Contents

Volume I

<i>Eero Tarasti</i>	
Presidential Address	1
<i>Nadia Ablih</i>	
Comprendre la communication touristique	7
<i>Tutku Akter</i>	
Power relations and construction of knowledge	16
<i>Peter Allingham</i>	
Autostadt – Cars, aesthetics, and movement	23
<i>Rodica Amel</i>	
To use signs vs. to invent signs	33
<i>Fernando Andacht</i>	
Reflections on an indexical Brazilian TV fable	44
<i>Celia Maria Antonacci Ramos</i>	
Graffiti: Polemic and protest in urban spaces	55
<i>Alessandro Arbo</i>	
Compréhension esthétique vs compréhension sémiologique: Quels enjeux?	63
<i>Michiko Arima</i>	
How we lose memory in aging	73
<i>John Ole Askedal</i>	
Semiotic reflections on the visual art of Brian Jungen	80

<i>Kristian Bankov</i>	
<i>Bankov's razor</i> : Some critical remarks on biosemiotics	90
<i>Jacob Bañuelos</i>	
Análisis de la espectacularización en You Tube: <i>Broadcast Yourself</i>	106
<i>Josep Barcons</i>	
The existential dimension of the phatic function in Arnold Schönberg's <i>Moses und Aron</i>	128
<i>Daniel Barragán Trejo & Carlos Armando Mendoza Santana</i>	
¿Cómo negocian sus identidades a través de la lengua los mexicanos en Helsinki, Finlandia?	138
<i>Pierluigi Basso Fossali</i>	
Dispositifs de mésentente dans l' <i>Hamlet</i> de Shakespeare	147
<i>Cristina Bayón García & Héctor Fernández Babillo</i>	
Misunderstanding technology: Communication and pedagogy in the L2 classroom	158
<i>Cristina Bayón García</i>	
Understanding and misunderstanding of genetically modified organisms (GMOs)	167
<i>Mirta Bialogorski</i>	
Campo semiótico y campo artesanal: El juego de las transformaciones y los bordes	177
<i>Bernard H. Bichakjian</i>	
The linguistic sign: From analog to digital	185
<i>Bogdan Bogdanov</i>	
Communication and understanding	197

<i>Priscila M. Borges</i>	
The sign tree: Peirce's philosophy through a visual model of the 66 classes of sign	203
<i>Laurence Brunet-Hunault</i>	
Le récit d'une privatisation, ou comment le discours de presse dramatise ou enjolive une aventure économique	213
<i>Patrizia Calefato</i>	
Dressing in signs: Fashion theory between sociosemiotics and cultural studies ..	224
What name are you?	234
<i>Alessia Caputo</i>	
The language of advertisement	245
<i>Stefano Carlucci</i>	
Contemporaries but different	251
<i>Josiane Caron-Pargue</i>	
Sémiotisation et actualisation des connaissances	258
<i>Giulia Ceriani</i>	
La prévision des tendances et la sémiotique	266
<i>V. Charissis and Marianne Patera</i>	
Symbolic vs alphanumeric representations in human machine interface design ..	276
<i>María Dolores Chávez García</i>	
The Mexican semiosphere	285
<i>Hsiang-Ju Chen, Kuo-Hsiung Lin, and Yuan-Hui Tsai</i>	
One aspect of neo-Confucian structure in decision making	294
<i>Mehdi Chourou</i>	
<i>Ethniktag</i> : Ever-changing understanding	309

<i>Vasilisa Christidou, Vassilia Hatzinikita, and Anastasia Dimitriou</i>	
Children's understanding and use of visual codes in their drawings about environmental phenomena	322
<i>Ahn Chul-Sang</i>	
From death to rebirth	332
<i>Camelia M. Cmeciu & Doina Cmeciu</i>	
Manipulating communication through images	337
<i>Aurel Codoban</i>	
Body of language and body as language	349
<i>Benedetta Colombo</i>	
To what extent might a semiotic approach avoid misunderstanding?	357
<i>Dario Compagno</i>	
Misunderstanding or misperceiving?	364
<i>Anna Czekanowska</i>	
Real vs. unreal, the literary vs. the musical message	372
<i>Ivan Darrault-Harris</i>	
Compréhension / Mécompréhension	381
<i>Fabio De Leonardis</i>	
Erasing the signs of the Other: Zionism and the Palestinians	394
<i>Ledia Dema</i>	
Fragmentation discursive et communication littéraire	408
<i>Maria Giulia Dondero</i>	
Rhétorique de l'image dans le discours scientifique	417
<i>Heloísa de A. Duarte Valente</i>	
À la recherche d'un temps perdu	430

<i>Jesús Octavio Elizondo Martínez</i>	
Stigma and visibility	440
<i>Drude von der Fehr</i>	
Thomas Bernhard's infectious style	448
<i>August Fenk</i>	
Inference, reference, and indexicality	459
<i>Héctor Fernández Babillo</i>	
Understanding mysticism in music	467
<i>Vladimir Feshchenko</i>	
Semiotics and the avant-garde as two ways of sign-making and sense-making ..	473
<i>Riccardo Fusaroli</i>	
The screen and the voice	483
<i>Hugo García</i>	
La ontología de los actos de habla y el problema de los universales	494
<i>Pauline Escande Gauquié</i>	
L'affiche du film <i>Pulp Fiction</i> de Quentin Tarantino en tant que référence à un genre populaire américain: "Le pulp"	502
<i>Carlo Germesbuys & Gerda Dullaart</i>	
Film editing and ideology in South African culture	511
<i>Karl Gfesser</i>	
Verstehen – Verständigung ist nicht Verständnis	520
<i>Yun-Csang Ghimn</i>	
Social studies of science? Semiotic studies of medicine!	533
<i>Tiziana Giudice</i>	
Metaphors and imagination	542

<i>Sandra Grötsch</i>	
Pets, fantastic beasts and magical creatures	551
<i>Robert Hatten – with Richard Littlefield & Charls Pearson</i>	
(The linguistic concept of) voice in music	559
<i>André Helbo</i>	
Sémiotique du spectacle vivant: Le corps du déni	564
<i>Sari Helkala-Koivisto</i>	
The accentuated signified	570
<i>Sonsoles Hernández Barbosa</i>	
Debussy y la plástica	574
<i>Drina Hočevár</i>	
An existential approach to the analysis of Sophocles' <i>Oedipus rex</i>	583
The musical understanding of literature	592
<i>Völker Hooyberg</i>	
Seeing connections	601
<i>Tomohēi Hori</i>	
Pentatonicism in the vocal music of Schubert's "Romantic period"	609
<i>Anne-Marie Houdebine & Ekaterina Nossenko</i>	
Texte-image: Relais, ancrage ou complémentarité?	624
<i>Florian Hruby</i>	
Preparing the unknown	632
<i>Dennis Ioffe</i>	
<i>Homo somatikos</i> and <i>Homo ludens</i> in Russian Modernist life-creation	641
<i>Maria Jodłowiec</i>	
Relevance and misunderstanding	651

Volume II

<i>Eva Kahana, Gül Seçkin, Loren Lovegreen, Boaz Kahana, Vinay Cheruvu, Jane Brown, Cathie King, and Jessica Kelley-Moore</i>	
Enhancing signal strength in later life through technology	663

Presidential Address

Opening of the 9th World Congress of Semiotics (Solemnity Hall, University of Helsinki)

Distinguished Mrs Councillor of State Uosukainen, Distinguished Rectors, Dear Semioticians from all over the world, Ladies and Gentlemen: We are now gathered for this long-awaited convention of semioticians of the world: the Ninth Congress of the International Association for Semiotic Studies (Association Internationale pour la Sémiotique). At the same time, we are also inaugurating here the international Charles S. Peirce Symposium.

History is present in this hall in many senses. First of all, these truly global meetings are not so numerous as to exceed the lifetime of one person – I know of scholars in this hall who have been attending these conventions ever since the first one, held in Milan in 1974. It was followed by the Vienna congress in 1979, the largest in the history of semiotics, with 2000 participants, and then in Palermo, Barcelona/Perpignan, Berkeley, Guadalajara (Mexico), Dresden, and Lyon. Now, for the first time, we are in Northern Europe, where for the second time such a congress is being shared between two cities, Helsinki and Imatra.

It may be asked, Why are we here? As a practical matter, we should recall that Finland was a candidate for the IASS congress even earlier, and I believe I am right in saying it was the dream of Thomas A. Sebeok, as well as the plan of A. J. Greimas, to have it here. Now the University of Helsinki and the International Semiotics Institute at Imatra are hosting this event.

We may also ask about our “raison d’être”, especially since our discipline has undergone so many changes and transformations during its half-century of existence as an institutional entity. The fact is that the

history of semiotics in the twentieth century, and now in the twenty-first, constitutes an amazing intellectual adventure and a real success story. The basic ideas and concepts of our discipline – discovered and defined many centuries ago, in classics of Antiquity and the Middle Ages – were grouped into various schools in the nineteenth and twentieth centuries.... And now they appear in almost every congress organized in the humanities, social sciences and biosciences.

Semiotics has been victorious, to such extent that those who have not followed its paths since its origins are often even not aware of speaking the international scholarly language called “semiotics”. Some may say that semiotics has become irretrievably commingled with other trends and schools, such as media and communication studies, cognitive science, biosemiotics, cultural studies, philosophy, and so on. If you go to congresses of these fields and many others, you will find the mere titles to be purely semiotic, stemming from our tradition. Others may see that semiotics has “exploded” into an array of different galaxies, fragmented into highly detailed and specialized fields.

In such a situation, it is, to my mind, extremely important that congresses be organized which are expressly dedicated to semiotics, in order to refine its concepts, maintain their actuality and theoretical sharpness, and remind us of our origins in classical thinkers. That is the reason for a world congress of semiotics, the best proof of which is your presence here today.

To try to define briefly what we do, we could say that semiotics is a science that is always two steps ahead of the others. It has served as a field of innovation in its truest sense, not as *pensée domestiquée*, to produce immediate economic profit, but as *pensée sauvage*, to quote Claude Lévi-Strauss, whose centenary we are also celebrating on this occasion (albeit a year in advance).

In a word: semiotics has kept itself as the *avant-garde* of sciences. It has always looked forwards, seeking and discovering new territories, asking new questions, mounting new explorations.

Nous devons regarder l’histoire de notre discipline. Quel facteur l’a rendu quelque-chose nouvelle dans les années 60, à l’époque glorieuse du structuralisme, lorsqu’elle est devenue institutionnalisée? D’une part, quant aux topiques traditionnelles de haute culture dans les arts, his-

toire, mythologie, patrimoine culturelle, la nouvelle chose, la modernité consiste en efforts d'y appliquer des points de vue radicalement nouveaux de la théorie d'information, linguistique, cybernetiques, études par ordinateurs. Ce nouveau aspect fournit ces sujets avec un effet d'étrangement, ils étaient tout à coup vu dans une lumière complètement inattendue, satisfaisante les idéals de l'efficacité, précision, formalisation, analyse structurale, alors epistémés de l'époque et à la mode.

Néanmoins, de l'autre coté aussi radical a sonné l'idée d'étudier la culture populaire, les «*lesser arts*», comme on dit en anglais, cinéma, publicité, mode, gastronomie, média par un discours rigoureux et formel ; ces sujets étaient pour ainsi dire élevées à un status des objets sublimes et nobles qui valaient études sérieuses et académiques. Là restaient la nouveauté de toute la sémiotique.

Mais quelle chose pourrait être «*nouvelle*» dans le contexte de l'année 2007? Le structuralisme a donné sa place il y a longtemps au poststructuralisme et postmodernisme. Pourtant j'ai le sentiment que nous ne vivons plus dans aucun monde de «*post*» mais que nous sommes en face des challenges et défis imprévues. Je suis convaincu que la science, même la plus abstraite and théoretique, est en fin exercé et écrit à partir de son propre temps, réfléchi et filtrée par les expériences subjectives sur monde de notre savant. Cette nouvelle science, j'ai le courage de l'appeler comme «*néosémiotique*». De quoi s'agit elle, je le laisse à décider, à vous, chers amis sémioticiens du monde, selon vos traditions et considérations.

Dans certains pays on pense que l'on peut tenir la sémiotique vivante et de l'avantgarde en étudiant des phénomènes fraîches de notre environnement culturel, c'est-à-dire de média, nouvelles formes de communication, internet, portables, les choses de cyber, consommation, le lieu urbain et post-urbain, futurologie etc. Evidemment c'est une avenue, mais il faut que nous nous souvenons ne pas d'être les *seuls* savants qui recherchent de tels sujets. Ils sont aussi traité par des autres provenant d'autres disciplines, qui possèdent peut-être une plus grande attraction à la grande publique. Nous sémioticiens ont, à savoir, une tendance d'être des intellectuels difficiles qui par nos notions abstraites et critiques produisons des troubles et plutôt dérangons la gaité de la vie mondialisé. La science est aussi une activité idéologique.

Or, existe-t'il en fin aucune idéologie «sémiotique» qui nous garantis l'intérêt pour la sémiotique comme une science progressive? Voici nous entrons la domaine des valeurs, qui ne doivent guère d'être exclues de l'approche sémiotique. La sémiotique a été trop souvent critiqué qu'elle essaie seulement élucider comment les choses *fonctionnent* au lieu de réfléchir sur les questions vraiment essentielles, comme qu'est-ce-que nous devons faire? Sémioéthique est une nouvelle sous-discipline qui se souci de prendre cette défi au sérieux.

Let us look at the history. What made semiotics something new in the 1960s, in the glorious days of structuralism, when it became institutionalized? On the one hand, traditional high-culture topics in the arts, history, mythology and cultural heritage were studied from radically new viewpoints of information theory, linguistics, cybernetics and computer studies. These new viewpoints and frames of reference provided these topics with an estrangement effect, such that they were suddenly seen in a totally new light, as fulfilling the epistemic ideals of efficiency, formalisation, and structural analysis. On the other hand, the study of popular, “low-culture” phenomena and “lesser arts”, such as cinema, advertising, fashion, food, and media, with a rigorous and formal discourse, elevated all those to a status of sublime and noble objects worthy of serious academic study. That, too, was a novelty.

What might the “new” semiotics bring us today, in 2007? Structuralism has given way to poststructuralism and postmodernism, yet I have the feeling we are no longer living in a “post-world”, but rather facing new challenges. My conviction also is that science, even the most abstract and theoretical, is ultimately done and written in its own time; in it are reflected and filtered the personal experiences of the world by the scholars exercising it. This new science I have taken the liberty of calling “*neosemiotics*”. What it is and will be, dear semioticians from many countries and traditions, remains for you to decide.

In some countries it is thought that semiotics remains alive and avant-garde by studying the newest phenomena of our cultural environment, by focusing on media, new forms of communication, internet, mobile phones, “cyber-toys”, consumption, urban and posturban spaces, futurology, etc. That is one avenue; but we must remember that we are not the *only* scholars studying such issues. They are dealt with by

others whose discourse may have more direct appeal to a large audience, since we semioticians tend to be intellectuals who, with our critical and abstract concepts, disturb the blissful life of the globalized world. Science is also ideological activity. Is there, then, anything like a “semiotic” ideology, which would guarantee its interest as a progressive science? Here we enter the area of values. These can by no means be excluded from semiotics, which has been overly criticized for clarifying merely how things *function*, instead of pondering such vital questions as, What should we do? Semioethics – a new subdiscipline – is trying to take this challenge seriously.

The theme of each world congress has been different. As you know, our theme has to be general enough that any semiotician of the world can attend. On the other hand, it should display a kind of actuality. Moreover, it should to some extent reflect the traditions and achievements of the host country. Hence such themes as “Man and His Signs / L’homme et ses signes”, “Signs of the World / Les signes du monde” and the like have figured as headings of these conventions

This time our theme is *Communication: Understanding and Misunderstanding*. The first concept – communication – makes reference to one very important field of our studies, in the area of *signification*. As you know, you are now in the country of Nokia, a pioneer in modern communication. Moreover, the idea of “understanding” reflects the philosophical tradition of our country, in names like George Henrik von Wright (highly respected by Greimas, among others) and Jaakko Hintikka, not to mention the many Peirce scholars who are having their symposium simultaneously with this one.

Now we come to the word “misunderstanding” in our title. Nothing could be more urgent and actual: we live in a world of conflicts, misinterpretations, errors, suspicions, tensions, hostilities, prejudices ... In short, as the American linguist Walburga von Raffler-Engel once put it at a historic congress in Finland in 1983 in Jyväskylä, we live in a world of *crosscultural misunderstanding*. As the patron of our congress, President Martti Ahtisaari, one of the world’s leading specialists in this field has said: “If we semioticians study misunderstanding we can find ways and open paths to the self-understanding of mankind.”

If you will look at the cover picture of your program and abstract books, or at our poster, designed by Jussi Rossi, you will find signs that

are not arbitrary. On the former, you see a graffiti-sign of our present world, giving the impression of contemporaneity. But why in the world is the name of Brazilian Emperor Pedro II engraved there, on something resembling grey stone? Some of our guests already know: it comes from some rocks at the Imatra waterfall, admired by semioticians of many countries and generations. Among many other notables over the centuries, Pedro II visited Imatra in 1876 after attending a Bayreuth Festival produced by Richard Wagner. Thus, the sign on our poster may symbolize both the presence of history and global communication among continents.

Finally, I ask you to look at three geometric forms visible there: a triangle, a square, and a circle. These are supposed to refer to various semiotic theories – to which ones I leave to your imagination!

Ladies and Gentlemen, at the end of the opening speech there is always a place for thanks. We have to express our gratitude to the following institutes in this country: the University of Helsinki, the International Semiotics Institute at Imatra, the Finnish Network University for Semiotics, the Ministries of Education and Foreign Affairs, Finnish Academy of Sciences, Finnish Cultural Foundation, Nokia, the Niilo Helander Foundation, the Istituto italiano di cultura, the embassies of France and Lithuania, and the Metropol Polytechnic University of Helsinki.

And above all, we are indebted to all of you who are present here, having made the (often long) journey to Finland. It is thanks to your contributions that our tradition of world congresses of semiotics remains alive and vigorous.

Comprendre la communication touristique

Approche sémiotique de la culture

I. Introduction

La communication touristique est devenue un élément indispensable pour faire connaître un lieu, le promouvoir et finalement le vendre à un destinataire “chercheur d’information” et “touriste potentiel”. Sous l’impact du développement croissant du tourisme urbain, de plus en plus de villes élaborent leurs communications touristiques. L’intérêt pour cette dernière n’a cessé de croître une fois que son influence sur le choix de la destination a été largement démontrée par des études de marketing. Mais l’utilité de la communication touristique va au delà de l’attraction des visiteurs ou d’investisseurs, elle joue un rôle déterminant dans la construction d’une image positive et valorisante de la ville. Cette image qui sera enrichie, maintenue, voire modifiée au cours du temps.

A travers cette étude, nous voulons montrer que la communication touristique est une pratique culturelle et donc sémiotique. Nous suggérons que l’appréhension de la communication touristique par la sémiotique permettra une meilleure intelligibilité de cet objet complexe. Pour élucider notre hypothèse, nous nous appuyons sur la sémiotique de la culture. Le travail présenté ici fait partie de notre recherche dont l’objectif principal est de montrer comment la communication touristique construit une identité de la ville en analysant un corpus de brochures touristiques concernant les villes de Lyon, Turin et Marrakech. Nous commençons par la présentation des deux éléments clés de cette étude: la communication touristique et la sémiotique de la culture.

1.1. La communication touristique

La communication touristique forme un champ vaste et riche en définitions. Marc Boyer et Philippe Viallon qui étaient parmi les premiers chercheurs qui ont consacré une étude complète à ce sujet ont bien souligné la diversité des supports, des émetteurs et des récepteurs de la communication touristique. Ce qui rend difficile la tâche de trouver une définition globale et précise de la communication touristique. Pour cerner cette diversité, Frustier et Perroy, dans “La communication touristique des collectivités territoriales”, font une distinction entre la communication “du tourisme” et la communication “touristique”. La première est élaborée uniquement par les professionnels du tourisme comme les agences de voyage ou les tours opérateurs. Elle porte sur un produit défini et vise une certaine cible. La deuxième englobe toute activité qui peut avoir un impact sur la fréquentation touristique. Cette distinction est importante mais les termes employés ne reflètent pas clairement cette différence dans le sens. Nous dirons plutôt qu’il existe deux visions de la communication touristique. Une vision “étendue” qui regroupe à la fois les moyens directs et indirects de la communication touristique. Nous pouvons citer comme exemples: un documentaire télévisé sur un pays (comme des Racines et des Ailes ou Thalassa qui sont deux émissions diffusées à la télévision française et qui présentent aux spectateurs des lieux différents), un article de presse qui accentue les avantages d’une région, un film qui met en avant une ville ou même un musée pour ne citer que “Da Vinci code”. Après sa diffusion en France, le musée du Louvre a enregistré un taux de visite exemplaire. Ces éléments énumérés relèveront de la communication touristique s’ils véhiculent une image positive et valorisante des lieux concernés. Dans cette considération large, nous dirons que tout élément qu’il soit médiatique ou pas est susceptible de devenir un instrument de la communication touristique sans oublier le fameux bouche à oreille. L’autre vision que nous appelons “restreinte” recouvre exclusivement les documents fournis par les organismes touristiques tels que les brochures, les affiches, les dépliants ainsi qu’internet.

Au sein de cette deuxième catégorie, nous devons aussi distinguer entre les organismes publics et privés. Cette distinction est d’autant plus importante puisqu’elle concerne deux types de discours qui sont aussi bien différents dans leur forme que dans leur contenu. Si le premier objectif des

tours opérateurs et des agences de voyage est d'attirer les foules de touristes, celui des offices du tourisme est de faire connaître leurs pays, leur villes et de promouvoir leurs cultures. Par conséquent, les documents publiés par les offices de tourisme utilisent un discours moins commercial et plus culturel que tout autre type de documentation touristique.

La communication touristique est donc un discours créé et élaboré pour représenter et vanter un espace donné – qui est dans notre cas la ville. Travaillant sur un discours officiel, celui des offices du tourisme des trois villes concernées, nous proposons de décrire ce type de communication touristique institutionnelle. Avant de procéder à notre analyse, nous devons d'abord présenter l'approche de la sémiotique de la culture.

1.2. La sémiotique de la culture

La sémiotique de la culture est généralement définie comme une perspective utilisant des méthodes et des concepts sémiotiques pour l'étude et l'interprétation de la culture. Elle a débuté dans les années 70 avec les travaux de l'école de Tartu qui portaient principalement sur l'histoire et la culture russe. Elle a connu ensuite des développements en Europe et en Amérique du Nord. Son projet principal est de fournir les éléments adéquats qui permettent l'analyse de la signification de tout ce qui relève de la culture que ce soit un objet ou une pratique. Son objectif est de rendre "les pratiques culturelles interprétables, en élucidant leurs codes, leurs références et les significations qu'elles peuvent représenter pour les acteurs sociaux qui les mettent en œuvre" (Lamizet 1999: 219).

Pour Lamizet, si la culture relève fondamentalement d'une sémiotique, c'est que le propre des pratiques culturelles est de s'inscrire toujours dans une logique de représentation. C'est d'ailleurs le principe fondateur du signe: représenter quelque chose. Par conséquent, la culture est intrinsèquement sémiotique car elle est un ensemble de formes symboliques dont la première fonction est la représentation de la sociabilité. Youri Lotman, un des fondateurs de l'école de Tartu et de la sémiotique de la culture, a plutôt adopté une définition opérationnelle de la culture. Selon lui, la culture c'est de l'information: "Nous dirons donc que la culture est constituée par l'information non-héréditaire que recueillent, conservent et transmettent les sociétés humaines" (Lotman 1971: 46).

Cette définition de la culture comme information est importante car, d'une part, elle insiste sur le rôle du langage naturel comme modalité de la transmission de la culture. D'autre part, elle souligne les caractérisations de la culture: le collectif, le sélectif, le conservé et le transmis. En adoptant cette définition, la communication touristique serait donc un objet culturel parce qu'elle est un ensemble d'informations recueillies, sélectionnées et transmises sur la ville. En parlant de Lotman, nous ne pouvons ne pas évoquer le concept de la "sémiosphère" qui occupe une place prépondérante dans sa sémiotique de la culture. Défini comme espace sémiotique, cette notion a permis de marquer l'hétérogénéité des formes culturelles et leur dynamisme même si elle est critiquée pour sa focalisation sur "le nous" ou le Soi (Rastier 2002). Traitant de la représentation de la ville, nous pouvons souligner le travail de Lotman sur l'importance de la ville dans le système symbolique d'une culture (voir le symbolisme de St Petersburg).

Cette courte présentation de la sémiotique de la culture nous a permis d'élucider le caractère sémiotique de la culture. Nous proposons maintenant trois considérations principales – et qui sont à notre avis complémentaires – explorer la communication touristique en tant que pratique significative.

2. La communication touristique: Une pratique culturelle

2.1. La mise en signes et en scène de la ville

Nous envisageons la communication touristique comme une pratique culturelle car elle est une pratique sociale signifiante menée par un acteur collectif – les décideurs – pour construire un objet sémiotique qui est la ville représentée. Selon Lamizet, toute pratique culturelle s'inscrit dans une logique de représentation, de signification et de sociabilité. A cet égard, la communication touristique ne peut être qu'une pratique culturelle dans la mesure où elle suit cette logique. La ville dans une brochure ou un dépliant touristique se manifeste sous la forme d'un ensemble signifiant composé de signes textuels et visuels. Ces signes sont sélectionnés, hiérarchisés et traités dans le but de créer une ville – discours qui représentera la ville réelle. La visée référentielle de la communication touristique qui consiste à faire croire que la ville représentée correspond à la ville réelle

n'est pas pour autant la seule. En d'autres mots, la ville n'est pas seulement représentée mais transformée en attraction – en employant un terme bien touristique – c'est-à-dire en objet de valeur qui pourra susciter l'intérêt d'un sujet. Cet objet sera également interprété comme une mise en œuvre de la sociabilité et surtout de l'identité. Nous développerons ce point dans la dernière section de ce travail.

Dans son livre *The Tourist*, D. MacCannell élabore une sémiotique de l'attraction. Selon lui, une attraction touristique met en relation un marqueur (marker) qui représente un "sight" (un lieu touristique à voir) pour un touriste. MacCannell définit le marqueur comme toute information à propos d'un "sight". Nous pouvons dire que MacCannell adopte une vision étendue de la communication touristique puisque – pour lui – un marqueur peut être une carte postale, un guide touristique, un article de presse, une photo, etc. L'intérêt du travail de MacCannell se lit dans sa définition du marqueur qu'il considère comme un signe représentant un "sight" au touriste. Dans ce contexte, la communication touristique serait la mise en circulation des marqueurs.

La communication touristique met en scène la ville en lui donnant une autre forme de présence: celle des signes qui la représentent et en même temps la construisent pour en faire un objet de valeur et de savoir. La communication touristique fait connaître la ville, ses atouts et sa culture au touriste – qui en principe ignore tout de la ville sauf peut-être le nom. Elle devient ainsi l'objet-intermédiaire entre la ville et le touriste. Pour cela, nous proposons de considérer la communication touristique comme une médiation culturelle.

2.2. La communication touristique comme médiation culturelle

Si on se représente le tourisme sous la forme d'un parcours narratif, la communication touristique se situe entre le désir de voyager et sa réalisation. L'envie de partir existe mais pour choisir sa destination, le touriste potentiel a pour solution de consulter la communication touristique. Cette dernière est souvent le premier contact qu'un touriste peut avoir avec une destination ou "un sight" comme l'affirme MacCannell: "Usually, the first contact a sightseer has with a sight is not the sight itself but with some representation thereof" (1989: 110).

La communication touristique met en scène la ville et rassure le touriste potentiel en lui proposant un voyage virtuel à travers ses textes et ses photos. Autrement dit, elle lui offre une première vue de la ville. La majorité des touristes ont donc déjà visité leurs destinations sans avoir quitté leur domicile. Par conséquent: “In many cases, tourists do not get to know the area, but get to re-know it” (Gali et Benito 2005: 778).

Nous voulons insister ici sur le fait qu’un lecteur est aussi un touriste – virtuel – et que la communication touristique est une zone de contact entre le touriste et la ville. Une brochure de notre corpus sur la ville de Turin commence avec l’énoncé suivant: “C’est en vous *promenant* que vous découvrirez les vrais trésors de cette ville, dans ses rues, dans les palais, dans les cours ...” Dès les premières lignes, la communication touristique met en relation le touriste – le sujet de référence du “vous” – et la ville. Certes, c’est l’actualisation du programme narratif “la promenade” – qui est une métonymie du voyage – qui permettra au touriste de découvrir les vrais trésors de la ville réelle. En attendant, il peut parcourir les pages de la brochure touristique et mener une promenade virtuelle par laquelle, il découvrira d’autres formes de trésors; celles de la ville représentée en mots et en photos. La communication touristique abonde en signes visuels iconiques représentant des espaces fermés et ouverts de la ville. Cette abondance est cruciale puisque le tourisme est le domaine du visible par excellence comme le montre bien d’ailleurs le mot anglais “sightseeing”. On voyage pour voir, d’où la nécessité de créer un monde sensible à l’œil du sujet-observateur dans et par la communication touristique.

La communication touristique crée un lien entre la ville et le touriste. Elle se présente ainsi comme une médiation culturelle entre le sujet (le touriste) et le monde représenté (la ville). Si l’objectif général de la médiation culturelle est la mise en lien du sujet avec l’objet ou l’espace culturel, nous pouvons dire que la communication touristique remplit pleinement cette fonction et de différentes manières. Premièrement, la communication touristique instaure un espace intersubjectif où le touriste rencontre la ville comme nous l’avons déjà signalé. Deuxièmement, la communication touristique cherche à séduire en représentant les objets et les espaces culturels attendus par les touristes sous un mode esthétique attirant. De plus, la communication touristique n’hésite pas à promettre explicitement aux touristes la satisfaction de leurs divers besoins culturels comme dans l’énoncé suivant: “L’art est chez lui, ici à Turin. 40 musées pour satisfaire

les passions et les curiosités culturelles et artistiques de chacun”. Troisièmement, la communication touristique n’est pas rédigée dans la langue naturelle de la ville (l’émetteur) mais souvent dans une langue étrangère: celle du touriste. Elle forme ainsi un discours sur Soi (la ville) traduit pour l’Autre (le touriste) constituant ainsi un pont culturel entre ces deux catégories. Ce que nous proposons de développer dans le prochain point est cette présence de soi et de l’autre dans la communication touristique.

2.3. La communication touristique comme présence de Soi et de l’Autre

La communication touristique n’est jamais neutre. Elle est surtout productrice d’images. Le concept “image” est utilisé ici dans le sens de représentation mentale qu’un sujet cognitif se fait d’un lieu sans être physiquement lié à ce lieu. Ainsi, la communication touristique transmet l’image que la ville veut donner d’elle-même au monde extérieur. Cette image construite est étroitement liée à une présence de soi et de l’autre dans le discours de la communication touristique. De ce point de vue, la communication touristique est une pratique où le soi se rend présent et signifiant à l’autre.

La communication touristique construit un objet sémiotique par lequel la ville est représentée à travers une pluralité de signes que le lecteur doit configurer et interpréter pour créer sa propre image de la ville. Cette représentation est essentiellement faite pour un autre- qui en principe un étranger qui veut découvrir la ville. Par conséquent, la communication touristique est le résultat d’une réflexion sur soi car l’émetteur s’engage dans un processus de sélection des éléments signifiants – des signes – qui selon lui, sont représentatifs de sa ville. Elle résulte également d’une réflexion sur l’autre puisque l’émetteur élabore son discours en prenant en considération ce que l’autre attend de lui. Ce faisant, la communication touristique relève en partie du métasavoir dans la mesure où elle traduit un savoir que le sujet-émetteur a sur le savoir du sujet-récepteur. Ce savoir qui est basé sur le croire-vrai de l’émetteur explique l’emploi des stéréotypes et des préjugés dans la communication touristique.

Dans la communication touristique se développe un processus identitaire complexe; celui de la valorisation de soi. Le sujet valorisant – l’émetteur de la communication touristique – donne du sens à la ville en faisant d’elle un objet singulier. Ce processus de distinction et de signification est

actualisé par l'emploi de plusieurs stratégies de valorisation qui font de la ville un objet utopique, ludique, historique ou pratique. C'est au lecteur de faire son choix selon ses motivations. Ce faisant, l'émetteur de la communication touristique met en scène et en valeur les éléments physiques de la ville (son patrimoine naturel et culturel) mais aussi ses croyances, ses traditions, ses valeurs, ses arts, son style de vie, ... en un mot son identité. La communication touristique se définit donc comme un lieu de construction de l'identité où on valorise les monuments et les paysages de la ville ainsi que ses bâtisseurs anciens et modernes, ses artisans et ses habitants qui font d'elle un objet unique comme le montre l'énoncé suivant extrait d'une brochure sur la ville de Lyon: "Au fil des ans, les Soyeux, les Imprimeurs, les Bâtisseurs, les Créateurs ont confirmé la vivacité de la Cité. Et ont tous façonné un patrimoine unique, rare, et beau".

La communication touristique transforme la ville en faisant d'elle un objet visible et lisible pour l'autre. Elle construit ainsi une identité de la ville, celle qui sera comprise, reconnue et acceptée par l'autre. Ce faisant, la communication touristique est un discours dont l'objectif est d'assurer la compréhension entre un émetteur et un récepteur appartenant à des cultures différentes.

3. *Conclusion*

La communication touristique n'est pas seulement une technique de promotion ou un moyen d'information; nous avons essayé de le montrer au cours de ce travail en élucidant son caractère sémiotique et culturel. En premier, nous avons proposé d'étudier la communication touristique comme une pratique culturelle puisqu'elle est une pratique sociale significative. Ensuite, nous avons élucidé son statut de zone de contact entre le touriste et la ville. Ce qui nous a amené à la définir comme une médiation culturelle. Enfin, la communication touristique construit une identité de la ville dans la mesure où elle est une présence de soi à l'autre et une présence de soi et de l'autre. Nous avons proposés ces trois pistes d'investigation afin d'assurer une meilleure compréhension de la communication touristique en tant que pratique significative et de l'inscrire dans la problématique d'une sémiotique des cultures.

Power relations and construction of knowledge

Introduction

Mass media keep us aware of world events, act as a means of recreation, and have even become accepted as a guide for general decision making. Mass media also undertake the education of society, by constantly imprinting identities, social behaviours, status quos and the roles that we play in daily life. The owners of the media institutions influence the structure of the ideologies disseminated. Hence the “same” knowledge, when imparted by mass media, may vary considerably from venue to venue. It is possible to claim that the owner(s) of the media may also influence the audience’s perception via the ideology that is injected.

This paper examines the changing discourses of various newspapers concerning the bridge that is supposed to symbolically “re-unite” Nicosia, the only divided capital city in Europe. The printed biases of different newspapers lead to different accounts of the same events, which engenders profound effects on everyday life.

1. Communication as producing and exchanging meanings

Verbal and written skills are one of the main distinctions that make mankind different from other beings. The production and exchange of meanings includes two interrelated concepts: transmission and interaction. Mass media are the most widespread means of communication, enabling interaction between communities and nations; and spreading information to the masses has become one of the main tasks of the media. But with the constant development and diffusion of new communication technologies, it becomes difficult to talk about pure information. Nowadays, the media

are an arena in which the owners compete – they use media for their own benefit. Hence the kind of knowledge disseminated is not neutral, but infused with “power relations”.

The term “information” can be defined as receiving and sending news or collected facts and data, whereas knowledge can be explained as “the psychological result of perception and learning and reasoning” and as the product of thought that arise from human intelligence. In other words, knowledge is a type of processed information that involves learning. It is not pure information but a reproduction of it. Thus, transmitting information with objective and impartial discourses would influence the knowledge obtained by individuals and society.

Media, used as an ideological weapon by the owners, can be accepted as the mean of a system constructed through “power relations”. Since media have the power to determine the attitudes and ideas of audiences, they can format, construct and reconstruct our knowledge. In order to investigate the power of media it is necessary to deal with the power of language and discourse. Language is a system of sounds, words, patterns, etc. that humans use to communicate thoughts and feelings; as such, it is much more complicated than we might imagine. It has the power to dominate and, in a sense, construct the things in our lives, even ourselves.

2. Language and the construction of knowledge

Under the heading of textuality one could summon up a movement within literary and cultural theory and in philosophy towards the revaluation and revalorisation of the text as *text* rather than as pale reflection of some prior reality (Barrett 1991: 124).

Words refer only to themselves, not to objective realities; therefore giving meaning to them should be in the hands of the reader. How readers do so is interrelated with their background and psychology, as well as the texts that they read (intertextual meanings). Some postmodernist and new pragmatist thinkers, such as Tzvetan Todorov and Stanley Fish, explain the meaning of text as “everything” and “nothing”. They also insist that each text is pre-text and bears the meaning that the reader gives it; in other words, readers both read and construct texts. The deconstructionists, following Derrida, answered the question of “what is text” as nothing. According to them there should be both thesis and antithesis within the

text, and the difference between them is used in order to construct meaning. They believe that within a text, in order to construct the meaning, the reader should recognize the hidden “differences” therein; for instance, while reading the term “black”, (s) he should be able to understand also the concept of whiteness.

A close relation obtains between text, author and the interpretation of hidden meanings within statements. There is also an interrelation between text and discourse. In the modernist perspective, the author, who is accepted as the creator of the text, has authority over his or her creation, and hence determines the destiny of the text and its interpretation. By contrast, in postmodernist formulations the reader and the text, as constructors of meaning, are privileged over the authors. Meaning arises from the interaction of the reader with text, with the reader’s past experience also playing a role in the establishing of meanings. How these meanings arise is another matter to be explored.

The concept of “discourse” is used by Mikhail Bakhtin, Roman Jakobson and then later by Michel Foucault (Doltas 1999). Bakhtin, in his article “From the Prehistory of Novelistic Discourse”, defines discourse as the communication of ideas by way of language. Jakobson accepts discourse as part of the communication process and as a power by which to transform systems of meaning. In his view, discourse explores the relation between “word” and “world”. Therefore two of the most important questions to be asked are, Which peculiarity of this cosmos or universe is expressed? And, How is it expressed?

Foucault, as opposed to modernists, claimed that some knowledge and thoughts are taken for granted in the construction of discourse and that they are not independent from history, culture and ideologies. Foucault draws attention to the relation between text and discourse:

The question posed by language analysis of some discursive fact or other is always: according to what rules has a particular statement been made, and according to what rules could other similar statements be made? The description of the event of discourse poses a quite different question: how is it that one particular statement appeared rather than another? (Foucault, in Barrett 1991: 126)

According to Foucault, there is a strong relationship between statements, the source of the statement (centres of knowledge), the hidden meaning of the statement, and what the discourse tries to emphasize. Yet

Foucault rejects the concept of ideology for three reasons. First, because it “always stands in virtual opposition to something else which is supposed to count as truth”, the effect of the truth produced within discourses, which in themselves are neither true nor false. Therefore discourse has in itself the power to produce or reproduce “truth”. His second reason for rejecting ideology is because it refers to something of the order of a subject; his last reason is that it stands on a determinate base-and-superstructure model within Marxism.

According to Foucault, discourse can actively constitute or construct society on various dimensions. Discourse analysis is concerned with specifying socio-historically variable discursive formations, which include formation of objects, of enunciative modalities, of concepts and of strategies. Through discourse the objects of social life are conceptually transformed and reproduced. Moreover, discourse is historically specific, yet open to change. Therefore it can be assumed that the historical can also be reconstructed through history again.

Social context and verbal context (its position in relation to other statements) determine the form of a statement and the way it is interpreted (Fairclough 1994). There are also extra-discursive relationships, which pertain to the relation between statements and institutions (Barrett 1991). According to Scott Reid (1999), language relates to power in four aspects: (1) language reflects power; (2) creates power; (3) depoliticizes power; (4) and finally, it “routinizes” power. As a rule of thumb: the dominant power will impose its own language on the population at large, thereby making it the standard language to use.

3. Changing discourses and constructed knowledge

The print media of northern Cyprus is controlled by political parties, each newspaper being owned by one of them, and serving as a venue from which to promote their various political intentions. This situation may be taken as proof of the democratic infrastructure of the republic, but it may have some disadvantages when it comes to the construction of the knowledge of the society as well.

As mentioned earlier, different newspapers voice different views on the symbolic bridge that is supposed to “re-unite” Nicosia, the only divided European capital at the time this essay is being written. The newspapers in

question are: the Afrika Newspaper, which can be described as extremely left wing; the Volkan Newspaper (right wing); and the Kibris Newspaper, representing the democratic left.

In the first week of the December 2005, Afrika Newspaper set its agenda on the significance of the bridge that was going to be constructed for “peaceful” purposes. These last received considerable attention, and only one day was there hard news, concerning the proprietorship problem of people living in northern Cyprus. Setting their sights on the significance of this “peaceful” bridge, the authors mostly acted as adversaries to the government or to the military, using harsh words to make their case. On the first day of December the headline was about the money spent for construction of the bridge. One author attacked the necessity of constructing the bridge, and pointed out that the upper passageways, essential to preventing accidents, were never built. The headline emphasized that the bridge was constructed simply for military purposes. The following day’s headline was based on the same assertion. By doing this, the Afrika Newspaper tried to inject the idea that the bridge could not be accepted as a sign of “peace” but rather of political and military force. The third day saw a criticism of the bridge as a connector between Heaven and Hell. The Afrika Newspaper is one of those that defend the necessity of re-unifying Cyprus. Thus, they signify Northern Cyprus as hell, because of not being recognized politically, and South Cyprus, that is to say, the Republic of Cyprus, as heaven. December 4 saw no headline related to the bridge but on the fifth day the newspaper gave place to the concerns of the president of the Republic of Cyprus regarding the military purpose of the proposed bridge. The next day, after mentioning Papadopoulos’s doubts, they poured shame on the Turkish military for operating in the region that the bridge was going to be constructed. Thus, Afrika Newspaper clearly aligned itself with the Greeks about the military purposes of the construction of the bridge, rather than its “peaceful” purposes.

By contrast, Volkan Newspaper set its agenda to focus not on construction of the bridge, but on the proprietorship suit in the case concerning the re-unification of Cyprus. The issue concerns proposed laws about returning, trading, or parcelling the properties owned by Greeks in Northern Cyprus. The Volkan Newspaper showed itself sympathetic to the idea of compensating Greek Cypriots in the south.

On December 1, the Kibris Newspaper – a defender of the democratic left – claimed that the bridge, meant to be a sign of re-unification, was instead causing a panic among Greek Cypriots and clearly favoring Turkish Cypriots’ political designs for the same bridge. On December 2 the headline was about the reaction of the president of Northern Cyprus, denying any suggestions that the bridge was to be used for military purposes. Acceleration of the construction of the bridge and decisiveness of Turkish Cypriots made the headlines on December 3. The next three days saw no cover stories about the bridge, but on December 7 an article ran about the obstinacy of Greek Cypriots in refusing to remove the wall that divides the city.

Afrika Newspaper, which had supported the Greek Cypriot position and opposed the government, was trying to inject the idea that the construction of the bridge was based on military purposes. The right-wing, Volkan Newspaper did not want to set an agenda for construction of the bridge, choosing to ignore even the possibility of such an event. Yet by putting the proprietorship case on the agenda, they indirectly underlined the fact that they were not defenders of the bridge case. On the other hand, the Kibris Newspaper, as a proponent of the democratic left, featured some constructive discourse on the bridge case. All in all, it is possible to say that, despite the fact that the Greeks opposed the construction of such a symbolic bridge, to insist that it would have positive consequences was a bit of a utopian dream.

The different agendas and discourses of the newspapers make it possible to interpret the proposed bridge-building in various dimensions. In such a situation, the political views of the newspapers’ owners are the main designators of discourse about events, as well as how to handle them. In this way, the newspaper owners tell readers what to think and “how to think”, manipulating them according to their, the owners’, political views. Afrika Newspaper and Volkan Newspaper, which are extremely opposed to each other, nevertheless agreed on some points of the issue. None of the newspapers really wanted such re-unification, for various, self-seeking reasons. But somehow they all agreed that symbolic re-unification of two sides of the island was not a good idea.

To sum up: reflections on the same signs may vary according to the ideology of the media owners. These last set the agendas for public opinion by promulgating interpretations of the events in the way they want.

The matter of the symbolic bridge is just one example of the influence of printed media on the construction of knowledge. The content of each newspaper emphasized the fact that it was the southern part of the island that disapproved re-unification. Thus destruction of the bridge can be a signifier of the fact that the dominant part of the island does not want such re-unification. The failed erection of the “symbolic bridge” serves as but one demonstration of the power of media on the construction of public opinion.

Autostadt – Cars, aesthetics, and movement

Die Theorie, man müsse nur genügend Angebote im Öffentlichen Nahverkehr erzeugen, dann stiegen die Leute auf die Straßenbahn um, ist deswegen falsch, weil die Straßenbahn niemals dieses Lebensgefühl, was auf gut bayerisch cocooning heißt, bieten kann, diesen Rückzug in einem Kokon in dem Sie niemand stört.

– Dr. Bernd Pischetrieder, Vorstandsvorsitzender
der Volkswagen AG (Eckard 2002: 10)

1. Introduction

The aim of this presentation is to examine the role of aesthetics in creating the experiential effects of the attractions of Autostadt. The latter is seen from the perspective of urban and regional development; in this context, brief reference is made to how Volkswagen AG has contributed to the development of the city of Dresden in Saxony by launching the production of luxury limousines at the centre of the city.

2. Autostadt

The 25 hectare Autostadt at Wolfsburg opened on 1 June 2000 in connection with the World Exhibition in Hanover, the EXPO2000. Today, Autostadt is the only existing tourist-oriented car theme park. It claims to be a futuristic theme park on the subject of “automotive mobility” (Brochure 2006: 11). Apart from being a communication and service platform, as well as a physical interface with the surrounding world, it serves at least three purposes. First, it is a piece of strategic marketing that takes care of the branding activities of Volkswagen AG. Secondly, it serves as the final stage in a sales process, namely, the delivery of the car. Thirdly, it is an important

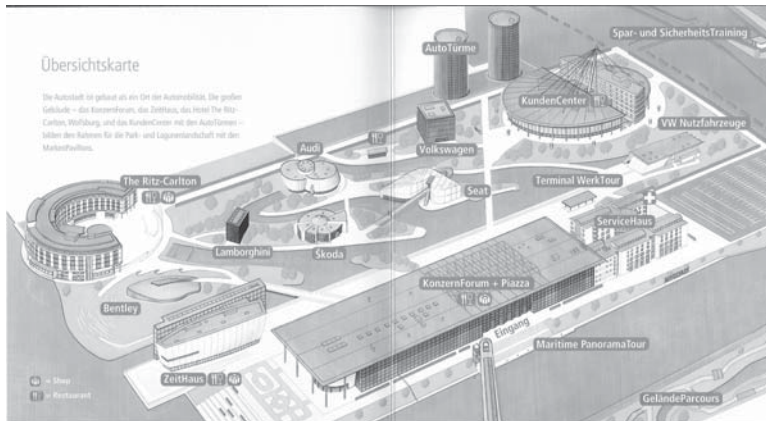

Image 1. Map of Autostadt.

part of an urban and regional development of the city of Wolfsburg and the tourist attractions of Lower Saxony.

Apart from those who work there, people go to Autostadt as visitors or as customers. Each year approximately 600 customers choose to collect their new VW-model at the KundenCenter at Autostadt. Many customers make it a family outing, arriving early on a Saturday so they can spend the day in the “Stadt”. If you wish, Autostadt can arrange for you to be picked up at your home address anywhere in Germany, in a Phaeton or a Tuareg, and driven by chauffeur to Autostadt. If you wish, and can afford the cost, you can make a holiday of the whole business, and stay at the luxurious, 5 star Ritz-Carlton Hotel in the “stadt”. Prior to collection, your car is stored in one of the two transparent Autotürme that tower above the Autostadt as a landmark of the biggest producer of automobiles in Europe. The two towers contain 800 cars.

One of the first objects that meet the eye of anyone arriving at Autostadt is a full-stop traffic sign bearing the inscription “Smile”. This symbolic index also anticipates what the slogan “Menschen, Autos und was sie bewegt” expresses; viz., that “Bewegung”, emotion, pleasure is the main attraction. And true, inside the “Stadt” there is not much physical movement. Except for the strolling visitors, Autostadt appears as a frozen spatial aggregation of the industrial-cultural past; present and future are symbolized by the contrast between the chimneys of the gigantic power plant

and the transparent Autotürme which houses the cars that are soon to be handed over to their new owners.

Most guests and customers enter Autostadt through the KonzernForum. Architecturally, this building seems an attempt to unite urban extremes of the public square, the central Piazza, with the private domain, the secluded cubicles, with nature outside. Through the opening and closing of the enormous column windows to the north and south, the space inside the building can be exposed to changing wind and weather conditions. Standing on the glass-covered floor of the piazza, underneath a big suspended globe, and looking out of the enormous column windows – all this may easily generate a floating feeling in any expectant visitor.

Many visitors stroll from the KonzernForum to the Zeithaus. This building contains an experientially oriented presentation of the history of mobility through a selection of historical “Meilensteine” in the development of the automobile. Because this building is a key to understanding the experiential techniques generally applied at Autostadt, we shall take a closer look at its architecture and aesthetics.

“Zeithaus” is a three-part complex consisting of two separate bodies connected by a glass-covered staircase room. The northern part is a transparent, square-windowed glass “rack” containing a collection of historical cars distributed among four floors. The southern part is an organically shaped, closed concrete compartment.

In the transparent, pixel-square windowed building the historic car models are presented like miniatures in a collection case, separately, and in chronological order, so that each car represents a stage in the technical development of the automobile. As such, the windowed building represents a form of digital memory and recollection. The closed, concrete body contains various dramatisations of the automobile in social and historical contexts. This part of the complex stands for associative, emotional or analogue, memory. The contrasts between the analogous and the digital, the square and the organic, the transparent and the opaque, support a final symbolic reference of the complex to a brain with a right and a left side. The balconies and staircases between the two halves, in extension of this symbolism, trace out the neuronal net connecting the two sides. It seems to have been the idea of the Henn architects to shuttle visitors between the two halves of the building, like impulses in a neural network, following

up on impressions and ideas and in this way building up their individual experiences (Henn Architekten Ingenieure 2000).

The “Zeithaus” presents the experiential matrix of Autostadt. Through the architectural metaphor of a brain and through the aesthetics of various design stories, the visitor is propelled like a neural impulse moving between sensual impressions and memory or knowledge. You “sample” the “Meilensteine” in the digital part of the building and see some of them in selected contexts in the analogue part. What has not been dramatized you must fill in yourself. This is the coveted and enthusiastic “Bewegung”: neuronal impulses becoming experiences that are personified in the guest driving away in his customized VW cocoon.

And yet, this matrix of the creative brain seems to cut two ways. Its focus on joyous expectation (on “Freude”, as it says on the escalator in the KonzernForum) and on spotless aesthetics both subdues and accentuates certain blanks. Though the “Zeithaus” is technically not a museum, it is hard to restrain your historical knowledge of Volkswagen; for example, the fact that Volkswagen, under the name of KdF-wagen, was a part of the Nazi organization of “Kraft durch Freude” and that Wolfsburg, until 1945, was called “Stadt des KDF-Wagens”. You have to look very hard to find any traces of this neatly blanked-out bit of history anywhere at Autostadt or Wolfsburg.

In this sense, the matrix is somewhat lopsided in disposition: digital vs. analogue; transparent vs. opaque; the present vs. the past; design vs. production; clean vs. dirty; *Freude* vs. ?? The mere fact that Autostadt, with all its aesthetic strategies, has as a backdrop one of the largest, most monumental industrial complexes in the world constantly refers to a certain historical knowledge or memory: the production of war materials during World War II and, after the war, the production of endless numbers of “Käfers”. Perhaps feeling somewhat pinched from this disposition, the guest moves on to the MarkenPavillons. Except for the Bugatti, there is one of each of the car brands that Volkswagen AG manages: Bentley, Lamborghini, Skoda, Seat, Audi and VW. A further pavilion contains the Nutzfahrzeuge.

One remarkable thing about the “Stadt” is that you do not see many big logos or other visual brand-labels. The point is that the brand is embedded in and speaks itself through the elegant design of the interior and exterior

of each pavilion. A major aesthetic force is the storytelling choreographed into the layout of each pavilion.

One example is the Audi Pavilion. Seen from outside, the truncated, reciprocally mounted cones of this pavilion bear only a slight resemblance to the four-ring logo of the Audi brand. Inside, guests enter into a story about the life of an Audi prototype designer, Max, and his wife Klara. As you move through the couple's studio and stylish middle-class home, you can interact with Max and Klara – dolls, with TV sets as heads, that start talking to you on sight. Then comes a bedroom, where a sleeping person's dreams of Audi race cars are projected on a screen, and finally you leave the building by going down a spiral ramp and around a central, screen-covered column showing scenes of the "active life", all this taking you to a sparkling new-model Audi.

The choreography of this pavilion seems designed so as to merge the Audi-brand rings with the contemporary elegance of a middle-class life style. This condensation of corporate history with contemporary, everyday life impresses the Audi identity on the guest. He or she is invited to make final judgement, by walking down the "creative" ramp and finishing at the new Audi, which sums up the whole experience.

The above description suggests that the entire Autostadt is organized in accordance with the brain metaphor. Each pavilion leads the guest in a choreography that suspends him experientially between analogue representation (e.g., family life) and a digitized aesthetic presentation set forth by individually "stacked" model cars. Autostadt apparently does not attempt to build a single, strong and unanimous corporate identity so much as it tries to make the individual guest become a vitalized metaphor of a creative vision framed by Volkswagen. The guest should move according to his own experiences, and not formally become part of a particular "Bewegung". The brand you belong to is a private, individual matter. Therefore, the network-matrix hybrid of the "Stadt", with its grid of streets, places and locales, and the "park", replete with slopes and winding paths, together constitute the perfect frame for what may be called an individualized experiential community, where "You go to your brand, and I'll go to mine".

*3. Wolfsburg: From industrial complex
to city of experience*

In recent years the city of Wolfsburg has gone through a profound transformation, from being simply a residential estate for a large industrial complex, into a city of experience. This development is organized through Wolfsburg AG, a public-private partnership that is a joint venture of the city of Wolfsburg and Volkswagen AG.

Various urban planning devices have been implemented in order to channel the success of Autostadt into the city of Wolfsburg. One such device has been to establish an axis from the historic castle of Wolfsburg, running through Autostadt, across the Mittellandkanal on a pedestrian bridge, and connecting to Porschestrasse, the main street of Wolfsburg. It is, of course, debatable how well this means of unification functions. It seems that Autostadt outshine the attractions of the inner city, despite attempts to boost the town's shopping area by means of a pedestrian street, a shopping mall, and art. The well-informed guest, however, may find connections between Autostadt and the cultural attractions of Wolfsburg, among them an art museum designed by Alvar Aalto and a theatre by Hans Sharoun.

