueur: 914m  
 Direction: NW  
 Largeur: 305m  
 Pendage: Vertical  
 ZONES D'ALTÉRATION: a) de la roche encaissante: Potassique, phylliteuse, argileuse, sodique  
 b) de la minéralisation: Bornite et hématite produites par altération rétrograde de la chalcopyrrite

ÂGE GÉOLOGIQUE DU GÎTE: max.  syn.  post.  
 ÂGE OROGÉNÉTIQUE:  pré-orogénique  
 ÂGE ABSOLU: m.a. Méthode: Fracturation, lithologie  
 CONTRÔLE(S) PRINCIPAL(AUX): Élément daté: Dévonien tardif

CLASSIFICATION GÉNÉTIQUE:  remobilisation  sédimentation  concentration résiduelle et supergène  substitution  ségrégation magmatique  exhalation volcanique

a) mode de déposition:  remobilisation  sédimentation  concentration résiduelle et supergène  substitution  ségrégation magmatique  exhalation volcanique

b) autres critères: Hydrothermalisme

SOMMAIRE DE L'HYPOTHÈSE GÉNÉTIQUE PROPOSÉE:  
 Gisement d'origine hydrothermale relié au granite des Monts Mc Garrigle au nord. Les solutions minéralisées se sont infiltrées dans les mêmes fractures qu'ont empruntées les dykes de porphyre et par le phénomène de métasomatisme, se sont localisées de part et d'autre des dykes, avec préférence marquée dans les lits de arkams (méta calcaire impur).  
 La minéralisation en molybdène, logée surtout dans les dykes bordant les amas de cuivre, est légèrement plus jeune que celle du cuivre.

## GÎTOLOGIE

- les caractéristiques chimiques et physiques du gîte
- l'âge du gîte
- le type génétique du gîte

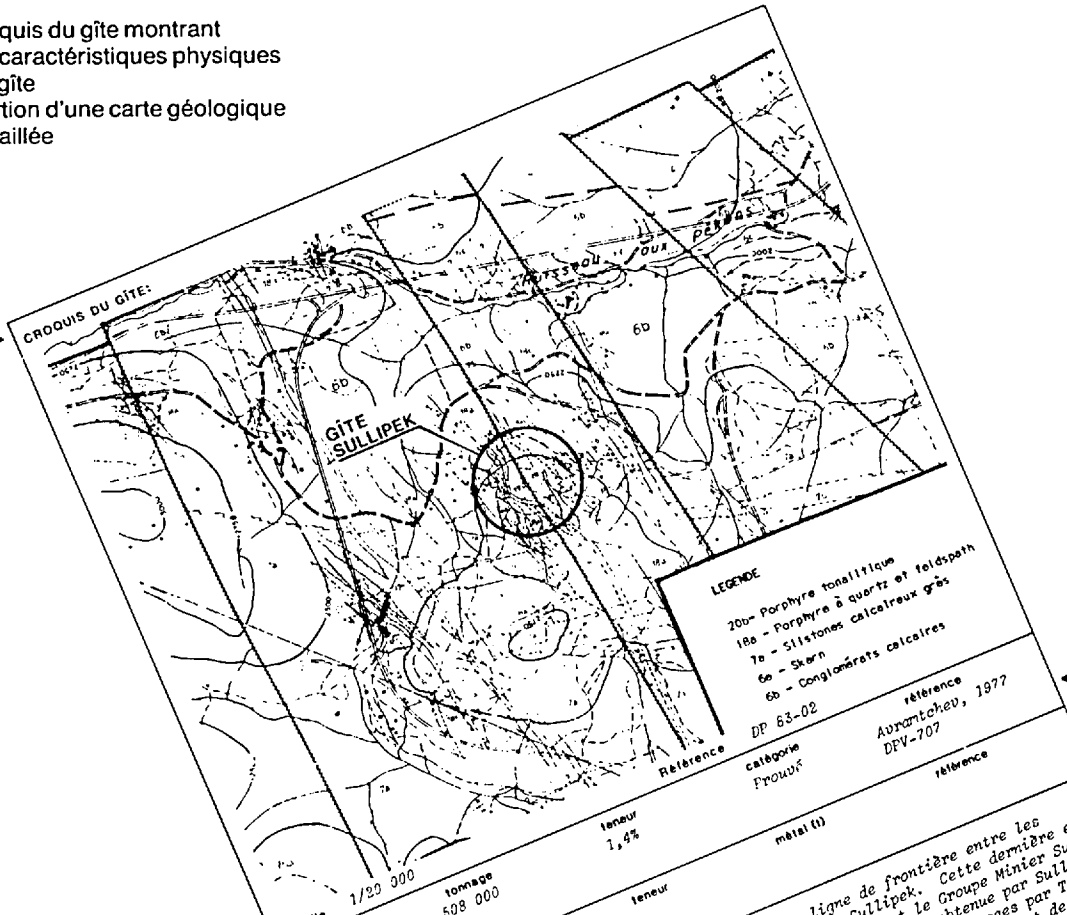

Format réel de la fiche de gîte minéral: 8½ x 14 pouces

PAGE 4 DE LA FICHE DE GÎTE MINÉRAL

**CROQUIS DU GÎTE**

- croquis du gîte montrant les caractéristiques physiques du gîte
- portion d'une carte géologique détaillée

**RÉSERVES**

- tonnage évalué avec ou sans précision

**PRODUCTION**

- minéral tout-venant traité

**RÉSERVES:** tonnage

**PRODUCTION:** tonnage

**AUTRES RENSEIGNEMENTS:** Le gîte Sullipek chevauche la ligne de frontière entre les terrains détenus par Les Expl. Terra Nova et ceux des Mines Sullipek. Cette dernière est contrôlée par Terra Nova, Patino Min., Hudson Bay Min. & Smelt. et le Groupe Minier Sullipek. Le gisement Sullipek se situe à l'intérieur de l'ex-concession obtenue par Terra Nova Expl. à l'été de 1965 laissant croire à la découverte d'un autre gisement de cuivre de la taille de celui de Murdochville (Mines de Cuivre de Gaspé). Malheureusement, les sondages à maille plus serrée précisèrent une toute autre image. Verticalement, la forme d'amas très localisés de part et d'autre de dykes de porphyre. L'altération la plus extérieure est dentritique, la distribution minérale s'éloignant latéralement le plus loin des frontes du dyke dans les couches de skarns. Compte-tenu de sa forme complexe, la compagnie arosa en 1968 un programme de développement sous-terrain comprenant le plus banc et plus de 6 500m de sondages. Les résultats de ces travaux auraient réduit passablement les réserves. Une réévaluation géologique de toutes les données disponibles était amorcée à l'été 1981. Parmi les grandes difficultés pour l'évaluation de ce gîte, notons l'incohérence de la terminologie initiale, ce qui rend la corrélation pénible. Ce gisement a initialement été défini par de fortes anomalies terrestres (PP & MAG). Selon Gilles Duquette, un rapport de Michel Pichette totalisant 508 953 t. à 1,35% Cu. Deux (2) de ces zones de quatre (4) amas cuprifères totalisant 187 107 t. à 1,3% Cu et 103 532 t. à 1,39% Cu seraient verticales (NNW) et non oxydées et partiellement oxydées (S9 790 t. à 1,45% Cu et et les deux (2) autres sub-horizontales 118 524 t. à 1,3% Cu).