Another unifying device has been the erection of a major attraction. The Phaeno is an experimental-experiential landscape enclosed in a building along the banks of the Mittellandkanal stretching along the railway, designed by the world-famous Iraqi architect, Zaha Hadid. From the outside, the concrete shell of the building, hovering on broad concrete pillars, might be said to resemble a moored canal barge. Inside, and on several decks, it contains a myriad number of experimental devices from the natural sciences, around which enthusiastic crowds of mostly young people flock. To judge by their reaction to it, the Phaeno is an undisputed success.

The question remains, however, as to how strongly the Phaeno provides coherence. There is no doubt that Zaha Hadid's creation puts Wolfsburg on the world map of architectural attractions. Likewise, it cannot be questioned that the focus on the natural sciences, on technology, and above all on the experiential approach, all harmonize with the qualities and branding intentions of Autostadt, and with the AutoVision of the Wolfsburg AG. Nevertheless, this symbolic axis is not sufficient to create coherence

among the several experiential centres in and around Wolfsburg. The problem seems to be that the areas, at present, remain disconnected enclaves, the corridors linking them being either too “weak” (e.g., the pedestrian bridge across the Mittellandkanal) or too “strong” (road systems for cars only).

In one respect, though, the general focus on aesthetic communication seems to create a strong feeling of identity. 25 per cent of all visitors to Autostadt come from the region, and a large number of them are employees and their family members (Eckhardt 2002: 6). So, the *auto-communication* of Autostadt is quite a success.

4. Die Gläserne Manufaktur at Dresden

The concept of city and region of experience has been given another design at Dresden, in Saxony. Here, Volkswagen has launched another service and communication platform, an “assembly plant” where buyers are involved in customising their new luxury Volkswagen limousine, the Phaeton. The name of the plant is “Die Gläserne Manufaktur”, the transparent factory. The name refers to the fact that the factory building is transparent, most of it being a huge glass structure. This makes it possible to see the assembling of cars from both inside and outside the building. The factory lies close to Dresden’s historic city centre, in a corner of the famous park, the Grosser Garten. This park formerly a Baroque garden, dates back to the seventeenth century.

The act of buying a handmade VW Phaeton has been scripted as an experiential sequence that carries the characteristics of an initiation into the world of culture. The act of buying includes, apart from the customising activities, an invitation from Volkswagen to spend a week in the city of Dresden. During the stay the customer is enrolled in a cultural programme that includes visits to a number of cultural and historical attractions in Dresden, a night at the Semper Opera, a tour of the Zwinger, a visit at the gallery, an afternoon at Schlosspark Pillnitz, and the like.

If you ask how VW has succeeded in opening a factory within a stone’s throw from the cultural centre of Dresden, the Altstadt, the answer will have to factor in the balance of power between private enterprise and public authority. On the whole, it seems that VW planned the factory in

ways that have proved sensitive to the spatial and historical urban context of Dresden.

First, the angular volume of the building continues the city space instead of blocking it. Second, the architecture repeats the open, green-belt areas of the adjoining neighbourhoods from the DDR epoch. Third, the Gläserne Manufaktur, to the south, relates to the Grosser Garten by also being embedded in a park-like landscape with a lake. Historically, the Gläserne Manufaktur continues a local tradition of exhibitions that has been going on at the site for more than a hundred years. Until the end of the nineteenth century the “Crystal Palace” of Dresden stood here.

Two further adaptations to the surroundings have appeared. First, as the damp tropical climate of the nearby hothouses at the botanical gardens supports plants that would not survive in the open Dresden air, the VW glass architecture serves as an artificial “biotope” for a kind of work that is quite rare today: manufacturing. In this “theatre” of labor, workers in white overalls and white gloves can be seen, standing on parquet flooring and assembling cars, calling to mind the cultural traditions in this manufacturing region of the country – for example, the making of porcelain in the nearby city of Meissen. Secondly, the transparency of the building refers to the anatomical model of “die gläserne Frau”, exhibited at the “Deutsches Hygiene-Museum” only a few hundred metres towards the city. On this model the mass of skin and muscles have been made transparent in order to make internal organs, blood vessels and nerve tissue visible; likewise at die Gläserne Manufaktur, the dividing lines between inside and outside have been suspended.

5. *Concluding remarks*

Perhaps some may see in this suspension a further confirmation of Paul Virilio’s idea that modern telecommunication is the force behind the disappearance of city limits, and a possible future loss of urbanity (Virillo 1997). VW has considered it important that the setting and staging of the manufacture of the Phaeton should not take place in an ordinary experiential theme park. Rather, what the customer should see through the aesthetic prism of the VW Phaeton is a reflection of himself as an integral part of the authentic ambience of a historical and cultural city like Dresden. This is just what the (experientially oriented) Phaeton Konfigurator-computer in

the (experientially oriented) basement at the Gläserne Manufaktur anticipates. On this computer the visitor can design his own model Phaeton and insert it and himself into any number of cultural scenarios that suit his dreams, e.g., “the Phaeton of the Semper Oper”.

Image 2. The writer’s “dream” come true in print.

Although it is a physical reality, however, the Phaeton is like the Gläserne Manufaktur: a phantom that does not escape a destabilizing disposition, because in this case, too, transparency seems to act as a disguise. True enough, transparency promotes aesthetic quality, artifice, and presentation. But it disguises representation. Is this not why the discrete teams of “Putzfrauen”, hovering in the wings of the showrooms at the Gläserne Manufaktur and at Autostadt, spring into action, removing all fingerprints from the car models on display, whenever a group of visitors has left a showroom? The indexing fingerprints refer to use and a history of use, which means that they disturb presentation and experience.

In a further perspective, a comparison between the experiential strategies applied by VW at Wolfsburg and Dresden, respectively, makes possible a number of observations on the impact of these means on the development of cities. First, instead of promoting coherence, a commercial branding strategy built on creating experiences through aesthetic appeal to the senses, as at Autostadt, seems to individualise and promote “cocooning” and enclavism on both a reduced and an enlarged scale. The ques-

tion is, does this work *against* the urban project, which has been generally described as one of social and cultural exchange. Secondly, is the extent to which the theatre of the Gläserne Manufaktur “re-produces” the city of Dresden also an attack on the urban project? So much so, that the signs of the city represent VW products rather than Dresden. The Dutch architect Rem Koolhaas has defined a city as “relations of constantly changing flows superimposed onto a generic template” (2001). If we accept Koolhaas’s definition, then we may well ask, Is what we see at Wolfsburg and Dresden changing flows – or attacks on the template?

Rodica Amel

To use signs vs. to invent signs

1. Premises of perception

1.1. Let us begin with two examples of signs and their possible interpretations. (a) First, a *moving staircase*: a moving staircase is an object, and this object may be considered a sign, a natural sign, in so far as it indicates the function which the respective object has, or, in Aristotelian terms, it indicates the object's final cause.¹ The semiotic force of an object conceived as a sign is codified through experience.

In Charles Morris's classification and behaviorist definitions, a *moving staircase* can be included within the type called "prescriptors". These last "are signs which signify to their interpreters the required performance of a specific response to some object or situation" (1946: 84). The signifying intention through "prescriptors" is normative; namely, they are signs that make demands upon a person's behavior. In Peirce's classification, a *moving staircase* might be considered an *indexical* sign – a *moving staircase* is an object that indicates the possibility for one to get to an upper or lower level, without having to climb up or down any steps.

(b) As the second example, we take the *180th meridian*, which has been *designated* as the International Date Line that separates one day from the next. On both sides of the line, the time is the same, but west of the line, it is one day later than it is to the east. The 180th meridian is a conventional sign and also a *prescriptor*, which, confirming international convention, establishes a prescriptive semiosis concerning the behavior of time.

1.2. Either by *using* or *inventing* a sign – or sign-function, following Hjelmslev's (1943) terminology – we accomplish a *semiosis*,² which corresponds to a sense-giving act. For Innis (1994), a semiosis is an act in consciousness, a kind of perception.³ In actuality, when a sign is perceived, a sense-giving act takes place. Sign perception is not strictly linear: in order to make possible the interpretation of the sign's meaning, the interpreter

should know the suitable premise of the perception. “Perception itself, properly taken, I argue, not only exemplifies the ‘play of signification, but, in fact, is its ineluctable matrix, foundation, and background” (Innis 1994, quoting Eco: 3). In our opinion, and from the perspective of hermeneutic philosophy, a “premise of perception” is more than the matrix of a sign; it represents, first of all, the ontological foundation of the sign’s meaning. The “premise of perception” is not only the condition of meaning that makes possible the understanding of the sign; it is also the condition that enables the sign’s meaning to become a reality in consciousness. We have in mind, here, the way Heidegger (1997) defines fundamental proof, as *der Satz vom Grund*.⁴

The two preceding examples can be considered pragmatic signs, because we *use* them for practical reasons, in virtue of codes of usage. If, in the case of those two signs, we replace the pragmatic function with a symbolic value, a completely different perception may develop. If we no longer *use* the respective signs for practical reasons, the codes that explain their meanings are no longer “in use”. By projecting the same reality, to which pragmatic signs refer, onto a transcendent horizon, we actually *invent* a new semiosis. In order to realize that we are confronted with new signs, the signification of which is different from that of previous ones, we should change their interpretation. In this way, we discover a new and unexpected perception of a reality that we had heretofore considered natural and unproblematic.

To illustrate, we return to the first example: (a) By abstracting the rolling image of staircases and their sound, we may perceive a sublime paroxysm of technical perfection, a “world” in which an indistinct crowd, deprived of any mark of humanity, rides up and down. What we discover is the peaceful ferocity of the life we live in. Regarding the second example (b), we have in mind Umberto Eco’s book, *The Island of the Day Before*. From the many interpretations this book can afford, we consider the most beautiful of all to be that which understands the discrete allegory of *nostos* (“the return”), the subtle meditation on the irreversibility of time: “... per quell’esiliato in un oggi senza fine, il cui futuro stava solo nell’arrivare, in qualche suo domani, al giorno prima.” (Eco 1998: 320) (“[Roberto’s] exile was in an endless today, whose future lay only in arriving, some tomorrow, at the day before.”)

Roberto, the last remaining survivor of shipwreck, is compelled to invent solutions in order to save his life. To do so fires his imagination, but

he drifts on, in vain, along a line (the 180th meridian), unable to cross it, as if it were a glass wall he could not sail through so as to reach land. After many aborted attempts, Roberto melancholically concluded: “La baya è ahimè troppo ieri” (The bay, alas, is also yesterday) (ibid.: 336).

Our present commentary is concerned with the second term of the opposition in our title: *inventing* signs. In this case, the position of the sign creator is symmetrical with that of the sign interpreter.

2. *Intelligible gain*

To use signs presupposes an innate competence, a natural behavior of humankind, that allows everyone to perform actions in ways that are codified, either through experience or through socially established conventions.

In turn, man has many opportunities *to invent* signs. We have in mind only the cultural framework of sign invention. Therefore, we focus on that semiosis through which man gets a cognitively spiritual experience, and through which his intelligible gain enables him to rise above NATURE to CULTURE.⁵ In a cultural framework, the new semiosis that man “invents” is a new premise of perception, by which a new perspective is thrown upon a functional sign. By shearing the world of its mundanity, the pragmatic dimension of a certain sign is transfigured into a symbolic representation of reality. Our idea corresponds to what the Romanian philosopher G. Liiceanu has said about symbolic activity: it implies “a redistribution of ontological emphasis in the perspective of a value system” (2005: 24). If a pragmatic sign is projected on a transcendent horizon, it gets new meaning, which is able to change the perception of life itself.

Semiotically speaking, the projection of a pragmatic sign on a transcendent horizon corresponds to a second-degree semiosis, which is a semiosis of a higher level than the original one. The last sentence emphasizes what we should understand by “inventing signs”: to invent signs means to change the ontological register of a sign-function. This occurs, for instance, in the following quotation from Malraux’s book, *La Tentation de l’Occident*. The author speaks about the contradictory ways in which two cultures, European and Indian, evaluate the dance ceremony – in a profane and sacred way, respectively: “Le mot ‘danse’ nous suggère le contraire de ce qu’il signifie dans l’Inde, qui ignore le bal. La danse des dieux est une

solennisation du geste, comme la musique sacrée est une solennisation de la parole” (Malraux 1967 : 277).

In our interpretation, by *inventing signs* man performs a cultural act, which is both creative and symbolic. When a new ontological horizon – a transcendent one – is opened to a pragmatic sign, the image of the human condition is perceived in its very essence.

To convert a pragmatic into a cultural sign requires a new interpretation, one which no longer involves the semiotic code as hermeneutical proof. Let us note, in passing, that while most of our examples of cultural signs have been drawn from the aesthetical field, the hermeneutical approach remains the same in any interpretative context. In so far as cultural signs are creative acts, they follow an interpretative dialectics, during which the ability to perform an ontological turn is relative. Not everybody can accomplish a semiotic “ascent” to second-degree semiosis.

2.1. Sign creativity is a subject that has long been debated in philosophical and/or aesthetical terms, in attempts to uncover the roots of human *energeia* in all its spiritual fullness. Semioticians normally explain the symbolic transfiguration of denotative signs as owing to some connotative attachment. The philosophy of symbolic forms approaches the issue from the perspective of both *formative* and *expressive* functions of signs; e.g., in the field of linguistics, Humboldt and his idea about *innere Sprachform*, or Ernst Cassirer’s (1972) sustained “philosophy of symbolic forms”, laid out in his book of that title.

In the present essay, our concern is with the *cognitive finality of signs*, how cultural signs are *invented* in attempts to find ever more sensible answers to the great questions that trouble humanity in respect to *the sense of life*. We call this problem: *the hermeneutical function of cultural signs*.

2.2. In many respects, the present study continues ideas debated in a previous contribution, “Sign systems vs. reference systems” (Amel 199b), presented at the 7th International Congress of IASS in Dresden. In that article, our philosophical interest was oriented towards the ontological origin of language, since we took for granted a Heideggerian premise (1985: 27): “Die Sprache spricht als das Geläut der Stille” (Language speaks as the bells of silence ring). By presuming the intelligible position of *being-in-the-world*, based on our capacity to render the world explicit and meaningful, we reach the starting moment of *language*. Originally, the intelligible func-

tion of signs was the call of *principium*, issuing from infinity and pointing towards finitude.

In the same study, we tried to go beyond Heidegger, by advancing the thesis that ontological representation is founded in consciousness through a process of axiological constitution. Here we should like to go deeper into this issue, by explaining the *persuasive*, not the relative, truth of axiology. From a very specific point of view, our approach reconsiders Protagoras's thesis: "Man establishes the measure of things."

We did not, in that study, engage with a very important problem, namely, that reference-systems actually represent the "premises of perception", either on the pragmatic or symbolic level. Reference-systems were operationally defined as follows: (a) Reference-systems should satisfy the transcendent principle of interpretative acts. (b) Reference-systems are not given, but synthesized through reflecting judgments. (c) In the hermeneutical field, reference-systems establish "possibility conditions" of meaning *pertinence*. In order to understand signs that are invented, not codified, we are compelled to establish such conditions of possibility. Consideration of the pertinence of cultural signs brings us to the aim of the present commentary, namely, to prove the cognitive finality of signs. In this regard, a very important remark should be made: *Cultural signs and reference-systems are members of the same semiotic triangle that refers to a second-degree, ideal reality.*

2.3. The present intervention is part of an extended study of mine, on the "Hermeneutical Turn" in semiotics. Not simply the interpretation of meaning, but a dialectical process of meaning constitution, Hermeneutics, from the semiotic point of view, becomes the way to render explicit the undetermined substance of Being. The conclusions reached in our study of reference-systems are taken as premises for the present one: (1) Second-degree semiosis – the semiotic step taking one from the pragmatic to the symbolic level – presupposes the institution of a "categorical sign", which, in our opinion, is a category of value. (2) The fact that second-degree semiosis develops an axiological dimension can be demonstrated by hermeneutical logic, which is not an ad-hoc concept.⁶ Hermeneutical logic is subject-oriented. The semiotic subject, the meaning intention of whom should be interrelated, accomplishes sense-giving acts, which are acts of

inventio. “La volonté culturelle du sujet”⁷ engenders a semiotic creativity that has both formative and expressive force.

What does it really mean to invent signs? From the cultural point of view, our answer emphasizes a reductive moment: to invent signs means to perceive the empirical features of life events in their *intelligible intensity*.⁸ This is the moment when a pragmatic object becomes more than itself; i.e., when the object signifies more than its function. Though Liiceanu was interested in opposing denotative to symbolic signs, and our own commentary establishes an opposition between pragmatic and symbolic signs, we are together in emphasizing the semiotic shift from *eikon* to *eidos*. Hermeneutical logic explains this shift dialectically.

Meaning in general, and hermeneutical meaning in particular, is open to opinion, choice and selection; for that reason, we qualify it as *doxastic*.⁹ In the course of interpretation, the task of hermeneutic logic is to establish the *original proof*. As the original proof is being sought, the cognitive intentionality of the semiotic subject is oriented towards the spiritual dimension of signs, namely, towards a principle of transcendence. From this moment on, we are close to Protagoras’s thesis. This issue was debated at length in our previous study, mentioned above.¹⁰ In this theoretically new context of debate, we try to explain the Final Cause of cultural signs. Here we extend the question to encompass the axiological acquisition of reference systems. In logical terms: at the first stage of axiological investment, signs are put under the determination of a *category of value*; at the second stage, the interpreter validates the finality of the *original proof*. The hermeneutics of cultural signs can not fulfill its task without admitting the contribution of cultural signs to man’s understanding of his place in the world.

3. *The moral object*

There is an *innate* condition of man’s consciousness that compels him to search for the meaning and sense of his life. One cannot ignore either the human need to transgress what is inherent, nor man’s effort to gain an intelligible perspective on his own experience. Through the cultural dimension of signs, “la condition humaine” acquires ontological value – a sense. To support our thesis, we shall explain the premises constitutive for the hermeneutical function of cultural signs.

(a) When hermeneutical logic raises the problem of validating the meanings of cultural signs, special emphasis is put on the original proof (Amel 1999). The cognitive subject gratifies his “volonté culturelle” by finding proofs of pertinence for his spiritual choices. He alleges, through self-reflection, a category of transcendence, which is by definition a category of value. We use the phrase “by definition” because, from the ontological point of view, the category of transcendence represents *the original proof*, the *value* in which the cultural subject recognizes himself and through which he defines himself.

(b) During “sense-giving acts”, the sensitive intelligence is extremely active, and the features of objects are perceived through the senses, in all their *symbolic intensity*. One may “translate” this affirmation with the Scholastic formula: *Nihil est in intellectu quod prior non fuerit in sensu*. In this context, *inventio* means to invent “una cosa mentale”, as Leonardo da Vinci described it.

When contemporary aesthetics theorizes the abolition of “art in itself”, the intention is to reduce the metaphysical dimension of art and to avert contemplation. The modern artist says: “Reality should be applied, not penetrated” (Honnef 1998: 76). The new trend in modern art – the so-called “installation” – can easily confuse the art consumer, because of the new premises it poses for art reception. By mixing art with reality, the real change at stake is the “distance” that the receiver takes vis-à-vis the object of art. In the installation, this distance is considerably reduced or no longer exists. The idea of artistic convention is extended in such a way that it implies active participation in a “possible world”, which actually is a virtual world, where the points of reference are no longer those of pragmatic life. Modern art is rather like a script or scene from a play, to be performed by those who enter it. It invites the art consumer to adopt an interactive attitude. As a case in point, I refer my readers to an exhibition by the artist Oli Grausz; I saw this exhibition in Israel, where it was entitled *Looking for the Lost Space*. The eye was trapped within a non-representative space, a space that remained pure and ideal. *The lost space* was deprived of time. Once inside this installation, the visitor was able to realize and evaluate the associative relationships between various objects that he uses every day, but at the same time was free to choose his role in the scene. The visitor discovered the coordinates through which the objects were symbolically projected. The artist helped the visitor to recompose in his consciousness

a space of significations, an essential space, within which all vital actions associated with the respective objects took place: for instance, the value of wheat, water and salt, the eating of bread, the vitality of grass, the greenness of which should be preserved in the temple of our soul, the sense of burning and combustion, which acquire quite mystical meanings ...

3.2. In our opinion, the semiotic step that aids in the transcending of an object – from a pragmatic to a symbolic level – becomes possible only when the premises of perception are changed.

We shall not lose the object of our commentary: *the hermeneutical function of cultural signs*. In trying to found the ontology of cultural signs on axiological terms, we are confronted with some puzzling aspects: on the one hand, “every school boy knows” and recognizes the relative condition of values; on the other hand, we try to invest them with grounding power. It seems that these two aspects stand in theoretical contradiction.

Nobody denies that values are context-dependent, but here we have in view man’s capacity to reach a universal level within the hierarchy of values, through his or her inner, *original experience*. For instance, through the semiotic representations that render sensible such “ideas” as *nostos, sacred, profane, splendor and magnificence of a feature in itself*, or “concepts” such as *technical perfection, or the peaceful ferocity of a life deprived of any trace of humanity*, and so on. All these values are values that ground the understanding of the human condition. There is no final “possibility” that could explain and define the way the semiotic subject gets the original experience of his own condition. The only way the semiotic subject can obtain the “idea” of what the “human condition” means is by searching for it. The fact that each cultural interpretation promotes disputable concepts is of less importance than the fact that all cultural acts have ontological power.

Cultural signs represent one of the many possibilities for providing evaluative interpretation through semiosis. During cultural achievement, the “ideal” reality is constituted as an inner event. An inner event *is* a value – and it is wrong when we say it *has* a value. The inner event, as an original proof, is waiting to be personalized, “objectified” under several sorts of signs. We should not forget that cultural signs have a sensible dimension. Cultural signs justify the spiritual choices of man (such as the examples listed above: *sacred, profane, technical perfection*, etc.), and they provide the moral sense for human life. They “represent” a *belief in a sensible way*; they

ground human beliefs, and, for that reason, the objects they refer to may be called “moral objects”. Through moral objects, belief gets the possibility of being defined. In so far as the moral object is only an “idea”, a cultural sign could be considered the sign of a *second-degree* referent.

4. Conclusions

If “language is a way of *being*”, as Heidegger said, then cultural production is also “a way of *being* – of “ideas” in sensible form, as Hegel would say. From the philosophical point of view, cultural signs can be considered an ontological proof.

Simultaneously, cultural production is an axiological proof that uncovers man’s spiritual effort to find meaning for his inner experience of life. Cultural signs “represent” both the categoric and the vectorial dimensions of the *original proof*. The human condition acquires meaning, and this meaning represents a kind of ontological orientation. By inventing categoric signs, humanity is involved in a great axiological acquisition of moral objects, onto which man projects his spiritual aspirations, and rejects that which seems to endanger his inner peace.

Notes

1. See the four causes of a phenomenon: efficient, formative, material and final, as established by Aristotle (*Metaphysics*, Bk.I, ch. 3; *Physics*, Bk. II, ch. 3; see Amel 2006).
2. A semiosis is a sense-giving act, either by “creating” a new sign-function (through metaphor or convention), or by “inventing” new interpretation for the same sign-function.
3. Innis (1994) finds his research on Eco’s thesis: “The reason is that a sign as such must be replicable, and hence social, and we must accordingly ascribe to ourselves powers of recognition, whose rules are deeply rooted in the mechanism of human perception. We must assume, [Eco claims], these rules to be already given in any semiotic inquiry.”
4. From our point of view, the principle of intelligibility (the principle that governs the interpretation of meaning) establishes grounding conditions, as the principle of reason does in epistemology. Due to the subjectivity of meaning, sign-foundation requires an original experience of meaning. The condition specifying that meaning should be perceived in itself, since being represents the possibility condition of speaking about it.
5. By opposing sign use to sign invention we mean the same thing as Liiceanu means (2005: 23) when speaking about “the shift from eikon to eidos”.
6. Cf. Amel (1999: 2). Bollnow (1983, vol. II) claims that the term acquired philosophical legitimation due to Misch and Lipps’s contribution to hermeneutics,
7. In his book, Liiceanu speaks about the will to culture, alluding to Cassirer’s similar idea and replying to Nietzsche’s syntagm, the will to power, and to Schopenhauer’s philosophical idea of the world as Will and Representation.
8. In Liiceanu’s book we find the same idea, differently formulated as “the sensitive genesis of abstraction”.
9. See Amel (1999: 3): “While questioning both the subjective and rhetorical involvement of doxa, our attention was focused on the mechanism of decidability in doxastic thinking.” Regarding doxastic dialectics, the conclusions we have reached concern the general philosophy of cognition: Doxastic dialectics engenders cognitive intervals between belief (a content posed in consciousness), opinion (belief’s discursive form), and doxa (the concept of value).
10. The principle of transcendence allows a categorical perception through which man defines himself from the spiritual point of view. In contradistinction to analytical logic, where the principle of transcendence is given a priori, in hermeneutical logic the principle of transcendence is sought

by reflecting judgments. Kant writes (1913: Einl & IV: 15): “Ist aber nur das Besondere gegeben wozu sie das Allgemeine soll, so ist die Urteilskraft bloß reflektierend.” Reflective power develops from within interpretative acts themselves. Through synthetic operations, the transcendence of semantic contents is conceptually instituted in a net of categories, which we call reference systems.

Fernando Andacht

Reflections on an indexical Brazilian TV fable

Signs of the Other in representations of the Real

1. Introduction: A semiotic approach to an indexical fable

My aim here is to revisit the esthetic notion of “realism” in audiovisual media through a semiotic analysis of Brazilian, realistic-TV fiction. In contrast with the tele-reality of so-called reality shows, which portray a detective-like quest for physiological traces of the body semiotic, and unlike the melo-reality of the novela – Latin American soap opera – in which the Real surfaces as bright quotes that stud the fictional text, I propose a third form of representing the Real, namely, tele-realism. It accounts for the aesthetic effect of some episodes of the TV series *Cidade dos Homens* (2002–2005; henceforth CdH). What distinguishes this form of representation of the Real is the way in which the signs of existence, or indices, operate in this TV series. In reality TV, indexical signs are featured as the compulsive expressions of the body (pulse, blush, sweat, tears) and refer to moods or emotions. These kinds of sign can do this because their link with what they represent is factual and not conventional. Indexical signification entails a material contiguity between the perceptible sign and its object: “the index... like a pointing finger exercises a real physiological force over the attention, like the power of a mesmerizer, and directs it to a particular object of sense” (CP 8.41).¹ The rhetorical treatment of this semiotic ingredient separates the TV realism of CdH from similar TV shows; e.g., the road-movie series *Carga Pesada*, which features two truckdriver buddies, whose job takes us along the vast Brazilian territory (Globo 2005-present).

In *Big Brother Brasil* (Globo 2002–2007), tele-reality exploits indices to produce an effect that I have dubbed “index-appeal” (Andacht 2003); it is the upshot of the endless recording and editing of the participants’ physiological reactions in the course of the 24/7 reality show. The tele-realism of CdH relies on indices which furnish evidence of the human geography of the story, and which also make up the narrative axis, enabling the audience to meditate on the life world beyond that of the favela (shanty town) where the action takes place. To recall the words of one film critic (Bazin 1985: 314), the representation of the real in CdH seeks to “introduce more reality in the work of art”, to create “a phenomenology [which] only knows the immanence, the pure appearance of the people and of the world”. Bazin was describing twentieth-century Italian neo-realism, but his account also suits the representation of the Real in contemporary TV shows such as CdH, one of whose recurring features is the unreliable nature of appearances, as well as the corresponding need to sharpen the observational skills that skills we take for granted in everyday perception.

The purpose of the images and sounds of neo-realism is not to convey a social lesson, but an aesthetic effect. In the case of CdH that effect derives from the show’s rhetorical work going unnoticed; the audience witnesses a world that is both true and false, and which functions an indexical fable. This analytical term applies to the kind of representation of the Real in some episodes of CdH, such as the one titled *Saturday*, which I consider in some detail below.

The signification mechanism of tele-realism contrasts with that of melo-realism, whose “formal conception consists in dressing up a story with reality” (Bazin 1985: 319). Although it is impressionistic, I find relevance in the film critic’s proposed contrast between dressing up a narrative with everyday life items, as opposed to neo-realism’s staging a story that is inseparable from the represented fragments of the Real. Only in the latter does reality as such become the theme of the story, one whose validity can be questioned. The difference between the two kinds of realism may be likened to the one between a surface upon which glittery crystals are scattered, and a fabric whose threads are arranged as the layers of an onion: one cannot get to the core of it, lest one be left with nothing to hold. The abundant references to urban violence in the melo-realism of the soap opera *Mulheres Apaixonadas* (Globo 2003) function as quotes, as brief, shrill sallies of the Real, which is out there, beyond the melodramatic

TV story whose daily episodes are produced for nine months. A much discussed incursion was the occasion when the novela took to the streets of Rio's upper-middle class Leblon area, to shoot a "stray bullet" scene (Fernandes 2003). Another controversial episode consisted of the participation of some characters in a campaign for people to surrender the firearms kept in their homes. These are all quotes of the Real, not just allusions to it. The actual presence of famous actors, as *dramatis personae* amidst the crowd which filled the streets of Rio on that day, casts the Real as a "special guest" in the narrative economy of that popular TV fiction.

"Realist" soap-opera offers an overt pedagogical message which stands out from the plot as much as the thinly concealed product placements do. What distinguishes the series CdH is the homogeneous amalgamation of indices of everyday life in the represented shanty town and its narrative fabric. My indexical claim does not undercut the fantasy ingredient of a TV fable that was created to stage a story in a shanty town. In melo-realism, the bright nuggets of the Real are topical references which are supposed to bring in some flavor from the world outside, to provide this industrial fiction with social relevance. Each quote, however, reminds us that this TV genre belongs to the "as if" realm of fiction, one which expects its viewers to suspend their disbelief, and enter the dream-like realm of soap opera, even if it is a realistic one. Saturday is an episode of CdH about the sexual initiation of two boys; within in its plot, indexical signification is used to upset the reliable representation of what is taken for granted in most TV realism. Indices increase the complexity of the narrative, requiring an effort of perception from the audience.

2. This is not a shanty town: On the supposed deficit of reality in Cidade dos Homens

The title of this section alludes to "The betrayal of images", Magritte's depiction of the realistic, didactic image of a pipe which hovers paradoxically above a handwritten phrase: *Ceci n'est pas une pipe*. To this I refer media critics and scholars that find too little representation of the Real in CdH. My own take on it follows Bazin's ideas on neo-realism, adapting them to contemporary TV. The fundamental critique raised against CdH is that it lacks reality. One scholar writes that the "home-made images [of CdH] create an authenticity effect, although they are produced profession-

ally, but it is important to emphasize that [the] images receive a thorough treatment and ‘belong’ to the series; it is fiction in both cases: neither one is an image of reality” (Schwertner 2005:48). In Bragança’s (2003) view, the characters of CdH are “naturalistic automata, mere aesthetic reproductions of the visual common sense built upon the journalism of social denunciation – a trembling camera and a over-exposed photography”.

It is hard to imagine an audience so naïve as to mistake CdH for a documentary on favelas, such as the recent film *Falcão: Meninos do tráfico* (Brazil 2006). The criticism of the supposed representational anemia is based on a fallacy concerning the ontological status of this TV series. The semiotic theory of Peirce (CP 5.607) posits that our access to the Real is both direct and mediated; i.e., our (physical) perceptions of outer or inner world are also representations. Images, facts and conventions may be true or false, in life as well as in the media. Thus, to assert that there is no scene of CdH which is “an image of reality” (Schwertner 2005) is as implausible as to claim that what is represented in CdH is only “the aesthetic reproduction of what common sense constructed” (Bragança 2003). In contrast, Eagleton’s (2003) views on realism are akin to Peirce’s notion of representation: “We cannot compare an artistic representation with the way in which the world is, because the way in which the world is, is a representational matter in itself. We can only compare artistic and non-artistic representations”.

3. Documentary value and tele-realism in the twenty-first century

I posit the mixed representation regime of tele-realism between the fictional melo-realism of soap opera, whose audiovisual iconicity represents a sentimental realm in a verisimilar setting, and authenticity-seeking tele-reality of many formats, whose key aesthetic effect arises from the gathering and gazing at bodily indexical evidence given off by anonymous people in theatrical captivity. Tele-realism embodies a TV rhetoric which relies on two kinds of indexical signs: internal indices are part of the plot; and external indices anchor the narrative in space and time. In CdH, time is embodied in the actors, who were born and raised in the shanty town, and whose life partly overlaps the lives depicted in the series.² CdH, thought not strictly biographical, uses historical elements that are factually insepa-

rable from the protagonists' own existence. Although the two protagonists are now famous³ their having spent a significant part of their lives in the place which is represented in the series produces a "credibility" effect analogous to Bazin's (1985: 55) "documentary value" concerning neo-realist Italian cinema: "The events which they represent are partly true."

Despite the marketing value of filming the favela, there is a specific meaning-effect which comes from representing the life world of social marginality in Brazil. As in the Oscar nominated film *Cidade de Deus*, CdH features a teenaged Virgil, only duplicated this time: our two black guides go by the nicknames of Acerola and Laranjinha (two citrus fruits). Through their innocent gaze we get to witness murders, drug dealers, everyday hunger, and the haunting uncertainty of the next meal, or the much feared police raids up the steep streets of the favela which is spread upon Dona Marta morro (hill).

The melo-realism of TV melodrama is the realm of the authentically false generated by the prevalence of certain qualities – iconic signs – which depict human emotions. Reality shows generate the falsely authentic, based on the index-appeal, namely, the display of bodyprints of participants, caught by the sleepless cameras, in order to recreate "a thorough melo-chronicle of human interaction" (Andacht 2005). The tragicomic aesthetic of CdH is a blend of the residual index appeal – the accumulation of the historical evidence of the lived space – together with the narrative created to explore imaginatively life in the shanty town. The tele-realism of CdH creates an indexical fable to represent the material density of life. As with filmic neo-realism, "the documentary value (is) the basis of the fable, the solid and undeniable basis of the myth" (Bazin 1985: 55).

Not all episodes of CdH belong to this representational mode. It is a necessary but not sufficient condition that the story be filmed away from the TV studio, on the crowded hills of Dona Marta; the indices must also embody "a dialectic of the imaginary" (ibid.). In an episode of the fourth season of CdH (2005), tele-realism is replaced by another kind of representation, though the story is staged in the favela. In *Appearances Are Deceitful*, the represented Real corresponds to that of the long-lasting, popular sitcom *The Big Family* (since 1972, Globo); the shanty town serves only as the setting for the narrated events, which could take place anywhere else.

3. *Dubious indices in Cidade dos Homens:
A semiotic-aesthetic analysis*

For Bazin (1985: 298), the plot of *Bicycle Thief* (de Sica, Italy, 1948) is “an insignificant incident ... the whole story would not even deserve two lines in the newspaper section of run over dogs”. Nor does this neo-realist classic shot in the streets of Rome depend on the absence of professional actors: “what we should be talking about is a kind of cinema without interpretation ... such is the identification between the man and the character” (Bazin 1985: 315). Rather than the amateur status of the actors of CdH,⁴ what is decisive for its status as an indexical fable is the fact of there is no perceptible gap between those actors, their circumstances, and the characters they perform in the series.

The plot of *Saturday* may be summed up as the unrequited love story of a boy who is too shy to tell his feelings to the girl he worships. Not much happens in it, and the expected outcome is frustrated, because of the dubious nature of the indices that represent the situation. The plot develops along a path which overflows with indices of daily existence in the shanty town of Santa Marta. If “it would not be excessive to state that *Bicycle Thief* is the story of the anguished wandering through the streets of Rome of a father and of his son” (Bazin 1985: 303), then it would not be wrong to say that CdH is the story of the roaming of two boys in the alleys of the rowdy shanty town up the hills of Dona Marta, in Rio.

A nook of the favela serves as the stage for close observation of the other, which leads us to a basic misunderstanding. This part of the narrative illustrates clearly the poetics of tele-realism in CdH. Instead of falling into the pattern of a comedy of unrequited love, *Saturday* reveals the working of our everyday indices. The hero is led to ponder the signification which underpins normal perception in the interaction order, as we come face to face with others, and must rely on our always fallible interpretation.

4. *The misguided indexical journey of an adolescent love*

The viewers of *Saturday* are eye-witnesses to the budding love of Acerola, as he sees the girl of his dreams walk by him.⁵ In a sun-drenched, dusty nook of the favela, he is busy rehearsing with his group, “O bonde dos mané”, their performance for the dancing contest on *Saturday*, at the funk party. With

an aura of child-like purity, Cristiane passes by. She is a pretty, black teenager in a school uniform who is accompanied by an adult. Deeply moved by the girl's calm beauty, Acerola cannot stay at the rehearsal; he leaves his frustrated dancing partners, to follow Cristiane discretely, as she walks down the narrow alleys of the hill, her hand held firmly by the man. As we tag along with the trio, we hear a voice-over of Acerola's thoughts. When we reach the foot of the hill, where the shanty town meets the border of the city, the boy concludes by saying what he loves most in Cristiane is her being so gentle ("quietinha"). Acerola finds another motive for joy in discovering a hidden fact: "Now I know her secret, her dad belongs to the MP [Military Police], if the guys up there knew it, he'd be a dead man". He has witnessed the change of clothes of the stern-looking man inside a bar. As viewers, we share that dangerous revelation, and the uncanny pleasure of possessing a hidden knowledge, Cristiane's secret, who, Acerola now thinks, may be so gentle because "she is always afraid".

Saturday is the day of the dance contest and also the precious chance for Acerola to talk to the girl about his feelings. For the inexperienced boy it is a feat, more a dream than a plan. The climax of Saturday is represented with indices, signs which are connected physically with their object, such as the skirt and blouse of Cristiane's uniform, which represent materially her school girl status, or the delicate gestures which denote her innocence and make the boy fall in love with her. To become genuine signs, indices must be interpreted, must become symbols, which turn the potential factual meaning into a fallible understanding. Acerola can interpret only what he saw, and holds confidently to his cherished conclusion: he has witnessed Cristiane's innocence, her purity. As a narrative counterpoint, his buddy Laranjinha plans to seduce four girls that Saturday night, to show that he is smarter and more experienced than his naïve friend when it comes to the opposite sex. With audiovisual sophistication, we see a fourfold split-screen, one space reserved for each one of the girls targeted by Laranjinha; the device is also used for the fourfold repetition of the only image that fills up the mind's eye of Acerola.

Once the dancing choreography of his group is over, he gathers courage to approach the girl, in the middle of the boisterous crowd, and then everything goes wrong; she leaves him with a vague promise of return. Clad in a sky blue psychedelic T-shirt, with a large white peace sign on it, Acerola looks even more naïve and out of place, in the sultry funk dance.

To underline this effect, we are shown Laranjinha's cool Rastafarian hairdo; the short tresses on his head stand up as jeering exclamation marks. Up to this narrative point, indices have done their usual job, but we are close to a revelation that manifests the dubious mechanism of these key agents of the ambiguous realism of CdH. As shocked as Acerola, we witness a violently "counter-indexical" scene. As the boy is going over his failed strategy to conquer Cristiane, he is struck by an unexpected presence: "I've got no chance! What's her father doing here, at the party?" – we hear him thinking aghast. What happens then is indexical but no longer dubious. There is nothing ambiguous in the man's passionate kiss on the mouth of the girl of his dreams. In despair and rage, Acerola asks frantically, from a friend who close by, what seems to need no answer, given the brute force of facts. The reply is fast and heavy as a blow, and it makes the old couple seem more sordid: "That one over there is O Bigode, my boy, the guy's married and has two kids, he's dating that young girl over there!" Thus ends the first unforgettable lesson of the sentimental education of our forsaken hero.

Through a flashback, we get a second chance to watch the birth of Acerola's passion; this time the action starts a little earlier. We watch O Bigode as he leaves his shack and says good-bye to his wife and baby. Then we spot Cristiane, who is waiting discreetly for her lover, at a corner of the alley. After an exchange of conspiratorial smiles, we see her enter the next scene by herself, as she comes into Acerola's view. It is then that she gives the boy her seductive smile, but its meaning is radically altered; it connotes the cunning of a young woman who obviously enjoys her power of drawing the male gaze. This is the crisis of the dubious indices of Saturday; with it comes the painful end of the innocence of the hero. The evidence seemed solid, but it crumbled in a second and left our passionate index gatherer devastated. Such is the lesson of the indexical fable of CdH; the staging of it is inseparable from the physical realm of the shanty town in Rio de Janeiro, but its purport could easily be extended to any other life world.

To close the indexical revelations of Saturday, we see the smug Laranjinha running terrified, as he finds out that his third target is the girlfriend of a local drug lord, to seek advice from Acerola. When they meet, there ensues another striking revelation. "You are a virgin!" cries in astonishment Acerola, as he listens to the confession of the Rastafarian Dom Juan: "I haven't had sex with anyone, I only played around!" The assertion devaluates the previous indices firmly anchored in Laranjinha's body. Acerola's

eyes are wide open, as if he tried to perceive and understand more of the complexities of life.

In the indexical fable, external indices generate the aesthetic of tele-realism, as it represents the partially self-enacted shanty town, which is gazed upon from outside by the Brazilian producers of O2Filmes. This is life in the margins of society, in Rio de Janeiro, as it is represented in the vehicle of a commercial TV fiction. But people, places, behavior and every concrete aspect of this story is firmly anchored in the everyday life of the Other of middle-class urban existence. Internal indices furnish the theme of Saturday. The bodily evidence originated in a mild, gentle temper, and the innocence that Acerola believed he saw in Cristiane – all this turned out to be an illusion which led him and the viewers of CdH to the wrong inference. The episode evokes the limits of indexicality insofar as it produces a reliable, tangible signification in our life world. Indices are also capable of deceiving us, of leading us on a blind chase through nooks and narrow, dusty alleys which end up nowhere. The experience makes us wiser, maybe more cynical, in the shanty town, and in the paved streets of the city, that lies at its bottom.

6. Conclusion: On understanding the misunderstandings of an indexical fable

What are the ethical implications of this aesthetic mode of representing the Real, of recreating everyday life, sex and bitter knowledge, in a shanty town in the hills of Rio de Janeiro? On account of its being an indexical fable, CdH occupies a distinctive point in the evidential media cartography, this being a key function of TV in “the age of abundance” (Ellis 2000). In contrast with the empathy we feel when we face the real pain broadcast by TV news, as part of our own temporality, and with the gentle consternation that results from our being engrossed with the sentimental hurricane of the imaginary space and time of fictional representation, the indexical representation of CdH holds a middle ground. Life in the favela is not represented as a tragedy, as an inevitable dark fate, wholly cut off from the time and the circumstances of its audience. The violence up the hills is represented as remote and close to the paved streets; it takes place in a shared space and time. The sequences of CdH are not represented live; still it is not a typical fiction, as that of melo-realism. As the result of

the work of internal and external indices, we watch an indexical fable. Its representation of the Real is a vigorous narrative invitation to ponder the collective dilemma which many Brazilian cities live and suffer. This TV series furnishes us with materials for our “working through,” a notion from Freudian psychoanalytic theory, which Ellis (2000) applies to the interpretative process of the TV audience. Viewers turn over and over various signs of reality, in a cyclical, evolving hermeneutic process that furnishes us with new insights into a complex situation.

Without any pretense of being or resembling a documentary of daily existence in the shanty towns of Rio de Janeiro, *CdH* is an aesthetic artifact which may be used to meditate in action, without a total suspension of disbelief. The adventures and misfortunes of Acerola and Laranjinha, which are not identical with those of Douglas and Darlan, the young actors who come from up the hills of Rio in an original TV proposal to, imaginatively, put ourselves in the hard place of the Other who has been traditionally forsaken. Its rhetoric is a hybrid mix of the Christian appeal to share the pain of the oppressed of the world, with an invitation to embark on an imaginative, vicarious flight of these invented and cherished lives. *CdH* manages to represent the Real and the fable in similar proportions.

The likeable presence of the two boys who guide us into the favela’s labyrinthine world is crucial to evidence the troubled alterity, in contemporary Brazil. Through a comedic gaze, the audience of *CdH* becomes the witness of a different but familiar universe, one which, strangely enough, is almost invisible, as it is reduced to a few, violent or picturesque scenes in the daily TV news. We experience something as universal as the bitter-sweet mixture of living, dreaming, discovering sexuality, and looking for the solution to problems that are as simple as daily meals, and as subtle as the negotiations of friendship and affection.

Notes

1. I use the traditional way of quoting Peirce: Volume.Paragraph (x.xxx), from the *Collected Papers* edition.
2. Due to its sequential production, the audience of *CdH* witnesses the biological maturation of the protagonists: the pre-adolescent boys of the beginning (2002) become the young adults of the fourth season (2005).
3. Douglas Silva e Darlan Cunha, the actors who play Acerola and Laranjinha in *CdH*, tell about their artistic beginnings at an actors’ workshop

- in the shanty town, in the DVD of second season of *Cidade dos Homens* (2003).
4. Most of them had already acted in the film *Cidade de Deus*, in the short-lived *Palace II* (Globo 2001); others took acting lessons in a theatrical workshop in the favela.
 5. *Saturday* (“*Sábado*”) was broadcast by Rede Globo on October 14, 2003. The script was written by George Moura and Fernando Meirelles; the latter directed this episode, as well as the film *Cidade de Deus* (Brazil 2002).

Celia Maria Antonacci Ramos

Graffiti: Polemic and protest in urban spaces

May of 1968 registered the classic youth protests: *It is forbidden to forbid! Anarchy is me! Imagination takes the power! Abolish slave labor!* In Brazil the messages of protest against the military dictatorship of the 1960s demanded the return of democracy, as in the phrase *Give us back the dungeons*, sprayed on the walls of the city of Rio de Janeiro. In a short space of time other youths had discovered new sites around the city. Monuments, public walls, and even private buildings were available to all and were of high public visibility. They had also discovered that spray paint was cheap, easy to write with, and had quick results.

Nearly fifty years have passed since the first interventions, and it is impossible to mention all the groups and artists, and less still to establish an analysis of forms, styles, contents or reasons the graffiti artists had. In Paris, May 1968, they were students, as I already cited above, and in New York they were youths from the peripheries of the Bronx, prefigurements of today's hip hop movement. They took possession of New York trains and made them their moving signatures – tags – with images of North American pop culture such as Santa Claus and Mickey Mouse; they criss-crossed the city provoking unrest in the population and the local authorities. In Berlin during the height of activist anxiety to end one of the most embarrassing political situations of the occident post concentration camp, passers-by, artists and activists started to make their mark with wall paintings and graffiti, symbolically knocking down this wall that entered history as the *wall of shame*. Many of its images are today safeguarded in contemporary art museums. In São Paulo, this novelty was started by students of architecture, Matuck and Zaidler, together with the Ethiopian, Vallauri, who had recently arrived in Brazil from New York and Buenos Aires. As artist Carlos Matuck points out, some images (the boot, for example) were extracted from a stamp catalogue, Dulcemira Ltd. Other images followed,

such as the panther, the comic book character Jungle Jim, and of the American, Alex Raymond and the Lacoste crocodile. From then on, many other characters started to liven up the São Paulo scene, among them, *TinTin and the Thief* by the Belgian Hergé, the *Little King* of Otto Soglow and many others of the North American pop universe, cinema characters like Laurel and Hardy, Elizabeth Taylor and Elvis Presley and also the *Queen of the Baked Chicken*, that came from the São Paulo rotisseries. This art work ended up in the Biennial of São Paulo 1987. Soon to follow, the *TupinãoDá* group, led by young middle-class students from USP who took over the urban São Paulo scene. The preference was abandoned places, neglected alleyways in disuse or neglected walls of houses. The majority of images were labyrinths and man-machines – metaphors of the contemporary city. Having studied pre-historic cave images at university, this group took over Rebouças Tunnel, the main access to the most important avenue of São Paulo’s financial center.

Even today graffiti artists prize the most unusual places. A good example of this is Zezão, who, unconcerned with the visibility of his images, went down into the city’s sewers and also to the ruins of the controversial prison Carandiru. He livened up these venues with organic paintings that remind us of rococo arabesques and also, contrary to all these interferences, the virtual possibility.

There is a site where gangs meet to collect images. Having been displayed in biennial galleries, graffiti started to be considered more elitist. Meanwhile *tags*, similar to those seen in New York, showed up in São Paulo, and since they are considered an act of vandalism, disturbing to inhabitants and local authorities of the city, they became known as *pichação*. The word in Portuguese *pichação* comes from the word “pitch” in English, which is a black and very sticky resinous substance distilled from juniper oil. The classification of *pitcher* is already considered racial discrimination.

Nowadays, the same gang who started it decided to write the word *pichação* with *x* instead of *ch*. Besides, they created a kind of personal alphabet that has been used and understood only by its own members. Beyond this intervention, they realized that the top of buildings, although difficult for conventional reading, was more visible as an infringement. One perceives that the spaces have not only been transgressed, but the grammar itself has been modified.

This not only excites quarrels regarding the occupation of the spaces of the city, but also on what is art, aesthetic, pretty, ugly, permitted, forbidden, etc., and who are the citizens of the city. More than anything, they defy the dominant chains that try to impose logic, linguistic and communicative aesthetic homogeneity on the city.

The graffiti artist Fred 04 says: “Pixadores make art, artists make money.” Art is for some an act of vandalism and a threat. The fact is that these interferences in urban spaces do not cease to bother the local authorities of the cities in their anxiety to regulate urban spaces according to their disciplinarian point of view. This epistemological controversy between graffiti artists and *pixadores* is on the border line as to what is considered art or vandalism and what is permitted and forbidden in public spaces. It is important to point out that this controversial force establishes frontiers not only of the urban spaces and the artistic values, but the space of its agents. In April of 2006, the city of Porto Alegre, capital of the state Rio Grande do Sul, awoke to find the tower of the Usina do Gasômetro (Gas Plant) spray painted with letters; *Letters painted by vandals on the picture post-card of Porto Alegre* was the headline read in the city’s local newspaper, *Zero Hora*. Four days later the same newspaper printed in red letters: *Stop graffiti*. The column stated that Gadenz, a rich local entrepreneur, had paid a team of mountain climbers out of his own pocket, to remove the “dirt” from the chimney. Gadenz, as quoted in the paper said: “When I saw on TV what they had done to the chimney I thought about taking steps immediately.” Apart from this headline the same paper printed another headline which read: *Stop graffiti – Art or Vandalism?* followed by an interview with Alan, the suspected author of the writing, who had been arrested the previous night. Questioned by the journalist from *Zero Hour* if it didn’t bother the artist to spray without authorization, Alan answered: *It is not pixação, it is graffiti.*

ZH: *But you didn’t have authorization to draw on the Mauá Wall.*

Alan: *The wall is full of drawings. In the part where I drew, there was nothing. You can’t generalize between pixadores and graffiti artists.*

ZH: *Which message did you want to give?*

Alan: *Of protest. Can’t you see it’s all wrong? Don’t say anything. You are part of the system too!*

ZH: *Why do you put yourself down?*

Alan: *Because it's like this. Just look at the injustice: I was painting but I've already been branded a pixador ...*

ZH: *What is the difference in this case?*

Alan: *The graffiti artist's work is more elaborate, it takes more time. Pixação is the same as scribbling on a piece of paper.*

ZH: *What would you scribble?*

Alan: *I would put, "In Charge". The system's in charge and the people obey.*

The newspaper article finishes by saying that, to prevent new *pixação*, city hall intends to block ladder access to the chimney with iron gratings and screens. It is interesting to point out that this plant was created in 1928 to generate electricity for the city of Porto Alegre with the use coal. In 1974 the plant was deactivated and in the 80s started to be transformed into a cultural space. Currently, the building has six floors dedicated to culture, from local craft fairs to contemporary art exhibitions. The Art Biennial of Mercosul is an example. This space also housed the World Social Forum in 2004. The Wall of the Mauá is a wall that separates the old wharf of the port to Mauá Avenue. This wharf was deactivated in the 60s but in the 90s, following the example of the Gas Plant, was transformed into an exhibition space housing art exhibitions. For ten years the Wall of the Mauá has been authorized by the city hall of Porto Alegre, for groups to paint. But this episode is not an isolated case of prejudice against urban interventionists. Recently, the Mayor of São Paulo, Gilbert Kassab, decided "to clean up" the city starting with graffiti images and their counterparts. But this politics of "cleanliness" in the city of São Paulo is not an administrative novelty. His colleague, Jânio Quadros, had followed the same path in the 80s.

This manifestation of authority by Mayor Jânio was mentioned in the biggest newspaper of the city. Thus, instead of intimidating the young "offenders", it seems to have propagated this idea and to have inspired these and other eager youngsters to appear in the pages of the newspaper.

From then on, graffiti artists and local authorities never again understood one another. Installed controversy, instant news! The chance to trespass! It is important to point out that it is not only in Brazil that these conflicts abound. This controversy has been apparent since the 70s, when the first graffiti appeared on New York trains. Some people thought that it

had been commissioned by the New York City Hall, “to decorate” the subways, and they started to enjoy the work. Others, threatened by the colorful drawings and phrases of protest, perceived them as subversive acts and demanded the “cleaning” of the trains. In the middle of all this confusion the graffiti artists crossed the labyrinths of the stations and subways sending their messages. But soon the authorities intervened, by starting to develop many techniques to dissolve both the images and the gangs themselves. At the beginning, The Metropolitan Transit Authority (MTA) ordered the cleaning of graffiti on a daily basis, using solvent that was normally used to remove daily dirt. The process was slow and expensive and the trains were soon painted all over again, as noted by Craig Castleman (1982: 149).

When these products were considered inefficient, other substances were sought and acid based chemical products started being developed by aerospace technicians. Between 1972 and 1973, \$1.3 and \$2.7 million dollars were spent respectively on products for cleaning trains, but the results were unsatisfactory. Meanwhile, the total number of imprisoned graffiti artists grew from 351 to 1,562 between 1972–73, reaching 1,653 in 1974. One third of these prisoners were sentenced and sent to clean the trains. In 1976, the head commissioner of the MTA, John de Roos, announced that a solvent had finally been found. A solution of polyurethane-base dissolved the spray paint and, guaranteed the commissioner, was not harmful to users of the subway (ibid.: 156).

More impressive still, was the repression by the authorities of Berlin, when a Berlin citizen was intercepted by a guard of the GDR for having, in the style of a minimalist performance, traced a white line over kilometers of graffiti work on the Berlin Wall (the wall of the shame). Having been sentenced, he remained in prison for six months, accused of having violated public patrimony (Waldernburg 1990: 13). Recently, a text by Anny Bloch-Raymond, *Du tag au graff jusqu’ aux fresques murales*, comments that these wall marks in France are perceived as signs of laziness, clutter and insecurity (2005: 265).

Attempts to discipline graffiti artists and their followers are not only manifested in the prohibition and “cleansing” of urban spaces. During the administration of Jânio Quadros, for example, a team of managers for urban spaces in São Paulo, having realized the task was impossible, decided to systematize it in such a way that they started to organize courses in graffiti. From then on, the department of urbanism of City Hall organized

those interested, gave them materials, and interrupted traffic in the spaces selected, generally on holidays and Sundays. The participants went to the City Hall very early and, upon arriving at the agreed destination, divided the space, delimiting it with white paint as if it were an enormous screen. As Milton Sogabe says: “In this space/time, delinquency is allowed.” Meanwhile, participants in the project, generally artists of the city, misinformed as to the intricacies of graffiti artists and their followers, considered the experience important, because apart from interrupting traffic in the streets, it gave free range to the artists: Even though they weren’t getting paid, the City Hall donated materials to their work in the studios (Ramos 1993: 60). To recall the words of Edward Said: “from whatever politics, governing bodies always stipulate disciplinary measures to reach order” (Said 2005: 385).

Without perspective, frame or owner, works cover the dominant culture and are mixed with other urban manifestations such as advertising announcements, political propaganda and together with random phrases and pornographic messages, these urban actions are perceived, most of the time, as graffiti, but when installed in galleries and museums, they gain *art status*. A good example of this are the pieces of the Berlin Wall, mentioned previously, that today are conserved in contemporary art museums. All human communication is expressed by symbols fixed in one medium.

For MacLuhan *the medium is the message*. However, like a sign, the medium is never neutral, it has always been of semiotic value, which is randomly codified from behind the hegemonic powers that give value to and fix their values on our perception through liturgical, political and pedagogic rituals.

In this form, in accordance with written law, the State, through the church and the schools, legitimizes codes and lends their support to them. As much by what is said or not said, what is written or shouldn’t be written, by means of signs or images, the messages go out and are pushed onto society. For example, the value of a message printed in the Bible or the newspaper will determine the appreciation of the message. Put like this, MacLuhan has a good point. However, we have to remember that the value of the Bible or newspaper had previously been established and ritualized, that is, fixed in our perception. In the same way, graffiti in the street, in a place pre-determined as sacred and therefore forbidden, takes on the value of *pixação* – and therefore vandalism. The same graffiti, in a museum or

gallery supported by the dominant system, acquires the status of *contemporary art*. The value of the support is semiotic, that is, arbitrary, according to cultural criteria.

Urban planners and the arts system itself have been institutionalizing and laying down rules of occupation to these spaces, either for architecture, commerce, art and other systems of communication. Those systems, in their planning, do not take contemporary diversity of the urban environment into account. Moreover, they do not perceive that a medium of communication is an interactive system that only gains meaning in the relationship of broadcaster versus receiver.

With one foot in art and the other in politics, these infringing interferences in the urban space represent an inventive or innovative act that encourages public participation not only by those who are artists but also those who circulate in the city. They offer social changes in the use of the urban spaces, and aesthetic appreciation no longer restricted to galleries and museums.

It is interesting to point out that these new forms of expression in the urban space represent manifestations of resistance or the expression of multitudes that accumulate in the cities. Today, with all the pushing and shoving, everyone wants a place in the city. A place to live, to work, to wander around, to write and leave a message; where you can see improvised and jumbled up architecture, the streets teeming with peddlers and salesmen and highways full of cars; but also and more especially, a place of manifestation. It seems that today all problems of habitation consist in communication and provoking presence in space. Graffiti artists and their followers tell a new story in defense of minorities, of multiculturalism, of the end to all differences, of dictatorships and of social and intellectual *apartheid*. In the humdrum of survival and communication strategies, in the body to body activities of hegemonic corporations and new citizens of history, spaces are being occupied and products, services, habits and codes are being innovated and globalized. The influence of these codes in media graffiti and in the language of expression can be seen all over. Remembering Joseph Brodsky: "All new aesthetic reality helps man to need his own ethical reality. The aesthetic is the mother of ethics."

Alessandro Arbo

Compréhension esthétique vs compréhension sémiologique: Quels enjeux?

Les modèles musicologiques caractérisés par une orientation sémiotique/sémiologique ont souvent repris des problématiques fréquemment déjà débattues au cours de l'histoire de l'esthétique musicale: on pense à des notions cardinales comme "expression", "compréhension", "symbole", et beaucoup d'autres. On a souligné à quel point il était important de soumettre celles-ci à des formes d'éclairage nouvelles, rendues possibles par l'utilisation des outils conceptuels propres aux sciences de la communication, du langage ou, plus généralement, à l'étude des systèmes symboliques. Mais l'esthétique musicale peut-elle vraiment – ou doit-elle, comme on pourrait le dire en paraphrasant (et en modifiant *ad hoc*) une thèse de Gadamer – se résoudre dans une sémiologie? Nous nous proposons de répondre à cette question grâce à une brève analyse du thème de la compréhension. Notamment, pour dévoiler tout de suite nos cartes, nous avons l'intention de montrer: 1) pourquoi, à notre sens, on ne peut répondre par l'affirmative; 2) qu'un tel constat est susceptible de nous suggérer, par-delà une opposition de principe, une forme de complémentarité des différentes conceptions du phénomène musical.

1. Les recherches d'orientation sémiologique se proposent d'étudier la musique en tant que fait symbolique et d'explorer "ses possibilités et ses modalités de renvoi" (Nattiez 1987: 137). Qu'on se rapproche ou qu'on fasse abstraction des modèles communicationnels, ce présupposé n'est jamais vraiment démenti – car le refuser reviendrait, au fond, à nier ce qui demeure inséparable d'une propriété minimale (pour autant que celle-ci soit approximative, contextualisée, ou encore qualifiée de non-propriété) du signe, *aliquid stat pro aliquo*. Or, le pouvoir de renvoi fait du signe (et de la sémiologie) non seulement une entité indéfinissable, mais une notion

des plus envahissantes. Rien n'échappe, en principe, à une "sémiosphère": tout objet rentrant dans son champ de gravitation sera capturé et dématérialisé jusqu'à n'être que simple indice, représentant, trace. On dira que tout cela est bien inévitable; que notre environnement humain est rempli de signes. Rien de plus vrai, même si un tel constat peut quelquefois nous déconcerter ou nous laisser sur un sentiment de frustration. C'est, me semble-t-il, ce qui ressortait de certaines paroles que Luciano Berio m'avait adressées, il y a quelques années, au cours d'une conservation téléphonique : "Vous avez dit sémiologie? Certes, tout est signe. Autant dire que tout est rêve!" – le jeu de mots fonctionne mieux en italien: "Tutto è segno. Come dire che tutto è sogno!"

"Tutto è sogno": c'est-à-dire que, une fois que nous avons pris nos distances par rapport à la corporéité des choses – ou de ces singulières quasi-choses que sont les sons – pour entrer dans cette irréalité fantomatique, tout (et son ironique contraire) devient possible. Tentons à présent de comprendre les implications d'un tel constat, appliqué à un thème aussi central que celui de la compréhension/mécompréhension de l'œuvre musicale.

2. Pour les sémiologues, la question de la compréhension (et par conséquent, de la mécompréhension) est liée à celle de la *signification*: comprendre un objet/signe musical veut dire saisir sa signification à l'intérieur d'un système de relations. Cela demande une étude attentive des compétences et des connaissances relatives aux codes et aux contextes dans lesquels un tel objet/signe a été composé. On pourra appliquer cette recherche aux objets musicaux les plus divers, du générique des programmes de variétés télévisées, de la musique de film aux hymnes politiques, des cultures musicales populaires aux sonneries des téléphones. Or, lorsqu'ils ont remis d'actualité une telle enquête, les sémiologues ont eu du mal à résister à la tentation de concevoir la signification en termes de dénotation (faible, peut-être, mais néanmoins explicite). Le fait est que l'adoption de la notion de signe les amène inévitablement à distinguer, ou, encore plus explicitement, à séparer un signifiant d'un signifié un matériau musical à la signification spécifique. Une telle séparation (en elle-même problématique) a pour corollaire la volonté de décrire ou paraphraser des "contenus de sens" qui, malgré tout, demeurent trop génériques et parfois franchement abusifs. On songe également à la volonté de stabiliser et d'enfermer à l'intérieur de cadres épistémologiquement cohérents la richesse d'une expérience qui se trouve

par définition plus riche de sens (et de significations) que les descriptions ou les explications que nous pouvons en tirer.

On dira que c'est un peu le destin de toute musicologie, et que du reste le pari de la sémiologie/sémiotique consiste justement à tenter de réunir ces deux pôles, ou plutôt à expliquer comment fonctionne leur union en termes méthodologiquement fiables. Cette opération semble néanmoins ne réussir que lorsqu'on analyse des objets musicaux simples, ayant une fonction facilement repérable dans un contexte relativement clos. Le problème est que ces cas sont assez rares, l'écoute d'une œuvre musicale impliquant en principe un nombre illimité de références culturelles, sociales, cognitives ou plus généralement humaines. Étudier celle-ci en termes symboliques, la comparer à un discours, à une forme de langage ou de narration, cela signifie d'ailleurs souvent la dépasser ou la traverser d'une quantité de questions qui, pour autant qu'elles importent à la compréhension du monde qui l'entoure, concernent seulement une part de sa manière d'être. Nous nous avouons souvent impuissants à expliquer sa propre individualité, les caractères qui en font une présence si particulière, l'objet d'une autre forme de compréhension que nous serions tentés d'appeler "esthétique". Mais qu'entendons-nous par ce terme? Essayons de l'éclairer à l'aide de quelques arguments.

3. Le premier consiste à souligner l'inséparabilité fondamentale du contenu et de la forme qui caractérise l'expression musicale. Il a été formulé par plusieurs philosophes et repris par nombre de musicologues et critiques musicaux (comme, par exemple, de Schläezer 1947). Il n'a pas échappé aux sémiologues, qui ont alors cherché à le parer en se fondant sur la distinction saussurienne entre "langue" et "parole": saisir les traits pertinents d'un acte de parole spécifique, en ce sens, pourrait être une démarche relativement proche d'une forme de compréhension musicale dans un sens esthétique. Mais cette proximité ne peut pas pour autant se confondre avec une forme d'identité. Pour s'en persuader, il suffit de rappeler qu'une saisie esthétique ne fonctionne d'une manière analogue que si l'on se pose la question de la *fonction* qu'assument les éléments identifiés sur une échelle généralement assez réduite (et donc, si l'on fait plus ou moins explicitement rentrer le discours dans un paradigme communicationnel).

Pour surmonter cet obstacle, il est possible d'introduire une distinction supplémentaire : celle qui existe entre des symboles conventionnels et des symboles d'un genre spécial. Comme le soulignait Boris de Schläe-

zer (1947: 33): “A compris ne nous conduit pas vers autre chose mais nous ramène à un A1 qui n’est encore toujours que A envisagé sous un nouvel aspect. On ne les comprend, ces symboles, qu’en y demeurant fermement attaché”. Plus ou moins à la même époque, Susanne Langer (1942) théorise une différence destinée à être souvent reprise par les philosophes, celle entre “symboles relationnels” et “symboles présentationnels”.

Or, ce qui nous laisse sceptique dans une telle distinction, c’est précisément le fait qu’elle nous oblige à renoncer ou à remettre en question une propriété élémentaire de la notion de signe ou de symbole – ou plutôt son manque même de propriété, sa capacité à se présenter ou à apparaître sous la forme d’un *renvoi* à autre chose. Si cette fonction ne peut pas rendre raison de la signification d’une œuvre musicale, si “ce qu’elle dit elle l’est” (de Schläezer 1947: 34), si son sens ne se laisse pas détacher de ses matériaux sensibles – pourquoi continuer à parler de signes et de sémiologie?

4. Un deuxième argument consiste à reconnaître que, bien qu’elle soit structurée comme un système symbolique et qu’elle manifeste la présence de règles grammaticales, la musique ne peut pas vraiment compter sur une forme d’interprétation sémantique de ses éléments. Pour autant que les efforts accomplis en ce sens par les chercheurs soient dignes d’intérêt et attestent de leur efficacité lorsqu’ils sont appliqués à l’analyse de certains styles musicaux, ils se révèlent insuffisants lorsque l’objet est complexe ou expressivement prégnant, notamment lorsqu’il dépasse le cadre de la musique tonale. Dans ces cas, les genres de saisie et de reconnaissance que nous mettons en acte demeurent en grande partie distincts de ceux qui interviennent dans une compétence verbale.

On peut alors concevoir la compréhension musicale comme une forme particulière, relativement autonome, de compréhension intentionnelle. Sa particularité, comme l’a observé Roger Scruton (2003: 90), réside dans le fait que, si d’un côté elle dépend de nos capacités intellectuelles et de notre culture, cette dernière se manifeste dans une manière d’*entendre* spécifique plutôt que dans nos manières de *penser* la musique – et même, pourrions-nous ajouter, de l’*interpréter*. On constate avant tout qu’une séquence de sons ou de bruits ne manifeste pas en elle-même (c’est-à-dire grâce à ses propriétés physiques ou perceptives) une valeur musicale: pour que l’auditeur puisse l’assumer en tant que musique, il faut qu’il puisse l’“entendre comme” (par exemple, comme une mélodie, comme un accord, comme une marche harmonique, etc.). Or, cela implique certainement la présence

d'une conception – laquelle, à son tour, comme le note Scruton, met en évidence la présence de nos capacités imaginatives et d'invention métaphorique. Nous devons pouvoir saisir la forme de nécessité spécifique qui caractérise la liaison et la succession des événements sonores. Mais cela fait également ressortir le besoin de retrouver une telle liaison à l'écoute effective de l'œuvre.

5. Nous pouvons encore nous rendre compte que notre décision de choisir telle conception (*Auffassung*) plutôt que telle autre intervenant dans une compréhension musicale ne peut pas s'établir entièrement *a priori*, à partir de l'examen d'un code ou d'un système symbolique de références, puisqu'elle dépend au moins en partie de la façon dont s'organise la configuration sensible sous observation. Avec la croche = 60, un extrait comme celui-ci (que nous empruntons à une recherche de Bozzi et Vicario 1960: 84) peut être entendu comme une sorte de ligne mélodique constituée par des couples de grands intervalles: *do – sol*, *la bémol – do dièse*, etc. (voir la deuxième portée, indiquant le résultat perceptif).

Exemple 1. Bozzi et Vicario, exemple de regroupement.

Ce regroupement peut s'expliquer par la proximité temporelle: les couples de notes se forment puisque celles-ci sont séparées par des pauses. Mais cela est possible seulement si la vitesse d'exécution est inférieure à une certaine valeur. Essayez d'accélérer: au-delà d'un certain seuil, on constatera la différenciation de deux lignes mélodiques. L'action de la proximité tonale, en conflit avec la proximité temporelle, finit par gagner. Avec la croche à 240, nous percevons clairement encore des couples de notes; mais elles se forment entre le *sol* et le *la bémol*, et le *do* et le *do dièse*; il s'agit de deux petits intervalles situés dans deux régions différentes de l'espace tonal (l'un à l'aigu, l'autre au grave). Certes, pour rendre raison de la "compréhension" (interne) d'un passage comme celui-ci, nous devrions sans doute l'inscrire à l'intérieur d'un contexte ou d'un système de relations. Mais il nous semble ici opportun de souligner que cette fonction de renvoi ne peut

ignorer les configurations qui se manifestent dans la présentation concrète des matériaux, quitte à perdre de vue ce qui pour l'auditeur constitue un résultat perceptif effectif. L'assimilation d'un code pourrait-elle nous porter à entendre différemment ce résultat? Je pense que la réponse serait : seulement en partie – ou plus précisément, seulement si l'on comprend d'une certaine façon le verbe "entendre". Car même si cette série de grands intervalles était bien présente à l'esprit de l'auditeur – imaginons, dans un contexte donné, qu'elle soit thématique, ou qu'elle se présente comme une figure spécifique par rapport à un fond –, celui-ci n'arriverait pas à l'*entendre* de cette manière: et cela, à cause de l'*émergence* effective de la nouvelle configuration (la ségrégation entre les notes aigues et les graves est forte, elle donne lieu à une unification par proximité de deux séries). Ainsi, le fait de demander à quelqu'un de comprendre cette figure sur la base du regroupement précédent ne pourrait pas suffire, sauf si par ce terme nous voulons désigner une forme d'*interprétation* de ce passage.

La présence ou l'action de ces facteurs d'unification ne devrait pas donner lieu à des malentendus. Il ne s'agit pas de penser qu'il existe une seule manière d'entendre ou de jouer ce passage. La volonté de l'exécutant et de l'auditeur est sans doute très importante : c'est à partir d'elle qu'il faudrait penser la transformation d'une séquence de sons en musique. On dira que cet exemple est encore beaucoup trop simple par rapport à ceux que nous pouvons rencontrer dans une expérience d'écoute musicale, et que, d'ailleurs, les unités perceptives ici identifiées ne sont pas forcément les unités pertinentes dans notre compréhension esthétique. C'est vrai; mais cela nous suffit néanmoins pour constater que notre saisie dépend aussi des forces ou des tensions qui se manifestent à la surface phénoménologique de l'objet (intentionnel) en question. Nous sommes confrontés à une forme de saisie aspectuelle obtenue en étroit contact avec l'expérience.

6. Ces observations nous permettent peut-être de montrer comment une compréhension et, en parallèle, une mécompréhension musicales que nous pouvons qualifier d'"esthétiques", fonctionnent parfois d'une manière indépendante des formes de compréhension/mécompréhension que nous pouvons mettre en évidence à partir d'un modèle sémiotique, surtout si celui-ci fait référence à une situation communicationnelle. Reprenons ce schéma classique, proposé entre autres par Eero Tarasti :

sujet S₁ ⇒ signe ⇒ sujet S₂

Selon ce modèle, une mécompréhension peut se vérifier de deux manières: soit lorsque le sujet récepteur (S₂) “se méprend sur le signe parce qu’il emploie un code, ou un système de signes – dans le lexique de Husserl, un *Bedeutungszeichen* – autre que celui qu’a utilisé S₁”, soit “S₂ se méprend sur le signe parce qu’il ne le reçoit pas en tant que signe expressif (*Audruckzeichen*)” (Tarasti 2006: 31). Cette dernière remarque semble cependant impliquer deux présupposés: 1) que l’expression du signe est normalement conçue d’une manière transitive 2) que ce que nous *entendons* se laisse absorber par la notion de signe et par ses fonctions de renvoi. Or, ni l’un ni l’autre de ces présupposés ne paraissent aller de soi. Par exemple, nous pourrions savoir (ou penser savoir) qu’une certaine mélodie est un signe expressif (de quelque chose), et cependant la jouer sans expression (avec un phrasé, une sonorité ou un mode de jeu qui ne met pas en valeur son individualité) ; parallèlement, à l’écoute, nous pourrions rater ses connotations expressives propres, tout en nous fondant sur l’identification de sa fonction ou de sa valeur en tant que signe expressif.

Une œuvre comme *Sequenza terza* de Luciano Berio est susceptible de mettre en pleine lumière cette duplicité. Fondée sur l’exploitation des aspects les plus connus de la vocalité quotidienne, cette pièce, selon les déclarations du compositeur, cherche à “exorciser l’excès de connotations en les rassemblant en unités musicales” (Berio 1998: 43). Pour ce faire, elle joue sur la possibilité de “jongler” entre différentes manières d’entendre: les gestes vocaux que nous prenons d’habitude pour des signes expressifs peuvent être en même temps entendus comme des figures musicales douées d’une expression propre. En effet, deux exécutions différentes de cette pièce pourraient s’accorder parfaitement sur le premier plan, tout en divergeant sur le second: c’est à la chanteuse de “construire” les unités musicales virtuellement présentes dans le matériau, de les faire émerger à sa façon (par exemple, la texture polyphonique, la spatialité et le rapport figure/fond d’un passage comme celui de l’ex. 2). Et c’est d’ailleurs à l’auditeur de parvenir à les saisir, en se mesurant avec la force de ses connotations les plus directes: la mise en scène du rapport entre l’interprète et sa propre voix est une trace sonore saisissable à condition de ne pas nous laisser capturer par l’expression transitive des ses matériaux (il suffit de prendre le coup de toux de l’exemple 3 pour un “véritable” coup de toux pour détruire l’unité musicale qu’il suggère). Bref, un auditeur S₂ peut comprendre ces signes précisément parce qu’il ne “les reçoit pas en tant que signes expressifs”.

Exemple 2. Berio, *Sequenza terza, pour voix de femme* (1966), environ entre 2'10" et 2'40".

Encore une fois, il faut reconnaître que les sémiologues ont eu conscience de ces problèmes. Mais la tendance à vouloir définir des systèmes de référence stables et, surtout, le présupposé qui veut que de tels systèmes puissent s'articuler comme les grammaires du langage risquent parfois de les rendre aveugles aux aspects émergents de l'œuvre. Là, à notre avis, se situe une des limites des formes d'explication ou d'interprétation sémiologiques: celles-ci courent le danger de survoler d'une manière trop désinvolte les propriétés des configurations audibles à la faveur d'une forme d'holisme fondé sur l'omniprésence de la notion de signe. L'idée d'une compréhension esthétique peut, selon nous, suggérer que, indépendamment du fait que nous parvenons à reconnaître une certaine intention de communiquer ou de symboliser, nous sommes capables de saisir (et éventuellement de décrire et d'expliquer esthétiquement) un certain mode d'apparition et d'organisation de la figure. Nous ne pourrions pas obtenir le même résultat grâce à la simple connaissance de ce qui est dénoté ou signifié par une telle apparence.

8. Il faudrait tenir constamment à l'esprit le fait que, même si une unité musicale renvoie normalement à d'autres unités déjà entendues ou à venir, elle ne se résout pas dans ce renvoi. Un accord, une mélodie, une phrase, une harmonie-timbre ou un son obtenu par synthèse additive fonctionnent certainement grâce au système de relations à l'intérieur duquel ils sont inscrits (et confèrent ainsi toute sa pertinence à la démarche d'une *semiosis*, tant "introversive" qu'"extroversive"); mais, pour les comprendre, nous devons les écouter et faire ainsi interagir ces renvois avec les virtualités qui se manifestent dans le "présent sonore". Voilà un constat incontournable lorsque nous voulons rendre compte d'une compréhension musical: car, comme l'a efficacement montré Jerrold Levinson (1997), si l'on se place du côté de l'auditeur, même des compréhensions à grande échelle se révèlent être subordonnées aux formes de saisie qui se réalisent dans la perception présente (ou quasi-présente). Ce qui émerge à ce niveau pourra difficile-

ment être considéré comme un reste négligeable. À l'inverse, on pourrait dire que ce "reste", impossible à éliminer et qui agit parfois "en dehors" des processus de *semiosis* (ou contre ceux-ci), justifie la spécificité d'un regard esthétique par rapport à celui qui est propre à la sémiologie. La possibilité même de ce discours nous semble en outre liée aux modes de fonctionnement propres aux données sensibles dans la perception musicale.

Pour résumer ces remarques, on pourrait dire que, pour expliquer une compréhension musicale, nous devons compter d'un côté sur une forme de reconnaissance des aspects à la surface sonore de l'œuvre et sur l'identification de ses relations internes, de l'autre sur une appréhension de sa valeur en tant que signe ou fait symbolique susceptible d'être mis en évidence à l'intérieur d'un réseau de signes. Il serait illusoire de penser que ce sont les propriétés objectives de la musique que nous sommes en train d'écouter ou d'analyser qui nous poussent dans une direction ou l'autre. Un hymne ou un générique télévisé semblent en effet mieux se prêter à une compréhension sémiologique qu'une phrase de Mozart. Mais il est tout aussi aisément démontrable que de telles propriétés apparaissent en fonction du contexte et des compétences de l'auditeur: la même phrase de Beethoven qui fonctionne grâce à son individualité propre dans une symphonie fonctionne comme indice de décision et de force dans le cadre de la publicité d'un parfum pour hommes. La musique occidentale qui s'est développée à travers la pratique du concert instrumental public n'est certainement pas la seule concernée par l'idée d'une compréhension/mécompréhension esthétiques. Cela dépend fortement, en fin de compte, de nos intentions, des objectifs que nous voulons atteindre dans l'interprétation de l'objet musical.

9. S'il semble vain d'imaginer une compréhension esthétique affranchie d'une compréhension symbolique, il semble également nécessaire de souligner qu'une saisie aspectuelle de nature esthétique ne se laisse pas absorber dans l'interprétation sémiologique des phénomènes musicaux. Pour conclure, on remarquera donc qu'une distinction entre formes de compréhension esthétique et sémiologique demeure valide lorsque nous cherchons à expliquer une compréhension musicale, et que cette distinction nous semble pouvoir s'effectuer à l'intérieur d'un champ de forces situé entre nos différents modes d'*entendre* les aspects caractérisant l'individualité expressive de l'objet musical et notre volonté de l'*interpréter* ou d'analyser ses éléments en tant que faits symboliques. Si elle est susceptible

de faire apparaître des différences épistémologiques et conceptuelles, une telle différence ne nous amène pas à mettre au jour une forme de divorce ou d'exclusion réciproque des paradigmes, au risque de nous éloigner de l'expérience effective que nous souhaitons analyser. Une coordination des différents résultats auxquels nous pouvons aboutir à partir de ces deux approches nous semble envisageable et permettrait d'aborder d'une manière concrète et globale le thème de la compréhension musicale.

How we lose memory in aging

A view according to the icon/ index/ symbol trichotomy of signs

1. Introduction

We commonly tend to lose memory in certain ways as we grow older. Why and how does this happen? Because we feel and think only in signs, our memories are also in signs, whether they are simply feelings, mere attention to an object, or verbal expressions. Assessing this problem according to the semiotic ideas of Charles S. Peirce, we find that these mental signs are hierarchical in nature, as instances of symbols, indexes, and icons.

Loss of memory in aging may be classified roughly into two types: the ordinary, which everyone experiences, and the pathological, such as Alzheimer's disease. The present discussion is limited to the ordinary type. I will analyze which elements of the sign are relatively less-retained in memory than are others, which may in turn help to explain why and how we lose memory in aging. It is indeed true that other, complicated social and/or physiological elements play a role in the loss of memory, but here I limit the scope of discussion to basic semiotic elements related to the icon/ index/ symbol trichotomy of signs. In my view, this trichotomy sheds light on significant points that have gone unnoticed in social psychological and physiological studies of memory (e.g., Vygotsky's theory) and in physiological ones concerning immediate, or "short-term", memory capacity. It may, incidentally, throw some light on general characteristics of aging as they relate to communication.

2. *Memory as icon/ index/ symbol trichotomy of signs*

The semiotic theory of Peirce is especially well-known for its seminal idea of icon/ index/ symbol, and the synechism of these three elements in signs (e.g., symbol involving index, index involving icon, and so on). Peirce's division of signs into icons, indexes, and symbols is based on quality, relation, and representation (or mediation), respectively, which is, in turn, based on the fundamental triadic relations of monadic, dyadic, and triadic. Triads cannot be reduced to dyads, nor dyads to monads; triads are composed of dyads and monads; and dyads are composed of monads. Logically, in this composition monads constitute Firsts, dyads Seconds, triads Thirds. Relations of Thirdness make up the elements of thought, such that Third implies Second and Second implies First. Peirce states:

First is the conception of being or existing independent of anything else. Second is the conception of being relative to, the conception of reaction with, something else. Third is the conception of mediation, whereby a first and second are brought into relation. ... In psychology, Feeling is First, Sense of reaction Second, General conception Third, or mediation.... (CP. 6. 32. [1891.])

Thus we find that feeling – a kind of First – is the deepest sign and one that is independent of anything else; reaction is Second, being relative to something else; and general conception is Third. The latter is semiotically the most superficial sign, relating feeling and reaction in itself. If all our memory obtains in signs, we may say that it consists of the hierarchical trichotomy of icon, index, and symbol.

3. *Typical phenomena of memory in aging*

According to questionnaires given to 100 Japanese people, from 40 to 90 years of age (see Arima 2005), as our memory decays in aging, we experience the following phenomena:

We seldom forget the names of such familiar people as our family members or close friends, but do tend to forget the names of mere acquaintances. Also, we seldom forget highly emotional experiences of any kind.

We keep memories of what happened in our childhood rather well, with a vivid sense of taste, touch, smell, and others.

We often retain the feeling and image of our acquaintances in memory; we can recognize who they are, but have difficulty recalling their names. There are also cases in which we retain some feelings and images in memory, but cannot recall the object(s) to which they relate.

Generally speaking, such senses as taste, smell, and touch often bring us back to the experiences related to them better than do other senses, such as sight or hearing.

Some verbal signs are liable to be lost before others: seldom-used signs before frequently used ones, proper nouns before common nouns, nouns before modifiers and modifiers before verbs.

Repeatedly used phonetic sequences are retained rather well in memory.

Connections between feeling, referent, and social meaning in the memory tend to become looser as we age.

All of these phenomena seem to indicate semiotically a definite hierarchical order of icon / index/ symbol, such that an image or feeling of the object is mainly iconic (First), reference to the object mainly indexical (Second), and verbal expression mainly symbolic (Third).

4. Some semiotic explanations of memory-loss phenomena

Now let us examine the above-mentioned phenomena one by one and explain them semiotically.

(1) As we have seen, emotions are iconic and weightiest in sign-value; hence they are, assumedly, the best-retained in memory. This seems to be demonstrated by the fact that we seldom forget the names of familiar people and highly emotional experiences. In addition, we are liable to remember very emotional objects of experience quite frequently; thus, they too may be indexically retained better in memory.

(2) This requires some explanation of the language-acquisition period, which is known to end at around 13 years of age. During this period, language is relatively underdeveloped, which necessarily makes the iconic and indexical elements more salient. Experiences are emotionally iconic and vividly indexical, hence their signs are better retained in memory. Thus the memory of experiences during this particular period is so distinguished by a relatively strong iconic and indexical interpretation that involves taste, touch, smell, and other senses. After the age of 13 or so, all experiences

come to be interpreted predominantly in a symbolic (linguistic) way; because of their semiotic superficiality, such experiences are more easily lost from memory.

Recent research into children's language development (Tomasello 2003) tells us that the "mutual attention" of gaze-following, joint engagement, social referencing and imitative learning emerges between 9 to 12 months of age. Gaze-following is to look where adults are looking; joint engagement is to interact with adults in relatively extended bouts of social interaction mediated by an object; social referencing is to use adults as social reference points; and imitative learning is to act on objects in the same way as adults act on them.

Observation shows that the expression of various feelings by a newborn baby is iconic in nature; mere attention to an object is only indexical; joint attention, however, is not just indexical, but indicates the emergence of a symbolic act, thus demonstrating an advanced stage of semiotic development. This order of semiotic development parallels the processes of First, Second, and Third as anticipated by Peirce.

(3) It seems that decay of memory proceeds from the most superficial Third to the deepest First (Symbol→Index→Icon), which is the reverse order of semiotic development (Icon→Index→Symbol). When symbolic elements are not working well but both the iconic and indexical elements are working more or less properly, we may have cases in which feelings and images of our acquaintances (= icon) and the recognition of who they are (= index) are retained in memory, and yet we have difficulty recalling their names (= symbol). When the iconic elements are working well but the indexical elements are not, some feelings and images of an object may be retained in memory, and yet we are unable to pinpoint the object(s) related to them.

Study of the ontogenetic emergence of human physical senses shows that the senses of taste, touch and smell are more primitive than those of sight and hearing. After impregnation has occurred, the senses of taste, touch, smell, hearing and sight emerge at about 7 weeks, 10–18 weeks, 24 weeks, 28 weeks and later than 38 weeks, respectively (see Ikuta 2002: 59–60). And according to Arima (2005), the more primitive senses of taste, touch, and smell are retained better in memory. Incidentally, modern brain research indicates that the senses of sight and hearing are largely processed in both the new cerebral cortex and the old cerebral cortex, whereas taste

and smell are processed mainly in just the old cerebral cortex, which is not linguistic (see Tokoh 2004: 103–105). If consciousness begins with the symbols of language, then the primitive senses are intrinsically more related to the unconscious, iconic aspect of signs, and for this reason may be better retained in the memory.

(4) Frequent use of the same verbal signs will strengthen their indexicality; conversely, verbal signs that are used infrequently become weakly indexical, causing the memory of them to be more easily lost. As a result of this process, little-used signs will be lost before frequently used ones.

Why are proper nouns lost before common nouns, nouns before modifiers, and modifiers before verbs? This problem also seems to be related to the relative strength of the indexicality of the sign in question. Proper nouns will be found to be indexically weaker and more independent from context than are common nouns, because they indicate only one particular object and indexically remain rather unstable, while common nouns indicate infinitely more objects of a given category and are made stable by infinitely more indices to a given category of object. This weaker indexicality may cause proper nouns to be lost to memory before common nouns.

Generally speaking, the more signs depend on context, the more stable they will be in context and the better retained in memory, because such signs may be more easily guessed or indicated abductively in a given context. Thus the degree of context dependency may be roughly taken as the degree of indexicality. As far as our knowledge of English and Japanese syntax indicates, nouns seem to depend less on context than do modifiers, and modifiers are less dependent on context than verbs. This may be demonstrated when we leave out the parts of speech in question and require their slots to be filled: e.g., *I met a _____*; *She lives in a _____ town*; *She _____ up the mountain*. Verbs will be easier guessed than modifiers, and modifiers better than nouns. We may take this difference of context dependency as at least one indicator of the different degrees of indexicality obtaining between some parts of speech.

Repeatedly used phonetic sequences will become more habitual, such that they become more unconscious (i.e., less symbolic). These kinds of indexical, relatively more iconic signs are called “chunks”. They are assumed to be retained better in memory because of their greater iconicity and/or indexicality.

As Peirce once wrote (see CP. 6. 105. [1892]), synechistic energy may be an occult power, and we are not sure from where it comes. It might be conceived as something like a vital energy, which seems to increase with growth and to decrease in aging. One aspect of this decrease of power may be the weakening of synechism between icon, index and symbol, which results in the loosening of continuity between feeling, referent and socio-linguistic meaning.

5. *Conclusion*

In this paper I have offered a hypothetical, Peircean semiotic account of how we lose memory in aging. Peirce tells us that feeling is mainly iconic, referencing is mainly indexical, and general conception is mainly symbolic. We have seen that iconic elements are deepest in signs and the last to be lost in memory; indexical elements are the second to be lost, and the symbolic elements are most superficial, and hence the earliest to be lost.

Thus we see that any emotional experience is retained best in memory, and any strongly indexical experience is retained better than mere symbolic experience. We have also seen that the language-acquisition period features the relative salience of the iconic and indexical elements of signs due to the underdevelopment of symbolic elements in this period. This is taken to explain why any experience during this period is retained relatively well and recalled quite vividly.

Concerning sensory memory, it was found that any experience involving such primitive senses as smell, touch and taste are retained best in memory, due to their stronger iconicity than sight and hearing. We have also seen that chunks are more iconic than symbolic, and this is why they are retained better in memory. We have assumed that at least some varying degrees of indexicality in syntactic context may be relevant to the problem of different degrees of forgetfulness of various parts of speech. And some weakening of continuity between icon, index and symbol has been suggested as a reason for the loosening of connectivity between feeling, referent and verbal expression.

On the whole, we may conclude that as we grow older we are liable to become more iconic than indexical, and more indexical than symbolic. We find this hypothesis to be consistent with observations of language-development in children, and hence more satisfactory and universal, than many

so-called cultural and other kinds of interpretation of memory retention and loss.

John Ole Askedal

Semiotic reflections on the visual art of Brian Jungen

Introduction

Brian Jungen (b. 1970, Fort St. John, British Columbia) is a First Nation Canadian, the son of a Swiss father and a Dunne-za First Nation mother. In recent years he has won international acclaim for his visual art, using modern materials for the creation of works having traditional native forms expressing traditional themes and displaying colors characteristic of indigenous art. Examples are baseball bats carved in the manner of totem poles, indigenous-looking masks and sculpture-like creations made of parts of disassembled Nike Air Jordan running shoes, a First Nations tent made of material from eleven Natuzzi leather couches, and “whale bone” sculptures composed of modern plastic chairs. Concerning his Nike Air Jordan masks, Jungen makes the following comment:

It was interesting to see how by simply manipulating the Air Jordan shoes you could evoke specific cultural traditions whilst simultaneously amplifying the process of cultural corruption and assimilation. The Nike masks and sculptures seemed to articulate a paradoxical relationship between a consumerist artifact and an ‘authentic’ native artifact. (Wikipedia entry, ref. 29.11.2006 09.30)

The present paper is concerned with the “paradoxicality” indicated by the artist himself. Among the conceptual distinctions inherent in Brian Jungen’s artistic problematization of cultural authenticity in a (post-) modern context are the following: synthetic materials vs. organic nature, leisure activities vs. cultural rites, modern comfort vs. survival under primitive conditions.

Baseball bats: “Collective Unconscious”, “First Nation, Second Nature”, “Work to Rule” (2005)

The three bats are displayed together (cf. *Jungen*, pp. 2–4). They thus form a group consisting of separate parts whose individuality appears to be underscored by the fact that the three bats are given individual names. From left to right their colors are red, black and that of unpainted, but polished wood. In the group context, the unpainted wood by presupposed contrast substitutes for white among the three colors red, black and white used for artistic purposes in the First Nation cultural community to which Brian Jungen belongs by birth.

The industrial and artistic production process starts with organic wood as the basic material. The wood is formed and transformed into a bat, an instrument of sport, in the course of an industrial process. What Jungen does is to provide the industrial products in question with carvings that immediately evoke a specific cultural affiliation, namely the tradition of totem poles and the culture whose most emblematic artifact totem poles are commonly considered to be. The carvings cut through and break up the smooth polished surface of the industrial product, where the producer’s logo and corresponding textual elements still bear testimony to the modern industrial mode of production of the bats and, by metonymical inference, the social and economic establishment behind it. Jungen leaves his carvings unpainted, thereby creating a unity of secondarily imposed traditional form – the carved pattern – and the basic material brought to the fore through the carving process. In the carvings, the marks of the carving instrument used by the artist are clearly to be seen, contrasting with the smooth, polished surface produced by mechanical means.

The result is an artistic object that represents cultural reversal although the transformed bats are obviously not new totem poles. Jungen’s artistic object is created to be seen by modern people who have at best a theoretical knowledge of the beliefs and ritual practices connected with totem poles and it is created in a societal and cultural context in which totem poles can no longer serve their original purpose. In a post-mythological cultural context, authentic traditional totem poles have no doubt suffered defunctionalization – in linguistic terms one might speak of desemantization – from communicating a set of mythical beliefs to having a primarily ornamental function (as on Stanley Island in Vancouver), or at most to

-serving as reminders of beliefs and ritual practices that are now history. (In the early twentieth century, totem poles were sold by their owners to museums and private collectors.) Of Jungen's baseball bats and authentic totem poles, the former have the more complex production history insofar as they have a cultural reversal history that is lacking in the case of authentic totem poles. Whereas authentic totem poles have become defunctionalized, the artist's bats are refunctionalized to highlight the contrast between modern and traditional culture; originally modern instruments of physical sport and leisure, they have been turned into an artistic means of cultural reflection.

A final twist is provided by the fact that when the thick end of the bats is taken as the upper end (*Brian Jungen*, pp. 3–4), a kind of “roof” pattern (ã) is pervasive in the carvings, suggesting eyebrows and a regularly shaped nose. When the bats are stood against a museum wall, the same basic figure element is turned upside down (v) and looks more like a mouth. In both cases, other elements of the carved pattern are recognizable as eyes. When both vertical orientations are considered, the impression is one of Janus-like reversibility in the vertical dimension.

The Michael Jordan running shoe project: “Prototypes for New Understanding” (2005)

In this project, which comprises a larger number of objects than the previous one, Nike Jordan Air trainers are disassembled and their individual parts are then reassembled to form sculptural creations that carry an uncanny likeness to traditional Aboriginal masks; “... Nike running shoes [are] deconstructed and then reconstructed into objects similar to West Coast First Nations masks, ...” (Kitty Scott, *Brian Jungen*, p. 117). Dana Augaitis uses the term “simulations of Northwest Coast Aboriginal artifacts” (*Brian Jungen*, p. 7). The Nike Jordan Air trainers are the expensive running shoes named after the famous American basketball star Michael Jordan and well known as a symbol of modern leisure and entertainment culture. There are 23 creations of this kind, corresponding to the number 23 on the back of Michael Jordan's team jersey. In a North American and especially US cultural context, the name Michael Jordan carries with it a connotation of strength and personal fortitude.

The sculptural creations in question are made of synthetic, inorganic material. In some of them, however, human hair is added. This addition of organic material of a human provenance underscores in an admittedly somewhat uncanny way the human connection. The colors are again red, black and white, according to Dana Augaitis “a classic combination prevalent in many Aboriginal motifs” (*Brian Jungen*, p. 7). It is a fair guess that the recognition of traditional colors in the running shoes helped to trigger the artist’s recognition of the shoes’ potential as material for an artistic experiment in paradoxicality. The majority of the sculptural creations exploit all three colors but in a few of them black is predominant and in others red is hardly visible (*Brian Jungen*, p. 45).

The synthetic materials – the disassembled shoe parts – are used for creations bearing a likeness to organic objects. Some of the masks seem to allow for a figurative interpretation as the head of an eagle (or a wolf or perhaps a dog; cf. *Brian Jungen*, p. 45). In other cases the shoe parts are reassembled to form abstract geometric patterns of a distinctly Aboriginal ornamental nature (*Brian Jungen*, p. 39). In either case, what happens is that a certain type of contemporary leisure object having no natural or, to use a Peircean term, indexical connection with indigenous traditions is dismembered to provide material for traditional forms of expression. Running shoes that are indicative of sport and a leisurely and elegant modern lifestyle are turned into strikingly different tradition-based forms which can be interpreted as carriers of myths and rites belonging in a totally different cultural world whose conceptual content is often no longer accessible to us. The perception of the imagery created by Jungen’s *Prototypes* is not unlike the bewildering, but not totally meaningless experience one may have when looking at ancient rock carvings where one can easily recognize and assign referential meaning to individual elements within an assemblage of carvings but the presumably coherent communicative intent of the assemblage as a whole remains impenetrable. Our knowledge of the modern industrial character of Jungen’s material adds a paradoxical feeling of familiarity that may enhance the bewilderment.

A furniture sculpture project: The tepee (2006)

In this case the outcome of the artistic creation process is a tepee, one of a limited number of objects commonly considered to be characteristic of

so-called “primitive” Amerindian lifestyle. Being the movable home of nomadic North American aboriginals, it is arguably also the object most basic to that lifestyle. The materials out of which Brian Jungen’s tepee is created are, on the one hand, eleven modish Natuzzi leather couches, known as expensive providers of personal comfort and a true symbol of a modern comfortable and luxurious international style of living, and, on the other, simple wood in the shape of the slender stems of young trees. The two different kinds of material are dealt with by the artist in significantly different ways. The tree stems have presumably been treated in the traditional manner to be expected in connection with the construction of a tepee; the branches and the bark have been removed and quite possibly the length of the stems have had to be adjusted to form an adequately proportioned structure. The Natuzzi couches, on the other hand, have been disassembled and the individual sheets out of which they were composed have then been sown together to form the covering of the tepee. This process is analogous to the disassembling of the Michael Jordan trainers and the reassembling of their individual parts. The color of the couches – black – is one of the traditional colors also found in the Jordan trainers. (Natuzzi couches come in many different colors.)

Conceptually, we are again dealing with functional reversal, but the reversal in question is in no way a “direct” one. For one, the leather of Natuzzi couches is organic material but in all probability stems from animals of a different kind than the one used in the construction of authentic Aboriginal tepees. The Natuzzi leather stems from domesticated animals whereas the North American Indians used leather from wild animals in the construction of tepees. In this sense Brian Jungen’s stripping of the couches represents symbolic reversal on the material level from domesticated animals serving an industrial function to a function originally served by non-domesticated wildlife. Thus Brian Jungen’s tepee covering finds itself at a second remove culturally from its source, the Natuzzi leather couches. Functionally, there is a transformation from luxury furniture that is being sheltered in a modern home into a culturally primitive shelter typical of a civilization still unfamiliar with the concept of furniture.

*“Whale bone” sculptures: “Shapeshifter” (2000),
“Cetology” (2002), “Vienna” (2003)*

These sculptures have the shape of huge whale skeletons and are created from white plastic garden chairs that were cut into pieces and then reassembled. Displayed against a dark or light grey background, the visual effect is a striking one. As in the case of the Nike sculptures, the material is inorganic, synthetic. In a functional perspective, the point of departure is again a modern leisure commodity that is stripped of its functional value and reassembled to form the likeness of something organic and natural. A comment by the artist himself confirms that this is indeed his intention: “When I made my first whale work, *Shapeshifter* [2002], I was curious to see if a reproduction of an object from the natural world could be made from something completely inorganic” (Jungen, interview with Simon Starling, *Brian Jungen*, p. 133).

By way of artistic restructuring and iconic illusion, Jungen makes the viewer feel that he is leaving the domain of human culture and entering the realm of age-old biology. In this there is a time dimension involving several layers. First, plastic is an inorganic product of late, technical civilization and a far younger material than bone, which is the product of biological evolution extending over millennia. Second, a bare skeleton implies a preceding process of biological disintegration, with the bone skeleton as the remaining durable matter. Third, Jungen’s artificial whale skeletons are a structurally reminiscent of dinosaur skeletons known from museums of natural history (cf. Dana Augaitis, *Brian Jungen*, p. 10) and may by virtue of this cultural fact evoke an impression of pre-human existence in the mind of the viewer.

*Attempts at characterizing the visual art
of Brian Jungen: Towards a perspective*

Jungen’s art has invited comments and characterizations from a variety of theoretical perspectives. In the current intellectual climate it comes as no surprise that minimalism is brought into the picture (by Dana Augaitis and Trevor Smith, *Brian Jungen*, pp. 8 and 81–85, respectively) but Jungen’s intentional mixing of cultural levels raises doubt about the relevance of this concept. Some of the characterizations given are fairly general and

therefore less illuminating, cf. for instance Dana Augaitis's comment on the artist's interest in "the physicality of objects" (p. 9), which tells us nothing about the specific ways this interest manifests itself artistically.

Given Brian Jungen's personal biography, it is natural that ethnicity and geo-political issues pertaining to colonialism and neo-colonialism should enter the picture. Dana Augaitis simply states that in Jungen's "world, the Aboriginal is brought together with the colonizer" (*Brian Jungen*, p. 11). Trevor Scott sees in Jungen an artist "exploring the effects of neo-colonial and global economic forces on the construction of social space and representation" (p. 83) and a representative of "the local tradition of engaging in a critique of representation as a form of social criticism" (p. 84). Cuauchtémoc Medina refers to "the production of objective mirages that mediate the interethnic imaginary of both individuals and communities on the North and South American continents" (p. 28) and maintains that Jungen's art "unfolds against a global context of colonial stereotyping" (p. 29). Medina further proposes that Jungen's art "can be seen as an example of how to use cultural stereotypes as a means of critical engagement" (p. 29). Such views also underlie the specific comments Medina makes about individual works by Brian Jungen. In his view the Nike masks "project back onto Western society all the suggestions of primitive delusion formerly attributed to so-called 'totemic' societies, picturing capitalism as a variant of idolatry" (p. 31); thus "Michael Jordan is replaced by an undefined 'totemic' identity" (p. 35) arising through "... the simulation of a 'primitive' religious object" (p. 35).

More pertinent to an understanding of Brian Jungen's intentions and techniques are the historical perspectives indicated by some commentators. As the artist himself points out in an interview with Simon Starling, there exists in Aboriginal Amerindian art a tradition of purposeful intercultural recycling:

There are plenty of historic examples of the artwork of First Nations cultures where European products were modified and used for their aesthetic qualities, thereby changing the intended value of these products. (*Brian Jungen*, p. 134)

Cuauchtémoc Medina refers to this tradition as "cultural distortions" that are "able to play a mediating role between communities" (*ibid.*, p. 28

f.). Brian Jungen is careful to point out that this is a general possibility, not a detailed recipe:

... the methods of incorporation of non-Native objects into Native cultures are as diverse as the different cultures of the continent, and varied insofar as the uses to which they were adopted. (ibid., p. 135)

Jungen is acutely conscious of the connection between the recycling practice in question and his own childhood experiences and, later on, his artistic training:

My approach to working with existing objects and altering them is directly related to a material sensibility I experienced in my childhood, the way my mother's family would use objects in ways that weren't originally intended, a kind of improvisatory recycling that was born out of both practical and economic necessity. Witnessing that resourcefulness continues to exert a deep influence on how I relate to the world as an artist." (quoted by Trevor Smith, *Brian Jungen*, p. 81)

The artist is well aware of political implications of his childhood experiences as reflected in his work: "So even as a child, I was exposed and conditioned by a rudimentary form of globalism" (ibid., p. 12).

Jungen's own comments on some of the works we have surveyed testify to the conscious way in which he applies his artistic technique; consider, for example, his remark on the *Shapeshifter*:

When I made my first whale work, *Shapeshifter* [2002], I was curious to see whether a reproduction of an object from the natural world could be made from something completely inorganic." (Brian Jungen, interview with Simon Starling, *Brian Jungen*, p. 133)

The Nike Jordan Air trainer *Prototypes* project is the result of the artist's equally conscious reflection on the artistic potential of his material with a view to perspectives deriving from current global economical and political practices:

Sometime later, in 1998, I was on a residency at the Banff Centre and started to investigate the possibility of using athletic equipment as a sculptural medium. Researching into Nike's use of exploited labour – which was being widely discussed in the media – and thinking about the iconic status of their Air Jordan range of shoes fuelled my interest. I started to make

connections between the issues of exploitation, production and commodification and started to think about how this might relate to native art generally.” (quoted by Kitty Scott, *Brian Jungen*, p. 124, n. 20)

There is thus a personal and ideological background to the way in which Brian Jungen as an artist “reconfigur[es] ready-made objects” (Dana Augaitis, *Brian Jungen*, p. 7). The import of this general reconfiguration strategy is characterized in somewhat different terms by the critics. According to Dana Augaitis, Brian Jungen “disregard[s] fixed and rigid orders of meaning” (ibid., p. 11). This may be taken to point to the “reversals” described above. However, Dana Augaitis appears to be only partly right in her assumption that Jungen “injects disorder into modernity’s notions of order – by transforming materials and exposing interiors, and by rendering things impure and complex” (ibid., p. 5). One may wonder whether “impurity” really is an apt term for unexpected material and conceptual juxtapositions resulting in multi-level structured complexity? In my view, Simon Starling is on the right track in the following question addressed to Brian Jungen in an interview:

It seems that in many of your previous projects there is a very direct dialogue between a motif and the material you choose to “reproduce” it in. Is it a way of problematizing a traditional understanding of sculpture, where the material is no longer at the service of the subject but rather in dialogue with it? (Starling, *Brian Jungen*, p. 133)

This indicates a paradoxical relationship between form and material, and “paradoxicality” is indeed a work used by Jungen himself in connection with the Nike *Prototypes*: “The Nike ‘mask’ sculptures seemed to articulate a paradoxical relationship between a consumerist artifact and an ‘authentic’ native artifact” (quoted by Cuauchémoc Medina, *Brian Jungen*, p. 30).

In my view, the concept of “reversal” is basic to understanding the “paradoxicality” referred to by Jungen himself. Reversal is indeed also the word used by Ralph Rugoff in connection with Jungen’s *Capp Street Project* (not discussed above). Here, Rugoff speaks of an “aesthetic reversal” that “might seem an ironic gesture” (in *Brian Jungen*, p. 109). According to the analyses of four of Jungen’s projects given, this is what it is about. Using materials stemming from modern comfortable leisure and sports culture, Jungen recreates quasi-mythical objects of art where the paradoxical relationship

between material and artistic form results in conceptual tension. Certain aspects of the works discussed here – in particular some of the *Prototypes* and the whale skeletons – have a somewhat uncanny appearance evoking a sense of alienation that heightens this tension. Put differently, Brian Jungen's art uses contrasting, yet integrative juxtaposition of material modernity and traditional content as a means of highlighting the complex and problematic nature of modernity in a multicultural context. This again is an artistic variation of a basic traditional/non-traditional, form/content theme. And there is of course an aspect of irony to all this. Brian Jungen's artistic artifacts are just that, created for no other use than to be watched in a gallery or museum, as reminders of paradoxical, even impossible, yet important connections.

Kristian Bankov

Bankov's razor: Some critical remarks on biosemiotics

Do not block the way of inquiry. No one could agree more than I do with this first rule of reason, which, Peirce suggests, should be “inscribed upon every wall of the city of philosophy” (CP 1.135). When I started to argue with my colleagues about some apparent contradictions within the philosophical foundations of biosemiotics, many of them understood my intent as a denial of the right of existence of biosemiotics, a negation of the whole project of inquiry. That is entirely wrong. *Bankov's razor is a contribution to biosemiotics, brought in from outside*, a tool for methodological perfection, or, if you prefer a congenial metaphor – a kind of immune agent within its theoretical organism. Biosemiotics needs to legitimize itself, needs to be taken more and more seriously by people not in the field. I want to help this process with my personal opinion, showing on one hand what I find unconvincing and, on the other, the direction to take in order to arrive at contributions that are irrefutably genuine.

Bankov's Razor was originally conceived as a reaction against my first impression of biosemiotics, mostly from conferences and congresses, including an entire semiotic school on that topic in Bulgaria in September 2000, of which I was one of the organizers. It seemed to me that the presentations were concerned, on the one hand, with “what biosemiotics should be”; on the other, there were descriptions of obvious and well-known facts about animal behavior and biological systems, paraphrased in semiotic terms. I saw no “profit” in that kind of theoretical mimicry, except the polemical justification or proof that everything in the living world is semiosis and not only human communication, as “those French guys” were trying to convince us. I thought this cannot be true – biosemiotics exists only for that semiotico-political reason! Fortunately, it was not entirely true, and I formulated the “razor” in order to separate, mostly for myself, the “political” from the “scientific” side of biosemiotics. The first formula-

tion was more or less this: *Let's speak about biosemiotics only if this discipline can say something new about biological, ethological and similar such facts.* And to “say something new” was not to repeat the obvious with new terms. What would be the point of using semiotics in biology if not to reveal, through its own paradigms, aspects of the observed phenomena in the natural world, the results of which are important, but are invisible or unexplained by any of the existing discourses? I am sure that there is room for such advances. But it is hardly convincing to say, for instance, that the service bull takes something that, under certain aspects, stands for something else, or that cells interpret glands' messages formulated as hormones, etc. The Razor cuts through all that stuff.

Time has passed since then. I have started to learn more about biosemiotics, thanks mostly to formal and informal debates with my colleagues and friends Kalevi Kull, Dario Martinelli, Soren Brier, John Deely and (by e-mail) Timo Maran. “The razor” started to work as my own interpretative key for biosemiotics, and it contributed a lot to the elaboration of my point of view. Most of all, it elaborated itself, so that now, for the first time, I dare to express those ideas in written form. And I use the verb “dare” because, as far as I know, no one else in recent years has explicitly criticized the biosemiotic approach.¹ But most of all I offer my reflections here because, after finally starting to read biosemiotics I found within its most representative contributors an awareness of those very problems which provoked my “razor” attitude. So, it goes without saying, the biosemiotics' immune system works, and I shall try to stimulate it with some methodological vaccinations.

The elaborated form of the “razor” includes three main questions about currently circulating biosemiotic ideas, regarding: (1) the philosophic grounds of the biosemiotic discourse; (2) the scientific output of biosemiotics; and (3) the ethical consequences of some biosemiotic presumptions.

Concerning the first point one must distinguish between several, inter-related discursive orientations within the field of biosemiotics. (a) There is a strong ontological pretense in biosemiotics, a philosophically grounded claim about how things hang together, what the real essence of nature and life is, etc. “Life is coextensive with semiosis” is characteristic of this kind of reflection. (b) A huge part of biosemiotics is dedicated to a kind of history of ideas, relevant to its predecessors and/or the discovery of biosemiotic

ideas in “unexpected” thinkers and scientists. Here enter also the contributions of systematization of contemporary advances in the field. (c) There is a descriptive, strictly scientific orientation, where we read about facts in the Universe and the biosphere: Big Bang, cells and molecules, plants and bacteria, animal behavior, etc. The kinds of just-described, theoretical mimicry can be found in most of those contributions. (d) Last but not least, there is the contribution of biosemioticians on current social and political issues, such as ecological consciousness, “bio-ethics” and more.

Considering this variety of discursive orientations, it is difficult to establish any clear identity for biosemiotics. After hearing that biosemiotics is “the study of signs, of communication, and of information in living organisms” (*Oxford Dictionary of Biochemistry and Molecular Biology*: 72) and even more: “the scientific study of biosemiosis” (Emmeche et al. 2002: 26), an unprejudiced observer would imagine people with an experimental agenda. Kalevi Kull would claim that “Biosemiotics means biology” (Kull 2002: 332–334). My expectations were in that direction too, but when I started to read books and papers I found much more philosophy than laboratory or field work. Somehow the identity of the discipline was to be established more as an interpretative than as a productive approach. And I think that more or less all scholars in biosemiotics would agree on the precept, present in any extended definition, that biosemiotics offers to the existing biological theories a kind of generalizing view which they lack and they need:

Biosemiotics attempts to bring together separate findings of the various disciplines of biology (including evolutionary biology) into a new and more unified perspective on the central phenomena of the living world, including the generation of function and signification in living systems, from the ribosome to the ecosystem and from the beginnings of life to its ultimate meanings. (<http://en.wikipedia.org/wiki/Biosemiotics>)

This ambitious engagement could be achieved with considerations on the order of ontology and not with a kind of research program. This view is shared by Stjernfelt in an important article, in which he presents biosemiotics as a formal ontology, necessary for biology to overcome naive mechanistic approaches to the explanation of living nature (in Popova 2001: 14). In one of the landmark books on biosemiotics, Hoffmeyer also presents an ontology, arguing that natural and cultural history should be included

in one common view in order to overcome dualism (Hoffmeyer 1996: 95). Most explicit of all is probably Emmeche:

The philosophical status of biosemiotics is best viewed as compatible with the ontological-level thesis. This means that biosemiotics is not as such a research program (or paradigm) that should be an alternative for existing biological research (in e.g., molecular biology, physiology, ecology, etc.). But it gives the research done here a broader interpretation, and helps to relate the findings of biology better to the general picture of the living world and the physical universe, a picture which has been dominated by atomistic and mechanistic notions of nature. (Emmeche 1999: 108)

Another smart move of biosemiotics, to avoid the requirements of research and verification, was made by its founder Thomas Sebeok. Does biosemiotics (at the time, zoosemiotics) need a proper theoretical foundation? “... what zoosemiotics sorely lacked, I thought, was a sound theoretical basis. This uninformed belief, as I soon discovered, or, in fact, rediscovered by the end of that decade [1970s], was totally mistaken. The theory was there, in theoretical biology” (Sebeok 2001: *xxi*). My impression is that this statement is the real program for the biosemiotic theory representing the above-mentioned discursive orientation (2), namely, as a kind of science. Consequently “the study of signs, of communication, and of information in living organisms” is invisibly transformed in the study of books and in the systematizing of existing theoretical ideas.

Hence the result that biosemioticians do not promote genuine research, but use existing data and theories for the construction of new, more totalizing and comprehensive hypotheses about the living world. Such “self-determination” of biosemiotics presumes that the real “data collectors”, the experimental scientists from laboratories all over the world, are incapable of those kinds of generalizations; it presumes that they lack ontological awareness or wisdom. Emblematic of that attitude is Hoffmeyer’s description of the “true scientist” – a narrow-minded operator, one who is unable to differentiate between data and the real world (Hoffmeyer 1996: 90–91).

I think that here we need some shaving. This presumed superiority of biosemiotics over conventional biology and mechanical sciences is misplaced. Biosemiotics relies not only on existing data achieved within certain sciences; it is entirely dependent on the scientific worldview, on

its articulations and categorizations of the surrounding world, on biological terminology², on the theory of evolution, and the like. Biosemiotics would be nothing without them, whereas they, the conventionally affirmed disciplines, have existed, exist and will exist totally unaware of biosemiotics. Their plurality and partiality, envisaged as defects by biosemiotics, represent the very guarantee for objective results. There are many other approaches similar to biosemiotics, on the margins of the debate, and there are many, mutually contradictory approaches within it. Science is no longer a unifying project; it has become irreversibly transformed into a pluralistic reality.

One of the great promises and ambitions of biosemiotics is to restore unity to the life sciences. I would suggest to my colleagues, however, that they first make their discipline a member of the club of the scientific communities. How? Certainly not by denying the existing membership *en masse*, and presenting their discipline as some kind of alternative ontology (to all of them). And certainly not with the obsessive re-descriptions of known facts and theories in (bio)semiotic terms. If there is no unified science, there nevertheless do exist some common standards used to validate scientific contributions. Such are the criteria for the assignment of the Nobel prize or, let's say, for accepting an article for publication in *Scientific American* magazine. *Biosemiotics needs to regulate its discourse, assess its claims, based on the same standards of validation required of the other members of the club.* This means participating in the front line of scientific inquiry, not only in the repartitioning of already conquered territories.³ And such a turn requires the kind of "scientific humility" that is absent from most of the papers in biosemiotics that I have read. Of course, one might rejoin that every scientific revolution has been preceded by a drastic shift of paradigm; but while we are awaiting this auspicious event, it would be better for biosemiotics to adopt a line towards empirical inquiry; a line which certainly exists, but is blurred by the other discursive orientations. In addition to the standards of validating contributions among the scientific community, there are also commonly shared resistances of the natural world – observable phenomena, which do not fit into any existing hypothesis. Abduction and experimentation are ways to struggle with the resistance of the natural world, and the validity of any new paradigm consists in its "fresh" lead toward new abductions and their ensuing confirmations. Poets and ontologists propose possible worlds, while ignoring the judge-

ments of facts.⁴ But a scientifically oriented discipline such as biosemiotics would be better off legitimizing itself with facts, and perhaps on such stable ground to erect credible, if not verifiable, generalizations. If such facts, such validated explanatory contributions, do exist, I would suggest that the biosemiotics' PR team put them in the window display and take away the promises of new beginnings for a unified science and of ultimate truth about nature: "from the ribosome to the ecosystem and from the beginnings of life to its ultimate meanings."

Those were the Razor's suggestions for the "foreign office" of biosemiotics. Now let's have a look at the bureau of "internal affairs".

Let's start with an empirical observation. It seems quite one kind of discourse if I write a paper on the behavior of my pet, the green iguana Paola, than if I write one on the French philosopher Henri Bergson, not on his behaviour, but on his ideas. I could sketch a theory of why Paola is making messes in the least appropriate places, every time I set her free in a room. To do so, I must quote observable facts and try to fit them into existing theories, which theories certainly will be based on other observed facts. My theory might contradict or confirm some existing ones. Someone who knows more about green iguanas or shares a different paradigm may challenge my theory. Validation of the theories will consist in a comparison of their relative predictive power, also realized through observation of facts. Thanks to the dependence on observable facts it is easy to involve "experts", who can judge with "yes" or "no" which one of the competing descriptions works better.

If I write a paper on, let's say, what in Bergson's philosophy is good for contemporary semiotics (as I did in 2000) I shall not rely on observable facts, but on written ideas, by Bergson himself, by people who wrote about him, and by others, all of them pertinent to my proposal. The validity of my work will most probably depend on my ability to involve as many sources (written texts) as possible and to construct a logically consistent narrative. Of course I could use facts and, for instance, attribute to Bergson words which are not his, and my proposal could be refuted for that reason. But what is important is that the proposal could also be refuted whether or not erroneous facts are present, just as it can be appreciated even if I mistake Bergson's year of birth or the publication date of some book. Even if my "confuter" and I call in experts to settle the matter, their judgement could never be absolutely "correct". This kind of discourse does not presuppose

“yes” or “no” decisions about its validity, but rather the kinds of attitude of the “accept” or “do not accept” kind, with an infinity of gradations.

What I am trying to show here is the “internal” confrontation among different standards of theoretical validation. Far from imposing any methodological dualism, in Dilthey’s style, I insist that the whole pluralistic multitude of communities of inquirers is positioned in a space between two extremes. The iguana paper, or better, the standard of validation which its explanatory ambition (with the respective discursive style) presupposes, leans towards that extreme for which the emblematic situation would be the following: Aristotle and Galileo are disputing the speed of falling bodies. Aristotle insists that the heavier the body is, the higher its acceleration. On the contrary, Galileo insists that all bodies fall at the same rate of acceleration. The bet is made, and we all know the experiments which proved irrefutably – in a “yes” or “no” way – who was right. At that extreme of the validation standards of theoretical discourses lies the ideal of scientificity. It works like a pole of attraction. The ideal of scientificity, from the Enlightenment on, has assumed the monopoly over truth, and a lot of science was and is produced under its lead.

On the other extreme of that space or area of the various standards of validation, the one towards which it is reasonable to position the Bergson paper, we can imagine those discourses which do not require the sanction, consideration, or resistance of facts. An emblematic candidate for the flag is Plato’s metaphysics. Although he probably bet with Aristotle about the validity of his doctrine – and I think this was the very moment at which Raphael pictured them – there was no grounds, or at least no objective certainty, on which to determine who was the winner. Throughout the whole history of philosophy, both men mustered armies of followers, since the nature of that kind of discourse allows *parallel existence*. After Galileo’s experiments, however, there are not very many who still believe Aristotle’s views concerning falling bodies. We may call one of the extremes of the variety of discursive validations *loose*, and the other *rigid*. Quite similar considerations about the loose side of discursivity can be found in Michel Foucault’s memorable article “What is an author?” (cf. Rabinow 1984). There he introduces the notion of *founders of discursivity*, a cultural phenomenon relevant for understanding how the internal constitution of a discourse can determine its interpretative fate.

It is important to stress one thing here: the standards of discursive validation always depend, although in a different degree, on the community of inquirers, i.e., on social phenomena. Truths can exist within a single mind, uncommunicated to the others, but the standards are social and conventional, like languages and codes. Another thing to be underlined: although until now I have mentioned only great figures of western culture, the standards are the same for anyone who aspires to contribute in a given area of inquiry. We can imagine the pluralistic totality of communities of inquirers to be organized like leopard spots, though not static, but with changing dimensions and continuously tending to move, to merge or to subdivide into smaller groups, to appear and disappear, and even to destroy each other.

Elsewhere I have developed a hypothesis, from a semiotic point of view, concerning the reasons for the different kinds of truths with which different discourses operate; there I focused on instances that *produce* discourse and those which *are subject to* it. The kind of “anti-dualistic” conclusions arrived at through those reflections resulted in the claim that *theoretical discourse and conscious aspirations for truth can be produced only by culturally “trained” human beings*. These last are persons who enter into well-determined practices, and who undergo many years of intensive schooling and education, and who thereby acquire knowledge and skills that are communicated within a context of cultural conventions, mainly languages. This hypothesis could be immediately refuted, should someone succeed in adducing a reliable theoretical discourse that has been produced by some other kind of being.

Thus, it seems that there can be no theoretical discourse without human being(s) behind it, without a community (society) provided with languages and other cultural conventions. The simple proposition is that, when the objects of theoretical description (or modeling, or explanation) are some of the instances necessary for its production (mind, society, language, culture, memory, etc.), then the kind of truth achieved in that way is not independent. The theoretical approach influences the object it describes; the theory partially constructs it. The eye cannot see itself seeing. The “theoretical eye” is constituted by elements which deprive it of the possibility of seeing them independently. Moreover, the output of a theory of mind may influence the mind’s operation; a theory about society could change that society; a theory of culture is part of the culture itself.

By the way, Goebbels knew this pragmatic aspect of truth quite well, and he applied his “1000 time repetition” principle to a lot of issues. He constructed truths, which were spread and believed as real (not constructed) truths. This is because society, mind, culture, language and the like do not represent a genuine *resistance* to human descriptive efforts. They exercise a resistance which is the resistance of habit, of convention, of common sense, of ideology, of power, of logic, of rhetoric, of legislation and so on. All those instances are, in principle, subject to transformation(s) resulting from their discursivation.

Nothing of that kind happens to rocks, planets, light, molecules and the like. The principles which govern their existence are *independent* of mind, society, language, culture, etc. Theories are made up of human discourse, languages, symbols and so on; they are mind- and culture-dependent; but they do not influence “the things in themselves”, the subject of description. Their resistance is genuine. Goebbels could not influence their course. New theories might reveal new aspects of reality and perhaps change our minds, but not the regularities and persistence of those aspects’ phenomenal appearance. The things and their principles do not care what we think about them; they care nothing about our desires, ideologies, battles, quarrels and congresses.

The result is, again, a rigid pole with standards of discursive validation and dominated by theories concerned with the genuine resistance of what Peirce would call a “dynamic object”. The loose pole of standards is about mind, society and culture-dependent discourses.

For me it is not difficult to position the “leopard spot” of what Sebeok calls “normal semiotics” or “anthroposemiotics” (Sebeok 2001: *xxi*) towards the loose pole of the standards for discursive validation. There semiotics stays in the good company of the “normal wings” of cultural anthropology, sociology, literary criticism, philosophy and many other humanities. Although many members of those communities of inquirers believe they are superior to the others – the bearers of “true” semiotics, “true” sociology, etc. and deserving of special consideration – they all participate in the same discursive “ecosystem”. Interdisciplinarity makes the “spots” even more fragmented and “authority” (i.e., founders of discursivity) oriented.

And here we are again with our topic: where is the spot of the community of biosemiotic inquirers to be located? As I mentioned before, it is difficult to extract a unified picture of the problem from the various

contributors. What provoked the first intervention of the Razor was the biosemiotic pretensions to validity, ranging from ontology to experimental science. My suggestion was to work at exporting valid principles from “normal” semiotics to biology, and mostly in ethology, with the aim being that of genuine contribution, sanctioned by facts: *The second intervention of the Razor will consider from inside the cognitive resources of biosemioticians, which they use to position themselves above culture and society and thus to develop a kind of discursive universality, not sanctioned by the existing standards of discursive validation.*

One of the main issues in biosemiotics is the necessity to overcome *anthropocentrism*. For Sebeok “restricting semiotic inquiry to our species is absurd” (ibid). Postulating the enlargement of the semiotic phenomenon to the whole living world is a very attractive theoretical project, but it presupposes a hidden shift of perspective. From within our species-specific, socially and culturally determined condition, we are the only privileged authorities of constructing models and hypotheses about how things hang together within our species-specific environment. Normal, anthroposemiotics contributed a lot during the twentieth century toward enriching our awareness of the human cultural and social constitution. When the perspective is enlarged beyond our species and our purpose as biosemioticians is to enrich our more general biological awareness, we tacitly continue to retain the position of privileged authority and the justification is simple: we are human animals, we are totally dependent on the continuous exchange with the biological environment, our vital metabolism depends on nature and not on culture. In our ontological solidarity with the whole biosphere we could employ a theory about “man as a biological entity rather than as a cultural entity” (ibid). This is smart, but an entirely wrong shift. It is wrong because it neglects the fact that what it is all about still is theory, not life itself. *The communicable account of our enlarged biological awareness is inescapably a discourse; theory is inescapably anthropocentric.* With tremendous efforts and systematic training we can overcome our anthropocentrism, we can switch off our human rational identity and way of behaviour, and merge into the natural environment with other living beings. Excellent movies have been made on that subject. Diane Fossey is a real person who did that. But any theoretical account of such an experience is condemned to pass through the gate of human, rational, culturally determined discourse. And within this discourse are, as we have seen, its

privileged constituents, the tools of its construction – languages, symbols, social conventions and the like. They are seen/constructed from inside; the rest of the nature is seen from outside, as phenomena, as ever challenging our theoretical accounts the dynamic object. The *Umwelts* of animals are as external to the human observer as are the plants' interaction with the environment: as external as the stars in the sky.⁶ And this explains an observable fact in biosemiotics – its continuous expansion to include phenomena of the external world. This small step toward overcoming the human cultural perspective turned out to be a gigantic step for the developers of the discipline. At first only the highest species of animals were involved; then it became logical to expand to the whole animal world ... But why stop there? There is no precise border; every body is made of cells/signs. Martin Krampen's famous article opened biosemiotic discourse to plants. Fungi were involved, and then it was logical to start questioning the appearance of life itself; so biosemiotics expanded to the interaction of organic and inorganic matter. Finally, following that logic, it was inevitable that someone would postulate the right of existence of "physiosemiotics" – the study of communication among rocks!

I am sure that even the "worst" among the anthroposemioticians will acknowledge his own vital dependence on the natural resources of the environment. I am sure he will never question the fact that the body is an absolutely necessary condition for the working of the mind. He won't even question the assumption that evolution was a gradual progress of the complexity of living forms, the last of which is the human being. But from those premises, it is going too far to draw conclusions, as do biosemioticians, about the importance which our biological constitution has to the articulations of our thought. And to accuse anyone who questions the cultural limits of his own thought of being a Cartesian dualist or idealist is an unjustified and incorrect move. Hoffmeyer goes too far in that direction. One of the basic presumptions is that "anyone who places himself out of Nature will feel out of place" (Hoffmeyer 1996: 92). I accept that. But I would say that it is much worse to put yourself out of culture. To do so is to attribute to yourself the authority to judge others according to values that are presumably universal. With this presumption, Western civilization colonized the rest of the world. Dictators, reluctant to acknowledge that cultural diversity makes people completely diverse from each other, accomplished genocides. I believe in human rights and want them every-

where, but I feel something wrong in imposing them with massacres or, even worse, with torture in prisons. This means putting yourself out of culture and judging what is right and what is wrong from a universal point of view.

In his campaign against dualism, Hoffmeyer suggests that we must unite our cultural and natural story “into one meaningful story – one which will ensure that we feel at home both in human society and in the living world from which we came” (134). Again, as a project it is a wonderful idea; but it neglects its conditions for possibility. If this claim aims to make us change our understanding of the surrounding world, we must consider the fact that it is accessible only to people, introduced to a particular way of thinking, within a particular cultural tradition. Nature itself is not a story. What makes a story from nature is culture. In various cultures, there are absolutely different stories about nature. And if language is such a naturally embodied, biological phenomenon, then why there are so many languages and cultures for the same animal species? I believe this to be so because the main (of course not the only) principle of human language is the arbitrariness of the sign. But that is another story.

I am sure that Professor Hoffmeyer is a kind and tolerant person, as are those of his colleagues involved in biosemiotics. But let's imagine that in a distant future some “social engineer”, invested with power, takes the following passage too seriously:

Psychosomatic suffering is the price we pay for this self-propagating folly [dualism]. Our swarming innards cannot live up to the demand placed on them to be meaningless. The psychological root penetrates deep into the bodily fluids to become illness. The brain-module cell swarms misunderstand one another and send conflicting messages to tissue and glands. We fall ill because our cells cannot quite succeed in uniting to create us (128).

If the internal premises of this passage are to be taken seriously, the main polemic is against cultural contingency, independence and creativity of mind. So this is not an opinion, a moral statement or a fantasy. It is not even an experimentally controllable scientific hypothesis, since according to the same line of argumentation, conventional science is dualistic too (93). It seems to be the Truth – Nature speaking through a privileged part of itself: the biosemiotician's body. And Nature is saying, “Close your mind! Don't think dualistically! Be Natural!” Of course any dictator would love

that, and most probably it would inaugurate the birth of a clinic. But it also could represent a program for reforming any other cultural reality that does not acknowledge the supremacy of biosemiotic principles.

To conclude this second stroke of the Razor, I would encourage a formal confrontation between conventional semiotics and biosemiotics. Although far from any Cartesian dualism, much of semiotics relies on the opposition *nature VS culture*. It is an “either – or” situation. Biosemiotics questions this situation, opposing to it a *gradual transition* scenario. It derives from evolution theory. Gradual was the transition between less and more complex species, gradual is the appearance of more and more complex nervous systems, and the human mind appeared gradually, following the same evolutionary process. This account is sound and convincing. Nevertheless, what is not gradual, but “either – or”, is the choice of how to account for that process, the choice of theoretical argumentation and the terminology of affirmed disciplines such as biology and semiotics, the choice of commonly shared standards of discursive validation. Membership in the community of inquirers is the acceptance of a very far-reaching cultural construction, and it is somehow strange to pretend to destroy that construction while you are upon it. You can reform parts of it, even consistently, from inside, and this is auspicious. This can be done, as we said before, but only through facts or other controllable output. There is an intermediate form of accounting for the surrounding world, usually adopted by *religious sects*. There you can find projects for radical reconsiderations of social institutions, including science; these are coherent in a way, in so far as they, in their denial, do not rely on the existing scientific worldview.

To conclude the whole argument I shall say something about the *ethical implications* of biosemiotics, trying again to apply the hideous Razor.

When biosemiotics introduces into the scientific agenda, and from there into a larger public sphere, ideas in aid of better understanding the interaction among living beings, this is not only praiseworthy in itself, but it also contributes much to the interdisciplinary prestige of semiotics. Any success in that area is most probably proportional to the above-mentioned genuine contributions – advancements of the understanding of the phenomenon of life, by means of applying the doctrine of signs. Advancements that are accessible and in some way measurable and from which a larger public can benefit. *What I find wrong with the whole enterprise is the*

claim that, in order to be more conscious in that way, we need to overcome anthropocentrism. It is in fact exactly the other way round. The Animal Rights project is the most anthropocentric one of all. The concern of one species to protect the others, the systematic and large scale effort to do that, even when it runs contrary to our own immediate interests – this is a privilege of being human. If, however, we follow the logic of evolution, if we adopt our biological identities and act according to natural interests, then we have to continue to exterminate, eat, use and abuse animals, as a big part of mankind is doing. The biosemiotic consciousness, with all its theoretical apparatus, is a very advanced product of western civilization; it is not a product of de-culturation. In terms of ethical evolution: first there will be the pre-cultural man, hostile to all others; then there will be the capitalistic man, brilliant at abusing natural resources and considering himself “the winner” of evolution; and only then do we have the ecological man, with all his concerns and his deliberate abstention from many opportunities to consume. *To be responsible means to be anthropocentric.*

But let's take look at a passage in which my dear friend Dario Martinelli suggests an ethical overcoming of anthropocentrism:

Finally, to study other animals from the perspective of human sciences is the result of a very clear historical course in the human evolution, i.e. – borrowing the expression from Johann Galtung – enlarging the centre and including more and more periphery. Who are WE? Nowadays, “we” corresponds to a larger number of individuals than just one century ago. “We” also means Australian aborigines, African pygmies, people with mental deficits, women, etc. A long time ago, “we” corresponded to a very limited amount of beings. In years to come, “we” will also cover other animals, and this future has already begun, if we, for instance, think about New Zealand and the so-called Animal Welfare Act, which ascribes to Great Apes (chimpanzees, gorillas, bonobos, etc.) the same basic rights to life as human beings enjoy. (<http://www.umweb.org/zs/intro.pdf>)

It is the typical, politically correct program to which any responsible person, myself included, would subscribe. But for the hundredth time, the undervaluation of the burden of our human condition makes the promises unsustainable by the premises. What about marriages? First THEY, the potential candidates for marriage, were limited by their social status, by class, by noble origins, and the like. Then THEY became a larger group, eventually overcoming even racial differences. Than THEY started to

include human animals from the same gender. What is the next step? Should we extend this mutual right to intermarry to non-human animals? Although there are some undeniable advantages to marrying a cow, there will be a constitutional blackout when the “marriage right” rumor begins to spread throughout the phytosphere. Or we should decide to exclude the plants from the party?

More generally, what about the fundamental right of not being eaten? Who should enjoy this right and who should not? How could living Nature work with prohibitions within its nutritional chains? Sure, “anyone who places himself out of Nature will feel out of place” (Hoffmeyer 1996: 92). But anyone who places Nature inside culture, thinking that he has won a victory over anthropocentrism, is underestimating Nature’s complexity!

That being said, I am grateful for the opportunity to write these lines, and I hope no one would take them seriously enough to get offended. This is a sport among friends. Also, I must admit that many of the things I have written until now could not withstand the strokes of my own Razor.

Notes

1. After the first draft of this text was completed, Timo Maran informed me about another critical contribution, by Tommi Vehkavaara, accessible online: http://mtl.uta.fi/%7Eeattove/limitations_on_peirce.pdf
2. In the above-mentioned article, however, Stjernfelt insists that biology borrowed terminology from semiotics, and not vice-versa.
3. It is one thing to discover that the cell is the basic unit of a living thing, but quite another to call this unit a “sign”.
4. This idea comes from Umberto Eco (1999), the chapter entitled “The resistances of being” in his book, *Kant and the Platypus*.
5. An example – I don’t remember where it was mentioned – might be to study the use of proper names among social, “non human” animals.
6. Here Timo Maran voiced an objection, which I find important, although it does not answer the question of our dependence on a cultural background. Here are his words: “You can communicate with an ape, dog or iguana, you can see them communicating, you can (at least to a certain extent) enter into dialogic relations with them and draw conclusions about their ‘inside’ based on that communication.”

Análisis de la espectacularización en *You Tube: Broadcast Yourself*

Nuestra época, sin duda alguna, prefiere la imagen a la cosa, la copia al original, la representación a la realidad, la apariencia al ser... Para ella, lo único sagrado es la ilusión, mientras que lo profano es la verdad. Es más, lo sagrado se engrandece a sus ojos a medida que disminuye la verdad y aumenta la ilusión, tanto que el colmo de la ilusión es para ella el colmo de lo sagrado.

– Feurbach, *La esencia del cristianismo*, citado por Debord 1967: 9

La humanidad se ha convertido ahora en espectáculo de sí misma. Su autoalienación ha alcanzado un grado que le permite vivir su propia destrucción como goce estético.

– Walter Benjamin citado por Debord, *ibid.*

Introducción

El presente trabajo tiene como objetivo realizar un análisis de del sitio *You Tube, Broadcast Yourself* <http://www.youtube.com>, como una “matriz de espectacularización”, definir sus mecanismos de interacción, socialización y consumo, las categorías de la interacción casi mediática virtual y las formas de clasificación de contenidos del espectáculo en el sitio.

Internet, como matriz interactiva de contingencia, instante-sitio, impone nuevas prácticas de uso y consumo cultural, así como nuevos procesos de recepción, producción, circulación y socialización de textos. La dinámica de consumo en Internet, condiciona el fenómeno de la espectacularización tradicional y le atribuye nuevas características de uso espacio temporales, nuevas fórmulas de construcción textual, y un alcance social en términos de difusión, producción y consumo sin precedentes. *You Tube, Broadcast Yourself* es un caso ejemplar de la nueva cultura del espectáculo en la era de Internet, basado en la “*autoproducción del espectáculo*” y la “*cultura basura*”

del clip”, con un crecimiento de 100 millones de visitas al día y un valor económico de 1,6 billones de dólares en menos de dos años, desde su creación en 2005.

El abordaje teórico que realizamos para describir los mecanismos de You Tube parten de tres fuentes: el modelo de conversación textual de Gianfranco Bettetini (1984), la teoría de la “Casi-interacción mediática” de John Thomson (1997), y la Teoría crítica del espectáculo de Guy Debord.

Desde el modelo de conversación textual de Bettetini, reformulado desde la Interacción Persona-Ordenador por Carlos Scolari (2004), se describen las cualidades de “conversación textual interactiva” de You Tube. Aplicamos igualmente la teoría de la “casi-interacción mediática” de Thompson (1997) para describir la categorías de la interacción y tipos de textos que se publican en el sitio. Desde la teoría crítica del espectáculo de Guy Debord, hacemos una descripción de las características socioculturales del espectáculo en You Tube, como forma de la autoproducción y emisión mediática del “yo”, como producto de consumo cultural bajo los valores del espectáculo en el sistema capitalista: la banalidad, la fama, lo efímero y la cultura del desperdicio.

El presente estudio es una aproximación inicial al fenómeno de la espectacularización en Internet, mediante el objeto de estudio *You Tube, Broadcast Yourself*. La metodología de análisis es experimental, el enfoque es crítico y apunta a la construcción interdisciplinaria de una sociosemiótica del análisis de la espectacularización y la interacción mediática en Internet. You Tube, al igual que sus contenidos, es un fenómeno en permanente cambio que prefigura el sistema de la llamada “post-televisión”. You Tube está construido bajo la lógica de la cultura capitalista del espectáculo, con cualidades interactivas, bajo el control de contenidos de una administración privada, que responde a las reglas del mercado y a la dinámica de una cultura contemporánea caracterizada por la efemeridad, la banalidad, y la instantaneidad. Este es por tanto, un análisis teórico-metodológico de un proyecto de investigación a largo plazo y de mayores alcances sobre el tema y sus derivaciones, que proponemos de tipo multidisciplinario e internacional.

1. Semántica de You Tube: Broadcast yourself

You Tube: Broadcast Yourself, fue fundado en febrero de 2005 por Chad Hurley, Steve Chen, y Jawed Karim y comprado por Google en noviembre

de 2006 por 1,6 billones de dólares. Posee diversos acuerdos comerciales con empresas como: CBS, BBC, Universal Music Group, Sony Music Group, Warner Music Group, NBA, The Sundance Channel.

Según la propia definición del sitio: “Cualquiera puede ver y compartir videos originales en todo el mundo a través de la Web”. You Tube “permite subir y compartir video clips mediante Internet, sitios Web, dispositivos móviles (teléfonos, palms), e-mail y blogs. El sitio ofrece “poder ver acontecimientos y eventos actuales, encontrar videos sobre hobbies e intereses personales, así como descubrir lo inusual. En la medida en que la gente capture momentos especiales en video, You Tube podrá convertir a los usuarios en los ‘emisores’ del mañana”.

La construcción “*You Tube: Broadcast Yourself*”, posee múltiples significados, es una expresión metafórica y altamente polisémica que apunta al “yo”. *You Tube* podemos traducirlo como “*Tu receptor o transmisor de difusión televisiva*”, dado que “*Tube*” se refiere al dispositivo o tubo (“*picture tube*”) de electrones donde se genera la imagen televisiva. Sugiere también la noción de “yo” convertido en “transmisor”.

Por otra parte, *Broadcast Yourself*, podemos definirlo como “*Difusión de ti mismo*” o “*Difúndete*”. *Broadcast* es una palabra generalmente aplicada al campo de la Comunicación con diversas aplicaciones y cuyos sinónimos en inglés son: advertisement, air time, announcement, newcast, performance, program, publication, radiocast, show, simulcast, telecast, transmission. Todos estos términos también son asociados a la construcción del concepto de “Espectáculo” en el campo de los medios de comunicación.

Por lo tanto, desde la propia construcción del nombre, *You Tube: Broadcast Yourself*, el sitio propone una “autodifusión espectacularizante”, o bien, una pragmática de la difusión espectacular del “yo”, un “*Difúndete*” en el marco conceptual de la noción del “*espectáculo electrónico, mediático, comunicativo*”.

2. Teoría del espectáculo e interacción casi-mediática en *You Tube*

En *You Tube* encontramos diversas funciones espectaculares, propias de un medio interactivo en el espacio virtual. Es necesario tomar en cuenta que el sitio no permite una interacción “directa” en tiempo real con otros usuarios, ya que no incluye la posibilidad del chat o el foro virtual. Se trata más bien

de una interacción diferida, en donde el usuario puede enviar comentarios, subir videos y hacer otras intervenciones, dejar huellas de su paso por el sitio, que se insertarán en la “escena” de la interfaz en el momento de su actualización. Los “otros” usuarios podrán ver las intervenciones en tiempo diferido. A esta característica de interacción diferida, le llama Thompson (1987) “interacción cuasi-mediática” y hablaremos de ella más adelante.

Las claves You Tube como matriz cultural de la espectacularización son:

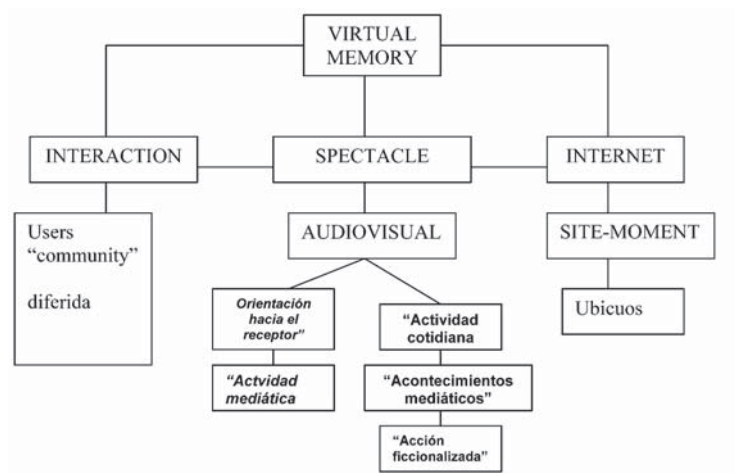

Figure 1.

Esta cualidad “interactiva cuasi-medática” del sitio You Tube le confiere características propias al momento de describir las función espectacular del sitio. En seguida, y siguiendo las aportaciones de Sonesson (1999), intentaremos describir los rasgos de la función espectacular en You Tube.

Para empezar diremos que en el sitio existe una función semiótica, dada por la relación expresión/contenido. Y una *función espectacular en la relación escena/público*. Entendemos como “escena” en You Tube la interfaz interactiva virtual.

You Tube: Broadcast Yourself Función Semiótica Expresión / Contenido				
YOU TUBE	Espacio	Tiempo	Expresión	Contenido
Expresión/ Contenido (función semiótica)	Ubícuo Desterritorializado Virtual	actual	Interfaz + Textos	Textos • Escritos • Audio • Video • Imagen fija

Table 1.

La función semiótica se realiza en You Tube con las siguientes características:

- El espacio es ubícuo, desterritorializado, virtual.
- El tiempo es actual, responde a necesidad de actualizar el sitio para realizar una lectura o una intervención.
- La expresión se da en la Interfaz y en los textos que contiene
- El contenido está expresado en la Interfaz y los textos que contiene: videos, escritos, audio, video, imagen fija.

La función espectacular en You Tube reúne las siguientes características:

- El espacio es ubícuo, desterritorializado, virtual.
- El tiempo es actual, responde a necesidad de actualizar el sitio para realizar una lectura o una intervención.
- Establece una relación entre usuarios de “autor” y “lector” alternativa e indistintamente.
- La interacción entre usuarios es diferida en tiempo y espacio, “casi-mediática” en palabras de Thompson (1997), y su intervención es actual-diferida, es decir, que tendrá que realizarse con la interfaz conectada y la intervención se mostrará al “otro” de manera diferida, no en tiempo real, ya que You Tube no cuenta con un chat acualmente (miércoles 6 de junio, 2007).
- La “escena” es la Interfaz y los escenarios de los diversos textos audiovisuales.
- El público es el universo de usuarios que participan interactivamente, ya como “autores/enunciadores” o “enunciarios/ lectores empíricos.
- El sitio reúne la condición de ser perceptible y sujeto a contemplación
- El sitio posee una componente predominantemente visual (Sonesson, 1999)

Por otra parte, debemos nutrir esta teoría de la función espectacular (Sonesson, 1999), con la Teoría del espectáculo de Guy Debord (1967), desde su extraordinaria reflexión vertida en el texto *La sociedad del espectáculo*.

La reflexión de Debord proviene de la teoría crítica heredada de la Escuela de Frankfurt, y prefigura cómo la lógica del poder en el sistema capitalista, invade las esferas de la vida cotidiana a través de la cultura del espectáculo como forma de dominación ideológica. You Tube queda descrito perfectamente en los valores que responden a esta lógica: banalidad, mercantilismo, instantaneidad, fama efímera, voyeurismo y construcción centrada en el “yo”.

En seguida resumimos los fundamentos de la Teoría del espectáculo en palabras de Debord (1967), que desde un enfoque crítico, describen a You Tube, interfaz, contenidos y usuarios, como una matriz cultural de la espectacularización:

YOU TUBE MATRIZ CULTURAL DE ESPECTACULARIZACIÓN		
Sociedad Espectacular	Usuario	Interfaz – Contenidos
Instrumento de aparente unificación	Relación social entre personas mediatizadas	Acumulación de espectáculos
Separación realidad-imagen	Visión del mundo objetivada	Representación
Unidad en cuanto separación	Monólogo autoelogioso	Aparece con réplicas mediatizadas
Lo verdadero es un momento de lo falso	Imitación extensiva	Carácter tautológico
Producto económico social: empleo del tiempo y cultura como mercancía	conciencia espectadora, prisionera de un universo plano, limitada por la pantalla	Dominantemente Audio-Visual
“lo que aparece es bueno, lo bueno es lo que aparece”	interlocutorios ficticios que la alimentan unilateralmente	Categorías del ver

Monopolio de las apariencias	necesidad de representación	Mapa interactivo virtual: ubicuo espacial y temporalmente
“El sol que nunca se pone en el imperio de la pasividad moderna”	“sentimiento torturante de hallarse al margen de la existencia”	Espectacularidad difusa: múltiple y superabundante
“filosofiza” la realidad	Invación de la privacidad	Lo “artificial ilimitado”
Especialización Del poder	Vigilancia y autovigilancia	Especialización técnica
Sistema ideológico: banalidad, empobrecimiento, servidumbre y negación de la vida real		
desvanecimiento de la distinción entre lo verdadero y lo falso		
<i>presencia real</i> de la falsedad que garantiza la organización de las apariencias.		
discurso ininterrumpido del orden actual		
“perpetuidad basada en el cambio, la instantaneidad y la eternidad del ciberespacio”		
Actividad soñada del idealismo, con la mediación técnica de los signos y señales que terminan por materializar un ideal abstracto, la “democracia de los sueños”		

Table 2.

You Tube como matriz cultural de la espectacularización, desde la perspectiva crítica, es un discurso ininterrumpido del orden actual, que ofrece la eternidad virtual del ciberespacio y la socialización, la mirada de los “otros”, mediante el acceso instantáneo a través de la imagen audiovisual. Responde a la lógica de la cultura como mercancía y al desvanecimiento de la distinción entre lo falso y lo verdadero, dada *la presencia real* de la falsedad como garantía de la organización de las apariencias. En palabras de Debord (1967):

El espectáculo, que es el desvanecimiento de la distinción entre el yo y el mundo por la destrucción del yo asediado por la presencia-ausencia del mundo, es también el desvanecimiento de la distinción entre lo verdadero y lo falso por represión de toda verdad vivida en beneficio de la *presencia real* de la falsedad que garantiza la organización de las apariencias. (Ibid.: 175)

Para Debord, la instauración de la verdad en el mundo, sólo podrá realizarse mediante el diálogo de individuos directamente vinculados con la historia universal, y no mediante individuos atomizados sumisos a la manipulación, es decir, reivindica el diálogo y el lenguaje como instrumentos de construcción social.

Quizás You Tube podrá convertirse en un instrumento de diálogo en el futuro próximo, dadas sus posibilidades técnicas y socializantes. Hoy no lo es. Se administra de forma empresarial, ejerce un estricto control de contenidos, “implicados” los propios usuarios, donde finalmente deciden los dueños del sitio. Ofrece una aparente plataforma de “autoproducción” con límites morales que responden a la lógica del mercado al que se ofrece. La “autoproducción” en You Tube tiene sus límites comerciales, moral y políticamente convenientes para el mantenimiento de su proyección político-mercantil.

Los “excesos” no convienen al sistema. Bajo el escudo de la defensa de los derechos de autor (el copyright) se erige en instrumento de censura e impone la lógica moral del sistema capitalista: la oferta y la demanda dentro del margen de lo moral y políticamente correcto, mientras no rompa con el *statu quo* del proyecto de negocio.

You Tube hereda los contenidos temáticos y el tratamiento banal de los contenidos que realiza el capitalismo para la industria cultural: cine, televisión, radio, música, prensa, internet. A los recursos técnicos de la plataforma virtual (Internet) -instantaneidad, tiempo real, ubicuidad territorial- se suman los contenidos establecidos en categorías temáticas y de tratamiento audiovisual (estrategias textuales), propias de la industria cultural dominante en el mundo capitalista actual.

3. *Interacción textual en You Tube*

Gianfranco Bettetini (1984), desde una perspectiva semiótico-pragmática, propone un modelo de conversación textual en el marco de una teoría del lenguaje audiovisual, que se puede extender a los medios virtuales interactivos (Scolari 2004: 58 y 155). El modelo de Bettetini va más allá de los valores semánticos presentes en un texto.

Bettetini plantea que un texto propone un intercambio comunicativo simbólico, en este caso You Tube como texto (y “como estructura textual”) e interfaz interactiva, que propone la creación de sentido y lectura al usuario:

El texto cumple un acto de puesta en escena suplementario respecto a su espesor semántico: el texto introduce también en escena un intercambio comunicativo simbólico, una “conversación” simbólica. La representación de sus valores semánticos es a su vez enmarcada en la representación de su traslación entre dos sujetos que al aparato textual constituye como imágenes fantasmales de quien transmite y de quien recibe. (Un texto, en síntesis, incluye también) la representación de sus normas de uso, de sus modalidades de acceso a su sentido a través de su articulación semiótica. (Bettetini, citado por Scolari 2004: 54)

El modelo de “conversación” textual presupone la existencia de un sujeto enunciador y un sujeto enunciatario. Todo texto incluye un “proyecto de relación comunicativa” apunta Bettetini, “un programa de desenvolvimiento de interacción con el público”. El espectador, por su parte recibe el texto con un “proyecto de interacción con las articulaciones semióticas que el discurso textual le propone” (Ibid.: 110/Ibid.: 55)

En la interacción Persona-Ordenador, siguiendo a Scolari (2004), podemos decir que en el sitio interactivo You Tube:

- La interacción en You Tube mantiene el carácter virtual y simbólico de la conversación textual.
- La interacción permite una intervención directa del usuario mediante la interfaz, en la producción de sentido.
- El sujeto enunciador se identifica con *un saber parcialmente estructurado*, debido a que está regido por *estrategias potenciales* que deben ser actualizadas por el usuario.
- El sujeto enunciatario/usuario asume un cuerpo simbólico simulado y además visible en la pantalla en forma de cursor para entrar en el texto. El simulacro del cuerpo del usuario aparece en la pantalla bajo la forma de cursor.
- El sujeto enunciatario/usuario es construido de una manera diversa, de acuerdo a las herramientas de interacción que ofrece y regula el sitio.
- La interacción presupone un “saber-ser”, un “saber-hacer” y además un “actuar” en forma de competencias de *diseño* y *uso*.
- El intercambio comunicativo en You Tube no se realiza entre dos sujetos empíricos, sino entre *estructuras simbólicas* (texto, sujeto, enunciador, enunciatario/receptor/usuario).
- El enunciador en You Tube se presenta como un *simulacro del emisor* instalado dentro del discurso (interfaz), que regula las formas de acercamiento al texto por parte del usuario.

- La interfaz de You Tube actúa como principio ordenador de los procesos simbólicos de los textos virtuales que contiene.
- You Tube se presenta como un *simulacro del emisor*, y este simulacro es “*un aparato ausente, productor y producto del texto, que deja las huellas de su paso ordenador sobre los materiales significantes*”. (Bettetini citado por Scolari, 2004: 155)
- El sujeto enunciatario, el usuario, es un destinatario implícito de la enunciación, presente en todo texto, con potenciales instrumentos de intervención interactiva en el texto que debe actualizar.

La interacción presupone un “contrato de lectura”, un “pacto de comunicación”, un “contrato de interacción”. Tanto el sujeto enunciatario como el enunciatario, dejan huellas estáticas y después de su intervención, así como huellas dinámicas (narrativas y comentativas) durante su interacción dinámica en el campo de la interface actualizada. Tales “huellas” son indicios de acciones que se revelan en la dinámica del consumo (Bettetini citado por Scolari 2004: 56). Ambos sujetos construyen huellas, “señales” e indicios del comportamiento de un interlocutor simbólico, “que adquiere gradualmente forma durante el progresivo encuentro de la interacción comunicativa de ‘lectura’” (Ibid,; 56).

El sujeto enunciatario y el sujeto enunciatario en You Tube tienen el mismo estatuto como usuarios-productores. El autor de un texto es tam-

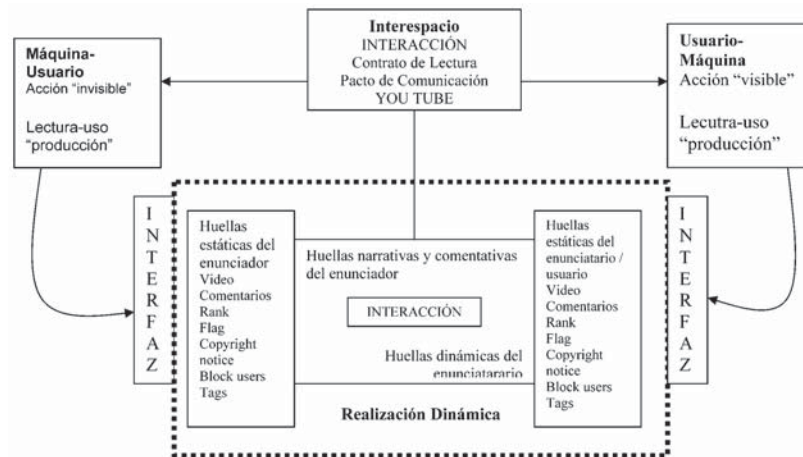

Figure 2. Modelo de la conversación textual (Bettini 1994), aplicado a la interacción en el sitio You Tube: Broadcast Yourself. Modificado del modelo original.

bién lector de su propio texto en la trama del sitio y el usuario receptor tiene las mismas posibilidades de producción que el emisor. Esta capacidad interactiva del sitio convierte al emisor en lector y al lector en emisor indistintamente, en términos de sus posibilidades interactivas.

En You Tube, un “autor modelo” envía un texto a un “lector modelo” (Eco 1979). Tanto autor como lector “modelo” deben moverse para construir el texto, el autor generativamente y el lector interpretativamente. Sin embargo, no basta esperar que el lector modelo “coopere en la actualización textual”, el autor modelo deberá “mover el texto para construirlo”. Por su parte, el lector empírico debe delinear “una hipótesis de autor, deducida de los datos de la estrategia textual. Tanto el autor modelo, como el lector modelo, se construyen como “estrategias textuales”, por lo que la cooperación textual en You Tube “es un fenómeno que se realiza entre dos estrategias discursivas, no entre dos sujetos individuales” (Eco, citado por Scolari 2004: 157). La “comunicación” se realiza cuando ámbos instituyen un contrato que regulará el intercambio, un “contrato de interacción” *mediado* por las reglas de interacción de You Tube.

“Desde una perspectiva semiótica, la comunicación es una acción que un sujeto ejercita sobre otro, un intercambio simbólico que remite a las ideas de conflicto, estipulación y conquista” (Scolari 2004: 156). Tales “actos” de conflicto, estipulación y conquista se realizan mediante la intervención dinámica en la *actualización interactiva* de You Tube: subir videos (upload), salvar favoritos, compartir (share), responder con un video (post video), clasificar (tag), enviar comentarios (post comment), calificar con estrellas (rated), señalar como inapropiado con una bandera roja (flag), bloquear a un usuario, notificar sobre la violación de derechos de autor (copyright notice), aceptar o rechazar comentarios (kinda) y por supuesto, hacer diversos tipos de búsqueda.

You Tube incorpora una dimensión interactiva del intercambio, constituye un simulacro de usuario(s), que funciona como propuesta de interacción en relación al usuario empírico sentado frente a la pantalla interactiva, quien decidirá si aceptar, rechazar o intervenir (ibid: 157).

El usuario empírico de You Tube acepta un contrato de interacción, para entrar a un sitio que tiene una propia gramática, un entorno en el que tendrá que interactuar con dispositivos y realizar operaciones técnicas previstas (y no podrá realizar otras, como descargar los videos a su ordenador).

La interacción e intercambio simbólico en You Tube, presupone la existencia de un sujeto enunciador (productor y producto del texto) y un sujeto enunciatario o usuario (producido por el enunciador y el texto). Sin embargo, “el simulacro dialogante del receptor será muy diferente del enunciatario que el texto pretendía producir y, sobre todo, el sujeto enunciatario modelo producido por el destinatario difícilmente será conmesurable con el sujeto enunciador, origen programado del discurso-conversación textual” (Bettetini citado por Scalfari 2004: 56)

4. Categorías de espectacularización y estrategias discursivas en You Tube

En You Tube habrá que distinguir dos niveles de lectura textual:

- La interfaz del sitio como texto, que propone un discurso textual espectacularizante (escenario/escena/público), y una serie de estrategias potenciales de interacción para acceder a los textos.
- Los textos audiovisuales (videos) que contiene el sitio y que la interfaz organiza, administra, gestiona y hace visibles, y que los usuarios producen y clasifican.

La interfaz de You Tube permite realizar una interacción con las siguientes pautas o reglas de intervención:

- subir videos (upload)
- clasificar (tag)
- salvar los favoritos (no guardarlos)
- compartir (share): enviar la liga recomendando por e-mail
- responder con un video (post video)
- enviar comentarios (post text comment)
- calificar con estrellas (rated)
- señalar como inapropiado con una bandera roja (flag)
- bloquear a un usuario
- notificar sobre la violación de derechos de autor (copyright notice)
- aceptar o rechazar comentarios (kinda)
- hacer diversos tipos de búsqueda, por:
 - *Most Recent* (más reciente), *Most Viewed* (más visto), *Top Rated* (más calificado), *Most Discussed* (más discutido), *Top Favorites* (más preferidos), *Most Linked* (más “pinchado”), *Most Recently* (más reciente), *Most Featured* (más recomendado), *Most Responded* (más respondido), *Watch on Mobile* (visto en un móvil)
 - Búsqueda por tiempo: fecha, día, semana, mes

- Búsqueda por categoría: autos y vehículos, comedia, entretenimiento, film y animación, gadgets y juegos, howto and DIY, música, noticias y política, gene y blogs, mascotas y animales, deportes, viajes y luars.
- Búsqueda por idioma: inglés, frances, español, árabe, chino, japones, alemán
- Crear canales y grupos
- Participar en divesos tipos de concrusos audiovisuales (principalmente promovidas por empresas multinacionales, como por ejemplo: Samsung, Heinz, Malibu, etc.)

Los contenidos están clasificados por categorías, termas, (firmas, palabras clave) tags, y relacionados entre sí, asociadas a las formas de búsqueda y al autor productor del texto:

- autos y vehículos
- comedia
- entretenimiento
- film y animación
- gadgets y juegos
- how-to and DIY
- música
- noticias y política
- gene y blogs
- mascotas y animales
- deportes
- viajes y luars

Retomamos el concepto de Thompson (1997) sobre la “casi-interacción mediática”, salvo que en You Tube adquiere posibilidades dialógicas difereidas.

You Tube Interacción casi-mediática	
Características de la interacción	Interacción casi-mediática en You Tube
Constitución espacio-temporal	Separación de contextos: disponibilidad extendida en el tiempo y el espacio (ubícua, virtual, instantánea, actual)
Alcance de las señales simbólicas	Estrechamiento del radio de acción de señales simbólicas: texto escrito, imagen fija, video, audio

Orientación de la acción	Orientada hacia un indefinido número de recipientes potenciales
Dialógica/ monológica	Dialógica/monológica /diferida Carácter híbrido "Interacción mix": "interacción mediática" + "interacción casi-mediática"

Table 3. *General vs. "Mixed Interaction qualities", after Thompson (1997).*

Las descripciones de Thompson (1997) sobre las interacciones y las "casi interacción mediática", permiten comprender que la interacción en You Tube es de tipo "mix", ya que incluye la posibilidad dialógica diferida y monológica. La interacción en You Tube implica la comprensión de un espacio y un tiempo virtual, y con ello la separación de los contextos en los que se encuentran los participantes. You Tube establece una estructura interactiva depositaria de formas simbólicas (textuales-audiovisuales), que consiste en dos o más regiones separadas en el tiempo y en el espacio.

En You Tube, las regiones en la esfera de la recepción no afectan a la estructura de producción. La "estructura interactiva de recepción" de You Tube, puede ser usada como marco para la "interacción casi-mediática" y eventualmente como marco para la "interacción mediática" (con la posible inclusión de un chat/ web cam) y "interacción cara a cara" como marco de una actividad receptora socializante, los usuarios reunidos covivencialmente frente a la interfaz del sitio (Thompson 1997: 125).

You Tube "estrecha" el alcance de las señales simbólicas, ya que reduce las posibilidades formales a textos escritos y audiovisuales (videos), orientada hacia un número indefinido de recipientes potenciales a través de la Internet. Los emisores y receptores en You Tube no tienen obligación mutua de tomar en cuenta las respuestas del otro.

Thompson (1997) señala cuatro formas de actuación del emisor para los otros, en You Tube adquiere la forma de "autoproducción audiovisual", como forma de intervención en el sitio y que aquí identificamos como estrategias textuales de espectacularización en You Tube:

- orientación hacia el receptor
- actividad mediática diaria
- actividad cotidiana simulada
- acontecimientos mediáticos
- acción ficticia

You Tube Estrategias textuales de espectacularización		
Estrategia textual	Acto mediático	Ejemplo
<i>“Orientación hacia el receptor”</i>	Cuando los emisores miran y hablan a la cámara	Monólogo frente a la cámara (Monologue in front of the camera): <ul style="list-style-type: none"> • Tony Blair (Views: 349,181) http://www.youtube.com/watch?v=P6Cu9187tCY • Lonely Girl 15 (Views: 1,425,906) http://www.youtube.com/watch?v=dZN-Wye4rDE • NumaNuma/ (Views: 3,506,565) http://www.youtube.com/watch?v=60og9gwKh1 • Noah/ (Views: 6,106,672) http://www.youtube.com/watch?v=6B26asyGKDo
<i>“Actividad mediática cotidiana”</i>	Se presenta como parte del actual flujo de conducta de la vida cotidiana. Los “actores” puede saber o no que estan siendo filmados	Vida cotidiana (Daily Life): <ul style="list-style-type: none"> • Edgar se cae (Views: 1,902,736) http://www.youtube.com/watch?v=b89CnP0Iq30 • Surveillance / self-surveillance Mexico City Underground:
<i>“Actividad cotidiana simulada”</i>	Los individuos participan en una acción ordinaria con el propósito de ser grabados”	Acto cotidiano simulado: <ul style="list-style-type: none"> • Evolution of dance (Views: 50,185,791) http://www.youtube.com/watch?v=dMH0bHeiRNq • News/Spencer Tunick México (Views: 1,902,736) http://www.youtube.com/watch?v=JDC0dqyn1tE&mode=related&search=
<i>“Acontecimientos mediáticos”</i>	Acontecimientos planificados, ensayados, contruidos en torno a la participación de los medios”	Acontecimientos mediáticos: <ul style="list-style-type: none"> • Olympic Games • Footbol • Concerts/ Freddie Mercury (Views: 72,040) http://www.youtube.com/watch?v=h4yjbsYCupQ

"Acción ficcionalizada"	Ficción narrativa planificada, representación propia de la producción televisiva / Delgada frontera entre acción ficticia y no ficticia	Ficción: <ul style="list-style-type: none"> • Films • TV-series • Soup-opera • Musical Videoclips • Clips • Documentaries, Fiction • Columbine High Scholl (20,777) http://www.youtube.com/watch?v=361wevQhEuE&mode=related&search • Anuncios/ (Views: 40,319) http://www.youtube.com/watch?v=P7WleXpzmZA • Pornografy
-------------------------	---	--

Table 4.

Algunas características de la recepción en You Tube, caracterizadas por Thompson (1997), los mensaje mediáticos adquieren:

You Tube Características de recepción		
Recepción	Cualidades	Ejemplo
"Elaboración discursiva"	Mensajes elaborados, refinados, criticados, elogiados y comentados por los receptores	Comentarios de texto escrito y en video
"mediatización extendida"	Respuestas mediáticas referidas a un texto o varios textos mediáticos relacionados: alto grado de autorreferencialidad, textos mediáticos referidos a otros textos mediáticos o acontecimientos relacionados relacionados	Videos que son "réplicas" inspiradas en un video anterior subido al sitio y tomado como modelo
"Apropiación"	Los textos mediáticos pueden ampliarse más allá de su actividad inicial-primaria, como un proceso extendido de recepción, en otros contextos.	Publicidad relacionada con algun video original subido en el sitio. Algunos canales de televisión, como Antena 3 (España) tienen como programa un espacio donde se emiten videos "preferidos" tomados de diversos sitios de Internet, entre ellos You Tube.

Table 5.

5. *Los contextos en You Tube*

En You Tube, como en cualquier otro sitio en Internet, el contexto es “multicontextual”, y podemos hacer una primera clasificación, de la siguiente manera:

- Contexto lingüístico y audiovisual
- Contexto situacional, conjunto de datos accesible a los participantes de una “conversación” o “intercambio”, en el contorno físico inmediato.
 - Contexto territorial (el tiempo y espacio de necesidad, el lugar del usuario)
 - Intracontexto, la Interfaz (el tiempo y espacio de sitio de Internet)
- Contexto sociocultural, conjunto de datos que proceden de condicionamientos sociales y culturales sobre el comportamiento “verbal”, “visual”, “sonoro”, y su adecuación a diferentes circunstancias. (Reyes 2000: 20)

En You Tube operan simultáneamente estos tres tipos de contexto, lo que convierte a los sitios en Internet en contextos complejos de socialización. Los contextos socioculturales contribuyen activamente a la interpretación de los enunciados. You Tube funciona como contexto dadas su reglas de intervención, consumo, intercambio, basadas en la “autoproducción” y la exploración o visualización “del otro”. Al igual que el lenguaje legal, religioso, político, médico, You Tube establece sus propias reglas de lectura, actualización e interpretación, centradas en la espectacularización y que hacen posible su funcionamiento, así como la interpretación de textos en su contexto que opera como el “frame sociocultural”. You Tube es un “*frame tecno-sociocultural*”.

You Tube como “*marco de referencia*” o *frame*, funciona como “*marco metacomunicativo*” que permite organizar y clasificar el texto, la situación de recepción e intercambio, así como el rol de los participantes. You Tube permite a los usuarios generar expectativas y presuposiciones que les permiten producir e interpretar los textos. (Reyes 2000: 20.)

You Tube, Broadcast Yourself como “marco metacomunicativo” tiene las siguientes cualidades:

- Es un marco de “autoproducción” centrado en el “yo”: “*Broadcast Yourself*”
- Es un marco interactivo de socialización, que permite participar activamente en la construcción del sitio: enviar videos, recomendar, calificar, emitir juicios de valor, escribir para comentar sobre los videos, lo que produce un sentido de apropiación individual y comunitaria del sitio.

- Es un marco referencial de lectura audiovisual sobre la alteridad: “los otros”, “lo otro”, el “alter-ego”.
- Es un “marco espectacular”, en el que todo texto y expectativa de lectura adquiere cualidades de “diversión”, “entretenimiento”, “efimeridad” y “espectacularización”.
- Es un “marco de instantaneidad” o “marco de actualización”, en el que domina la “instantaneidad” como experiencia de consumo en “tiempo real”, donde el espacio es el sitio y el tiempo el instante que opera como matriz de contingencia en el marco de Internet.

You Tube se construye como un “frame metacomunicativo”, como una “comunidad sociocultural” que comparte códigos y estructuras cognoscitivas, estructuras estereotípicas de tipo espectacular, sobre situaciones y conceptos, que permiten asociar significados.

You Tube permite realizar situaciones de comunicación ritualizadas (compartidas), donde el valor de verdad de los textos pasa a un segundo plano y el contexto, el “frame metacomunicativo” construido “colectivamente” bajo las reglas de consumo y producción textual del sitio, es lo que determina sus significados.

6. Las fronteras de You Tube

Como hemos apuntado, You Tube es un sitio en Internet sujeto a la lógica que lo fundamenta: lo efímero, la banalidad y el cambio permanente. Nuestro estudio se realiza durante junio de 2007 y sin duda el sitio tendrá modificaciones operativas, de contenido y de uso a lo largo del tiempo. No descartamos su desaparición, o bien, su conversión en una fórmula de la post-televisión. Por ahora hemos visto su evolución de ser un sitio con mayores libertades -menor ejercicio de censura y control de contenidos, la posibilidad de bajar los videos por parte de los usuarios, ausencia de publicidad-, a lo que tenemos ahora que ha sido adquirido por Google, con mayor control de contenidos, publicidad y sin la posibilidad de bajar los videos directamente al terminal del usuario, entre otros cambios.

Las principales fronteras de You Tube vienen dadas por la administración del propio sitio, aquí clasificamos tres fronteras en las que participan también los usuarios:

- Control de contenidos y censura por parte de los administradores del sitio con un carácter moral y legal.
- Control de contenidos por parte de los usuarios y “autocensura” con un carácter moral. Los administradores se encargan de revisar todos los videos marcados con una bandera roja por parte de los usuarios. Los usuarios no pueden quitar un video o texto escrito por sí mismos.
- Vigilancia sobre la no violación a los derechos de autor de contenidos registrados, con propiedad intelectual y derechos de uso lucrativo
- No protección a los derechos de autor de los usuarios.
- La responsabilidad final de cualquier contenido subido al sitio es del usuario, no de los administradores del sitio.

Como observamos, se trata de fronteras morales y legales, en cuanto a la protección de derechos de autor de terceros. En cuanto a la parte moral, el sitio es muy claro al establecer sus “códigos de conducta” (“Code of conduct”): http://www.youtube.com/t/community_guidelines), términos de uso (“Terms of use” <http://www.youtube.com/t/terms>), “recomendaciones de seguridad” (“Safety tips” <http://www.youtube.com/t/safety>).

Los administradores del sitio confían en la “responsabilidad de los usuarios” para usar el sitio, y señalan que todo uso irresponsable recae en los usuarios. You Tube no es un sitio de “choque” (“shock site”). No admite videos explícitos de: sexo, violencia, muerte, explotación infantil, odio, uso malintencionado que atente contra género, raza, orientación sexual, religión o nacionalidad. El sitio advierte sobre la “cero tolerancia” en el mal uso de información personal de otros usuarios.

En cuanto al respeto a los derechos de autor o “copyright” (véase: y las reglas sobre derechos de autor (“Copyright notices”, http://www.youtube.com/t/howto_copyright), se advierte que sólo se suban videos originales, hechos por el propio usuario, o bien, de los que se posea un permiso de derechos de uso por parte del autor o dueño del video. Esto incluye música original que acompañe un video. Un gran porcentaje de los videos en You Tube incluyen música original usada sin derechos de autor. El sitio hace caso omiso de sus propias reglas. Sólo aplica las que le son “políticamente y económicamente incorrectas”.

Las fronteras de You Tube están dictadas por una lógica empresarial. Google pagó por el sitio 1,6 billones de dólares y esto significa que detrás hay un mercado aproximado de 100 millones de usuarios potenciales cada día, es decir, un mercado que debe ser cuidado de acuerdo a un perfil de consumo establecido. Cualquier video o texto que altere el statu quo del

consumidor y del mercado de You Tube, debe ser quitado del sitio, censurado.

Sólo aquellos contenidos que alteren o excedan el perfil de los consumidores y ponga en riesgo el plan de negocios del sitio, serán sustraídos del mismo. La principal frontera de You Tube es su lógica de mercado. Y la plataforma que garantiza este mercado es la de la espectacularización.

Pongamos por caso un video subido a You Tube en abril de 2007, donde se ejecuta a un presunto miembro del grupo “Los Zetas”. Reseñado el día 2 de abril de 2007 por el periódico *El Universal* de México, se describe videograbación de la decapitación de un hombre con un “garrote” y un cable. Dicho video estuvo en el sitio por breve tiempo, aunque lo suficiente como para que se reseñara en la prensa mexicana a nivel nacional y trascendiera internacionamente. Actualmente dicho video no se encuentra por los motores de búsqueda, como www.google.com o www.yahoo.com en ningún sitio de Internet. Esto indica que hay sin duda, un enérgico control de contenidos en la red.

El castigo ejemplar por malos usos, que impone el sitio como penalización, es prohibir permanentemente el uso del sitio al usuario que viole sus reglas. Prohibe también, de una manera más bien inocente, que un usuario que haya violado las reglas, use la cuenta de otro usuario. Y advierte que se tomarán medidas legales contra aquellos que violen los derechos de autor de terceros. La pregunta es, ¿cómo identificarán a millones de usuarios que se identifican con nombres y datos falsos en el sitio? Quizás esto sea tema de otro estudio, en el que debamos entrar en materia de “policía informática”.

Por ende, la “autoproducción” en You Tube tiene sus límites, los límites de lo “político y económicamente correcto” de acuerdo a una lógica y un plan de negocios.

¿Podría You Tube trascender esta lógica empresarial como matriz espectacularizante, e ir más allá, para convertirse en un sitio de mayores alcances culturales? ¿Podrá convertirse en un sitio donde haya una verdadera interacción, una verdadera libertad en la “autoproducción” como forma de socialización, sin censura, o bien, con una verdadera autorregulación por parte de los usuarios? Son preguntas comunes cuando se hace un análisis crítico descriptivo del sitio You Tube, desde una semiótica pragmática como el presente. Tales preguntas responden a la promesa inicial que ofrece Internet desde su origen. La posibilidad de construir una verdadera “democracia de los sueños”, un verdadero foro de intervención e interacción social, un

espacio de diálogo en la esfera pública sin fronteras, y no una “democracia del espectáculo” comercializada.

El medio permite invocar nuevos usos y nuevos horizontes. Al igual que la televisión, Internet, es un instrumento tecnocultural que permite expandir los alcances del conocimiento, la capacidad de socialización y el crecimiento del ser humano en sociedad. Los nuevos desarrollos en biosemiótica e Internet exploran ya este nuevo curso de elementos sumados y colaborando en red para mantener y mejorar la vida humana.

Sin ánimo de ser apocalíptico, You Tube será sólo la matriz espectacularizante que se visualiza ya, mientras siga sea un sitio sujeto a la lógica del mercado. La potencialidad política del sitio basada en su enorme audiencia, puede introducir nuevos usos de carácter más educativo y cultural, tal como **e-youtube**, canal de difusión de la Unión Europea en You Tube, que persigue fines didácticos y culturales sobre el continente. Con seguridad, otros desarrollos más en Internet darán, sin duda, mayor impulso a la construcción de una cultura libre de la lógica del mercado y políticamente más humana y dialógica, y entonces sí, menos apocalíptica.

Conclusiones

You Tube es una matriz interactiva mixta (mix-interactive matrix) del espectáculo, basada en la interacción, el compartir, la socialización virtual, no en tiempo real, en donde el autor y el lector tienen las mismas oportunidades de interactuar, siempre bajo las reglas de uso de los administradores del sitio.

You Tube reproduce las principales cualidades de la sociedad del espectacularización propio de la industria cultural capitalista, basado en la estrategia de la “autoproducción”, limitada por la lógica de mercado y el plan de negocios del sitio.

Los límites de la “autoproducción” en You Tube, son los mismos que impone la lógica de mercado y el plan de negocios de los dueños del sitio.

Los usuarios buscan en You Tube una perpetuidad asentada en la memoria digital y el ciberespacio, con la “promesa de eternidad” y la promesa de “ser visto” por otros en la red interactiva: la promesa de la memoria visual interactiva.

La verdad es un momento de lo falso en You Tube, donde se diluyen las nociones de certidumbre y todo queda permeado por el tamiz de lo falso,

la incertidumbre, lo efímero y lo banal. La verdad en You Tube es la verdad de lo espectacular.

Las posibilidades interactivas de You Tube pueden crecer si se aleja de una lógica de mercado, y se abre a una auténtica socialización dialógica y de carácter humanista.

Josep Barcons

The existential dimension of the phatic function in Arnold Schönberg's *Moses und Aron*

Early in Arnold Schönberg's opera *Moses und Aron*, God tells Moses: "Now announce" (Schönberg 1984, mm. 14–15).¹ It must be supposed that Moses has just received a message that he must announce. However, this imperative statement is heard when the voice of God has only said: "Lay your shoes aside: you have gone far enough; you stand on holy ground". Considering the meaning of these words, it is impossible to think that they carry the content of the message that Moses has to announce. Then Moses answers God: "God of my fathers, God of Abraham, Isaac and Jacob, thou who have awoken again their thought in me, my God, do not compel me to announce it. I am old; let me tend my sheep in peace."²

In Moses' answer nothing is said about shoes or about holy ground. On the contrary, he says he doesn't want to be compelled to announce his father's thought. To Moses' objection, God replies: "You have seen the horrors, known the truth; so you can do nothing else: you have to free your people from it". The question is: To what is the reference of "from it" (*daraus*)? Is it supposed to be the "horrors"? The "truth"? Or is the reference to the very "thought of his fathers", which, according to Moses, God has reawakened in him? From a purely grammatical analysis, it is impossible to determine the actual reference of this *daraus*. But knowing the accuracy Schönberg put on the elaboration of the libretto, this ambiguity cannot be a mistake, but intentional, and it seems must necessarily remain unsolved (cf. Schönberg 1958: letters 128, 129 and 151). For the actual referent of this *daraus* could be any or all of these possibilities (ibid.: letter 117). According to this view, the word "free" (*befrein*) gains utmost signification, since the people has to be freed from any kind of constriction or slavery (on the understanding that any kind of constriction is suggested by

the multiple, or indeterminate, referent of this *daraus*). One of these possible constrictions (maybe the greatest one) is, precisely, the very idea – the thought, the *Gedanken* – of God. And this will in fact form the basis of the whole drama.

The opera (not the scene, which starts 8 bars later) begins with 6 *Solostimmen* singing “O” (see Example 1). These 6 solo voices contain the whole range of the adult human register and are placed inside the orchestra, doubled by one instrument each one. Though in the score Schönberg never refers to them by any other words than 6 *Solostimmen*, we can certainly suppose that they are the invisible – they are in the orchestra – but audible aspect of God (both for Moses and the audience). These voices sing during bars 1–3 and 5–7, with one purely instrumental bar in between, according to this distribution: 3 + 1 + 3, totalling 7. Knowing the importance Schönberg gave to numbers (see, e.g. Sterne 1994), both this structure and the presence of the number 7 cannot be accidental. The fact that these six voices (3 female + 3 male) are singing 3-voice chords during 3 + 3 bars, produces an evident structural parallelism between them and the bars employed, thus strongly connecting the very nature of the voices (so to say, their essence) to the place they occupy. This point of view is reinforced by the communicative structure of the first words: “O – ” can serve no other means but to stress the presence of a Sender who addresses a Receiver, since they share a common Code and are placed in the same Context (cf. Jakobson, in Sebeok 1960). In other words, this first speech act opens the Channel that enables Contact (phatic function of language) between two existential instances. Still following Jakobson's communication schema, we find that the only item neglected in this speech act is the Message itself. The content of the first word (an interjection) can only stress the fact that a communicative act is happening. “O” simply points out that a “we” is there (a Sender and a Receiver); in other words, that “I am here” and “you are here”. This is not so different from the well-known “I am”, or “I am who I am”, from Exodus 3:14, which is the underlying source of this passage.

Reacting to the voices he has just heard, Moses replies in measure 8, when the first scene begins: “One, eternal, omnipresent, invisible and unimaginable God”. Thus he responds with theological concepts to the purely phatic “O–!” With such terminology, Moses' response implies not only a heavy displacement of the dominant function of language from the phatic level to the message, but also the abandonment of the pure *hic et*

The musical score shows a piano accompaniment for measures 1-7. The treble clef part begins with a half note 'O' followed by a quarter rest, then a quarter note, and continues with a series of chords. The bass clef part consists of a steady accompaniment of chords. Brackets below the staff indicate a 3-measure phrase, a 1-measure rest, and another 3-measure phrase.

Example 1. Moses und Aron, mm. 1–7: “6 Solostimmen”.

nunc in which the first communicative act of the 6 *Solostimmen* was sited. Moses’ verbalization of such marked terminology (which is highly connotative) breaks the intimacy of the here and now that any phatic act implies, by bringing into scene an alien presence that was lacking until that moment – namely, the meaning, the signified, the world of external references of the words employed.

Not allowing him to finish, and restoring the *hic et nunc*, the 6 *Solostimmen* anticipate Moses’ last word (“God”) and begin their speech, giving birth to a second intervention that presents some dissimilarities to the first one. The first difference is that here the 6 *Solostimmen* join the *Stimme aus dem Dornbusch* (voice – singular – coming from the burning bush), compounded by six non-soloist voices, all of them placed behind the scene; and instead of singing, they speak. These voices cover the same range of the 6 *Solostimmen*, but substitute mezzo-sopranos for children, thus endowing the voice of God with the whole spectrum of natural human voices. It is noteworthy that the visible part of God is, musically speaking, quite sober and austere, reduced only to rhythm and not sung. A second major difference is the fact that, instead of the interjection of measures 1–3 and 5–7, here God proffers words comprising four sentences: “Lay your shoes aside: you have gone far enough; you stand on holy ground. Now announce.”

Although sentences and not plain interjection, their meaning is not so different from that of the initial “O”. Two of them are imperative sentences, whose meaning has nothing to do with the assertion of any concept or idea, since they ask for an action, thus stressing the relation between the Sender (who commands) and the Receiver (who obeys). The other two sentences are declaratives, but they refer to the immediate context (the shoes and the ground), and the presence of the Receiver is also noticeable thanks to

the verb and even the pronouns (*bist* and *du stehst*).³ Thus, the phatic element of this whole intervention remains evident, since the presence of the Receiver arises in all four sentences. This constant presence of the “you”, in addition, is always linked to the present space and time (Context) by the verbal tenses employed (imperative, present or perfect, whose implications concern the moment the speech act is taking place). The result is, once more according to Jakobson's typology, the negligence of the Message, a result of stress being placed on other factors of communication.

If we compare God's words to those said by Moses, the first noticeable difference is that God's words always neglect any Message, and thus any external presence conveyed by the recall of the reference. Moses, however, puts complete emphasis on the Message, neglecting the other communicative factors, mainly the phatic one, as well as the time and space where the communicative act is happening; i.e., he recalls the past dimension of his fathers. Also, in the 4 bars of Moses' intervention we find 5 adjectives, and in the 5 bars of God's intervention we find 4 verbs. Thus, God's words are mainly active (verbs always imply movement, not reification), while Moses' words are adjectives (determiners, determinators, constrictors, attached to fixed concepts). In God's speech we find few concepts: the shoes and the ground are part of the immediate context, so they do not need to recall an *ex-tempore* and external referent; even the idea of holiness (the only adjective in God's words) arises from the very place the conversation is held. Apart from the dominant presence of verbs, we also find quite a few adverbs and prepositions, and these, too, have an immediate referential function linked to a concrete space and time.

But the roles of God and Moses remain at opposite poles, not only in terms of text, but also in terms of music. Apart from the highly significant ways the dodecaphonic row is employed, there are also musical differences that a competent listener can catch by ear.⁴ Just to quote these last ones, the first major difference arises from the fact that the voice of God is richly polyphonic, whereas Moses does not even sing a melody, but speaks in his characteristic *Sprechgesang*. Apart from this major difference, it is noticeable that the orchestra turns to the low register when Moses speaks, with the introduction of a tuba, thus anchoring his words in a weighty dimension, completely contrasting with the transparent textures of the voice(s) of God. In terms of rhythm, the malleability of the first 7 measures becomes petrified when Moses begins his speech: the orchestral accompaniment to his

spoken words stands only on the strong beats of the bar, separated, moreover, by quaver silences with *fermate*. In the first seven bars, the rhythm was syncopated (mm. 1–3) or counterpointed by the orchestra (mm. 5–7), in a rhythmical plasticity that vanishes at the very moment Moses says his first words. In terms of harmony, the constant three-voice realization and salient featuring of the major 7th in God’s speech is changed to four voices with a predominant sonority of the minor 7th.

Given these differences, and after Moses’ request to let him tend his sheep in peace, and God’s intervention (“You have seen the horrors, known the truth”), something curious happens. If we consider that the first chords sung by the 6 *Solostimmen* in the first seven bars are the original model of God’s nature (its essence, as shown in Example 2), we will see that in the intervention we are talking about (mm. 23–25) there is a kind of retrogression in terms of the harmony; it is as if God’s speech were retracing its own steps (see Example 3). Instead of going on, when the D chord is reached, the steps followed are not E-F, but C-B-A. From here on, when this kind of withdrawal takes place in God’s interventions, the original chords always appear changed and transposed, never having their original pitches. As if a closing statement, the first transpositions (m. 26) are precisely D’ and A’ (that is, the starting and ending points of the retrogression). The original pitches (B A, last sung by the 6 *Solostimmen* in mm. 24–25) do not appear again until measures 91–93 (as A B), when the text “*verkünde*” (announce) is said a second time. However, these pitches do not appear in their original disposition, but inverted (with both chords showing the same inversion), and with the lowest note surrounded by semitones (see Example 4).

Example 2. Moses und Aron, mm. 1–7, chord progression.

What happens between measures 26–90 to provoke such a change in the musical discourse? During all these bars, there is a dialogue between

Example 3 shows a piano accompaniment for two vocal lines. The first system (mm. 11-14) features chords A, B, A, and B. The second system (mm. 15-18) features chords C, D, C, and D. The third system (mm. 19-22) features chords B, A, and D'. The fourth system (mm. 23-27) features chords D, C, and A'. The lyrics are: "Le - ge die Schu - he ab: du stehst auf hei - li - gem Bo - den. Bist weit ge - mung ge - gaa - gen: nun ver - küm - de! die Wahr - heit er - kammt; so kannst du nichts an - ders mehr: dein Volk be - frei! Du hast die Greu - el ge - sehn; so kannst du so kannst du nicht an - ders mehr: Volk be - frei!"

Example 3. *Moses und Aron*, mm. 11–27, retrogression, transposition, and new chord.

Example 4 shows a piano accompaniment for two vocal lines. The first system (mm. 90-92) features chord A inverted. The second system (mm. 93-94) features chord B inverted. The lyrics are: "Ver - küm - de, ver - küm - de, ver - küm - de! Ver - küm - de, Ver - küm - de!"

Example 4. *Moses und Aron*, mm. 90–94: *A B non-transposed chords inverted.*

Moses and God. Moses fears he will not be able to accomplish his mission (m. 36), because his tongue is clumsy; he can think but not speak (mm. 47–49). This inability to speak is obviously represented by Moses' *Sprechgesang*, that stands far from God's rich polyphony. To his objections, God replies: "Aron shall be your mouth", and "He comes towards you, in the opposite direction of your path. You will recognize him for this". That is, Moses will recognize Aron because they walk – with all the implications that such an expression has – in opposite directions. Their opposition is also shaped musically. While Moses, a bass voice, only speaks, Aron

is a tenor (one might say even a *bel canto* tenor) that sings in a very agile (not clumsy) way. However, their major opposition lies in their comprehension of God and the way they talk about God to the people. Moses in fact has the ability to sing, as happens only once in the whole opera, in mm. 208–214 of Act I; alone with Aron, Moses says to him: “Purify your thought; detach it from the worthless; consecrate it to the truth.” Yet he opts not to do so; rather, Moses limits his expression to his abstract-conceptual comprehension of God, instead of trying to speak to the people in their language (singing). By contrast, Aron’s speech, in its richness and melodic exuberance, seems to pretend to *recreate* God’s polyphony, in a kind of transposition (translation) of a synchronic axis to a diachronic one. That is, it attempts to turn verticality into horizontality, polyphony into melody, so as to *re-present* God to the people by making Him comprehensible (although Aron has not experienced Him directly). Moses’ word is powerful enough, as demonstrated when at his command the golden calf vanishes (end of scene 4, Act II). Yet he performs no signs or wonders in the eyes of the people; only Aron performs such miracles. To sum up, their opposition is similar to that between icon-allegiance and iconoclasm, or that between apophatic and cataphatic theology. In the protagonists’ own words, Aron: “I love this people, I live for them”; Moses: “I love my thought and I live for it.”

We have not yet elucidated the reason for the musical change in God’s speech in measures 26 to 90. To do so, we must return to the initial “Now announce”. Until that moment, we have had one, purely phatic intervention of God, and one response by Moses stressing the message. Only once has God used morphosyntactic categories other than the interjection, and even then to stress phatic implications, ending with “*Nun verkünde*” (Now announce); and one intervention of Moses, saying he does not want to proclaim the thought of his fathers. It is when this moment is reached that the next intervention of God begins the movement of retraction. This retraction coincides with the moment the speech of God neglects the phatic dimension, and begins to act according to the communicative model that Moses has been using ever since his first intervention (which was not focused on the facticity of the communicative act, but on the message, that is, on its *external* content or reference). The “Now announce” in measures 14–15 represents this turn, since, as we have already seen, its chords (C-D) will not be followed by E and F, but by the retrogression,

C-B-A (Ex. 3). This backward movement seems to imply that the only content to be “announced” is what has happened until the moment, not what it is to come. Once the retrogression is completed (first beat of m. 25), a new texture appears (“*so kannst du nichts anders mehr*”, you can do nothing else), which leads to the first transpositions of God’s chords, and ultimately to a new chord, corresponding to the syllable “-*frei*” (free). The constitution of this new chord is meaningful, since its notes are the same one that provided the harmonic support to Moses’ words in measures 17–18 (“thou who have awoken again their thought in me”), with two only exceptions. As shown in Example 5, the only two notes employed during measures 17–18 that do *not* appear in the chord at measure 27 are B flat and A, the very notes that originally formed the characteristic sonority of God’s chords: the major 7th. It seems clear that this is no coincidence, and that it should be considered extremely meaningful, a pertinent *thought*, to echo God’s words. In Schönberg’s own words, it must be an “opera of musical ideas” (Schoenberg 1984: 337),

The image shows a page of a musical score for 'Moses und Aron'. It features several staves: 1. Fl, 1. Ob, 2. Kl, Bb Kl, 1. Hr, 2. Hr, 1. Pos, MOSES (with German lyrics: 'I - saaks und Ja - kobs, der du ih - ren Ge - dan - ken in mir wie - der - er - weckt hast.'), 1. Br, and 1. Vel. The score is divided into measures 17-18 and measure 27. A callout box on the right shows a chord with notes G, Bb, and A, with arrows pointing to the corresponding notes in the original score.

Example 5. *Moses und Aron*, mm. 17–18, m. 27: Same notes except for A and B flat.

In this way, the music attests to a connection between *befrein* (to free) and *Gedanken* (thought). Thus, it is not the “thought” that must be announced. Rather, it should be freed, as one of the constrictions (prob-

ably the main one) to which the *daraus* (from it) was making reference. The *daraus*, said only by the *Stimme aus dem Dornbusch* in measure 26, maintains its imprecise reference, in spite of the concretion that the *befrein* imposes in terms of musical similarity.

What has to be announced? We, like Moses, have had the answer from the very beginning, right under our own nose. No content is to be announced, other than the very *act* of communication. Moses, however, misunderstands this commitment, concluding instead that he must “announce” the thought of his fathers. In misunderstanding, he neglects the importance of the experience he is living; he is not living it in its full consequences, with full attention. In Heidegger’s words, Moses was not having a “phatical experience of life” (cf. Heidegger 1995: chapter 1). And this phatical experience of life is precisely what religion provides. Schönberg’s idea of what religion should be comes close to the Heideggerian conception of religion, which is linked to the idea of “authentic existence” – this last, of course, being a personal path, apart from any “institution”, and the main responsibility of the *Dasein*. The fact of living a revelatory experience (not the fact of being told about it) stresses the *hic et nunc* that the subject experiencing this revelation occupies, thus allowing him to be aware of the fact that he occupies a place, and thus making him conscious of his own existence. Under this point of view it can be understood why revelation is supposed to be always unique, yet always the same.

The crisis of modernity led to Existentialism, the main basis of which (to freely paraphrase Jean-Paul Sartre) is the fact that essence no longer precedes existence; rather, we begin to exist without knowing our essence). The fact of realizing the place that oneself occupies – the function of revelation – provides us with the opportunity to take care (the Heideggerian *Sorge*) of one’s own existence, thus taking the reins of one’s own life. And such a thing only happens when the essence (the *Sein*, the fact of being) is linked or *relinked* – *religare* as a consequence of *relegere* and *reelegere* – to the phatical dimension of life. Such is achieved only by realizing – and living – the *hic et nunc* (the *Da*) of one’s own vital experience.

Notes

1. All English translations of the libretto are mine. All of the text considered here occurs from measures 1 to 90 in the score.

2. I translate the word *Gedanke* as “thought” instead of “idea”, the latter being more common (for instance, Schönberg’s *Stil und Gedanke* translated as *Style and Idea*). “Thought” not only maintains the etymological correspondence in German between *zu denken* and *Gedanke*, but shows that it is a result of “thinking”.
3. “Are” and “you stand”: German verbs are inflected so as to incorporate reference to the Receiver.
4. Concerning the composer’s treatment of the twelve-tone row, see Kerling (2004) and the pioneering work of Schmidt (1988).
5. The German text reads: “*Er kommt dir auf deinem Weg entgegen; daran sollst du ihn erkennen*”. Although *entgegenkommen* commonly means “to meet halfway”, the presence of *entgegen* gives a nuance of opposition when considered by itself. Understanding the passage in such a way, we are following Schönberg’s opinion concerning the way his texts should be approached: “... all the more if – which is, after all, as you know, absolutely necessary with my work – you had looked at every word and every sentence from several points of view” (Schoenberg 1987: 143, in letter n. 117, 5.VIII.1930).

¿Cómo negocian sus identidades a través de la lengua los mexicanos en Helsinki, Finlandia?¹

1. Introducción

“Mexicans and South Americans have only a vague idea where Finland is” y “A Finn’s ‘space bubble’ – or or personal space – is a circle of 1.2 meter radius, and woe betide the Italian or Mexican who invades it!” son las dos únicas alusiones a las relaciones entre mexicanos y finlandeses que incluye Richard D. Lewis en su libro *Finland, Cultural Lone Wolf* (2005: 129, 152). Sin embargo, en 2006, 229 mexicanos sí *ubicaban con exactitud* a Finlandia pues, *desafiando* la advertencia, habían *invadido* su territorio (Ulkomaalaisvirasto 2006). En este trabajo exploramos cómo diez de ellos negocian sus identidades en la Zona Metropolitana de Helsinki: cinco mujeres y cinco hombres, adultos todos, con licenciatura o maestría, y con uno a 15 años de residencia, a quienes entrevistamos en 2007. Así contribuimos al estudio de aquellas pequeñas minorías migrantes en Finlandia nunca antes descritas.

Con Bucholtz y Hall (2005: 586) definimos *identidad* como “the social positioning of self and other”, y seguimos sus cinco principios: aparición, posicionalidad, indexicalidad, relacionalidad y parcialidad. Por *negociación de identidades* entendemos “an interplay between reflective positioning, i.e. self-representation, and interactive positioning, whereby others attempt to position or reposition particular individuals or groups” (Pavlenko y Blacledge 2004: 20). La identidad, entonces, no es algo que una persona *es* o *tiene*, sino que *hace* a través de sistemas simbólicos como la lengua, co-construyéndola en contextos discursivos locales (Piller 2002: 10–12).

Además de esta introducción y la conclusión, integran el texto tres partes. Primero presentamos cómo posicionan los finlandeses a los mexicanos, de acuerdo con las propias experiencias de los migrantes. Luego mostramos cómo conciben los mexicanos la identidad nacional tanto de ellos que salieron el país, como de los compatriotas que permanecen. Finalmente examinamos los recursos lingüísticos con que se negocia la identidad mexicana en el nuevo lugar de residencia.

2. ¿Cómo posicionan los finlandeses a los mexicanos? *Testimonios de los migrantes*

Los mexicanos en la Zona Metropolitana de Helsinki bien pueden parafrasear la cita de Lewis que abre el capítulo: también los finlandeses tienen sólo una idea vaga de la identidad mexicana. Tal desconocimiento obedece a que su inmigración es reciente -frente a la sueca que data del siglo XII o la rusa que inició en el siglo XVIII (Latomaa y Nuolijärvi 2002: 104, 111) – reducida – compárese con los 25 315 rusos, los 17 543 estonios o los 8 295 suecos (Ulkomaalaisvirasto 2006); y a cuentagotas, en cambio, de 1990 a 1995 entraron a Finlandia unos 5 000 a 6 000 refugiados somalíes y hoy constituyen el cuarto grupo extranjero más numeroso (Degni, Pöntinen y Mölsä 2006).

¿Cómo posicionan los finlandeses a estos recién llegados, pocos y casi invisibles mexicanos? Distintos. Con este término nos referimos al segundo elemento de la táctica de intersubjetividad *adecuación/distinción* del *principio de relacionalidad* (Bucholtz y Hall 2004, 2005).² Los estereotipos que circulan en los medios de comunicación, la publicidad y el contacto directo con los mexicanos en Helsinki hace que los finlandeses borren las semejanzas y acentúen las diferencias entre ambos grupos. Recordemos que los estereotipos pueden ser tanto fuente de errores y prejuicios como factores de cohesión social que construyen la relación entre sí mismo y el otro (Amossy y Herschberg Pierrot 2005: 43).

En concreto, posicionan a los mexicanos como inferiores: los llaman “sudamericanos” y este error ilustra el *principio de indexicalidad* (Bucholtz y Hall 2005): los conceptos de “Norteamérica” y “Sudamérica” apuntan no tanto a ubicaciones geográficas diferentes cuanto a realidades socioeconómicas y geopolíticas distintas. Así, pertenecen al Tercer Mundo, viven en una nación no industrializada con un atraso tal que aún circulan caballos

y burros por las ciudades y cuyos habitantes son boxeadores y mueren de hambre por la pobreza. Esta imagen se alimenta de los medios finlandeses que casi siempre presentan noticias de acontecimientos negativos de México —“para ellos, era una fotografía de África”. Esta cita de María ejemplifica la *adecuación*, el primer elemento de la táctica de intersubjetividad que introdujimos antes, esto es, los finlandeses desvanecen las diferencias entre un país y todo un continente para igualarlos negativamente. Hambre, miseria y violencia, entre otras carencias, es lo que, también por indexicalidad, remite la palabra “África”.

Otra imagen que exhibe a los mexicanos como ensimismados en su cultura sin integrarse al mundo es la “[d]el mexicano con su sombrero y comiendo sus tacos, su salsa” (Emilio). Ésta se origina en la cinematografía estadounidense y en la publicidad de los alimentos y bebidas que México exporta a Finlandia, e. g., chiles, cerveza y tequila. Resulta interesante que los entrevistados reconozcan que las películas estadounidenses aportan en parte esa imagen; es decir, que no surge del contacto directo México-Finlandia sino que se triangula vía Estados Unidos. Camilo incluso afirma: “*todo* lo que saben de nosotros es a través de los americanos [sic]”.

Un estereotipo más procedente de Hollywood es el del *latin lover*, nacido con el actor italiano Rodolfo Valentino, quien en los años veinte del siglo pasado encarnó el papel del seductor irresistible. Así, otra vez por *adecuación*, se uniforma a todos los latinos como seductores. Pero aquí se pasa de la ficción de la pantalla grande a una amenaza de la vida real que posiciona a los mexicanos como violentos: los varones finlandeses creen que los hombres mexicanos llegan a *robarles* sus mujeres. Por lo tanto, hay que cuidarse de ellos pues, aunque estén en tierra ajena, los mexicanos *lucharán* contra los finlandeses y les ganarán una pareja que no les corresponde.

Irrumpir escandalosamente en el silencioso “space bubble” finlandés es otra característica violenta de los mexicanos que emerge del contacto directo entre grupos. Esta identidad que los mexicanos construyen siendo parlanchines y “hablando muy fuerte” (Jennifer) provoca que los finlandeses “cre[a]n que nosotros no tenemos privacidad ... que contamos todo” (Oralia) y que la descalifiquen. La *ilegitimación* es el segundo elemento de la táctica de intersubjetividad *autorización/ilegitimación* del *principio de relacionalidad* y, a través de ella, las estructuras del poder institucionalizado y la ideología desestiman, censuran o ignoran las identidades (Bucholtz y Hall 2005: 603).

Esta ilegitimación se origina porque mexicanos y finlandeses no comparten las mismas *ideologías lingüísticas*, “the situated, partial, and interested character of conceptions and uses of language” (Errington 2001: 110). La ideología lingüística finlandesa permea los diez valores básicos de los (hombres) finlandeses que plantea Lewis (2005: 58–63), de los cuales destacamos aquí dos: ser taciturnos y ser directos. Así, prefieren reservarse sus sentimientos y pensamientos optando por el silencio y desconfiando de y censurando a quienes no son breves y directos en su hablar – como los mexicanos.

Con todo, pese a que el silencio y la quietud sean la forma natural de ser finlandesa (Carbaugh et al. 2006), no siempre los mexicanos son posicionados de manera negativa: se les reconoce el ser cálidos, agradables y divertidos. ¿Coinciden estos posicionamientos recogidos de las experiencias de los entrevistados en Helsinki con la identidad que de sí mismos construyen?

3. ¿Cómo se posicionan a sí mismos los mexicanos? *Visiones y revisiones de cerca y de lejos*

La visión de los entrevistados hacia su propia identidad es más profunda que los estereotipos de los finlandeses. México no sólo es “lindo y querido” (Alfredo), sino se revela como “una mezcla de colores y sabores” (Paula). Detectamos cuatro líneas de comportamientos contrastantes que componen esa heterogénea mezcla de la identidad mexicana:

Aguantamos (la pinchi perra vida) vs. Luchamos (le entramos cabrón, nos la rifamos)

Nos abrimos (somos hermanos) vs. Abusamos (unos de otros)

Aguantando (la pinchi perra vida) significa padecer con resignación la situación económica del país. Esta pasividad es vista como una cualidad positiva, puesto que se soporta sonriendo y esa sonrisa es el *bastón* que permite *seguir andando*. Las mujeres mexicanas van un paso atrás en ese caminar, pues el que aguanten las “dictaduras” de los varones (Paula) se considera un defecto: más que pasividad, es conformismo.

Paradójicamente, *luchando (entrándole cabrón, rifándose, siendo chingones)* significa abandonar esa pasividad y volverse agente, entrándole (cabrón) y enfrentando esa adversidad porque “no hay de otra” (Javier).

Hombres y mujeres despliegan esa agencia luchando con pasión y sin cansancio, siendo creativos e ingeniosos aunque, como reconocen los entrevistados, no todos son así.

Abriéndose (somos hermanos) significa pinchar el espacio personal y abrirse de par en par: mostrándose sin miedo tal como uno es, compartiendo la comida, festejando, conversando, ayudándose, integrándose en familia y, más aún, llegando a considerar familiares a quienes no llevan la misma sangre: “el mexicano necesita hermanos, no de sangre, pero gentes ... alrededor” (Paula). Así, los mexicanos se abren y se acercan.

Abusando (unos de otros) significa que ese acercamiento a veces es invasivo: “el mexicano roba al mexicano ... no se respeta a sí mismo” (Leticia) ni al otro. También son incumplidos; los hombres abusan de su condición y son machos; las madres abusan de su papel y son regañonas. Precisemos que para nuestros entrevistados, ser madres más regañonas y conservadoras que las madres finlandesas es una virtud que las distingue de ellas. Es obvio que esta cualidad sólo emergió a través del contacto con el otro.

Así, los finlandeses no se equivocan del todo en imaginar a los mexicanos como inferiores y violentos: no todos los mexicanos llevan una existencia plácida; *hurtar* la mujer ajena sería otra forma de abusar del otro; y ser cálidos, alegres y divertidos forma parte de la convivencia fraterna.

Al mismo tiempo, radicar en Finlandia ha hecho que los migrantes mexicanos se repositionen tanto a sí mismos como a los compatriotas que no salieron del país. Nombraremos “finlandización” y “domesticación” (Emilio) a este proceso que integra elementos de ambas culturas. Por un lado, amplían sus perspectivas y reconocen y respetan a un otro diferente, por ejemplo, “que es normal no sonreír” (Camilo). Por el otro, aprenden “las cosas buenas de estos países” (Leticia) y enmiendan rasgos de su carácter, por ejemplo, se vuelven fríos y calculadores y ya no cometen las “locuras” que harían en México (Javier – convirtiéndose, al retornar al país de vacaciones, en presa fácil de abusos. Buena parte de esta “finlandización” ocurre a través de, precisamente, el finés, ¿cómo en concreto?

4. ¿Con qué medios lingüísticos negocian sus identidades los migrantes mexicanos?

Los individuos y grupos minoritarios se (re)posicionan eligiendo una lengua, aprendiendo otra como lengua segunda (L2), alternando entre

códigos, cruzando (*crossing*), inventando y usando una nueva variedad lingüística, aprendiendo a leer y a escribir, adquiriendo nuevas estrategias retóricas y creando nuevas identidades narrativas (Pavlenko y Blackledge 2004: 22-23). Para vivir en Finlandia y lograr ser audibles y visibles (Miller 2004) en esa *casa ajena* – así visualizan los entrevistados a su nuevo país – los mexicanos amplían su repertorio hablando inglés y aprendiendo finés como L2.

Hablar en inglés es dar el primer paso en ese espacio ajeno y salvar las comunicaciones básicas. Todos los entrevistados lo aprendieron en México, cursando su educación primaria en escuelas privadas, o como niños, adolescentes y jóvenes en academias de idiomas, o bien, residiendo una temporada en países anglohablantes. Su autoevaluación en esa lengua es muy alta: la mayoría reconoce hablar, leer, entender y escribir inglés con fluidez. Incluso, uno reconoce ser más competente en inglés que en español: “Español, mal español, a pura mentada de madre y... e inglés, o sea, hablar realmente, inglés” (Emilio).

El inglés no es la única lengua extranjera que han aprendido: algunos hablan además francés, italiano, alemán, holandés y sueco pero parece que no las utilizan (mucho).

El inglés les permite a los mexicanos trabajar y socializar con los finlandeses, llegando a funcionar como un “pequeño escudo” (Leticia) que relaja tensiones comunicativas -malentendidos, incomprensiones- cuando se les habla en finés. Sin embargo, el escudo es, justamente, “pequeño” porque no en todos los casos garantiza esa relajación y continuidad en la interacción: sólo sirve “para que te entiendan... *cuando quieren entenderte*” (Camilo). Por lo tanto, que los mexicanos empleen el inglés, la lengua global, no los coloca automáticamente al mismo nivel de los hablantes de finés, el idioma co-nacional, ni les asegura la completa audibilidad y visibilidad -procesos, como bien advierte Mills (2004: 291), co-construidos.

Es cierto, entonces, que se puede vivir en Finlandia sin hablar finés, “pero se vive mal ... si no sabes finés, nunca estarás integrado a la sociedad” (Camilo). Tal integración podrá vislumbrarse complicada, pues todos los entrevistados concuerdan en que es un idioma difícil, pero es en este nuevo entorno donde los mexicanos echarán mano de la agencia que, aseveran, los distingue. Así, en algún momento de su estancia, todos han llevado cursos en la Universidad de Helsinki, la Universidad de Verano o la Escuela para Adultos.

Ahora bien, aprender e interactuar en finés como L2 no es, simplemente, dar un segundo paso en esa casa ajena, sino “es la llave de la puerta principal” (María) que facilita la integración y nivelación con los finlandeses y agiliza la “domesticación”. Se dejará de ser el *latin lover* roba-mujeres para transformarse en miembro de la sociedad. Con el finés, los mexicanos están dentro de la casa, acceden a más posibilidades laborales, son aceptados socialmente y mejoran su audibilidad y visibilidad, aunque todavía deben pugnar para que los finlandeses los legitimen como hablantes de finés. Aquí entra en juego la táctica de intersubjetividad *autenticación/desnaturalización* del *principio de relacionalidad* (Bucholtz y Hall 2004, 2005).

En efecto, si un mexicano aborda en finés a un finlandés, con frecuencia éste le responderá en inglés. Proponemos dos explicaciones a esta ilegitimación: si el finlandés percibe -a través del acento, por ejemplo- que la competencia en finés del mexicano es limitada, intentará facilitar la comunicación cambiando al inglés. Desde luego, casi siempre, al finlandés le basta la vista para percatarse de que su interlocutor y él no hablan la misma lengua: como la fisonomía (estereotipada) mexicana – “moreno[s] de pelo negro” (Emilio) – difiere de la (estereotipada) finlandesa, indexicalizará una identidad extranjera que (en muchos casos) no autentificará a ese finés (cf. Miller 2004). Recalquemos que no todos los mexicanos se rebelan contra esta desnaturalización -vuelven al inglés antes de obligarse a sí mismos y al otro a usar el finés.

5. Conclusión

La *finlandización* de los mexicanos en la Zona Metropolitana de Helsinki nunca es total pues “no se puede negar lo que se trae en la sangre” (Camilo); empero, hablar inglés y aprender y comunicarse en finés como L2 sirven de estrategias para posicionarse ante los finlandeses y revertir los estereotipos negativos de inferiores y violentos. Negociar la identidad mexicana en Finlandia significa “sacar provecho” de ambas culturas, alcanzado “un punto medio” (Camilo). No obstante, toca a los finlandeses, los habitantes de la *casa ajena*, considerarlos audibles y visibles y legitimarlos como hablantes de esa L2. Así, esta *domesticación* es un proceso que, incluso para quienes llevan mayor tiempo residiendo en Finlandia, aún no culmina.

Notas

1. Este trabajo se inserta en el proyecto “Dinámica de los contactos entre español, lenguas indígenas y lenguas extranjeras: ideologías lingüísticas” con sede en el Departamento de Estudios Mesoamericanos y Mexicanos de la Universidad de Guadalajara (México). Agradecemos a nuestras familias por el apoyo y comprensión en el tiempo invertido en esta investigación, a Verónica Alcocer por su rápida y eficiente transcripción de las entrevistas, y a Jesús Cerpa por su apoyo y comentarios. Empleamos seudónimos para garantizar el anonimato de los migrantes.
2. “Tactics of intersubjectivity are the relations that are created through identity work” (Bucholtz y Hall 2004: 382).

Notre contribution n'est pas une analyse textuelle, mais plutôt une petite investigation de la culture théâtrale par rapport au thème du congrès: *understanding/misunderstanding*. Une sémiotique de la culture théâtrale n'est pas sans méthode et doit s'occuper du statut textuel, des pratiques, des domaines sociaux qui sont tous impliqués dans l'*implémentation* publique d'une œuvre pour la scène. Mais le théâtre est aussi un *medium*; dans cette perspective il soutient d'une manière spécifique la vie d'une *culture* et sa relation avec l'*environnement* (d'une part, nous avons des *systèmes de signification* et, de l'autre, une *sémiosphère* qui exprime des facteurs d'indétermination). Dans la "médiation théâtrale" on peut trouver alors une écologie de valorisations spécifique et une reconfiguration des relations entre formes de vie et *sémiosphère* (Basso Fossali 2007b). Le théâtre n'est pas un simple opérateur de *mimesis*, mais un facteur de ré-médiation des accès aux valeurs et de leur polémologie communicative. Or, en raison de leur diffusion et impact social, les tragédies shakespeariennes semblent un terrain privilégié pour conduire une brève investigation sur la capacité théâtrale de mobiliser et "ré-cadrer les dispositifs d'entente et mésentente affectés par une culture.

Il y a un lien intime entre théâtre et compréhension, vu que le premier n'est que l'exemplification diagrammatique des asymétries que toute action engendre: c'est l'asymétrie énoncée entre celui qui prend l'initiative et celui qui est manipulé, entre rôle actantiel actif et rôle passif, entre stratégie et tactique; mais c'est aussi l'asymétrie énonciative entre observateur (spectateur) et observé (acteur). A ce propos il faut dire que le théâtre ouvre le vertige interminable d'une possible subversion, étant donné que l'acteur sur la scène peut devenir spectateur du spectateur dans la salle, même si ce dernier est protégé par l'obscurité; et en parallèle le spectateur peut réagir à l'action sur la scène et se proposer comme facteur d'indétermination par

rapport au déroulement du spectacle. Cet aspect est sans aucun doute plus important que la vulgate qui conçoit le théâtre comme un lieu d'autoreprésentation d'une société. Dans le théâtre émerge le vertige du social en tant que socialisation de l'asymétrie et de la contingence. Pour que ce vertige soit tolérable, il faut que l'asymétrie soit maîtrisable, donc *reproductible* (le théâtre construit une dialectique entre la partition littéraire et l'événement scénique) et *contournable* dans un espace délimité. Dans cette perspective la scène théâtrale est ambiguë car, d'une part, elle est une organisation qui relève d'un système et d'un jeu linguistiques; de l'autre, la scène théâtrale peut devenir – et cela constitue sa faiblesse extraordinaire – un “environnement”, un milieu qui exprime des facteurs d'indétermination. Dans la représentation tout est coordonné pour faire en sorte que la polémique et le différend soient affichés sur le plan de l'énoncé; mais dans l'énonciation tout est précaire et le contrat théâtral souffre de chaque type d'indétermination, à commencer par la subversion actantielle pour en finir avec la déstabilisation de l'espace scénique. En regardant l'espace scénique, le spectateur entre dans une relation médiatisée avec les corps actoriels où il y a une sorte de pellicule fictionalisante qui transforme un espace homéopathique et proximal en un territoire allopathique et distal. Plus les passions et les motivations qui soutiennent les actions des personnages sont renvoyées aux règles distales et indiscutables des conventions scéniques et aux prescriptions de la notation, plus un régime allopathique est soutenable: c'est-à-dire, “je comprends, je vais adhérer aux valeurs représentées, mais je peux le faire à travers la médiation d'un monde possible fictif et autoréglé; mes réactions émotives sont donc élaborées sous un régime “comme si” (*als ob*), ou – comme le dirait Gregory Currie (1995) – elles sont gérées *off line*. Par contre, plus les passions et les motivations des acteurs sont perçues comme contingentes, plus la co-présence des corps actoriels et spectatoriels retombe dans un régime homéopathique: c'est-à-dire, l'énonciataire retrouve une sorte de ré-embayage, de ré-assomption directe de l'espace de l'énoncé théâtral et le système de la représentation devient une sémiosphère qui exprime des facteurs d'indétermination communs entre acteurs et spectateurs.

Le mot grec “*drama*” signifie *action* et le théâtre n'est que le lieu expérimental d'une *observation de deuxième ordre* sur la gestion des asymétries que toute action implique. Les asymétries de points de vue sont avant tout une dialectique entre facteur systématique et facteur d'indétermination,

entre programme et contingence. Mais le théâtre est notamment le lieu culturel qui célèbre la dialectique entre compréhension et malentendu. Cette dialectique est beaucoup plus qu'un simple *topos*, elle exprime la vocation même du *théâtral*: (1) exemplifier le rôle de la médiation (spatiale, linguistique et médiatique) comme fondatrice de la compréhension *tout court* et en même temps (2) afficher sa vulnérabilité, sa faiblesse congénitale. A ce propos, "*understanding*" est un mot qui exprime la face cachée de la compréhension; en effet, "*understanding*" veut dire *to stand between*. Pour comprendre ("prendre ensemble") il faut construire un interstice, une médiation interstitielle. La "prise en direct" du faire scénique représente à la fois la volonté de préserver une compréhension implicative (participation au même scénario de valeurs) et la reconnaissance d'une médiation inévitable. Un geste est "théâtral" parce qu'il dénonce cette reconnaissance, donc il est marqué en soi-même par une observation de deuxième ordre, par une arrière-scène. L'enracinement du sens scénique est dans les coulisses. L'ultra-visibilité de l'action scénique est corrélative d'une médiation cachée ubiquiste. La fiction théâtrale affiche sa propre médiation et ses conventions, mais elle signale aussi, en abîme, des emboîtements de médiations ultérieures. Grâce à elle on comprend des interstices, des diagrammes de relations qui sont construits justement pour pouvoir attribuer des rôles actantielles et ne pas laisser un scénario expérientiel dans l'indétermination; mais le théâtre, dans son exemplification d'une sémiotique sociale, va continuer d'interroger les identités actérielles.

Dans la représentation théâtrale, les identités des personnages sont des environnements psychiques, des champs d'indétermination (Simondon 1964), et cela bien avant la leçon freudienne. Le système-personnage au théâtre est un faisceau des traits identitaires toujours précaires. La compréhension du domaine subjectif – qui a toujours besoin de médiations – devient "théâtralement" intime, intérieure. Dans le monologue, un *soi-ipse* ne recherche pas seulement les différents *soi-idem* qu'il a récités, mais recherche aussi le champs d'indétermination de ses énergies et de ses pulsions: il peut avoir confiance d'être fidèle à *soi-même* seulement dans une perspective à court rayon, c'est-à-dire limitée, car les fondements du *moi-chair* (Fontanille 2004) restent indéterminés.

Dans le théâtre, le même espace (le plateau) peut subir des partitions, ou mieux il est une totalité partitive par excellence: dans l'*aparté* on assiste à une partition de l'espace où d'autres personnages sur la scène ne peuvent

pas comprendre les mots de l'acteur absorbé par son monologue. Le théâtre est une anatomie de l'espace de médiation où chaque champ identitaire peut se mesurer à ses propres limites dans la sémantisation de l'entour. Le contrôle de la compréhension dans chaque espace est confronté avec sa dissolution par le moyen du comique ou du tragique. Le comique est le fruit d'un vertige de *valeurs opérantes* (facteurs hétéronomes) qui surmonte (ponctuellement ou à court rayon) l'initiative de signification du sujet ; le tragique est le fruit d'un vertige de *valeurs opérables* (c'est-à-dire dépendantes du sujet autonome) qui vont être surmontées par une trajectoire destinale incontournable.

Le héros tragique opère une anticipation destinale, mais cette prestation cognitive est en même temps – comme le dirait Peter Szondi – un anéantissement de la volonté, étant donné que le débouché destinal ne peut pas être compris (plutôt c'est le destin qui nous "comprend"). Bref, le débouché destinal ne peut pas admettre d'autres projets. Penser le tragique c'est une tragédie de la pensée. L'anticipation destinale confronte le héros tragique à l'absurde, c'est-à-dire à une érosion radicale du signifié à la faveur de l'empire d'une pure expression: la dernière image avant l'accomplissement du destin c'est l'horreur. Mais pourquoi faudrait-il penser tragiquement?

Le paradoxe de la pensée tragique, élaboré sans cesse par le théâtre, est que le destin *inéchangeable* du héros (c'est-à-dire, le destin que personne d'autre ne peut assumer et comprendre) est toujours anticipé dans la réflexion, étant donné que cette anticipation reste le seul moyen pour construire une vision éthique. L'éthique théâtrale prévoit une distribution des rôles actoriels en fonction d'une commensurabilité de destins inéchangeables, c'est-à-dire qu'elle ne parvient à une consistance sémantique que comme intersection de destins dans le point limite qu'ils partagent asymptotiquement.

Le scandale de l'asymétrie destinale est au niveau potentiel l'anéantissement de toute raison, de toute motivation à dialoguer et à rechercher une compréhension mutuelle: en perspective tout va nous séparer. Mais, dans la pensée tragique, et grâce au médium théâtral, on peut afficher cette asymétrie radicale pour la dépasser, pour renverser la direction de la désémantisation destinale de chaque forme de vie dans la valorisation de la lutte contre la contingence en acte. En anticipant la trajectoire destinale on trouve qu'il y a encore quelque chose à comprendre, à mettre en commun,

une socialisation de l'indétermination, une éthique qui peut penser dans le présent comme s'il y avait une intersection finale des destins.

Le théâtre exprime une conception laïque du fondement distal du sens, mais c'est une conception qui n'accepte pas le recours à la loi. Y a-t-il du sens au-delà de la loi? C'est à cette question que répond la pensée tragique. Le drame chante l'asymétrie destinale tandis que la loi survient seulement comme un deuil réparateur, vu qu'elle dénonce, en dirimant le caractère diabolique des relations, la fausseté de toute prétention irénique.

Le héros tragique peut officier la loi et en même temps éprouver son insuffisance. Il est condamné à une sorte de strabisme; avec un œil il peut percevoir le réconfort de la loi, avec l'autre il aspire à mettre en commun les instances anti-systématiques, à socialiser exactement contingences et asymétrie. À la rectification idéale des trajectoires de vie prévue par le droit, le tragique ouvre un œil doué d'une inhibition latérale particulière. Il emphatise la ruine future pour voir un salut (encore et malgré tout) possible/impossible, des asymétries destinales pour construire leurs intersections dans un point de fuite commun.

L'éthique du tragique est exactement un effort pour gérer la signification au-delà de la *jurisprudencia* et au dehors de toute juridiction. Le paradoxe est que le théâtre ne réussit à thématiser cette écologie des valorisations que par rapport à une juridiction, à un espace "réglementé" : le théâtre s'ancre dans un contrat spectatorial, dans des conventions, mais la compréhension qu'il vise (une commensurabilité des valorisations) et l'*understanding* qu'il projette (un interstice médiatique qui réinterprète les relations inter-identitaires) sont fonction de la confrontation possible avec le vertige de la signification (Basso 2007b), l'au-delà de la loi. Le reniement du savoir et la dénégation des valeurs codées relèvent d'une complexification de la gestion du sens, une complexification à son tour corrélative d'une recherche adaptative: sauvegarder une signification devant l'anéantissement et l'absurde.

Dans le théâtre on trouve un refus avant la lettre de la sémiotique du code. Et ce refus relève d'une double émancipation: d'une part, la prolifération de la multiplicité identitaire, de l'autre, le tissu narratif qui élabore ensemble des valeurs qui ont un statut et ancrage différents. L'histoire des héros n'est pas liée aux lois locales: c'est une histoire croisée des duperies, d'un côté, et des actions qui aspirent à la mémorabilité, de l'autre. Le mémorable c'est la mémoire en acte, ce qu'on ne peut ni archiver, ni classer,

ce qui reste indice d'un champ de possibilités ouvertes de valorisation.

Dans *Othello the Moor of Venice*, Iago est l'incarnation de la multiplicité identitaire ("I am not what I am" – avoue-t-il à Roderigo; *Othello*, I, 1), celui qui gère les facettes proliférantes du monde à son propre avantage. Par contre, Othello "is that he is" – comme le dit Iago (*Othello* IV, 1), c'est-à-dire un trou noir figuratif qui va absorber en lui toute conflictualité hétéronome. Du théâtre de la bataille, où Othello est un vaillant combattant, on passe au théâtre intérieur, où il est effaré par chaque duplicité, par toute duperie. Othello cherche une cohérence interne des valorisations même au prix de construire un amalgame de données perceptives, songes et suppositions.

Pour Othello la compréhension revient à assumer tragiquement en soi-même le germe de la multiplicité; Othello ne croit pas vraiment à Iago (voir Cavell 1987). La relation est plus complexe: Othello utilise Iago comme un agent de saturation de toute perversion possible par rapport à sa propre valorisation originelle de Desdemona. Pour anticiper son destin, le héros tragique doit épuiser toute possibilité. Devant les sollicitations provocatrices de la part de Iago, Othello est comme en transe: Iago est un facteur d'accélération de la computation des indéterminations, le catalyseur d'un procès d'auto-dévoration intérieure. En effet, dans toutes les tragédies shakespeariennes il faut relever la quantité énorme des raisonnements figuraux qui concernent le corps comme restriction progressive du royaume, de la juridiction. En outre, même la compréhension relève d'une restriction de domaine. S'il y a quelque chose de pourri au Danemark, mieux vaut se limiter à observer la corruption qui est déjà dans le corps, le venin qui court dans les veines.

Comprendre la multiplicité proliférante c'est l'assumer dans son propre corps, parce que pour le héros tragique shakespearien on ne peut pas posséder l'autre en terme de *savoir*. L'autre n'est pas quelque chose qu'on peut attester et cela révèle un échec indépassable pour la compréhension. L'intersection de destins propre à l'éthique tragique interdit de refuser chez les autres la capacité d'être "autrement", de se mettre en variation. Au début, Othello a peur de consommer son mariage parce que Desdemona est pure (elle est d'un blanc immaculé alors qu'il est noir et sale de tant de batailles); après la délation de Iago, il a peur de se mêler avec quelque chose qui a en soi la trace d'une corruption et il voudrait retrouver une Desdemona originaire. Dans les deux cas son aptitude reste la même: transfor-

mer sa femme dans une figure d'albâtre, dans le monument de la pureté perdue (*Othello*, V, II). En tant que homme de loi, il tuera Desdemona, de façon qu'aucun ne pourra être trahi ni corrompu par cette femme. Mais le héros shakespearien ne peut pas sauver sa conscience avec la loi et en effet il interroge la signification au-delà de la réglementation qui permet d'organiser l'indéterminé. Othello a besoin de croire en Desdemona et cette nécessité est déjà l'attestation de sa perte de confiance en elle. Le héros n'a pas peur des décisions qui le transcendent, mais plutôt de l'indétermination à portée de la main. Croire est déjà s'exposer à une vulnérabilité : en effet, une visée qui ne peut pas attester son objet est une perspective qui n'a pas une garantie d'être soutenable à l'infini, ou mieux jusqu'au bout. Le héros est indéterminé comme l'autre sujet qu'il voudrait attester; cependant il devient une figure de la concentration, une "prison d'interprétations". Pour le héros shakespearien l'ontologie négative de l'autre n'est pas un *a priori*, mais quelque chose qu'on obtient *a posteriori*, c'est-à-dire après la saturation intime et interminable de toutes les possibilités de duperie, de trahison, de déhiscence identitaire. La compréhension tragique est un voyage au bout de la nuit des incompréhensions. Or, la restriction de l'espace théâtral (le héros shakespearien réduit la scène à son corps) est paradoxale parce qu'elle reproduit un dualisme: au dedans de soi-même Othello retrouve la présence d'une autre scène intérieure, à savoir l'observation de deuxième ordre qui est au profit de l'autre. Pendant que le héros tragique essaie de se sauvegarder par rapport à l'indétermination de l'autre (une sorte de sacrifice anticipé en fonction de l'émancipation des ses propres valences), il est vulnérable au regard de ce dernier: il risque, dans cette tentative de "concentration", de finir par paraître ridicule, de jouer une parodie de lui-même. Pour rendre l'autre commensurable il faut perdre la mesure, devenir démesuré, une figure instable et exacerbée. C'est un autre paradoxe théâtral: la tension maximale à la compréhension de l'autre va coïncider avec l'assomption de l'apparence moins compréhensible, moins intersubjective. Othello, avant le congé de la vie en présence de Lodovico, Montano et Cassio, veut se consigner à l'histoire; il invoque une narration de sa propre vie, une inscription mémorable qui ne puisse pas le ridiculiser, fût-elle impitoyable.

Dans *Macbeth*, l'érosion des horizons de la signification procède de la confiance dans l'autre vers la croyance dans le transcendant. Macbeth doit comprendre un destin assigné (prophétisé) et pour l'assimiler il doit

dépasser tout principe éthique. De plus, il écoute seulement la partie de la prophétie qui le concerne directement (il sera roi), et il neutralise la pleine assomption cognitive de l'autre partie (les fils de Banquo inaugureront une longue lignée de rois). Donc, Macbeth manque de construire au début une intersection entre son destin et le destin de la lignée de Banquo; il laisse tomber toute confiance dans l'autre (sinon par rapport à sa femme), mais en même temps il réduit le rapport avec les sorcières et les esprits à une relation proximale, dialogique et déterminable. Il sera puni par la duplicité du langage, à savoir sa polysémie. Macbeth veut espérer dans une compréhension immédiate, sans médiation, si non dans une compréhension soutenue par un langage parfait: "langage des esprits". Or, paradoxalement, plus le circuit de médiation est court, plus le malentendu est probable; c'est la médiation qui réduit et règle les facteurs d'indétermination.

Macbeth et sa femme n'acceptent plus les lois du temps. La prophétie doit être *the future here and now*; une fois la prophétie réalisée Macbeth et sa femme projettent d'éterniser le royaume, sans lignée. Les corps royaux doivent se présenter sans plus aucun orifice (*Macbeth*, I, v); ils doivent rejoindre un stade d'auto-conclusion figurative, dans le refus de toute interpénétration avec le corps d'autrui. Donner ou recevoir compréhension n'est plus nécessaire; mais cette autonomisation radicale de la signification identitaire soustrait Macbeth et sa femme à tout principe de réalité: le premier ne parle désormais qu'avec les esprits et la deuxième passe les nuits dans un état somnambulique. Les esprits font des jeux de mots et le sommeil oblige Lady Macbeth à raconter les délits en anéantissant sa volonté. En habitant le transcendant, Macbeth et sa femme retrouvent une projection des tromperies mondaines. En réduisant le terrain des valeurs opérantes et opérables au corps royal (c'est à dire à son propre corps), Macbeth demande finalement au docteur qui soignait sa femme désormais morte, une purge pour tout son royaume (*Macbeth*, V, III).

Le vaillant Macbeth n'a plus de gloire à conquérir dans les batailles et il doit seulement garder un royaume qu'il voudrait réductible à une inscription éternelle. A la fin, la révélation qui s'annonce à Macbeth est que la vie est tout simplement théâtre: "Life's but a walking shadow, a poor player / That struts and frets his hour upon the stage / And then is heard no more. It is a tale / Told by an idiot, full of sound and fury, / Signifying nothing" (*Macbeth*, V, v).

Le pli metathéâtral du *Macbeth* relève du vertige provoqué par chaque acte scénique au moment où on assume une observation de deuxième degré; l'acte scénique devient tragique en soi-même, il anticipe l'impossibilité de toute compréhension. Un pauvre acteur va continuer la représentation mais celle-ci n'a pas un futur significatif; elle reste intransitive, sans réponse. De même pour un narrateur idiot qui raconte des scènes, mais son conte reste inarticulé, absurde: une prolifération de l'expression ("sound and fury") et une dissolution du contenu ("signyfing nothing"). Voilà le double vertige théâtral: le tragique récité en première personne ne peut pas se sauver de l'anéantissement du sens à travers le témoignage, le conte qui déroule à nouveau le passé. Comme la tragédie de Macbeth, la tragédie d'Othello est double: "tragédie" dans l'aboutissement interminable d'un projet de vie, mais "tragédie" aussi de la mémoire, à savoir risque du ridicule par rapport à l'aspiration au *mémorable*.

Othello et Macbeth sont des victimes d'une théâtralisation tragique de leur vie; à l'inverse, peut-on utiliser le théâtre comme une arme? C'est le projet de Hamlet, même si le théâtre se révélera une arme à double tranchant. *To be or non to be* c'est exactement un problème paradoxal d'existence par rapport à la compréhension. Hamlet ne peut pas tolérer le mariage hâtif entre sa mère et son oncle (le nouveau Prince du Danemark); plutôt que démontrer qu'il comprend la situation, il préfère simuler la folie. La folie rend impertinente chaque tentative dialogique et reste un échec pour la socialisation. Plus tard, une compagnie théâtrale arrive à la cour du roi (à Elsinore), et Hamlet fait montre d'une culture théâtrale formidable (il se met dans la position d'un pauvre acteur qui délire presque en repentant des pièces théâtrales connues); de plus, il commence à réécrire une pièce (*The Murder of Gonzaga*) comme un narrateur idiot qui cherche à témoigner les vraies raisons de la mort de son père. Hamlet veut faire comprendre à son oncle le délit que ce dernier a commis. "Faire comprendre" c'est littérairement reconstruire une scène de manière qu'elle puisse être finalement assumée. Le théâtre d'ombres qu'il veut mettre en scène n'est que le terrain fictif où il peut installer un dispositif des miroirs qui devrait consigner sa famille (mère et oncle) à ses fautes réelles. Mais pour parvenir à ce résultat il faut absorber un gradient de fausseté, de fiction. "Etre ou ne pas être" n'est pas une réflexion sur la vie et la mort, mais sur l'anéantissement tragique devant la compréhension, c'est-à-dire la nécessité de construire un dispositif de fiction pour affirmer non pas soi-même, mais la possibilité

d'être un miroir pour l'autre. Si Hamlet se limite à *être*, il abandonne toute possibilité de partager une intersection destinale avec l'autre: il peut simplement attester une incommensurabilité des valorisations entre soi et sa famille. Par contre, si Hamlet devient faux (sa folie feinte, sa représentation théâtrale), il choisit de *ne pas être*; en s'abandonnant soi-même, il devient homme de théâtre qui construit sur le plan de l'énoncé la reproduction de l'assassin de son père et sur le plan de l'énonciation le vertige d'un spectateur électif (son oncle) qui perçoit à la fois la protection de la convention théâtrale et la possibilité que la représentation peut afficher un déictique accusateur envers lui.

Dans le même temps la compréhension reste un problème d'efficacité symbolique, une chose qui fait dépasser des "effets de sens" aux "effets de vie", aux *vécus de signification*. La représentation théâtrale, derrière la partition à exécuter en suivant la prescription prévue, affiche un milieu, un dispositif de capture, où l'autre parvient à une définition identitaire. Donc, la fiction, le jeu linguistique théâtral dévient un champ d'indétermination qui dispose l'émergence des figures identitaires par rapport auxquelles les deux partenaires réagissent asymétriquement, mais corrélativement: "The play's the thing / Wherein I'll catch the conscience of the King".

La compréhension du texte théâtral n'est pas réductible à sa sémantisation ou à son interprétation selon une observation de deuxième ordre; elle est une question de transformation des instances subjectives impliquées dans le régime communicatif réglé par le médium théâtre. Donc, la compréhension concerne la relation entre la forme de vie et la sémiosphère de la représentation théâtrale, une écologie de la valorisation identitaire qui va se rapporter à un champ d'indétermination, c'est à dire à un terrain qui rend vulnérable le caractère systémique du texte et du dispositif. Comprendre est la problématisation maximale du savoir, de l'information; donner aux valeurs apprises un statut positif seulement après l'anticipation de leur destin, c'est-à-dire actualiser l'indétermination de leur valence dans le temps. La compréhension mutuelle est en soi un mirage, mais dans le même temps elle ne peut pas être réduite simplement à l'attestation d'une action coordonnée. La compréhension mutuelle est reconnaissance à la fois d'un milieu commun caractérisé par des facteurs d'indétermination (*sémiosphère*) et par un milieu privé (le champ psychique): le travail de la sémiotisation construit un pont, à savoir une homogénéisation entre milieu

social et milieu psychique, une homogénéisation qui permet la synthèse disjonctive des identités où chacun joue le rôle de miroir pour l'autre.

L'incompréhension et le malentendu ne peuvent pas être réduits à une perturbation du canal de la communication ou à un décodage fallacieux de l'information. L'incompréhension est toujours méta-théâtre, dispositif qui va attester une gestion de l'indétermination de la signification identitaire insuffisamment partagée par les interlocuteurs. L'incompréhension devient une arme pour précariser la confiance *de et dans* l'autre au profit d'une relance des enjeux intersubjectifs, ou envers un croyance, ou envers un système de capture encore plus semblable à l'effet-miroir.

Le medium théâtral est exactement ce qui démontre la complexité du procès de compréhension, qui est bien loin du mouvement logique de porter quelque chose sous un concept, de subsumer une instance perçue dans une classe. Comprendre n'est pas faire du décodage, ni simple énonciation. La compréhension est la gestion du sens qui auto-observe les médiations utilisées et la sémiosphère qui reste indéterminée par rapport aux valeurs saisies. Pour cette raison la compréhension est la maîtrise d'un rapport entre deux extrêmes : fiction et croyance, initiative endogène de modélisation et attribution de fondement de valences à un horizon distale et imperceptible directement. Cela ne démontre que la nécessité persistante de nouvelles médiations.

Misunderstanding technology: Communication and pedagogy in the L2 classroom

“It is the supreme art of the teacher to awaken joy
in creative expression and knowledge.”
– Albert Einstein

There has been an increasingly growing interest in researching the most effective system for learners to take charge of their own learning (Wenden and Rubin 1987). Bransford, Brown and Cocking (1999) have recently called this relatively new phenomenon of technology “constructivist learning” in which students are responsible for their learning process. Technology-enhanced curriculum is designed to this end, and therefore plays a crucial role within the instruction of a second language in a way that content, the tasks of the teacher (see Volman 2005) and teaching materials are undergoing a change in teaching methodologies. Against this background, the present article examines the impact of technology on student learning by conducting a survey, whose outcome aims at the improvement of both computer-generated feedback and affective activities. We discuss critically how educational software modifies instruction by facilitating acquisition of knowledge primarily through the learner’s activity, rather than through passively receiving information. The paper concludes with several pedagogical implications of the strengths and weaknesses of computer technology education on the role of the teacher.

1. The Spanish Basic-Language Program

Technology-enhanced instruction through a new digital environment is being implemented in the Spanish Basic Language Program of the Penn-

sylvania State University that numbers among the largest non-English language curricula, serving more than 5,000 students per year. In the Spanish Program, which started in Fall 2004 and comprises 3 different levels (Spanish 1, 2 and 3), class meetings have been reduced from four to two days of class per week due to the implementation of technology. From that date, students have been assigned to work with technology outside the classroom through a combination of a learning phase and a number of assignments on listening, reading and writing. In other words, after receiving input in the learning stage every week (e.g. at home, at computer labs), students complete several sets of homework designed so that the learners do something with the input (Lee and VanPatten 1995). In overall terms, the homework for the following week is due the week before the instructor carries out diverse communicative activities in class. Ideally every student will have exercised the grammar and vocabulary ahead of time.

2. Description of digital learning environments

Among educators, technology-based resources serve as a scaffold to provide comprehensible input which has been shown to be needed in order for second-language learning to take place (Krashen 1989). Along this line, ANGEL (a New Global Environment for Learning) developed by Penn State's Course Management System (CMS), is software that enables faculty to enhance their courses by a syllabus and lesson space, teams, discussion, quizzing, surveys, assignment drop boxes and grading, along with unique faculty tools (e.g., WhoDuntIt) that let the instructor track the students' work as well as modify their learning processes.

3. Strengths and weaknesses of digital learning environments

ANGEL facilitates learning primarily through interaction, rather than through a passive attitude in receiving information. The most salient advantage of technology resources is the non-judgmental nature of the computer, which represents an ideal tool for self-paced practice in grammar and vocabulary, as well as for helping second-language learners feel secure enough to make and, possibly, correct their own errors without anxiety. In addition to this, researchers have found that the use of media can

motivate students to learn (García-Barbosa & Mascazine 2002). In order to further highlight the strengths and weaknesses of digital educational tools, forty learners of two different sections of Spanish 1 participated in a survey that was conducted in Spring 2005. From the student's point of view, here are the most important strengths that they emphasized about the implementation of technology in the Spanish curriculum:

- Learning at your own pace.
- Teach yourself without just reading the textbook.
- You can continue to learn and progress outside the classroom.
- You do not have to worry about losing your homework because it is online.
- More resources and ways to learn.

By contrast, students stated the following with regard to the weaknesses:

- Unclear directions in the write-in sections. Fill-in-the-blanks were difficult due to the many possible answers. More attempts to submit answers in the fill-in-the-blank section.
- No interaction. Students cannot speak the language.
- Correct answers are not posted. Answers would be nice so that I could understand what I actually did wrong.
- No room for technological problems. No good sound files.
- Working alone. By having classes on line, students lose the student-teacher relationship that can be imperative to learning. It also takes out some of the fun. It leads to lack of motivation.
- Putting courses on-line is a way for the universities to make more money with less effort. I think it is absolutely wrong.
- Not being able to ask somebody a question about the on-line homework as you are doing it.

Regarding skills, students were asked on the questionnaire to what language skill does this learning environment contribute to developing the most. As a result, reading outperformed the rest of the skills, speaking being the least accomplished practice. The results are illustrated in Figures 1 and 2.

In terms of digital learning effectiveness, students were asked if they received any type of help when doing their on-line homework (e.g., from a Spanish friend). More than 50% of the students were helped more than once. All of them agreed that the assistance of a native speaker was somehow helpful, but also stated the learning process did not occur, since students were more worried about getting the answers right.

Figure 1. The most effective skill in this particular digital learning environment.

Figure 2. Help received while doing on-line homework.

In light of these survey results, let us explore the two main weaknesses spotted in the survey: the use of feedback and the implementation of affective activities.

4. Computer-generated feedback

It is widely accepted that one of the goals of second-language instruction is to assist learners in achieving grammatical accuracy. From the various types of feedback on error, the most useful for research can be divided into four categories:

- Utterance Rejection: *Wrong. Move on to the next sentence.*
- Explicit correction: *Wrong. La chica es alta. Move on to the next sentence.*
- Recast: *La chica es alta. Move on to the next sentence.*
- Enhanced recast: *La chica es altA. Move on to the next sentence.*

The particular digital setting of the present article does not provide the learner with the correct answer after every question, just utterance response (“Right” or “Wrong”) for each item after the entire quiz has been submitted. To return to the survey: students wished to have some type of explicit on-line feedback. Research shows that the benefits of corrective feedback are being investigated in the classroom (Mackey, Gass & McDonough 2000) and in experimental studies (Mackey & Philip 1998). The findings of these experiments suggest that the type of teacher-generated feedback is based on the nature of learner error, and that the feedback type chosen by teachers does not necessarily result in successful learning. Other studies have confirmed that feedback generates little benefit (DeKeyser 1993).

More exhaustive research indicates that *utterance rejection* outranks *no feedback* in several studies (Nagata & Swisher 1995; Rosa & Leow 2004). Although utterance rejection seems to be beneficial, more research is still needed to find out if recasting is significantly more effective than utterance rejection. If so, then computer-administered feedback may facilitate the noticing of target forms and may promote language progress. Although still debated, technology could help students by providing some type of feedback before moving on to the next question.

5. *Affective activities*

Koper (2000) argues that it is possible to adapt content, format of class presentation and teaching method to the characteristics of students of a particular discipline. Following this line of research, technology outside the classroom seems to be beneficial when the instructor can customize materials and adapt them to the learner’s interests through innovative ways to achieve effective learning (e.g., by means of affective activities such as message boards within electronic environments). Since the implementation of technology in Fall 2004 in the mentioned state university, the greatest challenge has been to convert traditional, teacher-centered instruction into a more interactive learning experience. To exemplify this better, here are the guidelines of a particular assignment:

Week 6: February, 14 – 18. Homework 1.3. due on Wednesday. Writing 4 due on day 2 of class: Using the question words that you learned in the previous section, choose another student or your instructor from class and ask them 5 questions about themselves (25 words).

The objective of this writing was to master question words (interrogatives). After gathering a number of compositions as hard copies, the instructor realised that learners from the same section already knew well enough about each other so there was no real need in communication, therefore, no sign of challenge on this writing.

With the goal of interactive learning experience in mind, a message board was set up as a follow-up exercise to review question words by means of blending the rosters of the two different sections in order to provoke meaningful student-to-student communication. By means of a customized message board and a blended group, the instructor could provide an ideal atmosphere with the objective of engaging learners in more communicative activity. Students of one section were paired and assigned to ask questions to students of the other section, and vice versa, following the directions of the mentioned assignment. In this way, communicative interactions promote learners' intellectual thinking processes to reflect on and articulate ideas (Oliver and McLoughlin 1997). As a result, more meaningful student-to-student communication was created since students felt more motivated about inquiring other learners in the same level of Spanish that they did not know personally. Questions were more creative (e.g., What is your e-mail address? telephone number, favourite colour, etc.; a few even dared to meet each other eventually).

Although the assignment was over after those five questions, it was noted that learners showed motivation by posting new threads on the message board sessions, which remained open until the end of the semester. There was a clear need for communication implied in the assignment, which may have led students to start gaining self-confidence about communicating in the L2 (with the limitation in this specific task of using just the skills of writing and reading). These message boards can also be used for posting questions and doubts that learners can exchange with each other. Therefore, the students discover that technology may help them implement learning beyond classroom interaction. Taking into account the number of benefits, yet insufficiently explored, for second language learners in a technology-enriched curriculum, the task of training teachers, too, should not be disregarded.

6. *The new role of the teacher*

Computers are transforming our existence in ways we hardly have time to contemplate. According to Volman (2005), the teacher does not function exclusively as an instructor but, *inter alia*, as a trainer, consultant, and assessor. The instructor is not only the conveyor of meaning but also facilitates the learning process, systematizes heterogeneous forms of learning, and becomes a “didactic and instructional tailor” of lessons and projects, as in the example of the message board to review question words. Teachers can monitor and coach students in many unique ways, from small groups to one-on-one and by e-mail to threaded discussion boards. The following quote encompasses what has been previously stated:

The role of teachers, however, will become more complex rather than simpler. Teacher must know what programs are available that are suitable for their students’ individual needs and keep abreast of this. They are the “arrangers” of students’ learning processes: they bring together the educational tools and set them up in a particular way. In addition, they fulfill the role of the instructor, trainer, coach, advisor, consultant and assessor. (Volman 2005: 22).

This quotation implies a multi-faceted role for teachers. However, instructors do not have to be good at all of these tasks. Furthermore, they can be specialized in a particular type of duty. Some of the answers reported on the survey respond to several types of roles. The statements of “not being able to ask somebody a question about the online homework as you are doing it”, and “you do not have to worry about losing you homework because it is online” would fit into the task of consultant and administrator, respectively. From the point of view of the consultant, the teacher will still provide support to individual and collective learning processes. With the gradual shift of teacher competencies, some roles seem to outrank others. The task of assessing the learning process on the part of the teacher is becoming irrelevant, since assessment is predominantly done electronically. Hence, digital learning environments are well suited to monitor the progress and development of every student.

7. *Conclusions and pedagogical implications*

The relationship between SLA theories and classroom pedagogical practice has been a controversial issue in pedagogy as well as the amount of technology used in and outside the classroom. What seems clear is that technology is building an increasing activity and a greater responsibility on the part of the learners. Therefore, technology as a component of university classrooms is shifting the instructor role. Not only a conveyor of information, the teacher is turning into a “manager” of learning processes. We may be on the right track if not only teachers but also administrators learn how to teach and design technology appropriate to the pedagogical context. Technology should be intended to assist teachers in creating a supportive affective environment both in and outside the classroom. The next step may be to continue doing research on the specialization of tasks of the teacher, based on a ranking of numerous roles.

If technology is not used in context, it turns into a drill. This is why it is necessary to create engaging and customized activities, such as message boards that promote an interactive learning environment. The good news is that content has reappeared, by new technology generating multiple unexplored possibilities in which faculty need to be trained. The less good news is that it takes laborious adaptation, skillful design, and teamwork between teachers and students. To this agenda, we must add the need for intensive research on feedback. Investigation in this area is still in its infancy. Nevertheless, if a university seeks mastery both in educational technology and fruitful instruction, their teachers should make use of imagination in technology and critical thinking as their primary resources.

Understanding and misunderstanding of genetically modified organisms (GMOs)

A semiotic analysis of biotechnology images

1. Introduction

Due to the complexity of making scientific discoveries comprehensible to the general public, popularization of science calls for images and visual signs, which serve as a tool to facilitate the understanding of informative messages about technological advances (Moreno Castro et al. 1996: 27). Since “media imagery can play a symbolic role in how the public views new technological advances” (Crawley 2007: 341), the present paper investigates six images that depict Genetically Modified Organisms (GMOs) employed by biotechnology companies, governments, NGOs and newspapers (see Appendix). In order to carry out the study, semiotics provides a methodological framework for a qualitative analysis so as to interpret how the visual signifier is encoded and how the signified can be construed by two potentially amalgamated sign systems (Peirce’s trichotomy of signs and the Greimassian square), if account is taken of the “context of communication” (Cook 2001: 3–4) in which the message is transmitted.

2. Description of biotechnology images

It is said that a “picture is worth a thousand words”, and clearly the selected biotechnology images capture a wide range of meanings. The first two images were downloaded from Monsanto 2004 pledge report (see appendix image 1 and Syngenta’s webpage, appendix image 2). It is worth noting

that there has been a change in these companies' webpage design, such that seem less picture-oriented than before. Concerning these first two visual signs, it is also worth noting that a human being is the central focus of the image.

In the first image, Monsanto seems to create a picture of the process of growing maize as being a wholesome family affair, with the father embracing his daughter in the foreground. They appear to be prosperous and content, and the farmer trusts the corn enough to give it to his own child. This ad probably targets farmers, as an effort to persuade them that growing GM corn is a good idea. This is supported by the slogan in which there a pun is intended on "growing": as it refers to our options increasing, referring both to the growing child and the growing corn. Hence this is a man who wants to feed his daughter, and feed her well. For a consumer, it would create a comforting image that the company is supportive of young families. These are healthy and vibrant people, pictured along with the green and thriving plants. What is more, it presents a positive picture of GM foods, making them seem like a natural "option" for receivers, rather than forcing the decision on them.

This positive aspect focuses on the depiction of the girl, a device that recurs frequently, at least since Charles Dickens' novel, *Hard Times*. One of Dickens' greatest achievements is narration through the eyes of a child so as to make the audience sensitive to social injustices (*Oliver Twist*); after all, children commonly represent to many the future of a nation. This is possibly what the blonde girl in this image is intended to signify: the potential of a new generation. In broad terms, it may also be identified as an image of capitalist economy and western culture.

In the second image, a mature farmer, thoughtfully examines grains, with a large field of wheat in the background. He is not a trendy newcomer, but rather has probably been farming for generations on his land, all this suggesting the traditional family aspect of farming. This serves as contrast to the highlighted word "innovation", perhaps as a form of reassurance – innovation need not necessarily mean the abandonment of traditional values. The scene seems to be somewhere in America, to judge by his dungarees and the flat land stretching into the distance. It is interesting to note that there is more focus on the cereal than in the first picture, although it the image is a bit blurred. It seems as if the details do not matter, only the big picture – making a profit for corporations – because this would prob-

ably feed more than one family. Apparently, this looks like it is targeting investors from big business who want to exploit the crops for maximum profits. In fact, this is the image of Syngenta's homepage and, therefore, one of its corporate emblems. Conceived of in this way, Robbins argues that "corporate images represent a type of visual capture of consumers, markets and global space" (2004: 5) in which marketing is brought into action. In the form of an ad, this multi-modal image encompasses visual signs and flashing on-line text, multimodality being one of the prototypical features in advertising discourse (Cook 2001: 219).

By contrast, the third image is one of a stick of GM maize designed to appear like a hand grenade, against a dark background to make it as stark as possible. This damaged cob of sweet corn is pinned with a man-made implement – mind you do not crack your teeth on it! It is certainly an extreme point from Greenpeace to the general consumer, which sends the message that GM food can only be harmful. There is not even the slightest hint that GM could be beneficial for people or the environment. In effect, the picture evokes images of a harmless and mundane object made to appear dangerous, or at least potentially so, via the grenade imagery. The caption backs this up in emphasising the danger of this "experiment". As a consumer, the word "dangerous" grabs the eye in the remark underneath – which does not appear in on the website view, but in the print one only. As a result, the addressee may feel manipulated by the biotech industry.

Along this line, the next image, issued by ecologists, appears to be another ad-buster, with the Kraft logo distorted to carry an anti-GM message. There is a play in the ad of the famous food manufacturer, where the logo is mutated or altered as well as are GM foods. The "Not in My Kitchen" slogan personalises the protest against GM foods. This may be just a statement of opinion – that Friends of the Earth (FoE) would not want GM in their houses – but it seems a more neutral picture than the previous image.

In the fifth image, from *The Washington Post*, a Latin American farmer is cautiously examining some crops from which he probably makes his living. However, the meaning or interpretant of this photograph is not clear enough until the text tells us what to see, namely, that there is something wrong with the crop, which looks sickly and is unpleasant to eat. On second glance, the farmer in the photo seems to be unhappy about the look of his crop. From the point of view of a farmer or consumer, the

subtext would make the reader concerned about the health implications of GM crops, both in terms of yield and consumption. The text would play on this fear.

Similarly, the last photograph does not clearly portray benefit or harm; in it a female scientist in a white lab coat and gloves is taking samples from a castor bean pod at the United States Department of Agriculture (USDA). It looks like a working snapshot in which the plant is tagged, suggestive of a controlled experiment. It is unclear whether the photograph illustrates an experiment of what the scientists are trying to create, something they are trying to avoid, or if they are monitoring the possible contamination of another plant. The caption does not help, since the word “testing” might demonstrate that the science behind GM technology is both complex and, possibly, inconclusive.

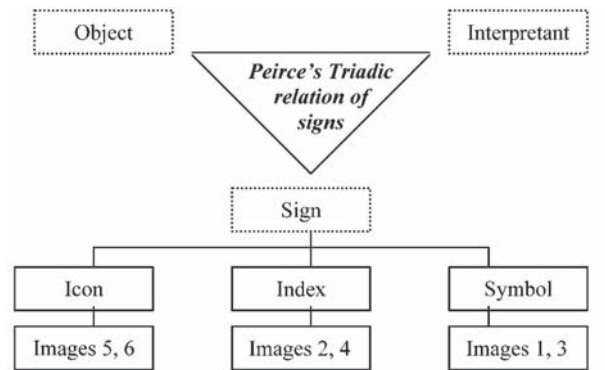

What may be striking is the fact that photographs issued by governments are few in number. The DEFRA (Department for Environment, Food and Rural Affairs) has pictures of scientists, but none about GM food. Most of the information uploaded on its website abides by rules and regulations. As a drawback, we may point out that, unless they are customers or involved in the debate, many readers will never bother to wade through a biotech company webpage nor an activist one.

3. *Peircean semiotics*

Through the descriptions of those images, it is possible to make a connection between the sign and the object, which does not have to reflect all the object’s properties. Rather the link evokes different degrees (Peircean sign trichotomy of icon, index and symbol) of one or several characteristics of the object, as indicated in diagram 1.

Taking into account that a sign may be viewed as iconic, indexical, and arbitrary at the same time (Cook 2001: 75), I classified the images into one of these categories by virtue one feature being more salient with respect to the others. Of course, any type of classification is subjective, and the one provided below may differ from interpretations made by other readers.

To begin, the greatest degree of representation is expressed in the symbol. Based on the previous description, it may be argued that images 1 and 3 may have a more developed interpretant, a more open relation between the sign and the object, thus reaching the stage of a symbol. The

*Diagram 1.*

blonde girl seems to represent the future, and possibly the American dream and freedom of choice, whereas the maize is likely to stand for a metaphor of war or battle. A fairly loose relation between the sign and its object may be seen in image 2, which appears to point out the innovative “field” of GM crops, and in image 4, which hints at the “creation” of a mutant type of food – Frankenfoods. Finally, the tightest degree of denoting the object is expressed through photos 5 and 6 – those appearing in the newspaper and on the USDA webpage – which are the most iconic, that is, the most faithful imitations of the object. Although these last two photographs are intended to be referential, they nevertheless an undertext to get their meanings across.

4. Greimassian semiotics

Having supplied a narrative description of images using Peircean concepts, it would be interesting to move on to a cognitive position in which “images or metaphors not only constitute means of expressing ideas, but also function as sociocognitive devices that help to organise the understanding of a phenomenon” (Bauer & Gaskell, 2002: 266). Since the well-known Dr. Pustzai wrote up the term “harmful” in a reply to the Royal Society in 1999, public debate has swirled around the harmful-beneficial nature of GM food.

We have seen that biotech companies, responding to this hotly debated issue, have circulated photographs of happy people surrounded by text pro-

claiming the virtues of genetic engineering techniques. Dissenting voices attempt to neutralise this effect by claiming that “biotechnology and its applications” are “a harmful intervention in natural processes” (Bauer & Gaskell 2002: 254). Although it has not been proved that GM food is harmful, it is so in the eyes of those who believe that GMOs are interfering or tampering with nature, and thus wish to demythologise the potential power of GM propaganda.

I have studied this opposition in a comparison of the Monsanto pledge report 2004 with several reports by Greenpeace and FoE (cf. Bayón García 2007: 19–20). The issue is turned into a linguistic phenomenon – semantic prosody – in which verbs like “increase”, employed by biotech companies, are usually collocated with noun phrases impregnated with positive meaning (e.g., crop values); conversely, the tendency by ecologist organisations is to select a negative ones (e.g., “dangers”). Apart from this predictable stand-off, a larger corpus-based study may shed more on the use of semantic prosody as a tool in this battle of ideas and dollars.

In cognitive terms, this antagonism may be mapped onto the (Greimasian) semiotic square by the S_1 and S_2 primary positions, as illustrated in diagram 2.

Not only does this elementary structure of signification map out the rudimentary binary opposition S_1 - S_2 , but also alternative conceptual combinations such as S_1 /non- S_1 and S_2 /non- S_2 , which state contradiction. The semantic relation and logical conjunctions between these four notions – which are rooted in comparative mythology (Greimas 1987: 3–16) – denote the different actants of the biotech world through an opposing relation and a complementary one.

Placed within an oppositional relation would be governments (non- S_1 /non- S_2) and newspapers (S_1 - S_2). The USDA picture, with its relatively neutral and denotative image, does not illustrate to what extent this technology may be beneficial or harmful. In the same vein, and a little more strengthening, newspapers tend to include both positions, one of them predominant from time to time. A combination of both stances is displayed in the image from *The Guardian*, though overall this newspaper is likely to take an anti-GM position, whereas *The Times* is prone to adopt a more pro-GM one (Cook 2004: 47). As for a complementary relation, the information is conveyed by S_1 /non- S_2 (biotech companies) and S_2 /non- S_1 (NGOs), as shown in images 1–4.

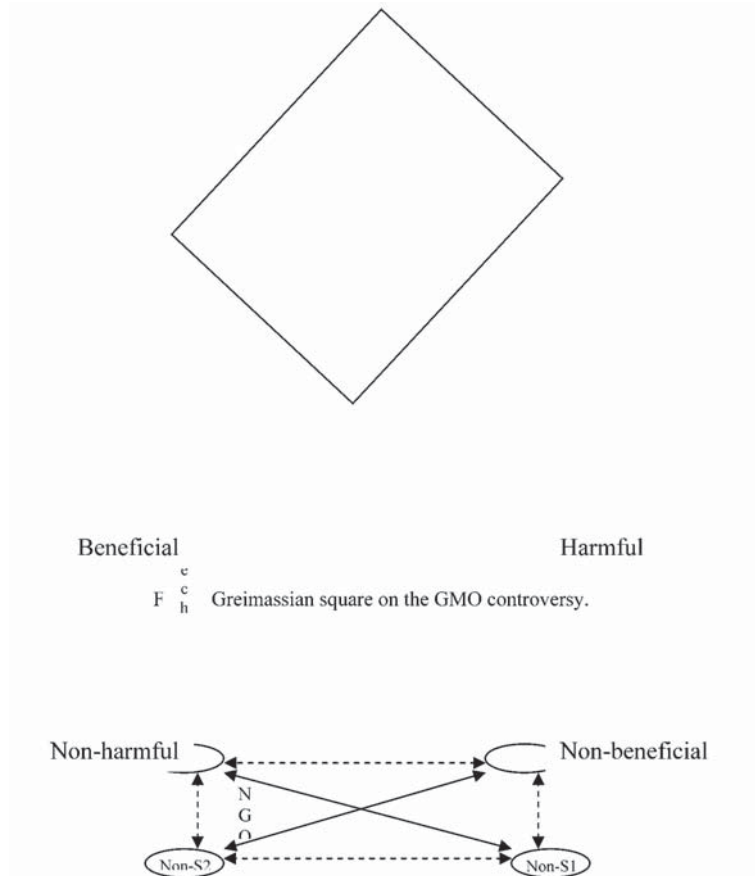

Diagram 2.

The gestalt properties of the square can join Peircean insights with Greimassian ones. One may say that, the more the image is fulfilled by the most developed meanings on the Peircean scale (images 1–4), the more entails a complementary relation ($S_1/\text{non-}S_2$ and $S_2/\text{non-}S_1$). In contrast, the more iconic the picture (images 5 and 6), the more likely it is to trigger an oppositional connexion ($S_1\text{-}S_2$ and $\text{non-}S_1/\text{non-}S_2$).

5. Conclusion

The interpretation of these images reminds us that, although science as a discipline is neutral, the images which illustrate science may not be. As shown in the structural relations pictured in the semiotic square, the structure of biotechnology can be paired into four positions that interfere with each other; for example, beneficial (S₁), harmful (S₂), non-beneficial (non-S₁) and non-harmful (non-S₂).

The complementary relations of GMOs are structured into concepts loaded with positive (S₁/non-S₂) information, as in images 1 and 2, and negative information (S₂/non-S₁), as in images 3 and 4. When the information from a complementary relation reaches the highest expression of the sign, the interpretation of the object is subjective, connotative and advertisement-like. In turn, an opposite relation (S₁-S₂ and non-S₁/non-S₂) is conformable to the objects themselves; here the signified remains at the initial, developmental stage of the sign, and features objective, informative and referential images (5 and 6).

The semiotic analysis presented on this paper help explain why companies and NGOs picture the signified with a more focused lens, making images more salient than those employed by newspapers or governments. Others may appear to be torn between two lands: GM and non-GM.

Mirta Bialogorski

Campo semiótico y campo artesanal: El juego de las transformaciones y los bordes

En la actualidad, un conjunto de enunciados y significados vigentes en el discurso social, identifica una serie de comportamientos, objetos y prácticas como pertenecientes al llamado “campo artesanal”. Esta denominación se utiliza sobre todo, desde la década de 1980 en Latinoamérica, para aludir a un *campo social* (Bourdieu 1988) atravesado por tensiones, conflictos y alianzas de sectores (burocracias estatales, organizaciones no gubernamentales, intermediarios, etc.) en el que “artesano” y “artesanía” designan a un determinado grupo social y su producción, ligados al circuito económico por un lado, y al cultural por otro (García Canclini 1992; Cousillas, 2003). Pero ¿desde cuándo existen los términos “artesano” y “artesanía”? Sus significados ¿han sido siempre los mismos a lo largo de su historia?

Nuestra finalidad en este trabajo, es aproximarnos a los enunciados que otorgaron existencia a estas entidades, en tanto fenómenos reconocibles y acotables social e históricamente y a la transformación que han ido experimentado en el tiempo.

Orienta nuestra tarea, la noción de campo semiótico entendido como “conjunto determinado de fenómenos contextualmente situados en un momento determinado de una sociedad determinada, cuya existencia ontológica y perceptibilidad proviene del conjunto de enunciados y significaciones vigentes en esa concreta sociedad”.

Consideramos asimismo la noción de *bordes* conforme a esta misma propuesta según la cual, “los bordes de un campo semiótico (borde,) son los marcados por la necesidad de hacer posibles las operaciones mediante las que se construirían los enunciados y significaciones posibles que darían existencia ontológica y harían perceptibles a otros determinados fenómenos posibles. Esto iría desplazando el campo semiótico y en el continuum

de este desplazamiento, otro borde (borde₂) se iría delineando a partir de los enunciados y significaciones que irían dejando de ser posibles, con la consiguiente expansión entrópica de los fenómenos cuya existencia ontológica dejaría de ser perceptible” (ibid). Es ésta la primera etapa de la investigación que inicié con una búsqueda etimológica de los términos “artesano” y “artesanía” y mediante la consulta de textos historiográficos y fuentes históricas que hicieran alusión a los mismos.

“Artesano” y “artesanía” aparecen en el universo terminológico en distintos momentos históricos tanto en el ámbito europeo como latinoamericano pero no lo hacen de manera simultánea. Podemos adelantar que “artesanía” es posterior a “artesano” y que “artesano” está documentado de manera diferencial según se trate de la lengua castellana, francesa, italiana o inglesa acorde a las circunstancias de cada contexto.

En los diccionarios etimológicos de habla latina, el término “artesano”, es registrado recién a partir del siglo XIV (en italiano) o aún del siglo XV (en castellano). En lengua francesa, la referencia es aún más tardía ya que se la remite al siglo XVI.

Por su parte, la palabra “artesanía”, según los datos que pude hallar, está mencionada en los tres casos recién en el siglo XX. No ocurre lo mismo en lengua inglesa en donde esta situación tiene sus variantes a partir de que el término correspondiente es “craft”. Cuando nos remitimos a documentos tales como los “Libros de Oficios” y las Ordenanzas que regulaban la estructura interna y el funcionamiento de los gremios en época feudal (entre los siglos XIV y XVI en particular), observamos que no aparece utilizada ni la palabra “artesano” ni “artesanía”. Se hace mención en cambio, a oficios concretos: sombrereros, boneteros, sastres, jubeteros, tejedores de lienzo y mantas, herradores y herreros, doradores, cerrajeros, carpinteros, cesteros, plateros, orífices, cordoneros, etc. En cuanto a quienes desarrollan su actividad en los talleres se los nombra como “maestros”, “aprendices” y “oficiales”.

Pero vayamos más atrás en el tiempo, entre los siglos XI y XIII. Al no contar con diccionarios (al igual que en el caso anterior), acudimos a una de las fuentes fundamentales de la época como son las Crónicas Anónimas de Sahagún que documentan la historia del surgimiento de las primeras poblaciones urbanas que se crearon a lo largo del camino a Santiago de Compostela a fines del S.XI.

En su acápite 13 vemos que se hace referencia a los grupos sociales y a las actividades de los habitantes: comerciantes por un lado, y por otro, “... burguenses de muchos e diversos oficios, conbiene a saber, herreros, carpinteros, xartres, pelleteros, çapateros, escutarios ...” (Puyol y Alonso 1920: 32)

Tampoco aquí aparecen los términos en cuestión, lo que comprobamos ocurre también en otro documento perteneciente al siglo XIII, las Siete Partidas de Alfonso X, El Sabio. Suponemos por lo tanto que durante la Baja Edad Media, no existe todavía el concepto abstracto y sintetizador de “artesano” tal como se lo utilizará posteriormente. Se trata de múltiples, variados, heterogéneos oficios urbanos que producen lo imprescindible para atender las necesidades de los habitantes de las poblaciones.

Si bien todos esos oficios son “artesanales” en nuestra terminología, no encontramos esta palabra (ni ninguna otra) que abarque a sus ejecutores en una única entidad conceptual. Es posible creemos, que al no haber comenzado a generarse aún otro tipo de actividad u otros cambios en la estructura socio-económica, no fuera necesario un término que acotara e identificara diferencialmente a quienes producían esos bienes.

Al ser ésta una primera aproximación, podría darse el caso de que ambas palabras figuren en documentos todavía no consultados, o bien que, efectivamente se trate de una ausencia y que la misma sea significativa. La duda acerca de su existencia surge sobre todo, cuando consultamos la bibliografía actual que, para referirse a las actividades económicas medievales hablan de “artesanos” y “artesanías”.

Para retomar el ejemplo anterior, leemos en un texto contemporáneo de historia medieval, que las ciudades en la ruta de Santiago de Compostela eran habitadas por burgueses y otros grupos sociales dedicados al “comercio y las ‘artesanías’ citándose las Crónicas Anónimas de Sahagún como fuente de apoyo que incluso se transcribe textualmente” (Pastor de Togneri 1964: 56). Quizás sea interesante reflexionar sobre el uso que se hace de las palabras cuando con ellas se alude desde el presente a fenómenos del pasado. Son términos actuales, ya interpretados con los cuales se estaría asignando un significado que dichos fenómenos no tenían.

Pero entonces, si no encontramos un término que los identifique y que distinga sus actividades y producciones de otras ¿podemos decir que existían “artesanos” y “artesanías” antes del siglo XV? Como ya adelantamos al principio, “artesano” está documentado recién para finales de la Edad Media, más exactamente para 1440, de acuerdo con el Diccionario Crítico

Etimológico Castellano e Hispánico de Joan Corominas y José Pascual (1980). Como derivado de “arte”, el término alude a un “hacer algo bien con las manos”. Y “arte” como el “conjunto de preceptos y reglas para hacer bien alguna cosa”.

Una vez que aparece documentado el término, si seguimos su recorrido histórico para ver qué designa en distintos momentos y contextos, qué incluye y qué excluye, nos encontramos con que en la primera edición del Diccionario de Autoridades de la Real Academia Española, de 1726, se hace referencia a “artesano” como al “oficial mecánico que gana de comer con el trabajo de sus manos” y “el que tiene tienda pública y se emplea en tratos mecánicos”. “Mecánico” a su vez, refiere justamente, a “lo que se ejecuta con las manos” aunque no sólo eso. También se lo asocia a “una acción indecorosa y mezquina propia de la gente baja”. Sólo la palabra “mecánica” comienza muy tangencialmente a remitirse a “máquina” lo que indica que ya ha comenzado a identificarse en la sociedad un nuevo acontecimiento que incorpora al significado otro matiz.

En las versiones de 1770 y 1780, desaparece la alusión a “oficial mecánico” y la expresión “trabajo con las manos”. “Artesano” es ahora, aquel que “ejercita algún “arte mecánico” y se contrapone al que practica un “arte liberal” (...“la que se ejerce con solo el ingenio, sin ministerio de las manos”). También se contrapone “arte mecánico” a “bella arte” que “requiere el ejercicio del entendimiento y cuyo objeto es expresar la belleza” (tal el caso de la pintura, la escultura, la arquitectura, y la música.). O sea que, en este momento, “artesano” enfatiza la habilidad manual en oposición a la habilidad mental y al intelecto con un fin estético.

Durante el siglo XIX en los diccionarios se sigue conservando la idea de “artesano” como aquel que “ejercita algún “arte u oficio meramente mecánico” (RAE, 1803, 1817, 1822; 1869, 1884 y 1899) La diferencia sigue siendo entre el *trabajo manual* y el *intelectual*. No se registra todavía en la definición ninguna vinculación con el fenómeno de la *industrialización*. Es posible que el término “artesano” aún no se hubiese consolidado en el uso con ese sentido.

Recién en la segunda mitad del siglo XX (RAE 1956 y hasta la actualidad) estos cambios se incorporan a dicho término. “Artesano” designa entonces, “al que hace por su cuenta objetos de uso doméstico imprimiéndoles un sello personal, a diferencia del obrero fabril”. El *artesano* aparece entonces identificando a quien por su posicionamiento en la estructura

económica, por su modo de hacer y por el tipo de producción, se distingue del trabajador industrial.

Visto desde el presente, podríamos decir que hasta ese momento, su significado estaba en un borde todavía indefinido. Se encontraba aún en el borde entrópico de lo indiferenciable (Magariños de Morentin 2006). Es de notar que, a diferencia de lo que ocurre en francés y en italiano, en ninguna de las acepciones en castellano, se hace referencia a la palabra “manual” que se define desde 1734 como “lo perteneciente a las manos” y a “la obra que se hace con ellas”. En cambio siempre está presente el término “mecánico” que, recién a partir del siglo XX, se lo asocia explícitamente al uso, manejo o arreglo de máquinas (RAE, 1914, 1927, 1970).

En el momento actual, el término “artesano” no sólo se contrapone al de “obrero industrial” sino también al de “manualista” (aquél que realiza “manualidades”), palabra que no figura en los diccionarios pero aparece recortando un nuevo fenómeno y desplazando el campo semiótico del campo artesanal. Digamos además, que desde mediados del siglo XX, “artesano” designa a un sujeto político y en los últimos años se lo define en discursos patrimonialistas de organizaciones internacionales como la UNESCO, como “patrimonio cultural viviente”.

Ahora bien, ¿qué ocurre con el término “artesanía”? En principio, su recorrido histórico es más reciente que el de “artesano”. Tanto “artesanía” en castellano como “artigianato” en italiano y “artisanat”, en francés, están documentados para el siglo XX.

Esta palabra aparece por primera vez en el Diccionario de la Real Academia Española en la edición de 1947 designando a un *grupo social*, “la clase social constituida por los artesanos”, y a un *tipo de producción*, “el arte u obra de los artesanos”, acepciones que se mantienen hasta la actualidad. La historia del término “artesanía” va a ser distinta según se trate del contexto europeo o latinoamericano, pero además tendrá su desarrollo particular en cada uno de ellos. En el caso de la Argentina esta palabra comienza a utilizarse hacia fines de la década de 1940, en el discurso académico y en el ámbito de la gestión cultural.

A fines de 1949 se realiza un Primer Congreso Nacional de Folklore en el que se dedica una sección importante a trabajos sobre producciones asociadas a los sectores populares de la población, a las que se denominan explícitamente “artesanías”.

Al año siguiente, en 1950 y como resultado de otro encuentro de estudiosos también del Folklore, se establece una definición de la palabra “artesanía” que hace alusión a un “conjunto de oficios o actividades que produce objetos de uso práctico o ceremonial ... adornados o conformados con fines artísticos”. Para especificar aún más el fenómeno, sobre todo en relación a los productores, se incorpora la expresión “artesanía folklórica” con la cual se hace referencia a un conjunto actividades u oficios propios de la cultura tradicional de los sectores populares de las “sociedades civilizadas” que producen objetos de uso práctico o ceremonial con dimensión estética (Boletín del Museo José Hernández 1950)

A los objetos a los que se nombra como “artesanías” se les da el valor de supervivencias del pasado preindustrial, y los sectores a los que se describe como productores son los grupos indígenas y criollos. Hacia fines de la década de 1950, en el ámbito académico y de la gestión, se adopta una nueva definición de “artesanía folklórica” que se propone entonces, para designar actividades, destrezas o técnicas empíricas, practicadas tradicionalmente por el *pueblo*, mediante las cuales, con intención artística se crean objetos destinados a cumplir una función utilitaria. Deben dar cuenta de la labor manual (aunque puede complementarse con herramientas o máquinas), del trabajo individual o en grupos reducidos, por lo común familiares y de un estilo que concuerde con el predominante en la cultura tradicional de la comunidad” (Cortazar 1976: 43). “Pueblo” aquí refiere a comunidades denominadas “folk” caracterizadas por oposición a las sociedades urbanas, como pequeñas, aisladas, autosuficientes y con relaciones cara a cara. “Artesanía” se vincula, pues, a las comunidades folk y se las liga además, a un pasado hispano-criollo.

A diferencia de la definición anterior, se excluye de la expresión “artesanía folklórica”, la producción de los pueblos indígenas y también, las manualidades femeninas, los oficios masculinos y las producciones de grupos inmigrantes y urbanos en general. Si bien se habla ya de “artesanía urbana” se identifica con este término en ese momento, la creación personal de artistas (no de “artesanos”) que viven en la ciudad y cuyas pautas de producción se contraponen a las consideradas propias de la tradición popular.

Desde la década de 1980 la “artesanía” refiere a diversos repertorios de objetos cuya elaboración remite a diferentes técnicas, diseños, grados de funcionalidad y mecanización. Fundamentalmente, se deja de asociar su

producción a un determinado sector social. Técnicas tradicionales utilizadas en materiales novedosos; diseños tradicionales en nuevos formatos, la *artesanía* es nombrada desde entonces, como “tradicional”, “popular”, “indígena”, “urbana” y más recientemente, como “contemporánea”, “neartesanía” o “artesanía indígena urbana”. Hasta se habla de artesanía “post-industrial”. Sin embargo, no puede decirse que se trate de definiciones taxativas, los significados de cada una de estas expresiones se desplazan, emergen nuevos fenómenos y nuevos enunciados.

El universo significativo de la palabra “artesanía” al igual que “artesano” se complejiza cada vez más y son asumidos por múltiples discursos con componentes políticos, socio-económicos, históricos, académicos. Tal pluralidad de usos requiere desde ya un estudio analítico aparte, para el cual la perspectiva de la semiótica de los bordes se presenta como muy productiva.

En este trabajo hemos comenzado a explorar la eficacia que los términos “artesano” y “artesanía” tienen en relación al fenómeno social que están acotando.

Hemos investigado el campo semiótico y semántico de ambos términos y hemos observado algunos de sus cambios en su devenir histórico. Nos preguntamos ahora, siguiendo la propuesta de la mesa, ¿cuáles son sus bordes? Y por lo tanto, ¿hacia qué nuevas reconfiguraciones se dirige el campo artesanal? Una rápida mirada sobre el uso de estos términos hoy día, nos muestra que están vigentes en distintos ámbitos discursivos dando cuenta del desplazamiento de sus significados.

Podemos advertir por ejemplo, que si bien en los discursos patrimonialistas, artesano y artesanía, se asocian a oficio, experiencia, técnica y especificidad cultural, en los discursos de política social tal significado remite meramente, a quien vende lo que produce con sus manos, sean piezas que muestren valores genuinos de diseño o simples reproducciones semiseriadas de formatos estereotipados (Cousillas 2003).

En este caso, vemos un desplazamiento hacia otro campo que es el de las “manualidades” y los “manualistas”. También en la actualidad advertimos un desplazamiento en el significado de “artesano” y “artesanía” hacia la idea de fusión de lo autóctono con lo contemporáneo y de lo industrial con lo manual, e incluso hacia la idea de un nuevo concepto referido al destinatario o consumidor.

Mi experiencia cotidiana como investigadora en un Museo de Arte Popular que convoca a artesanos de todo el país y lleva a cabo un Programa de patrimonialización de las artesanías, muestra que estamos ante un campo en permanente transformación. Un campo en el que la investigación y la gestión trabajan sobre categorías difusas y sobre modalidades interpretativas múltiples y contradictorias. Un desafío que lleva a estar permanentemente atentos a la emergencia de nuevas significaciones, de nuevas expansiones y límites enunciativos y evidentemente, a la evolución misma del lenguaje.

Bernard H. Bichakjian

The linguistic sign: From analog to digital

1. Introduction

In this paper, I argue that the changes which have taken place in the course of the evolution of languages consist of a shift from analog to digital features; I also discuss why the prototypical features were analog, and why they shifted to digital alternatives. Since the analog prototypes of lexical items are too few and far too remote, I focus on the wealth of tangible data provided by grammatical and phonological features, in arguing that a shift from analog to digital took place in all areas of language.

2. Analog vs. digital

The terms *analog* and *digital* are used constantly today. Their immediate meaning can readily be inferred from their application to items such as timepieces. An analog timepiece is one that uses the position of the “hands” on a dial to show the progress of time, whereas a digital timepiece provides that information numerically. The technical definition of these terms is based on the notion of continuity.

Analog signals are continuous electrical signals that vary in time, as shown in Figure 1a. Most of the time, the variations follow that of the original, non-electric signal. Therefore, the two are analogous; hence, the name *analog*. On AM radio, for instance, the strength of the radio wave goes up and down in analogy with the loudness of the original sound.

Digital signals are non-continuous; they change in discrete steps. They consist of pulses or digits having discrete levels or values. The value of each pulse is constant, but there is an abrupt change from one digit to the next (see Figure 1b).

Figure 1a. Analog signal.

Figure 1b. Digital signal.

Before being transmitted, the original information is converted into a string of bytes. A radio signal, for example, will be either on or off. Digital signals can be sent over long distances and suffer less interference than do analog signals.

In linguistics, perhaps the most obvious example of an analog signal having been replaced with a digital one is provided by writing. Writing started with the analogical representation of the referent. The graphic representation of an ox – natural, stylized or synecdochic – signaled an ox; the graphic representation of an owl signaled an owl, and so on. These graphic signals, called ideograms, were continuous: they followed the shape of the referent continuously, without displaying a sequence of discrete, distinctive elements. Alphabetic writing, by contrast, is not continuous, but made up of a sequence of discrete distinctive elements. Just as in electricity, where digital signals are obtained by converting signals that originally were analog, alphabetic writing is achieved by switching from the *signifié* to the *signifiant*, from the physical referent, which is continuous, to its linguistic label, which is not, and thence proceeding to represent the digital

label with discrete alphabetical items. The evolution of writing from hieroglyphs to alphabet is well known (inter al., see Diringer 1968, Gaur 1984; for an evolutionary presentation, Bichakjian 2002: 221–258).

3. *The shift from analog to digital in grammar*

The extent of the shift from analog to digital is considerable, and it is almost ubiquitous in grammar, where evolutionary processes can be traced quite far back in time. I shall discuss the evolution of argument alignments, word order, complex sentences and the expression of verbal action in reference to its occurrence.

3.1 The evolution of argument alignment

Typological data suggest that the prototypical sentence was built around the notions of agent and patient. The essential distinction was whether an argument was an agent, i.e., the one who performed the action, or the patient, i.e., the person who endures the action or is the scene of the action. In a sentence such as *The hunter killed the bear*, the hunter is the agent and the bear is the patient. But in a sentence such as *the old king died*, the king does not perform the action; he is merely the scene of death. The ancestral distinction can be seen, for example, in the contrast between Latin active and deponent verbs. The verb meaning ‘kill’ is active (*neco, occido, interficio*); the verb meaning ‘die’ is deponent (*morior*).

The agent-patient alignment has practically disappeared today. It survives in Basque and Georgian, the native languages of Australia, and a few native tongues of South America. The modern alternative is the nominative-accusative or subject-object alignment.²

The analog nature of the ancestral alignment can hardly be contested. The incipient speakers, striving to produce an argument-alignment model, copied the events they observed in real life, such that one either performs or endures an action. Just as ideograms followed the contour of their referents, the agent-patient syntactic model followed the roles of participants in the events taking place in the outside world.

But there is more: the agentive model is based on the continuity between the verb and its main argument: a verb such as *kill* must have an agent, while a verb such as *die* can only have a patient. Unlike agents and patients,

subjects are independent from the verb with which they combine. The action-*vs.*-endurance dichotomy binding verbs, on the one hand, and agents and patients, on the other, no longer plays a role. There is discontinuity between verbs and argument: all verbs take a subject, and, conversely, any subject combines with any verb.

3.2 The evolution of word order

Whereas the evolution of argument alignment took place a long time ago and today the overwhelming majority of languages use the subject-object model, the evolution of word order is a more recent phenomenon, with the ancestral model still present in many languages. The process is nevertheless certain: the ancestral order was head-last, or SOV, and the trend is toward head-first or SVO.¹ The shift has not taken place everywhere, and among the languages where the shift has indeed taken place, some have moved faster and covered more ground while others have shown restraint. Similar disparity exists elsewhere: technological advances, e.g., are not equal in all parts of the world. Whatever the rate, the evolution of word order is from head last to head first, and in normal circumstances, this trend is irreversible.¹

That the head-last order is holistic and continuous, while the head-first order is discontinuous and analytical is not difficult to see. If it is head-last, a sequence cannot be interpreted until the head, i.e. the last item, has been uttered. The modifier and its head are amalgamated and constitute a continuous block. Head-first structures on the other hand allow the interpretation to begin immediately and to proceed as the sequence unfolds. Heads and modifiers are not amalgamated, and head-first structures are therefore discontinuous. Given that head-last structures are continuous, and head-first structures discontinuous, the evolution of word order can rightly be concluded to move from analog to digital.

While the continuity of head-last structures can readily be seen and accepted, one is still left to wonder what the head-last structures were analogous to. This is not an easy question to answer because, unlike with ideograms and agent-patient alignment, the model is not concrete. Yet, the model exists: it is the holistic perception of an event. It will be recalled that chimpanzees required tremendous perceptual abilities to survive in the wild, and though in the course of human evolution they traded off these

remarkable abilities in favor of a greater potential for abstract concepts, the ancestral holistic perception of incipient speakers must have provided the input of the first grammatical structures (Springer 2006: 14).

Describing the situation of an autistic boy, Oliver Sacks wrote: “[w]e do not know ... how Stephen thinks ... [, b]ut we do know that though he may be lacking in the symbolic, the abstract, he has a sort of genius for concrete or *mimetic* representations” (Sacks 1995: 241; emphasis added). This is not an attempt to equate autistic patients with early humans. Yet, their deficit in abstract thinking, counterbalanced by a “genius for concrete mimetic representations”, can provide a window on the mental disposition of prelinguistic humans trying to cobble together a grammar and, by so doing, lend support to the view that the ancestral grammatical structures were modeled after their holistic perception of surrounding events. The resulting analogy could then explain why the ancestral structures were holistic, continuous, and head-last.

3.3 The rise of complex sentences

The distinction between analogous head-last structures and digital head-first structures also applies to the distinction between participial phrases and subordinate clauses. The sentence embedding technique is relatively recent. Before its invention, languages expressed subordination mainly with participial phrases (Meillet 1964: 373). These were head-last structures with limited grammatical marking and syntactic expansion. They are conveniently used today when the phrase is short and the marking limited. Though English would prefer *the lady in the blue dress*, it would be acceptable to say *the blue-dress wearing lady*, but it would be difficult if not outright impossible to express with participial clauses the contents of [*I spoke to*] *the lady who was wearing a blue dress she had bought in a store her friend had suggested when they had met for tea in a restaurant near the Opera*. Such a sentence is perfectly acceptable because it has a digital structure. Each embedded sentence is indeed embedded, i.e., part of a hierarchical structure, but it is fully autonomous and the embedding process almost endlessly recursive. The recursivity of sentence embedding makes complex sentences digital structures while participial or infinitival phrases are analogous because they allow very little or no recursivity. The model of the analogy is again the holistic perception of outside events.

3.4 From aspect to tense

Another well-established evolutionary development is the shift from aspect to tense. The ancestral languages made aspectual distinctions – an action was either completed or in progress or in a state resulting from a presumed action. In the course of evolution, temporal distinctions emerged and gained the upper hand. Temporal systems are organized around reference points in time – the present is opposed to past or future points in time, the past tense can have a past and a future of its own, and the future a past of its own.

The trend is well known. Meillet stated long ago that “l'élimination de l'aspect au profit du temps ... [est] l'un des traits qui caractérisent le développement des langues indo-européennes” (1928: xii), and Jerzy Kuriłowicz went even a step further by stating that “the opposite development does not seem possible” (1964: 130). This is not to say that aspectual distinctions have disappeared. French, e.g., makes a distinction between *j'ai fait* and *je faisais*), while English distinguishes *I have done* from *I did*, but French and English have essentially a temporal system, and the trend among languages has been a shift to temporal systems.

Speaking of a deaf boy who had been deprived not only of hearing, but also of sign language, Sacks made the following observation: “Joseph ... was *missing ... a clear sense of the past ...* he had no problems with perceptual categorization ..., but he could not, it seemed, go beyond this, hold abstract ideas in mind. ... He seemed, like an animal, or an infant, to be *stuck to the present*, to be confined to literal and immediate perception (1989: 40 and 44, original emphasis). It has also been established that chimpanzees “are excellent at perceiving the immediate significance of events, but they do not retain most of those events in long-term memory, nor do they think abstractly what the events might mean in the far future” (Smith 2006: 72). The assemblers of ancestral grammars were, of course, neither born with chimpanzee-like brains, nor congenitally deprived of hearing. Yet, as they were trying to construct a grammar, they were in fact in a prelinguistic state, and in that transitional state, exhibited the deficiencies observed in apes and in language-deprived patients. They were, we may surmise, confined to the present, and not yet ready to place an action in the past or in the future. It is therefore quite natural that incipient grammars would feature a system of aspectual distinctions that is analogical with the ancestral

speakers' perception of events. It should also be noted that aspectual distinctions are continuous, because they are confined to the present, during which they are constant. As they evolved, aspectual distinctions were gradually supplanted with temporal ones, which, unlike their antecedents, are discontinuous since tenses place events along a time scale. The shift from aspectual to temporal systems is therefore another shift from an analog to a digital system.

3.5 The evolution of marking techniques: From Ablaut to words

Along with the task of devising syntactic strategies and defining grammatical distinctions comes the job of inventing marking devices. The historical data suggest that grammatical marking started with forms of stem modulation, which was expanded and later largely replaced with suffixation, which in a third step has given way to fully independent grammatical words. The initial step is easy to imagine. Having achieved the coining of a word for a given action, incipient speakers were soon confronted with the task of stipulating whether that action was ongoing or completed. Their ingenious solution was to modify the shape of the word, either by stretching the vowel or by reduplicating the initial consonant-plus-vowel sequence of the stem. Latin preserves the process in pairs such as *ēdit* "(s)he eats" vs. *ēdit* "(s)he ate" and *pendit* "(s)he ponders" vs. *pēpendit* "(s)he pondered".

The next strategy was to take a consonant or a vowel or assemble a short segment, assign it a grammatical value, and tag it to the stem. In some Latin verbs, e.g., an *-s-* after the stem indicates that the action is completed: *dīcit* "(s)he says" vs. *dīxit* (phonetically, *dīk-s-it*) "(s)he said". Suffixation was highly developed in the classical languages, but as the greater frequency of, for instance, *more pleasant* over *pleasanter* suggests, the trend is toward marking grammatical values with independent words, such as prepositions, adverbs, auxiliaries, pronouns, etc.

One failure of linguistics since the mid-twentieth century has been the unwillingness to recognize the role of evolution, and instead to see circular changes everywhere, including where developmental processes have clearly pursued a unidirectional course. It has thus been claimed that suffixes were originally independent words that were downgraded to grammatical markers after being phonetically reduced and semantically hollowed out (see,

e.g., Heine 1994; and Bybee et al. 1994; for a critical account, cf. Joseph 2001). Grammaticalization is indeed documented. The classical example is that of Finno-Ugric *bél*, which once was a full-fledged lexical item meaning “intestine” or “bowels”, but which later developed into case markers for Hungarian nouns (Collinder 1936: 58–59 and 1956: 120). Another clear example is that of the Latin verb meaning “to hold” or “to own”, which withered into a temporal auxiliary and the suffixes marking the future tense in Romance languages.

That lexical items were occasionally reduced to suffixes or simply converted to vectors of grammatical notions is not disputed, but these are indeed occasional occurrences and cannot explain the abundant inventory of suffixes and thematic morphemes ubiquitously present in inflected languages. Neither can they explain the developmental logic of grammatical markers. Grammatical marking – it may be surmised – began with stem modulation techniques such as Ablaut and stem reduplication. Since words were modified holistically (e.g., *sing/sang* as opposed to *work/work-ed*) the signal was continuous and therefore analog, and indeed analogous with the perception of the actual referent. A completed action is not action plus something; it is action in a modified form. After stem modulation came suffixation, which represented a shift to digital signals: the markers are (largely) independent of the stem, though not always free of some phonetic blending. Finally, the use of auxiliaries, articles, pronouns and prepositions, etc. made the signal completely discontinuous and fully digital.

3.6 From vowel length to new vowels

Like the evolution of writing, which started with holistic items analogous to their referents and gradually changed to digital signals using letters for each sound of the referents’ lexical labels (*signifiants*), it appears that vocalizations were also originally holistic and continuous before becoming digital signals structured in discontinuous distinctive speech sounds. While to infer such a shift is legitimate, it must be stressed that the events occurred in the mists of time, and no data – observed or reconstructed – are available to document them.

A more recent development provides evidence that the shift from analog to digital also occurs in phonology – though perhaps on a smaller scale. That development is the shift from vowel quantity to vowel quality, or

from vowel length to new vowel sounds. Whatever their origin – Ablaut or compensatory lengthening – long vowels have often provided a way of enriching the inventory of vowels. If the five basic vowels are paired off with the corresponding long ones, which was the case with Latin, for instance, some ten syllable peaks become available, which in turn will reduce the chances of homonymy. In itself, a greater inventory of vowels is an advantage, but length, as a distinctive feature, tends to disappear, partly under the pressure of syllabic configuration. When long vowels become restricted to open syllables, where they are unmarked, and short vowels to close syllables, where they are more suitable, vowel length is no longer distinctive. To make up for the loss, languages tend to introduce newer vowel sounds such as *y*, *ø*, and *æ* or *ɨ* and *ʌ*. Examples of these new vowel sounds are Dutch *duur* “expensive”, Ger. *schön* “beautiful”, Fr. *sœur* “sister”, Ru. *сын* “son” and Eng. *cup*.

Since they are produced with one pitch held constant over two phonological units (*morae*), long vowels are indeed continuous, and as such they constitute an analog signal. Analogy may also be seen in the usage of the same vocalic “material” to create new vowels and the recourse to length, which is a perceptual experience. Vowels with a different pitch are original inventions, independent of the existing inventory. In that sense, they constitute digital signals.

4. *Why a shift from analog to digital?*

As stressed above, when it has been observed that A regularly becomes B, it is incumbent upon a scientist, not only to describe the change, but also to discuss (1) why A was the starting point and (2) why A shifted to B. In the foregoing, when a shift was presented and described, a sustained effort was made to suggest why the prototypical item was analog, and what it was probably analogous to. The question now is, Why the shift to digital alternatives? The answer is clear and unambiguous: because the digital alternatives are more advantageous. Subject is more advantageous than agent because it makes it possible for speakers to assign the subject function to any noun. Subject-object grammars are more powerful than agent-patient grammars because the action can be described from more than one vantage point. Head-first word order is also more advantageous than head-last. Because head-first order allows speakers and listeners to

process utterances as they unfold, more complex structures can be used, whereby information is organized in higher hierarchical constructs and is transmitted and received more economically. Temporal systems are also more advantageous than their aspectual forerunner because they allow speakers to guide their interlocutors through time, both past and future. The marking techniques have also shifted to more advantageous alternatives. The stem modulation techniques – Ablaut and reduplication – provide for a very limited number of distinctions, and also sharply reduce the variety of lexical items. If the *sing/sang* alternation were the only past-tense formation rule, it would mean that all English verbs would have to have an *i* in their stressed syllable, and verbs such as *bang*, *dance*, *glance*, *fence* etc. would be impossible. Suffixation parries this problem, but suffixes can exercise an unsettling influence at the phonetic level and trigger morphological irregularities. Word-type markers provide the best guarantee for the integrity and proper recognition of all constitutive segments of a word and its grammatical attributes. Finally, vowels such as the rounded front (*y*, *ø*, and *æ*) and unrounded back (*ɨ* and *ʌ*) provide better alternatives because they can be used without problem in all syllable configurations, whereas long vowels are less amenable for use in certain positions. In all of the above cases, the digital alternatives present definite advantages over the analog ones, and their advantageous character explains why languages have gradually shifted to them (for an extensive discussion of the notion of advantage in language evolution, see Bichakjian 2002 and 1999; for a brief discussion, see Bichakjian 2004).

5. *From grammar to lexicon: From seen to unseen*

While it has only been suggested, not demonstrated, that the prototypical form of the above-discussed features were analogous with the prelinguistic experience which incipient speakers brought to the task of formulating a grammar, arguments have been presented to support the view that ancestral features were indeed analog in nature, and that they shifted to digital alternatives because these last are more advantageous. In grammar and to the extent that they occur in phonology, these shifts are observable: they are either ongoing or part of the historical record, attested or reconstructed. The “birth” and subsequent development of lexical items are shrouded in the mists of time. We do not have the prototypes; our only data are

words in the form they are today. These words are said to be arbitrary, and indeed, they are. They are neither analogous to their referent nor do they constitute an analog signal. They are digital signals (cf. Martinet's second articulation), including the onomatopoeia, and because they are digital in nature, they must be fully or at least largely arbitrary. Arbitrariness is no doubt a salient feature of the lexicon, but the underlying feature is the digital character of words, which coincides with the shift from analog to digital observed in grammar and to some extent in phonology. These two sets of observation and the emerging similarities suggest that the shift from analog to digital has been a dynamic force active in all areas of language because it leads to more advantageous alternatives. Digital means more advantageous; hence, the shift ... taking place everywhere!

Notes

1. I, for one, had argued that the ancestral word order was head-last, and that wherever word order had evolved, it had become head-first (Bichakjian 1991). This observation was first met with skepticism, but mainstream linguistics finally concurred (Newmeyer 2000).
2. For a discussion of the shift from active to nominative syntax, directly or possibly via an ergative phase, see Klimov 1977: 318 and 1979: 332; and Plank 1979.

Bogdan Bogdanov

Communication and understanding

Arguments for a broader pragmatic understanding of linguistic expressions, meanings, and things

There exists no generally accepted definition of communication; rather, it is discussed on the basis of models of different scopes. Some of the broader theories include communication in animals and in plants. More frequently, however, communication is considered a typically human phenomenon, conditioned by man's linguistic and social competence. Yet even in this case, the basic features of communication are determined in different ways.

Among these features there are certain less-disputed ones, such as understanding; hence the grounds for asserting that communication is *human* communication, in which understandings are exchanged or, conversely, in which messages are misunderstood. By the term "understanding" we mean the currently evolving, scientific idea that human communication constitutes itself in a context or situation, according to available rules, norms and meanings, which communicators rely on during the process of configuring and sending messages. This obviously concerns direct and indirect communication, as well as verbal and non-verbal exchange of information by means of gestures, mimicry and images.

According to this model, communication occurs on several levels. Communicators rely on both the verbal message, as well as on the accompanying non-verbal one(s). In the language of computer science, the human communicative act is construed as comprising and complementing one sort of digital message with another sort of analogue message. This dual, or rather multiple, encoding of the message in communication corresponds to the contemporary model of how the human brain functions:

different sections or structures of the brain encode signals coming from outside with a view to their eventual usage under different circumstances.

Probably to this end, the human communicative attitude is such that one and the same bit of information can be understood in at least two different ways. This is manifest not only in a differently configured message, on the lines of verbal and non-verbal communicating, but also in the ambiguously organised flow of the communicative verbal act. A certain understanding of the sender's message is not only understood equally/differently on the other side of the communicative act, but becomes different from its primary variant in the process of communication, even for the one who sends it.

In addition, the information of the verbal message itself signifies dually (or more). It is construed so as to be understood in different ways in the communicative act, as well as open to change in regard to one task or another. This holds also for an individual word, which is always polysemic, and, indeed, for any linguistic expression: both or either of them combine several meanings and can refer to several things. Particular words are more indisputably polysemic, whereas expressions and texts, developed according to certain specifications, are less polysemic, at least at first sight.

Of course, the verbal message in itself is a conditional state. Even in examples of one word or phrase, their usage becomes obvious, and there is a choice of one meaning over another. Be that as it may, no pragmatic usage can specify a linguistic expression so closely as to obliterate its polysemy. The latter always remains, serving as an internal resource for generating other understandings, either by steering a linguistic expression towards another meaning or by referring it to another thing.

Yet when considered by itself or, as it were, "unused", a linguistic expression has, at the very least a dual meaning and a dual message, combining an explicit and implicit meaning, if nothing else. These two meanings or messages can also be ordered successively. This occurs in cases where something spoken is clarified by a similar locution; in this way, an ambiguous message is clarified by being narrowed down to two alternatives. Expressed separately, however, each of them promptly inclines to ambiguity. The speaker is aware of this ambiguity and, eluding it, he continues in a linear way by explicating again and again the generated, implicit meanings. It should be noted, however, that ideal textual linearity can be achieved in an instant.

No message or meaning can be self-identical, because, as a linguistic form, it designates and denotes, but the meaning does not correspond to the denoted thing. Just as a linguistic expression is related to other expressions, a meaning is related to other meanings. In addition, the thing loosely corresponds to the linguistic expression and the meaning, because it is related with other things in many ways.

In every linguistic expression, then, meanings or possible messages are given as stratified, in the sense that one of them is the expression of another – or in the sense that a concrete message is attached to a general message, which motivates the former, but which does not refer to the thing commented upon; rather, it refers to the context of speaking or to the larger context of the world. In most cases, the concrete message intends the two contexts at the same time.

We can conclude, provisionally, the following concerning the issue of understanding and the communicative act: an understanding is always manifested in several combined understandings. This also corresponds to the dual setting of the communicative act, which, besides this act, is also the model of another, similar act that is constituted under different circumstances.

Just as a speech act, the communicative act has both an actual and model structure; that is to say, it occurs here and now, but it models and situates an event or act occurring in any place at any time. Just as the brain's activity allows for more uses, the communicative act combines more messages and meanings, starting from a basic primary message, then developing a secondary message that specifies and changes the former.

The text of the so-called primary verbal message is organized in a similar way. Its explicit meaning is layered upon other, implicit meanings which can also emerge in the foreground during this communicative act. One reason for this ambiguity is that the linguistic expression, or message, is something ready-made, something available and in this sense already used; in addition, it is something that has to change to a certain extent so as to serve in actuality, here and now. This is due to a kind of rotation of the “kaleidoscope” of what is already given, which must have at least two meanings.

In this sense the understanding, faced with polysemy, is called upon to choose one meaning and disregard another, and to combine meanings in regards to one concrete application or another. Understanding is not only

the understanding of something given as existing in a context of things; it is also a step-wise process. Above all, understanding is the making of an actual meaning and a thing. The thing can be an existing one, which is only specified and in this sense elaborated. Or it may be a non-existing one, and the communicative act can assure its existence. This means that the thing is posited in relation to other existing things, thus assuming a community that understands or accepts the existence of that thing, the context of other things, and the meanings produced for this purpose.

This making in the act of communicating not only makes something and its context. When a communication occurs, the complex, multilayered content of the message is refined and thus the communicators undergo a change. Even the most elementary of communicative acts are adjusted so as to fit within the context of the concrete communication as well as within the most extensive possible context, that of the world.

Understanding, conceived in this way, is achieved in the process of the communicative act; in addition, it is expressed in happening-making: of a thing, of a context of things, and of a more general context of the world and the community of those who understand in this way. Altogether, these activities change the participants in the communicative act, in which process they become different, to one extent or another. This activity is also a kind of making, insofar as it not only happens, but is made.

This leads to a more expanded understanding of the human communicative act – as a living situation of a passing move to something else. That is why, according to an authoritative model, communication occurs not only when people are really communicating, but also when a person is alone and in a state of mental activity. In this case, he communicates with himself as another or, on the level of understanding, he is performing the mental action of understanding himself in the world, which means an understanding of something and a context. All that is needed is the desire to communicate and an object of that desire.

Obviously, the communicative act may be fruitfully considered as not only a communication between people for the purpose of exchanging information and as a means of understanding and/or happening-making. It is also a process in which communicators achieve a new attitude toward a changing world, which is to some extent one of their own making.

A practical question arises. Of the many available models of understanding the human communicative act, which of them is the best? Is there

in fact an ideal model of understanding? That is unlikely. As with all things, also in this case: as thought accumulates, so do more models, according to the different tasks which they may perform. For, being linguistic entities, these models are true in a twofold sense. They ostend something existing and also show that, in some way, they are making this very thing.

Nonetheless, insofar as the choice is independent of the task, it can be based on a common-sense principle of good measure. We can take the line that the chosen model of communication is neither too narrow, and is directed towards understanding or an immanent change in the understanding community which, because of that, change the message itself; nor too large, such that the idea of communication would become blurred along the lines of the so-called “flow” of a living situation.

Hence we arrive at the appropriate delimitation, which directs the topic of communication towards its manifestation as speech activity. In this model, the topics of understanding and acting are preserved. Moreover, observation can eventually pass on to the discernible materials of the text of the message and the secondary text of the communication. A third strand of the line of action is constituted by those resources for understanding the speech act in a larger sense, as pervaded and completed by non-verbal gestures, such as those of images and other sign systems.

There is also another resource – the text of verbal and non-verbal communication that is pervaded with, and which pervades, regular human actions and the making of things without words. Both in doing something and by means of what is said, the human being is speaking, as it were. This holds even when he does something silently – either with a mental parallel with an internal silence; in either case he is moved towards a sense by a reason and a purpose. Evidently both acts – of thinking when speaking and of thinking when silently making – combine with something more general, which may be called speaking, and not only in a metaphorical sense.

Another thing: on the basis of the presented model of communication we can say that there is a speech activity of the communicator who speaks but ostensibly does not communicate. Since he is within and engaging in speech, however, there are others at his disposal with whom he communicates indirectly, and still others in the virtual community of those who understand or should understand as he does. Depending on the speech, the communicator may engage with a community that is listening to his

monologue, with an imagined other person in a dialogue, or with himself as the other in an internal, event-filled dialogue.

On this communicative base a typology can be expounded for various kinds of discourse. This typology would preserve and sustain the wider pragmatic conception of speech as a communicative act and would allow for developing a pragmatic theory of meaning. The basic principle of such a theory would be that all saying and speaking are to be understood as understanding and as making, as well as a change in the communicators' attitudes. Such a theory of meaning could be further elaborated by analyses of speech activity that is not isolated from other human activities, such as those treated by pragmatics in a large sense of the word, as a general theory of human activity. But for that it may be too early.

Priscila M. Borges

The sign tree: Peirce's philosophy through a visual model of the 66 classes of sign¹

1. Introduction

The creation of diagrams to help explain Peirce's Semiotic is a common practice among semioticians; even Peirce himself did so. He believed that diagrams were a good way to represent with precision the course of thought (CP 4.530). We find in his writings many diagrams and visual models used to explain triadic relations in phenomenology, semiotics and classes of signs. In this way he developed his logic – also called Semiotic – with the aid of *existential graphs*, which are diagrammatic ways of representing the reasoning processes.

As a scientist and philosopher, Peirce studied many different subjects, in trying to understand the logic of science and different types of reasoning. Therefore, we must take a careful look at the complex structure of his philosophy in order to understand the relations among its branches and not treat them as disconnected disciplines. For instance, from his studies of logic and mathematics he developed the concepts of relation, infinity and continuum, which are also important concepts for understanding semiotic processes.

Here I present a 3D model created according to the logic of cenopythagorean categories, as applied to the ten trichotomies which make up the 66 classes of sign. First I explain the relations between visual elements and the sign theory. Next, analyze the model, showing that although it was constructed to describe and illuminate the different classes of signs and their relations, it can also point out the connections among semiotics, metaphysics and pragmatism.

2. Model construction

Two different classifications were used by Peirce to explain how signs function: (1) according to sign-ground, called “cenopythagorean” categories; (2) according to those sign structures called “trichotomies”. Both classifications explain logically how signs work. Even though Peirce passed many years of his life developing the sign concept, he left that work unfinished. In his papers we find a very detailed description of how 10 classes of signs are produced by the combination of three cenopythagorean categories with three trichotomies. In his correspondence with Lady Welby, he developed the structure of signs in detail and expanded the trichotomies to 10. These 10 trichotomies, combined with the three cenopythagorean categories, make possible 66 different classes of sign. It is precisely this combination of ten trichotomies with three cenopythagorean categories that is presented here in a visual model.

Next, I will explain the logic of the relations that guide sign theory, since it was the ground for constructing the diagrams. The categories of phenomenology are related to the sign ground. Peirce worked first on observing all phenomenal types, trying to find the most general and fundamental categories of *phaneron*. He writes:

Firstness is the mode of being of that which is such as it is, positively and without reference to anything else. Secondness is the mode of being of that which is such as it is, with respect to a second but regardless of any third. Thirdness is the mode of being of that which is such as it is, in bringing a second and third into relation to each other. I call these three ideas the cenopythagorean categories. (CP 8.328)

Figure 1. The categories of phenomenology.

A relation of dependence is established between the three categories as follows: firstness is independent of anything, secondness depends on firstness, and thirdness depends on both secondness and firstness (see Figure 1).

Figure 2 is modeled on the growth of trees, an organic process that resembles sign growth in many respects. The concept of triad is related to bifurcation of branches, and their growing subjected to the action of time. It is necessary to pass from one trichotomy to the other. All relations between them are determining relations, such that the antecedent must act on the consequent. The antecedent is past, already determined, and the consequent is future, full of possibility, still undetermined.

Figure 2. Illustration of the semiosis process, based on the idea of tree rings.

Tree rings are used in dendrochronology to estimate the age of trees. As the years go by, the rings grow larger, but they are also affected by climate factors. More than a sign of time, tree rings show interaction between systems. All these concepts apply to the semiotic process. Each ring corresponds to one trichotomy: the first trichotomy comes in the centre, the second trichotomy in the second ring, and so on.

Since there is a determining relation among the rings, construction of the diagram of 66 classes of signs necessitated a better understanding of the order of the trichotomies. It was not easy to decide in which order the trichotomies should appear – one of the hardest problems facing Peirce scholars. According to Queiroz (2002: 87), there are several different opinions on this matter, due to the lack of development on this subject by Peirce. He did not describe the 66 classes of signs, and in his papers one finds more than one ordering of the trichotomies, and reports of his own doubts about how to order them.

At first I had the central “ring” represent the ground of Sign, because the semiosis process begins with it (Figure 3). This construction has its advantages. Firstly, it fits perfectly with the way Peirce described semiosis processes and ordered the ten trichotomies in a letter to Lady Welby (CP 8.344). Secondly, it emphasizes the sign in relation to object, showing that the knowing process begins with the sign. But a diagram constructed in this way – with rings ordered from center to periphery in a determining relation – does not go well with the analyses which Peirce, in the same letter, made of the possible relations between ground of sign and immediate object (CP 8.353–365).

Figure 3. Order of the sign trichotomies adopted in the ring-diagram.

Since the object determines the sign, and not *vice versa*, it was necessary to put the dynamical object in the central ring, followed by the immediate object and the ground of the sign. Given the first three correlates, we arrive at the first relation: between sign and dynamical object. This relation determines the possible interpretants, called “immediate interpretants”, which, when they are existent become dynamical interpretants. Then come the elements that compose the second relation: between sign and dynamical interpretant. Moreover, semiosis is an infinite process, the “goal” of which directs the dynamical interpretant; hence one more relation: the final interpretant and its relation to the sign. Finally, given all correlates and all dyadic relations, it is possible to theorize the triadic relation among sign, dynamical object and final interpretant.

Having defined the order of trichotomies we can combine them with the cenopythagorean categories. The cenopythagorean categories – represented by spheres, cubes and pyramids – should take place in every ring, starting from the central one and following the others according to the logic of categories (see Figure 4). So, if in the first ring there is a sphere, the next one must also contain a sphere. If in the first ring there is a cube, a sphere or a cube would take place in the second ring. And if in the first ring there is a pyramid, then a sphere, cube or pyramid would take place in the following ring.

Figure 4. Ring model of Peirce's 66 classes of signs.

This trichotomic order, which stresses the way things are in reality, can be a problem for the superficial reader who understands semiosis to begin with a dynamical object. This is not the case, however, since everything we know about the object comes only from its signs; thus, human knowledge appears in the middle of the semiotic process and not at its beginning. Putting the object as the starting point is a good way of taking man out of the center of knowledge. More than that, it forces us to acknowledge that the knowing process encompasses more than human knowledge, and that man cannot reach the origin or the end of this process. Putting the object as the starting point also accords with Peirce's belief that in fact a reality does it exist, and its existence does not depend on what we think of it; for this reason he can be called an "objective idealist". This is also in accordance with the concept of semiotic enlargement, which takes the concept of intelligence far beyond the human mind. In addition, the center of the rings represents the backward movement of the object, and its border represents the infinite semiosis. Together these create a temporal line similar to the one seen in trees (Figure 5).

Figure 5. Tree model of Peirce's 66 classes of signs.

The process of constructing the 66 classes of signs reveals that signs themselves are complex structures which can increase as more details are considered. However, the classification of signs, on its own, makes semiotics overly formal; moreover, it is an endless and goal-less project, as Peirce well knew. The mere naming of signs does not solve semiotic problems. It does, however, describe signs in detail and makes it possible to understand Peirce's philosophy. According to Nadin (in Santaella 2004: 15), "the sign can only be conceived and interpreted in the range of uncertain logic and with announcement of the continuum doctrine." The diagram shows both points: in the center, the incomplete knowledge of the dynamic object represents the uncertain beginning. And at the border, the growing of rings as time passes represents the growing of thoughts. Interpreting a sign is a process that, in turn, produces another sign with the same capacity of being interpreted and of creating signs, *ad infinitum*.

The 2D diagram was used as a guide to construct the front and side views, which in turn generated the 3D model. Both diagrams illustrate in detail the logical structure of the 66 classes of sign as being a complex system; they do not treat each sign as an individual and isolated from the rest. But it is only in the 3D model that the relation between semiotics and Peirce's philosophy comes into view. Akin to a tree, the theory of signs must be related to an environment, and it must have some purpose that guides the growth of its roots and branches.

Figure 6. Four different views of the 3D model representing Peirce's 66 classes of sign.

Figure 7. Top view of the 3D model representing Peirce's 66 classes of sign.

First let us see how the roots are formed. As it is known, in semiosis the dynamic object always refers backwards; it is never shown in its fullness. The sign can represent the dynamic object in many different ways, but always in parts, never completely. Since it is impossible to reach the dynamic object, we say that it retreats. This backwards motion appears on the z-axis in the negative direction. Because it is located in the center ring, we can imagine that the backwards movement of the dynamic object forms the trunk and roots of the tree.

To see how the branches grow, it is necessary to look at the external rings. In the last three rings we can find the final interpretant, the relation between sign and final interpretant, and the relation between dynamic object, sign, and final interpretant. Since the final interpretant is not an existent but a course of representation that the sign must follow, the end of this path is a place that will never be reached. It is always in the future, in the infinite, and it is the aim of semiosis. The other ring, representing the relation between sign and final interpretant, points to the description of semiosis *in toto*: the triadic relation among object, sign and interpretant.

As a result, we can observe two processes going on simultaneously. On one hand, the dynamical object retracts in the direction of the ground, forming the trunk and roots in a way that makes the object itself more complex and impossible of being fully represented by the sign. On the other hand, the triadic relation of signs shows a mediation process – which can also be understood as a way of thought – pointing to sign growth, which in the model is represented by the branches.

In view of all this, it is possible to presume that the retraction of the movement of the dynamic object connects semiotics to metaphysics, and that the growing of semiosis – toward the “future” of the final interpretant – connects semiotics to pragmatism. Considering this hypothesis, we will next look, on the central and external rings, for traces that relate semiotics to metaphysics and pragmatism.

In the dynamic-object ring, there are 55 signs of collection, 10 of occurrence, and 1 of possibility. If the dynamic object determines the sign and always appears mediated by it, then the dynamic object might be the reality. The recession of this object would seem to be the province of metaphysics: to discover the reality behind the appearances. In addition, the signs of possibility can be related with chance; the signs of occurrences with existence; and the signs of collections with law. Signs of collections are the greatest number of signs in this ring, which points to the realistic thought of Peirce that generalities are real and that reality is full of laws.

In the external ring we come across the exactly opposing relation among the classes of signs, since most of them are of Firstness and just one of Thirdness. As this ring represents the triadic relation, or the way of thought, it is composed of 55 classes of signs that are instinctive thought, 10 that are the thought of experience, and 1 that is formal thought. This exclusive class of sign that represents formal thought can be related with the aim of Peirce’s pragmatism: “concrete reasonableness”. By this he means that the purpose of thought doesn’t lie in an action, but in the development of an idea, and that it is through reason that we can reach this aim (CP 8. 212).

Finally, I hope you can see – through the explanation of this 3D model – some ways in which semiotics and other areas of Peirce’s philosophy are connected, and that further analysis may reveal even more about these relations. Although the model was constructed to clarify sign theory, it also is of use in describing the structure of Peirce’s philosophy. Comparing it to a tree enables one to consider Peirce’s philosophy as a system, and not

as an isolated discipline. I could sum up this by saying: first, semiotics is the structure of the Sign Tree; second, its relation to metaphysics is captured by the growing of roots that represent the increase of complexity of the reality; and third, its connection with pragmatism is accounted for by the growing of branches, which represent the development of thought.

Laurence Brunet-Hunault

Le récit d'une privatisation, ou comment le discours de presse dramatise ou enjolive une aventure économique

Ce travail est le résultat d'une expertise que le laboratoire DynaLang-SEM, dirigée par Anne-Marie Houdebine, a mené en 2006 pour EDF. Il s'agissait d'analyser un volumineux corpus média constitué d'articles de presse écrite (nationale et régionale), de scripts d'émissions de radio et/ou de télévision, de dépêches d'agences de presse et de caricatures (presse satirique). Sur les quelques deux mille « textes » qui constituaient les données fournies par EDF, nous avons sélectionné trois cents documents qui ont servi de support à l'analyse détaillée dont nous rendons compte aujourd'hui. Ainsi, bien que le corpus soit imposé par le commanditaire, il nous est possible de construire un objet d'étude. Le corpus est non seulement important mais aussi hétérogène tant sur le plan des supports concernés que sur celui des situations de communication qu'il met en scène.

L'analyse du corpus s'appuie sur la théorie mise au point par Anne-Marie Houdebine (2004), *la sémiologie des indices*. Cette théorie postule l'existence de la structure à la suite de Saussure et garde un rapport étroit avec la linguistique dans laquelle elle puise ses outils et ses méthodes. *La sémiologie des indices* se situe dans le cadre d'une sémiologie générale qui a pour objet la « les signes de la vie sociale » envisagée par Saussure. L'enjeu de cette sémiologie est de décrire les éléments de l'objet sémiologisable, en l'occurrence des discours de presse (phase descriptive), d'expliquer leurs fonctionnements (phase explicative) et d'en dégager les effets de sens et les valeurs symboliques (phase interprétative). Il s'agit ainsi de pratiquer une ou mise au jour des « insus culturels » dans ce type de discours.

La présentation de ce travail s'articule donc sur les trois étapes de la sémiologie des indices : la description du corpus, l'explication de ses modes de fonctionnement, l'interprétation, ou dans ce cas, la mise au jour de deux axes interprétatifs signifiants : l'idéalisation et la dramatisation.

*1. Description du corpus :
La structure événementielle du récit*

Nous considérons le récit comme un ensemble d'unités qui s'articulent autour d'une quête, d'une recherche ou d'une mission à accomplir, etc., ainsi « l'opération d'ouverture du capital » est la mission qu'on nous narre. Il s'agit dans ce corpus médiatique d'une narration élaborée par plusieurs narrateurs : l'ensemble des journaux, des radios et des télévisions.

Le récit débute sur une situation initiale (SI), /la décision de lancer l'ouverture du capital d'EDF/ qui à la suite d'une série de transformations se clôt par une situation finale (SF), /l'entrée dans le CAC40/. Les dates clefs de l'opération d'ouverture du capital, forment des repères événementiels qui cristallisent les différentes transformations propres au récit, c'est-à-dire les événements qui permettent de passer de la situation initiale à la situation finale : ces transformations peuvent aussi être considérées comme les épreuves qualifiantes que le héros doit franchir pour mener à bien sa quête (selon le modèle actantiel de Greimas [1966]). Ces dates clefs sont la fin de la souscription (18 novembre 2005), le congrès du Parti Socialiste au Mans (18-20 novembre), le premier jour de cotation (21 novembre), etc. ; puis suivent une série de petits événements : l'annonce quasi quotidienne du nombre de souscripteurs ou les mouvements contre la privatisation d'EDF, etc. qui maintiennent le récit dans l'actualité médiatique.

*2. Explication : Remaniement du schéma actantiel
de Greimas, les actants du récit*

La description événementielle du récit permet de mettre au jour les différents pôles actantiels qui supportent les transformations selon le schéma de Greimas (donateur(s)/narrateur(s), destinataire(s)/lecteur(s), quête, héros, adjuvant(s), opposant(s)). Les pôles actantiels, principalement ceux des donateurs/narrateurs, destinataires/lecteurs, adjuvants, opposants, sont tenus par des actants, les institutions bancaires et/ou financières, le

gouvernement, les associations de consommateurs, les syndicats etc. et/ou par des acteurs comme Dominique de Villepin, Thierry Breton, Pierre Gadonneix, les *leaders* syndicaux, etc. Nous incluons sous le terme d'*actant*, aussi bien les *acteurs* que les *actants* proprement dits, n'effectuant pas dans ce travail une analyse détaillée des personnages du récit.

Si l'on considère comme Roland Barthes (1966) que « ... le récit, comme objet, est l'enjeu d'une communication : [pour lequel] il y a un donateur du récit, un destinataire du récit », celui de l'augmentation du capital d'EDF possède une pluralité de donateurs ; qu'il s'agisse du gouvernement (premier ministre, ministre de l'économie et des finances, etc.), des syndicats et de leurs représentants ou des associations de consommateurs, etc. De la même manière, les narrateurs (les médias) sont multiples qui co-construisent le récit au travers des articles, interviews, dessins de presse et autres émissions de télévision, etc. Le *destinataire* du récit est à la fois le lecteur, le téléspectateur, l'auditeur, etc. et l'*investisseur potentiel*. Ces deux pôles de la narration sont invariables, c'est-à-dire occupés par les mêmes types d'actants.

La définition de la quête est le premier point qui interroge le modèle actantiel. D'une part on peut considérer qu'il s'agit de « l'ouverture (partielle) du capital d'EDF », quête portée par des actants héroïques comme EDF ou le gouvernement incarnés par des acteurs comme Pierre Gadonneix, Dominique de Villepin et/ou Thierry Breton. D'autre part on peut considérer que « la privatisation d'EDF » est la quête portée par des actants héroïques comme les syndicats (en particulier la CGT), la Gauche (en particulier le Parti communiste et/ou le Parti socialiste) incarnés par les différents *leaders* syndicaux et/ou différents représentants des partis de Gauche. En fait, au début du récit le terme *privatisation* est celui qui est utilisé par tous les actants, puis avant même la fin de la souscription, une différenciation apparaît entre « l'ouverture (partielle) du capital d'EDF » et « la privatisation d'EDF ». La première expression, utilisée par tous les actants favorables à l'action relatée par les médias est celle qui s'impose avant même la fin de la souscription ; cela pour éviter le champ sémantique mis en œuvre par le terme *privatisation* (du côté de l'opposition public/privé, libéralisme/socialisme, etc.) sur lequel s'appuient les syndicats et tous les opposants à *l'ouverture du capital*. Cette expression définissant la quête met en place les banques et les salariés souscripteurs comme *adjuvants*, les syndicats et la Gauche comme *opposants*.

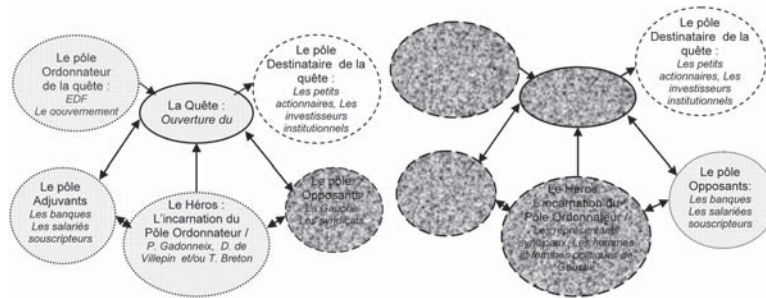

Schéma 1. Rendrement <ouverture (partielle) du capital d'EDF> / <privatisation d'EDF>

A l'inverse, *la privatisation*, ou plutôt *le refus de la privatisation*, est la quête soutenue par les syndicats et la Gauche. Elle est le versant négatif de l'ouverture du capital ; dans ce cas les adjuvants deviennent les syndicats et la Gauche, les opposants les banques et les salariés souscripteurs. Le récit se construit ainsi autour d'une quête à double face que les indices discursifs permettent d'identifier. Comme le montre le schéma ci-dessus, le pôle ordonnateur change aussi pour être occupé par la Gauche et les syndicats.

La co-existence de deux quêtes conditionnant le renversement des pôles actantiels crée deux schémas actantiels qui peuvent exister en même temps dans la narration. Cependant les pôles actantiels ainsi définis ne suffisent pas à expliquer tous les fonctionnements narratifs du récit. Aussi ont été ajouté au schéma actantiel original : un pôle neutre et un fluctuant. Le pôle neutre, représenté par les journaux et les analystes financiers, les associations de consommateurs, ne soutient ni n'empêche la quête. De manière plus générale et souvent pédagogique, il informe sur ses avantages et ses inconvénients. Le pôle fluctuant peut tenir toutes les positions actantielles du récit (hormis la quête). Il est représenté par les journaux financiers et certains analystes qui, au cours de l'évolution du récit (évolution du nombre de souscripteurs, hypothèses sur le prix de mise en bourse de l'action, variation du cours, etc.), basculent de la position d'adjuvant à celle d'opposant ou à celle de neutre. Ces variations de positions se font à la fois sur l'axe du temps de la narration (diachronie narrative) et pour le même actant dans la synchronie narrative ; par exemple le même journal financier peut tenir par l'intermédiaire de différents journalistes des places neutres et adjuvantes ou neutres et opposantes. Toutefois, certaines com-

binaisons s'excluent mutuellement dans la synchronie narrative telles que opposant/adjutant.

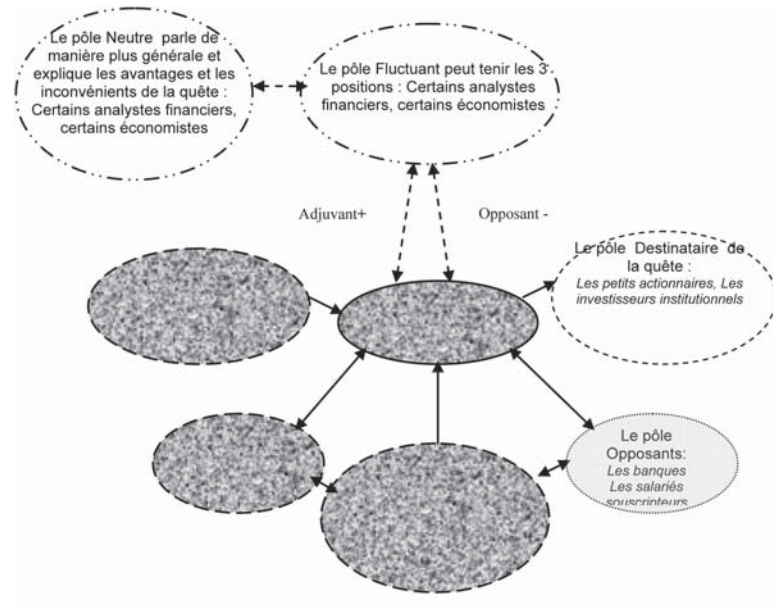

Schéma 2. Extension du modèle actantiel

Sur le plan formel, les fréquences statistiques (en terme d'occurrence dans les documents) placent *l'ouverture du capital* avant *la privatisation* et construisent une hiérarchie qui favorise un récit, celui de « l'ouverture du capital » par rapport à l'autre, celui de « la (-) privatisation ». En outre, comme le montrent les schémas, les mêmes actants et leurs incarnations occupent une majorité de places pour une même quête (exemple : les pôles d'ordonnateur, de héros et d'adjutant pour le gouvernement : récit de « l'ouverture du capital ») ce qui confère à la narration médiatique une apparence de consensus, alors que la multiplication des pôles actantels et leur variabilité donnent une certaine confusion au récit, tant sur le plan de sa progression qu'en terme d'identification des positions actantielles et narratives. L'association de ces deux traits fait osciller le récit entre consensus apparent et dissension.

3. *Interprétation : Idéalisation ~ Dramatisation*

La troisième phase du travail, interprétative, consiste à dégager les effets de sens. Parmi les nombreuses pistes interprétatives dégagées, nous ne présentons dans ce travail que l'axe de l'idéalisation versus celui de la dramatisation, celui qualifiant le(s) récit(s). Cet axe interprétatif s'appuie d'une part sur des caractéristiques du discours et d'autre part sur les actants qui le supportent. Des nombreux indices mis au jour par l'analyse, nous ne retenons que quelques uns des traits identifiants, que nous jugeons pertinents dans la mesure où ils existent aussi bien dans le récit de « l'ouverture du capital », le seul présenté dans cet article, que dans celui de la « privatisation ».

Trois types de discours, s'appliquant à l'entreprise EDF et à l'opération « d'ouverture du capital » en elle-même, caractérisent les actants favorables à la quête (les ordonnateurs de la quête, les héros, les adjouvants). Le discours de la compétition, qu'elle soit sportive et/ou économique ; de celui de la satisfaction (auto-satisfaction) qui loue le(s) vainqueur(s) de la quête et celui de l'identification du coupable, sorte de catharsis qui permet d'attribuer les erreurs susceptibles de faire échouer la quête à d'autre(s) qu'au(x) vainqueur(s).

La compétition est avant tout économique. Dans ce domaine EDF est une entreprise en concurrence, la compétitivité est le maître mot de cet univers discursif. Au nom de la concurrence et pour répondre aux directives européennes, l'ouverture du capital est présentée comme le seul moyen de donner à l'entreprise la possibilité de faire face à la concurrence. Et à ce titre il la justifie. Ainsi dans un article de *L'Usine Nouvelle* (03/11/2005) sont exposées trois raisons pour justifier l'ouverture de capital d'EDF : « 1 Réussir son programme d'investissement ... S'il veut rester le premier exportateur d'électricité en Europe, sans risque de coupure, EDF doit relancer son outil de production et renforcer ses capacités d'échanges avec les autres pays. », « 2 Devenir un acteur gazier à part entière ... pour proposer une offre à la mesure de celles des grands concurrents européens diversifiés comme EON. », « 3 Elargir sa base européenne S'il ne veut pas être en reste dans un marché européen en plein mouvement, [...] ». Ce discours est celui de la compétition en termes d'objectifs à atteindre. Les expressions *délais à tenir*, *objectif chiffrable et quantifiable* sont employées comme dans les compétitions sportives peuvent être utilisées

les performances qu'il conviendrait d'atteindre pour telle ou telle équipe en vue de changer de division, etc. *L'augmentation de capital d'EDF* est donc construite comme une compétition et transforme l'entreprise en un concurrent parmi d'autres dans l'ensemble des *ouvertures de capital* précédentes (celles de France Télécom et Gaz de France, les plus fréquemment citées) : « Quatorze jours pour convaincre : c'est le laps de temps qui reste à EDF pour tenter de rallier les suffrages des investisseurs institutionnels mais surtout des particuliers alors même que le PDG, Pierre Gadonneix, s'est fixé un objectif ambitieux de 4 millions d'actionnaires individuels ». Une fois la compétition lancée et les objectifs fixés, les médias rendent régulièrement compte du score, c'est-à-dire du nombre d'actionnaires, en particulier, *petits actionnaires, actionnaires individuels, actionnaires particuliers*, ayant souscrit l'action EDF : « L'introduction en Bourse d'EDF suscite un réel engouement chez les particuliers. Moins de deux semaines après le lancement de l'opération, les *petits porteurs* ont déjà transmis plus de 2,5 millions d'ordre d'achat à leurs intermédiaires financiers. », (*Les Echos*, 10/11/2005) ; « Rué sur l'action EDF » (*Libération*, 16/11/2005)

Ainsi, compétition économique et compétition sportive entremêlent leurs mots et construisent comme un défi (sportif) que héros, donateurs et adjuvants doivent relever et gagner. Les défaillances par rapport à la quête, ou les échecs, sont commentés sur le même mode discursif : (*France soir*, 22/11/2005) avant-titre *Première heures de cotation titre L'action EDF déçoit les porteurs, ...* « Les banques qui ont organisé l'opération essaient de maintenir le cours en hausse, sinon une dégringolade serait une catastrophe pour l'Etat. C'est une hausse artificielle », a commenté M. Sabatier, stratège boursier chez JCF Facser. ... « Contrairement aux espoirs des petits porteurs, l'augmentation de capital d'EDF ne réalise pas la performance de Gaz de France ..., » parlant de maintien du cours ou de maintien en *ligue 1* et utilisant le registre de l'affect à la façon d'exprimer les états d'âme des supporteurs d'un club sportif aux de mauvais résultats.

Ce dernier exemple montre le lien entre discours de la compétition et discours de satisfaction (auto-satisfaction lorsque l'émetteur du message est l'ordonnateur de la quête et/ou le héros) qui qualifie les vainqueurs. Au même titre que le discours sportif, la satisfaction s'exprime par des superlatifs et par le verbe *gagner*.

Ce discours s'associe à celui de la compétition ; il appartient au gagnant ; il est donc tenu principalement par le pôle ordonnateur, héros y compris,

et concerne surtout *l'actionnariat populaire*, qualifiée le plus fréquemment de : *d'extraordinaire, très grand, formidable, ...* En outre, L'atteinte et le dépassement des objectifs du nombre de souscripteurs est souvent décrit de manière métaphorique par des expressions telles que : *record battu pour une privatisation, record battu toutes catégories pour le ministre, souscription qui explose (qui a fait exploser) les compteurs*. Cf. : (*Aujourd'hui en France*, 11/11/2005), sous-titre : *Privatisation. Les français ont réservé en nombre des actions EDF, s'est félicité hier le ministre de l'économie, etc.* ; *EDF a gagné son pari pour l'introduction en Bourse (La Tribune, 19/11/2005)* ; le discours de satisfaction concerne non seulement les commanditaires de la quête et les héros mais aussi les destinataires lecteurs, employés d'EDF¹ qui y ont participé (petits actionnaires - adjuvants), puisque l'entreprise victorieuse du défi de *l'ouverture du capital* en sort grandie et le destinataire *amoureux* rassuré. Enfin la quête est en elle-même qualifiée par ce discours de *succès populaire (sans précédent, ...)*, (*vrai, sensationnel, extraordinaire, etc.*) *plébiscite*, etc. Ainsi tout est fait pour glorifier. L'ensemble des effets de sens dégagés contribue à augmenter l'impression de consensus d'autant que la fréquence de ces discours est supérieure à celle qui supporte l'autre discours. On peut alors faire le parallèle avec l'ambiance euphorisante du Téléthon lors de l'annonce de l'augmentation des promesses de dons (nombre de souscripteurs pour EDF), le montant maximal de souscriptions étant dépassé, record battu. Ainsi, non seulement la quête répond à l'un des idéaux sociaux du moment, mais aussi elle valorise héros, adjuvants et destinataires en les faisant porteurs de « la bonne action ».

Or, tout n'est pas succès dans la quête et dans le flux de communication du récit, il convient de justifier les échecs, c'est-à-dire de trouver ce qui (ceux qui) en est la cause, soit à justifier ces « ratés », de trouver qui est responsable de *la mauvaise première cotation de l'action EDF, de l'effondrement du cours* : il s'agit de trouver un coupable.

Ce discours concerne essentiellement les premiers jours de cotation de l'action EDF. Si la quête connaît des ralentissements ou des échecs, ils ne peuvent être attribués aux actants soutenant la quête (ordonnateurs, héros, adjuvants). Deux mouvements de désignation du coupable sont en œuvre : le premier met en cause *les petits actionnaires*. Ce sont principalement les ordonnateurs de la quête et le héros² qui portent ces accusations (cf. *Europe 1*, 23/11/2005) à propos de la chute du cours « Pour la suite ça ne devrait pas s'arranger prévoient les analystes. Ils expliquent que de très nombreux

particuliers ont choisi de revendre leurs titres même à perte par crainte que la baisse se poursuive. Bref 48 heures après l'introduction officielle on cherche déjà les coupables [...] ». Puis, presque concomitamment, ce sont les *hedges funds* qui sont mis en cause non seulement par les ordonnateurs de la quête et les héros mais aussi par une partie de adjuvants (en particulier les petits actionnaires contre les *hedges funds* les particuliers contre les institutions). (*AFP*, 29/11/2005), titre *EDF enquête de l'AMF sur le rôle des fonds dans la baisse du titre*, « Les fonds sont soupçonnés par le gendarme de la Bourse d'avoir 'fait artificiellement baisser le cours de l'action lors de son introduction' ... ». Sans entrer dans le détail de l'analyse des différentes manières de porter l'accusation. Il est important cependant de constater que ces dernières finissent par n'être proférées que contre les actants les plus éloignés du pôle adjuvant : les *hedges funds*.³

L'idéalisation discursive et actantielle mise en place s'appuie sur les valeurs en cours dans le socius compétition sportive et identification au groupe des vainqueurs, *les gagnants gagnants*.⁴ La (-) *privatisation*, l'autre quête, construit, le contre discours qui se fonde sur trois types d'indices discursifs : les annonces et ou les compte rendus des actes contre l'ouverture du capital, des discours de mise en garde et de dénonciation. Comme dans la quête de « l'ouverture du capital », ce discours « anti » est tenu par le pôle ordonnateur, les héros et les adjuvants de la quête, c'est-à-dire la Gauche, les syndicats et leurs *leaders*, les associations, etc.

L'objectif de ce discours étant de mobiliser, c'est-à-dire de créer une réaction « contre »⁵ rend compte des mouvements sociaux « contre la privatisation et pour la défense du service public »⁶: *La Marseillaise* (09/11/2005), titre *Journée d'action pour la défense du service public*; *AFP*, (08/11/2005), titre *Mobilisation contre la privatisation d'EDF : Grèves et baisse de production*. Hormis la défense du service public qu'il faut entendre comme opposé au privé⁷, la protection des français et la sauvegarde d'EDF *patrimoine qui appartient à tous les français*⁸ figurent dans les arguments les plus utilisés.

Le discours de mise en garde met en place les risques et les dangers que fait courir la privatisation : dangers par rapport à la sécurité, à la santé en particulier en ce qui concerne le nucléaire et sa gestion ; les risques financiers dans la mesure où la privatisation coûte cher et donc qu'elle peut s'avérer être un placement dangereux : (*Challenge*, 03/11/2005) titre *La privatisation d'EDF pour qui la facture ?*, sous-titre *Le gouvernement*

privatise EDF, une entreprise qui présente à terme un lourd risque financier pour la collectivité ; Les privatisations spolient la nation et abusent les petits actionnaires. Cet ensemble de mises en garde se tresse avec le discours « anti », c'est-à-dire les thèmes qui cristallisent les craintes de la société, soit la mondialisation, le nucléaire (ses accidents, le stockage des déchets, etc.), les licenciements et le chômage, bref le capitalisme. Ces discours se retrouvent souvent mis en scène dans les dessins de la presse satirique. Discours « anti » et discours de mise en garde sont ainsi associés à celui de la mobilisation. L'ensemble de ces discours active les peurs économiques et sociales pour créer le drame autour du récit. Cette quête n'aboutissant pas, elle construit un récit dysphorique.

Ce travail d'analyse qui a permis d'étendre le schéma actantiel de Greimas, et de monter la coexistence simultanée de deux schémas, l'un euphorique l'autre dysphorique, le récit oscillant entre les deux positions, ou même, tenant toutes les positions comme en témoignent les actants fluctuants. Anne-Marie Houdebine parle alors d'oscillation discursive et Jean-Pierre Faye « d'oscillation sémantique ». Ces notions qui inscrivent le flou de cette médiatisation, qu'on peut dire *langue de caoutchouc*, qui semble être le propre du récit médiatique, marque éventuelle du désir d'objectivité de médias ou de manipulation.

Notes

1. Cette attachement à l'entreprise EDF, « *entreprise préférée des français* » est souvent repris par les médias dans la période qui précède l'annonce de l'ouverture du capital et pendant tout le récit que nous analysons.
2. Particulièrement le gouvernement, le Premier Ministre et le Ministre de l'Economie.
3. Il faut se rappeler que l'ouverture du capital a été annoncée comme le moyen pour les français de posséder leur « *entreprise préférée* », ou de favoriser « *l'actionnariat populaire* ». En outre, les *hedges funds* sont des institutions non des individus, ce qui rend l'accusation plus impersonnelle et permet aux petits actionnaires particulièrement concernés comme destinataires de ne pas se sentir visés.
4. Ainsi que dans les discours de la dernière présidentielle.
5. Contre l'idée d'ouvrir le capital avant l'ouverture de la souscription puis contre la souscription, etc.
6. C'est l'expression la plus utilisée dans les médias.

7. Dans cette quête le privé est vu comme négatif, il représente le « capital », le monde des finances dans lequel, seuls les profits comptent.
8. Le terme patrimoine est à entendre au sens économique.

Dressing in signs: Fashion theory between sociosemiotics and cultural studies

1. Introduction

Since Roland Barthes wrote *The Fashion System* in 1967, semiotics has analysed the nature of what may be termed the “fashion sign”. For Barthes this was the sign of described fashion, i.e. fashion converted into language in specialised magazines. Apart from this special Barthesian type of sign, we can speak of “real” fashion (as he himself called it), i.e. a system that is not only “inscribed”, or described, but also a system of communication and social interpretation that is syncretically fed by other communication media – film, TV, the Internet, music, photography, video games, etc. – and is emerging as “mass fashion” (Calefato 1996; new ed. 2007).¹

In this sense, the semiotic perspective coincides with fashion studies, or what I would describe more exactly as “fashion theory”, a multidisciplinary field that looks at fashion as a system for producing meaning within which cultural and aesthetic performances of the clothed body are produced (see Calefato 2004). In this paper, after clarifying some methodological, historical and theoretical issues relating to fashion theory, I analyse certain aspects of the socio-semiotic fashion system – among them the relationship between the clothed body and identity, including gender identity – and then examine a number of topics such as luxury, proper names and writing.

2. Fashion theory

The term “fashion theory” refers to an interdisciplinary field that sees fashion as a meaning system within which cultural and aesthetic portrayals of

the clothed body are produced. From a terminological point of view, my choice of this term reflects a development in which the traditional history and sociology of clothing have been critically superseded and theory is implicitly seen as the deconstruction of universalistic canons. From a connotative point of view, “fashion theory” recalls such expressions as “film theory”, “gender theory”, “queer theory”, etc., in which “theory” means specific, genealogical knowledge. The “theory” sees its “subject” – in this case contemporary fashion – as a system in which roles, social hierarchies, models of the imagination, figures of the body are produced. In this sense, fashion theory is culture theory, an expression that partly covers modern “philosophy of culture” but reconceives its terms in the light of the tradition of cultural and gender studies, post-structuralism and post-colonialism.

“Fashion theory” is used here in preference to the term “fashion studies”, which more specifically extend to the various disciplines associated with the professions in the fashion world (from styling to marketing). The use of the term “fashion theory”, on the other hand, points to a transverse theoretical approach which, in advance of any professional know-how, constructs favourable conditions and theoretical filters by selecting from among the human and social sciences (including literature, philosophy and art) the fashion system understood as a special dimension of material culture, the history of the body, the theory of sensibility. Fashion Theory is also the title of an international quarterly edited by Valerie Steele and published by Berg (Oxford) since 1997, which adopts the selfsame approach.

Antecedents and fundamentals of fashion theory can be found in some basic early twentieth-century sociological studies, the most extensive and far-sighted of which are those by Georg Simmel; in the philosophical writings of Walter Benjamin, particularly his notes on nineteenth-century Paris; and in linguistic structuralism, which sees clothing and fashion as a semiological system that to some extent operates like language.

Georg Simmel’s 1895 essay on fashion defines it as a system of social cohesion that allows the individual’s membership of a group to be dialectically reconciled with his relative spiritual independence. Fashion, says Simmel, is governed by motives of imitation and distinction, which are transmitted vertically to the community by a particular social circle. They are accompanied by the “stimulating, piquant” charm that fashion conveys through what Simmel describes as the “contrast between its broad, all-permeating dissemination and its rapid, fundamental evanescence” and as the

“right to be unfaithful to it”. Simmel’s analysis implicitly lays the basis for a definition of fashion as a system that can only be spoken of in the context of modernity, and specifically the mature modernity of mass society, in which the production of goods automatically means the production of mass-producible signs and social meanings. In this classic phase of fashion the dissemination mechanism is a “trickle-down” process from the leisured social classes to the masses, followed by horizontal extension through the imitation mechanism, only to be immediately replaced, in a new cycle, by the distinction mechanism.

Written at the same time as Simmel’s work, Thorstein Veblen’s *The Theory of the Leisure Class* (1899) includes spending on clothing as part of conspicuous consumption by the upper middle classes, whereas Sombart (1913) takes the view that spending (especially by women) on luxuries, of which clothing and accessories are a significant part, has been a key feature of capitalism ever since its original accumulation phase.

As something that is inherent in the mass-reproducibility of commodities, fashion is graphically described in Benjamin’s *Passagen-Werk* (1982) as the “sex appeal of the inorganic”. To Benjamin, fashion represents the triumph of the commodity form, in which the body has become a cadaver, a fetish. In fashion, in an exemplary manner, the relationships between the living and the inorganic are Marxistically inverted and duplicated: the (female) body displays the charm of a devitalised, estranged nature, and remains as an envelope, an adornment, a cadaverous support for clothing. The scenario within which Benjamin constructs this spectral vision is that of the modern city, prototypically presented as the nineteenth-century Paris of passages and flâneurs, of goods exhibited at major fairs, of oneiric architecture, a city in which the Baudelairean worldly artist and the Poe-like madman are striking figures.

A comparison between fashion and language is provided, if only in passing, in two very brief references from Saussure’s *Course of General Linguistics*. The first notes that fashion, unlike language, is not a completely arbitrary system, since the obsession with clothing that fashion implies can only move so far beyond the conditions dictated by the human body. The second deals with the mechanism of imitation, which concerns both the phenomenon of fashion and the phonetic changes in language, and whose origin, says the *Course*, remains a mystery in both cases.

Linguistic semiology in the first half of the twentieth century is fascinated by fashion and costume phenomena, precisely because there it sees the operation of mechanisms of internal opposition between features, of compulsory yet unmotivated variation – a systematicity, in short, that is highly reminiscent of the functioning of language as seen in relation to the notion of sign. In the 1930s Nikolai Trubetskoy, the founder of structural phonetics and at the time a member of the Prague Linguistics Circle, applied the Saussurean contrast between *langue* and *parole* to the relationship between costume and clothing, seeing the former as a social phenomenon (which therefore includes fashion) similar to *langue*, and the latter as an individual act similar to *parole*. Trubetskoy speaks of a homologous relationship between the system of language and the system of clothing, between phonology and study of costumes, thus confirming the more general link that European structuralism established between linguistics and anthropology from the 1930s to the 1950s. In the same direction, Petr Bogatyrev, like Trubetskoy (and Jakobson) one of the leading members of the Prague Circle, produced an analysis of the folk costume of Moravian Slovakia, using a functionalist approach that identified a hierarchy of functions in the costume, including practical, aesthetic, magical and ritual functions (Bogatyrev 1937).

In 1931 the Lithuanian-born American linguistic and anthropologist Edward Sapir wrote the “fashion” entry in the *Encyclopaedia of the Social Sciences*, in which he established the differences between fashion and taste and between fashion and costume, in that the latter is a relatively stable type of social behaviour, whereas the former is subject to constant change. It may be no accident that both Sapir and Trubetskoy (admittedly in different cultural settings) turned their specific attention to both fashion and the notion of the phoneme, i.e. the basic unit of language which is a distinctive, constant feature of it, and on which the recognisability of a linguistic system by contrasts is based. Imitation and distinction, let us remember, are the very motives that Simmel identified in fashion.

3. *Clothing, fashion, identity*

Roland Barthes's *The Fashion System* (1967) is the text that most clearly reflects the shift to a theory of fashion as a social discourse. Radically, Barthes does not deal here with real fashion, but with fashion as described in

magazines: the garment is completely converted into language, and even image is merely used in order to be transposed into words. In this sense, not only (as Barthes provocatively maintained in the face of the Saussurean tradition) is semiology part of linguistics and not vice versa, but language, which “the science of all imagined worlds” (i.e. linguistics) endeavours to set up as a system “with a second birth”, is not “the same as that of linguists”: Barthesian linguistics breaks the canon. Barthes’s lesson, which thus goes beyond actual semiology, is that fashion only exists through the apparatus, technologies and communication systems that construct its meaning. In Barthes’s *System*, specialised journalism is the place where fashion is discussed, where both the subject of fashion and the person for whom it is intended (the reader) are constructed. The post-modern context makes clear that a whole series of social discourses from film to music, the new media and advertising, are the places where fashion exists as a syncretic, intertextual system, as a reticular reference between the signs of the clothed body and as a constant construction and deconstruction of the subjects that negotiate, interpret or receive its meaning.

Dick Hebdige’s 1979 analysis of the subculture fits in perfectly with this. Moving away from the more classic positions of British cultural studies, Hebdige defines style as a form of aesthetic and ethical group membership in mass society with emerging in-crowd cultures (the influence of Gramsci is fundamental here) made up of blocks that include ways of dressing, music, literature, film and daily habits – a pop universe that is expressed in “street styles” ranging from rockers to punks, which Hebdige contrasts with fashion seen as one of the “pre-eminent forms of discourse”. He believes that punk, in particular, was a strategy of denaturalising style, rather like surrealism, which had the effect of revealing paradoxical readings of objects, such as the safety pin stuck into the skin, or unnatural hair colour, simultaneously and criminally revealing the unnatural character of any discourse.

In fact, fashion theory reaches maturity with the abandonment by various disciplines of the whole notion of fashion as an institutional, upper-class social system. “Trickle-down” is turned into “bubble-up”, as is clearly shown by the history of two garments that are emblematic of the twentieth century: jeans and the mini-skirt. Fashion as mass fashion is seen as the place where a complexity of tensions, meanings and values – and not only in relation to clothing is manifested. This complexity is centred on the

body and the ways in which it exists in the world, is represented, is masked, disguised and measured, and clashes with stereotypes and mythologies.

The clothed body is the physico-cultural territory in which the visible, perceivable performance of our outward identity takes place. This composite cultural text-fabric provides opportunities for the manifestation of individual and social traits that draw on such elements as gender, taste, ethnicity, sexuality, sense of belonging to a social group or, conversely, transgression. Fashion studies of masculinity or of the gender differences that have been historically and culturally constructed through clothing show how the history of clothing has also been the history of the body, of the way in which we have constructed it, imagined it and divided it between men and women on the basis of its productive and reproductive functions, its discipline, the hierarchies written on it, the discourses that have constructed its passions and meanings. Fashion – or rather fashions, in the plural – are the devices that organise the signs of the clothed body in time and space, almost as if forging its language, and at the same time they represent possible ways of mixing the reference codes by constructing hybrids between signs, just like the linguistic and cultural hybrids within which the very idea of identity is constructed.

4. Names and brands

Proper names have to do with the body; to be more precise, they “inscribe” the body in the social sphere within a modelling practice – clothing – which can be entirely defined as a form of language, and within fashion seen as the communicative institution that defines clothing in our day and age. In this sense, the name as considered here is part of a range of terms for which I will now propose a provisional “glossary”. The signature is the designer’s signed name, associated with a craftsmanlike and even artistic dimension of stylistic creation; it includes manuality, the charge of passion and identity which the signature as a writing practice contains within it. I am thinking, for example, of the difference between a painter signing a picture and a citizen signing an official document. The former involves the meaning of the work, the complex relationship between the producer and the product which he is relinquishing and giving to others, to the world and to time. The latter involves the performative power of language: a signature on a cheque gives it value in exchange, a signature on a document

endorses what is written in it, and a signature on one's passport confirms one's social and civil identity. Everyday language invents neologisms such as *signé* – a French word that implies the exclusivity, the distinction, the economic and status value contained within the garment.

The brand is the name a company adopts, the sign it uses to “brand” the commodity, quite literally, like livestock. Sometimes it is a name in the strict sense (Armani, Missoni, Benetton, etc.); sometimes it is a symbolic name, a nickname or a fanciful name (Kookai, Krizia, Nike, etc.); sometimes it is a symbol that accompanies the brand and thus becomes a logo (the Nike swoosh, the Lacoste crocodile, the Trussardi dog, the Mandarina Duck duckling, etc.). The proper name is often sufficient on its own, as a text. Sometimes the brand is the genealogical, paternal number, like the signs on the body that the father of the main character in Greenaway's film *The Pillow Book* “gave” her every year on her birthday, but sometimes it enables the body and the identity to mimic itself through clothing, just like a “nickname” on the Internet.

Thus the clothed body often wears proper names. In various spiritual experiences, in religions, traditions and cultures that are sometime very distant from each other in space and time, “wearing” a name often means writing the sacred name of the divinity on one's body. The god's letter or symbol, tattooed or painted on the skin or woven into the garment, metonymically transfigures the devotee's body by bringing it closer to, or actually making it part of, God – a practice that would seem to bring even the great monotheistic religions close to an immanence that is conveyed by language, or rather writing.

Today the proper name written on the body is the secularised, trivial name whereby the garment is “christened” by the person who has the means and power not only to produce it, but above all to communicate it and make it circulate in the empire of signs: the name is in fact fundamentally the brand, symbol, logo or signature that the body is showing off. Here again there is a metonymic relationship, though it is different from the one discussed earlier; in this case it is the garment that becomes a name, and it is the name-as-brand that becomes, if not actually God, at least a myth, a principle and a vehicle of meaning that is seemingly “natural”, but in reality is developed culturally through complex strategies of manipulation and pretence. Objects thus have proper names that are separate from their everyday function: we have always been fond of objects,

like Linus of his blanket, and the best way to show fondness for an object is to give it a name, as though it were an animate being. A name effectively “animates” things, brings what is inert and inorganic to life, in this sense acting as one of the main vehicles of fetishist perversion, be it the expression of the rite of passage of the polymorphous infant, or the obsessive tic of the consumer. What happens when a garment is “christened” brings this perversion directly into contact with the transfigurations that we perform on our bodies whenever we get dressed, in the ordinary, everyday action that revives – though often imperceptibly and unintentionally – both the carnivalesque ritual of disguises and masks and the dress code of uniform.

Nevertheless, the closing years of the twentieth century were marked by hypertrophy, or hypercodification, of proper names in the clothing world. A specific characteristic of social reproduction in our time has in fact been the construction of a style or philosophy of life around the brand, which is the only “product” that companies, with multinationals in the forefront, now want to create, leaving the production of actual goods to “nameless” companies scattered around the world. The globalisation of production is now finally separating those who produce from what they produce: for example, if a multinational has a pair of shoes made at low cost in Indonesia, the shoes will never be worn by the people who have actually made them. The worker will have made the shoes with his or her own hands, but will be dispossessed of them from the outset, since the only thing that matters is who makes the brand, which is what finally gives these hypothetical shoes their name and the aura that the world of marketing and advertising surrounds them with. This can be conceived as an interesting twenty-first-century version of the notion of alienation caused by capitalistic methods of production, which makes one think deeply not only about the power of names, which are truly commodity signs (as Rossi-Landi would say), but also about how relations between “East” and “West”, “first” and “third” worlds, are being redefined in the communication of objects and images associated with the complex system of fashions.

In the fashion system the role of the proper name is particularly rich in both pragmatic (and, I would say, political) and theoretical implications. This notion has its roots in the fullest study ever carried out on the relationship between clothing and language: Barthes’s *The Fashion System*. As already indicated, Barthes treats fashion purely as “described fashion”, i.e. fashion converted into language in specialised magazine features. The

author keeps this fashion quite separate from the “image fashion” of photography and from “real” worn fashion. However, as has also been indicated, Barthes’s treatment sheds a good deal of light on the wider relationship between clothing and language, so much so that *The Fashion System* can truly be considered a “standard work” on the subject. This is also reflected in two striking elements introduced by the name: (1) the construction of a mythological frame of reference based on words: specifically, the brand assumes a precise role in the construction of values and meanings in which the value of the verbal sign is today translated as a commodity; and (2) the function of writing within the same “real” garment, which often explicitly shows the relationship between the garment and the world and between the garment and fashion, as happens with “inscribed” T-shirts or when, more generally, the signature is displayed on garments.

Today the objects of fashion – garments and accessories – have been completely converted into language, to the point where, beyond the requirements of empirical analysis, every presumed gulf between described fashion and real fashion can be said to have been bridged, so essential are the brands, the slogans, the “living captions” that make up the garment, as well as the intersemiotic practices of constant cross-reference between fashion and other meaning systems: film, advertising, metropolitan art, rock music, new in-crowd idiom. Ultimately, “real” fashion is always imbued with language, textuality and intertextuality.

5. *Conclusions*

Today, as Gayatri Spivak Chakravorty (1999) has said, fashion is the way in which narratives of transnational capitalist domination are organised. Yet fashion is ambivalent: it carries stories within in, it institutes spaces, it produces myths, it gives a voice to meanings and is a place of conflict, just like the whole contemporary world is a composite scenario in which clothing signs are in dialogue and are translated. The street is thus the physical and metaphorical place in which styles, tastes and habits that link fashions in a kind of diffuse, popular in-crowd culture emerge. Communication media, above all cinema as a great store and mainspring of social imagination, are acting in extremely close synergy with fashion. New communication techniques are altering the very definitions of corporeality in the social context, and there is a new theoretical awareness of what it means to

see body clothing as a disguise which allows people to abandon social or sexual stereotypes, break the rules of the game with deliberate ambiguity, and produce performances that give pleasure.

Note

1. *Mass moda* in the original Italian: a pun based on the similarity between the words *moda* (“fashion”) and “media”.

Patrizia Calefato

What name are you?

Understanding/misunderstanding a “proper” sign^t

Proper names are like clothes in that they identify us within a multitude and, at the same time, cling to us like a second skin. As with clothes, we can hate them or love them; they can be light or heavy, fashionable or outdated, aristocratic or lower class. They may be our great-grandmother's legacy, like a sort of family *vintage*; they may be taken after film or TV stars, after the protagonist of a novel or an historical figure. They can arouse the senses – sight, touch or smell – like flowers; they can fit us, like a “little black dress”; sometimes we can slip out of our everyday names and put new ones on, a rebirth or to disguise and hide. They can inscribe our identity in the ciphers of a legend, like the one about a family from Emilia – a historically communist Italian region – whose 3 children were named *Rivo*, *Luzio* and *Nario*, so that the three names together would form the word *Revolutionary*. Likewise, the same thing happens when our clothes display a clearly visible brand. Some people achieve their name through many trials, some others make it up by themselves and many others hand it down to their children and offspring.

Names as clothes: this image seems a felicitous one when I focus of proper names as identity signs materializing on an individual body in a metonymic way, just like clothes and garments lie on the body itself. But the issue thickens if we shift from people to places and from places to objects. To name is to bestow life on what is lifeless, but sometimes it may imply the arrogance of considering as lifeless or nameless that which already has a name or a life of its own. Therefore proper names may signify possession, as revealed by the names scattered through History by the empires that have baptised human beings, cities, rivers, mountains and continents into the world. To name is always to infuse the territory with an identifying

sign: always a way to humanize nature. What image is then evoked when the bearer of a proper name is an animal? The owner is usually the one who names the animal, but it may also be an accidental human friend, as happens in the movie *Dances with Wolves*, whose protagonist names a lone wolf “Two Socks” on account of the white colour of his front legs; or as in *Breakfast at Tiffany’s* where the protagonist, Holly, calls her anonymous cat “Poor slob without a name”. But animals, too, use names to call each other with sorts of indices that, in their context, function as those name badges that waitresses wear on their chests in American movies. A way to simplify life. But when the name is placed within language, that is to say within a human system measuring the world, it is not a mere badge on the chest. And if it is, then it means something.

The issue of the name is not easily solved: it cannot be solved by onomastics, which collects valuable inventories of a world that is too big to be encompassed by one entry alone. Indeed, there are also proper designations similar to names, such as book and movie titles or shop signs. And in the same order of the name, bordering the stereotype, we can also include every definition that hastily and inexorably labels somebody or something. Also a proper name is the appellative we use to address our parents or relatives in direct speech: dad, aunt, grandpa. And in reported speech there is a different shade of meaning between “my mother” and “mom”; “aunt Rosa” and “aunt”. The different designation implies a relationship between the speaker and the one who is called. It is also here that the name, in all its senses and meanings, becomes a generating principle of affects, the sign of a relationship.

But there is more to this, because meanings of the name are not confined to verbal language alone, but live in close connection to images. In visual culture such elements as logos, brands, labels and goods packaging, function in a similar way to names: they are signs that translate richness into emblems. Signs that we can see and often feel with all our senses, sometimes even “touching” their smells and tastes. The issue of the name resists be solved, because its features and powers can only be touched upon in contexts other than that of communication.

What is a name? The answer that Juliet provides to this question conveys all the naiveté of her age. If Romeo Montague took off the family name that identifies him, he would no longer exist, because there would be no way for his story and for Juliet Capulet to exist. And yet, within and

without the narration, in the thread of a discourse whose end reaches us, she is talking about the family name as an intruding wedge between their love, and she advocates fighting against any chauvinist and identitarian idea of belonging that the proper name may symbolize.

In reality, as well as in fiction, the name hosts a narrative principle that makes it live as a sign; the name is always anchored to a myth, be it a foundational myth of an origin or a prosaic, contemporary one. My curiosity and passion for the status and the powers of proper names was prompted by an essay by Roland Barthes about names in Proust. I will let a quotation speak for itself:

Le Nom propre dispose des trois propriétés que le narrateur reconnaît à la réminiscence: le pouvoir d'essentialisation (puisqu'il ne désigne qu'un seul référent), le pouvoir de citation (puisqu'on peut appeler à discrétion toute l'essence enfermée dans le nom, en le proférant, le pouvoir d'exploration (puisque l'on "déplie" un nom propre exactement comme on fait d'un souvenir). Le Nom propre est en quelque sorte la forme linguistique de la réminiscence. (Barthes 1972: 124)

Therefore names designate, quote, help us remember, although sometimes we may forget them and they are stuck on the tip of the tongue. Unfortunately this is precisely one of the first signs that disappear from speech when some strange alchemies of the age make our memory fade selectively. To call somebody may express the wish to hold, to ask to come closer, to call for help, as when we call "mom" or "God" in moments of grief. Naming can also mean letting go, as when the proper name becomes the cipher of the separation between the maternal body and that of a newly born body. The name cannot be taken in vain.

The paths to the name cannot be exhausted in infinite surveys or typologies. They would be too many; maybe as many as the existing names, because the issue of the name is best explored through singularities, anecdotes and daily storytelling.

What happens, then, when we name? When we call or name others or ourselves, when we say the name, when we give the name, when we hide it? What signifying practices revolve around the proper name? These questions are not meant to find a univocal symbolism, a key or magical word that would reveal some kind of wonder. These questions are not searching for the name in itself, but rather for the act of naming as a way of living the

language and within the language, a way to build the relation between the speaker and the world, and at the same time to question that very relation, on the basis of language itself. These questions do not call for a univocal answer given once and for all, but rather question the common condition of possibility of speaking and of calling each other, the condition upon which the relationships between human beings originate and their positions are defined.

By naming, human beings address themselves, the world and things; they somehow question them, addressing them a simple question: “What’s your name”? This common attitude is to be found in all languages, though it is not an innate one: purloining the term from Christianity, I call it “baptizing”. Of course I am figuring the name according to the uses and powers that are known to me, according to the ways it usually works in European modern languages. But I can sense that multiple tensions are at play in this common attitude to “baptizing”.

The category of proper names has always played a key role in philosophical, linguistic and semiotic studies. It is peculiar to proper names, whether of people, animals or places, to raise the issue of the relationship between the *presence* of the being or of the object it refers to, and its *evocation* in the word. Surely this is a problem concerning the whole of verbal language; more generally, all signs, verbal or nonverbal, are kinds of “substitutes” for something to which they refer. But the proper name, in that it is usually considered as a sign precisely identifying its bearer, reveals the features of a peculiar element in language, not only with regard to the person, the place or the animal it refers to, but most of all in relation to identity.

Many modern linguistic, logical and philosophical theories on proper names are based on the assumption of an intrinsic relationship between language and truth. Albeit from different perspectives, all these theories have shown that the proper name is a very special entity in language. Philosophy of language has privileged the referential connections of the name with its *denotatum*, or referent, either real or fictional, which the proper name identifies, such as a person, an animal, a place, a star, a literary character, and so on. This trend was developed by twentieth century authors such as Frege (1892), Russell (1905) and Kripke (1980) who followed the classical theory on proper names by John Stuart Mill (1843).

Still, those various logical and linguistic-philosophical theories on proper names all agree on one aspect: proper names, as Mill stated, denote

but do not connote; that is to say, they have a somehow unique and identified referent, be it a person, an object, an animal or a place, but they don't have a meaning. These theories prompt a fascinating insight that reveals or resonates with the mysteries of language: in all of them, the object-“proper name” has been moulded according to the idea of the patronymic, of the name of the same. An implicit patriarchal view underlies them: a view of naming and baptizing that can be metaphorically defined as “male”, at least in the sense that in all these reflections we can see a baptism without “flesh” at work. What is lacking in all these “filiations” is that principle which, just as metaphorically, can be defined as “female” or “maternal”. According to this principle, the body receiving the name is a body that is separated through birth, a body to which we say “go now”, rather than a body on which the name is imposed as a “property” warranty.

Several issues have been raised by modern philosophical-linguistic theories. For instance, how is it possible to name the same thing with different names (such as the evening star and the morning star, Hesperus and Phosphorus)? Or what happens when a “definite description”, in Russell's definition, cannot be given any “true” name (“The present King of France is bald” might be a description, but there is no present king of France)? In a word, the limits of theory have appeared when it implicitly comes to light that the reference of a name is not the rigidly designated “thing”. On the contrary, the name can be better understood as interpretation, social context, thickening shifts, not only logical or conventional ones, that engage the subject in the act of naming and that constitute him/her in the relation with others and with that very linguistic matter of which names are made.

Does “naming” mean leaving a word as mark of identity and of property on the world, or does it rather mean leaving the word to others? According to Roman Jakobson (1963), proper names represent one of the forms of the “circularity of language”. Unable to express any kind of intellectual abstraction, proper names can only refer to the linguistic code in a circular way, according to this view. “Jerry”, writes Jakobson, means a person named Jerry. “Fido” a dog named Fido. Referring to Bertrand Russell, Jakobson writes that, the meaning of the attributes that might refer to Fido, such as “mongrel” or “pup” or “hound”, can always be replaced by general abstractions such as mongrelness, puppihood, or houndness, but there is no such thing as a general meaning of Fido that qualifies as “Fidoness”. In a word, the proper name would be but a tautology. Modern linguistic theo-

ries have often ill-treated proper names though at the same time they have been fascinated by them. Even personal pronouns – infinitesimal particles, such as “I” or “you”, sounding like trifles if compared to a proper name like “Vercingetorige” (see Caprini 2001) – have had a better, more decorous fortune, and, for instance, in the theory of enunciation (see Benveniste 1966) have even emerged as those elements in discourse by which subjectivity can emerge in language.

Yet the name is a whole world, it animates the world, it makes us alive – and not only because it classifies, as argued by Lévi-Strauss (1962), who nonetheless recognized that proper names had social meanings linked to their ability to identify and to qualify individuals in a human social system. But the order cannot fully explain proper names. Actually it is the less conventional side that captivates the dark and brilliant powers of proper names, especially of personal proper names. It is the space of laughter and of parody that sets names to work and, for instance, gives birth to nicknames and monikers, such as those that emphasize certain bodily features of the person that receives them.

Consider the worldwide web, that shapeless and “smooth” territory (Vulli 2005) which is nonetheless crossed by countless paths of meaning, by voices, bodies, drives and laughs, just like a square or a street crowded with people. It is on the web that we can withdraw at night, as if it were a room with transparent walls, and try to guess who will be the stranger that will cross those walls, calling us. It is there that one can be in dinning crowds, in a jarring choir of asynchronous lines that run one after another through open windows and childish ruses of emoticons and trills. It is there that the anonymous and brandless knowledge settles, is downloaded and searched for; it is there that images, music, videos, writings are posted and shared. It is there that we send and receive countless emails that might well remain there, unanswered for the next ten thousand years, if only we wanted them to. It is there that we wear our *nicks*.

Nicks interpret and fulfil the human vocation to create literature. That has always been a peculiar feature of nicknames: small texts that can hold together, in just one sign, body and laughter, very often a laughter that sounds like mockery, like a pillory. The nickname, like the sobriquet, is a sign achieved with art but, unlike the latter, is gained by the “owner” as if it were a small trophy. Boys and girls chatting on MSN can change one nick per day, according to their mood or to the music they are listening to

in their playlist, always managing to match it with a motto, a desire or a provocation in their “name cards” – a way to yield or deny oneself to those who hold us on their “contact list”.

Widespread technology has made us all more skilled in making up words: how many passwords do we have to coin and remember every day to access our mailbox, online banks or Ebay? A ciphered memory binds us to our money every time we use the cash card and are required to insert the pin code. But nicks we do not need to remember, because they belong to us. They allow us to make explicit the meanings conveyed by the name, like Manzoni did with “Azzeccagarbugli” (literally, someone who deliberately tangles things up; Manzoni used it to name the character of a pettifogging lawyer). Or they allow us to hint playfully at those meanings, as Dickens did with Jingle. Or they may allow us to reproduce the *senhal* of Provençal poets in a small scale, but with ourselves as depositories of the “screen name”.

Thus electronic *nicknames*, grotesque sobriquets or art pseudonyms, are all signs of a “scene of writing”, to use an expression by Derrida (1967). They are a way to get the chance to choose a “shifted” fate, both when the function of the name is limited to conveying an “essence”, and when naming ourselves as others lays open our desired choices, which language alone can fulfil.

The name “Luther Blissett”, for instance, has become one of the most anonymous and shared names of the last decades. Or better, it has become the typical example of the “anonymous” name, a name that belongs to everybody and to nobody, ownerless, with no possible denotation other than the media hoaxes that featured him as absent protagonist in the 1990s, or the fact that a multitude of newsgroup and chat users exhibited that name, it finally becoming the name of a collective of literary authors based in Bologna.

We live within received meanings, but we must not lose, or perhaps we must regain, the possibility to think about the meaning of the relationship that occurs between ourselves and the world through language. There are moments in life, like childhood, and places in language, like literature, in which our meta-linguistic awareness of this relationship is very high. Through the “why” of children or through the questions posed by poetic language, words interrogate themselves. They do not do so to get a sure answer, but rather to offer themselves as “question-words”, as crossings,

doors or bridges in language. The name can be one such question-word, if we manage to grasp its power. “Language, however formal it might be, lives on blood, flesh, material elements”, wrote Luce Irigaray (1985). Woven into language, we reproduce its materiality and every time the question-words drape us, all the articulations of our relationship to the world regenerate.

A sign becomes many-faceted when its function goes beyond one communicative system, such as the verbal one, and takes on a complex relational value that becomes a basis to build beliefs, behaviours, habits and ideologies. Brand, trademark, logo, *griffe*: in that disguise, proper names have gained extraordinary power in contemporary communication. We are surrounded by names; we wear them on clothes and accessories, hidden in labels or flaunted like decorative features; we find them on every street corner, on every magazine page. Sometimes the first act in the establishment of a firm, a company or a work group, is the creation of the brand. A creation that is all the more evocative, effective and stimulating if grounded on a culture and awareness that are not only graphic, but wide-ranging.

Perhaps the culture of the brand name can be found in the direct etymology of the current denomination of the trademark transformed into a visually recognizable emblem: “logo”. The word “logo” is an abbreviation for “logotype”, which is defined as “A name, symbol, or trademark designed for easy and definite recognition, especially one borne on a single printing plate or piece of type” (*American Heritage Dictionary* 2000). However, it is not without meaning that the term “logo”, unvaried in several languages, refers to “logos”, and not only from a lexical point of view. In the philosophical lexicon, the Greek word “logos” is often untranslated. In its semantic universe we include language, discourse, reason, besides the basic Heraclitean sense of “connection”. From “logos” originate such words as “logic”, and parts of such words as “monologue” and “dialogue”. In Italian and other modern European languages, it is a confix that expresses a reference to speech, in such terms as “logopaedics”. In another sense, the same confix “logo” recalls a specialism, as in “papyrology” or “allergology”. Even the brand-logo is a “concentrate” of language and reason, so to speak. Most of the time it is a proper name that is represented and stylized, namely, the surname of the owner or the name of the firm, inscribed as a word or an initial. But in other cases a specific symbol can visually represent by abstraction a general concept, as in the case of Nike’s “swoosh”: a swirl, a boomerang or apostrophe suggesting the idea of speed and movement.

The brand is a manifestation of contemporary myth, as Barthes (1957) meant it, that is to say, as signs and artefacts that manage to appear natural, eternal, beyond time. The brand gives life to things and places, as if it were the sign of an imaginary “baptism” through which objects, institutions, and spaces are invested with a life of their own. Brands are thus able to arouse passions, emotions, memories. Obviously the proliferation of brands, trademarks, labels and logos, especially in recent years, makes everything sound as if it were already heard, already named, already “baptised”. Sometimes there seems to be no room for the nobodies in this world. In today’s world of communication what has become more and more important is not so much the object in its usefulness, nor its monetary value (at least not directly): what matters nowadays is the communicative value of an object, its function as a sign, its philosophy, the “life style” it conveys. And what better symbol than a name, a brand, a logo to sum all this up? What greater power can be found in language than that of the proper name or of its graphic equivalent (signature or symbol), to seal the evocation of a whole world in just one sign? Teenagers are often seduced by the logo. It is the brand drawn on backpacks and on school diaries; it is the sign that makes them socially classify others and identify their “tribe”; sometimes it becomes a sign tattooed on the skin. The “monobrand”, metaphorically understood as uniformity in globalized habits and fashions, as copyright on things and people, lurks as linguistic cipher of money and of its power to reduce and flatten the world under its signs. As Benjamin (1928) wrote in “The Origin of German Tragic Drama”: “In the context of allegory the image is only a signature, the monogram of essence, not the essence itself in a mask.”

A real “naming euphoria” has crept into those systems that regulate the use, consumption and communication of objects, above all the fashion system which, by contrast, is also the system that decrees the emptiest generic-ness of the replaceability of bodies. Actually, the symbolic economy of fashion regulates other mythological institutions of these times, as well. Forms of consumption, media passions, political illusions – how many fashion patterns fit in the labels, brands and “colours” we follow! And the more the name as brand and as logo invades individual lives, the more anonymous, generic and interchangeable we become.

It is this semiotic and existential space that the possibility to perform a semantic inversion, a mocking treatment of the name, comes to life. It is

precisely this carnivalesque and derisory manipulation of the name that sheds special light on the phenomenon of the fake. In the fake, the brand – the registered institution, the source of wealth, the status symbol and the myth – is pilloried. In Italy the phenomenology of such places is well known: think of Forcella or street markets where explicit mystifications of big firms circulate freely. A source of profit for global mafias, a world risk if it enters the market of pharmaceutical products, an attack on the image of quality that distinguishes the “Made in Italy”, the fake occurs through the disguise or the copy of the brand, label or logo. Released on the market in this way are products resembling the “original” ones in everything except for their “quality”. The fake can be a mere imitation of a prototype, or a real forgery of the brand, or the counterfeiting of a name, or a symbol that resembles the original, but is slightly different from it.

Today, critical awareness of the power of the sign develops by means of several strategies. In recent years several associations, groups of activists, jammers and hackers, magazines and web sites have produced what has been defined as “culture jamming”, that is to say, the parody and exposure of misrepresentations connected to the brand and to advertisements by means of practices that include street graffiti, graphic interventions on billboards, and hacking. It is the proper name that becomes the main target of this real “semiotic guerrilla warfare”, which uses the same techniques of marketing and of advertisement to play on signs and to subvert completely the meaning of the values communicated. Also these jamming practices make use of names, as in the example of Yomango, a group of Spanish activists that deform the logo of a “youth fashion” brand, Mango, and subvert it with an expression meaning “I steal”. The proper name thus becomes the result of collective practices of “anonymity”, disguise and distortion, used by many contemporary metropolitan movements that strive for emancipation from those bonds that symbols impose on us, but that signs can defy.

The language of advertisement

The term *advertising* derives from the medieval Latin verb *advertere* “to direct one’s attention to”. It describes any type or form of public announcement intended to promote the sale of specific products or services. This kind of public announcement is directed towards large numbers of people, in an attempt to influence their behaviour.

In order to analyse advertising as a means of communication, it might be useful to consider Jakobson’s model of communication. In advertising, the *addresser* is the company or producer sending an *ad-message* to the *addressee* who is represented by the reader, the viewer, or the listener, depending on the kind of medium used. The message lives in a *context* that includes the sponsored product or service. The *code* common to the addresser and the addressee is oral or written depending on the medium. A *contact* between the addresser and the addressee is also necessary, “enabling both of them to enter and stay in communication” (Jakobson 1960: 353).

Jakobson proposed that each of these six factors determines a different function of language. All the functions analysed by Jakobson are present in advertising, as in each communicative act. However, as Eco (1968), Ferraro (1999) and other theorists say, one function might prevail over the others, so that the advert will be characterized by that particular function. According to these theories, there should be:

- a *referential message*: oriented towards the context, its main goal is to give information about the product;
- an *expressive message*: focused on the addresser, it is meant to express the image of the brand;
- a *phatic message*: concerning the contact, its purpose is to establish and maintain a relationship between the addresser and the addressee;
- a *conative message*: regarding the addressee, it is intended to influence the addressee’s behaviour;

- a *metalingual message*: oriented towards the code, it refers to the nature of interaction;
- a *poetic message*: concerning the message, it foregrounds textual features.

Since the addresser must exploit all the expressive and stylistic components of the message to be convincing, the *poetic* function is basic. However, according to Volli (2003: 56), the more a message is dominated by the poetic function, the latter being original, ambiguous and allusive, the more it risks not being understood. In this context, it is possible to understand the importance of the *metalingual* function, the purpose of which is to rule the communication of the code and so the comprehensibility of the message.

A *phatic* advertising message will use all the devices to attract the receiver's attention in order to create a contact between the addresser and the addressee. Through the use of colours, music, jingles, particular images, it will try to catch the addressees' attention so that they will not change the radio or TV programme, or they will look at the print advert or posters without turning the page or their head. The phatic function is necessary to the ad-message, since, if it fails to capture the attention of the addressee, it will never be decoded.

The contact created by advertising is often imposed on the receiver, invading his perceptual sphere. The receiver cannot escape from it, since it is present on every occasion in public or private life. Moreover the receiver's capacity to control ad-messages is limited, since the latter succeed in imposing themselves and attracting the attention of those who do not even look for them intentionally. Each type of advertising has a different way of creating a contact and imposing itself. In fact, the receiver's possibility to control ad-communication varies according to the medium used. TV and radio commercials last a few seconds, during which they try to catch the addressee's attention. Often receivers are not paying attention to the spot, as they are doing something else, as a recent study by Mark Ritson has demonstrated.¹ Moreover, they always have the communicative situation under control and can switch over when they want. So this type of advertising does not have a strong capacity to impose contact between addressee and addresser.

Posters wait to be looked at by addressees, so their location is crucial, and addressees can simply see them and then turn their head, or study them

attentively, it depends on the interest the ad arouses. The printed advertisement does not have the possibility of imposing itself in a stable way since it is located on a magazine page that is meant to be turned. However, it offers the possibility of being reread and re-examined, as with all written texts. Internet ads are the most intrusive: it is impossible to avoid them because they are on the pages that the addressee is reading. Recently, banners have started appearing on videos, placing themselves over the text. So the perceptual contact is imposed, but the communicative contact and the phatic function, as a consequence, are often obstructed. In fact the strong imposition is considered irritating by addressees, so the advert is not effective.

As for the referential function, it prevails over the others when the message is mainly a description of the advertised object or service. But the most characteristic function of advertising is the *conative* one. It tries to influence addressees so that they will change their initial indifference towards the product into acceptance, and finally into a desire to have it. Persuasion uses a lot of devices to be effective. One of them is to propose a model of the customer using the product in order to fascinate addressees and persuade them into thinking that, by buying the product, they can assimilate that model lifestyle. This method refers also to the *expressive* function so much used in the creation of an attractive brand image for the addressee. So it is possible to create the illusion that, by owning the product, you can transform your image into the one proposed by the addresser.

To look back through the history of advertising and study the evolutionary changes in the predominant communicative functions employed can be most informative. It enables us to see that past forms of advertising, such as ancient posters, town criers, the first printed ads – all these focused on the utilitarian aspects of the product itself (its qualities, price, and functions). Thus, it is possible to say that past adverts were mainly characterized by the referential function.

In the nineteenth century, printed ads began to exploit stylistic components of the language, particularly for slogans; adverts began to include rhetorical figures, rhymes, assonances, coining of new words. With this, the poetic function started to become a protagonist in advertising. Moreover the use of colours, particular font styles, and formats were employed to catch the readers' attention, so the phatic function started to be consciously exploited.

It is possible to say that, in the beginning, ads were more direct and explicit, then with the passing of time they became more implicit. From the 1920s onwards, advertisers began to give more importance to the hoped-for customer than to the product itself. This is the moment in which they began to realize the power of the expressive and conative functions. So their efforts have gone toward creating the consumer's image, and they focus on personality models (glamour, romance, sensuality) that the addressee may find attractive.

Considering the fact that the addresser imitates the lifestyle model to which the addressee aspires, it is possible to accept Marcel Danesi's theory that advertisers are not innovators:

They are more intent on reinforcing lifestyle behaviours than in spreading commercially-risky innovations. Advertisements are not in themselves disruptive of the value systems of the cultural mainstream; rather they reflect "shifts" already present in popular culture. If they are effective..., it is primarily because they tap into deeply-engrained mythical and metaphorical structures that constitute a culture. (Danesi 1995: 14)

In order to facilitate the construction of an image accepted by the consumer/addressee, ad campaigns often try to give local features to the product. Even if the product is created in a different country, in advertising it will often be perceived as belonging to the country in which it is advertised, and thus closer to the addressee.

Conversely, sometimes the campaign does not create the illusion that the product is local, but stresses the fact that it belongs to the country in which the product is made, if that country is synonymous with something that can be attractive to the viewer/reader. Paradoxically, some brands try to take features that are characteristic of other countries, as some kind of guarantee of the worth of their product. For instance, Roland Barthes (1964) in his essay *La rhétorique de l'image* analyses a printed advertisement of a pasta, made in France, which exalts the fact that it is produced *à l'italienne*, following the Italian way of pasta-making. In fact, its name *sounds* Italian, and the visuals of the ad display the colours of the Italian flag, etc. This occurs because Italy is perceived abroad as the best maker of pasta.

Other ad-campaigns are based on an "internationalized" nature. It is what Volli (2003: 85) calls "isotopia intertestuale", to denote the constant

presence of a textual element, concept, or other significant component that constitutes the text core, which in advertising is located around the brand. It is intertextual, since it is possible to find it in everything concerning the product. It can be the colour, the trademark, the content. For instance, *Coca Cola* has never changed its lettering and its red colour. These elements remain the same in time and in space, so the brand can give a reliable and stable image to the addressee.

Each campaign is addressed to a particular target audience who can identify themselves with the image established by the company. Advertisers study their target audiences closely in an attempt to create the image and message most likely to influence behaviour. As Fairclough says:

Adverts represent an interpersonal relationship between the producer/advertiser and the consumer. This relationship facilitates the “ideological work” of the advert: that is to establish trust, goodwill, or another relevant basis that will support acceptance of the product and consumer image, and therefore compliance with the message of the advert. Adverts construct “positions” for consumers that will give them a good fit with the product being advertised. Positioning of the consumer can be done by presupposing that s/he has certain knowledge, beliefs, aspirations, income, habits or possessions, or implying that s/he should have them. (Fairclough, cited in Delin 2000: 131).

As noted above, this strategy involves the expressive function in the brand image construction, and the conative function in the consumer’s image-creation. At the moment, this is the most exploited practice in advertising. It can be risky, however, when ads are excessively focused on the consumer’s image and needs. In fact, if the ad is accepted by addressees because it makes them dream or generates laughter, then it is not focusing on the product and will thus prove unsuccessful. It will fulfil the addressee’s escapist needs, but the product, its name, and its characteristics will be easily forgotten.

In conclusion: advertising must create a balance among all the communicative functions. The persuasive strategy, which includes the conative and expressive functions, needs to take into consideration the referential function, so that the right importance will be given to the brand, to the consumer image, and to the product itself. The poetic function should balance with the metalingual function, so that the ad’s message will, at the same time, be refined and comprehensible. Phatic aspects should be meas-

ured in relation to the ad's potential intrusiveness. The effectiveness of an advertisement may depend on suppressing those aspects that might cause a lack of equilibrium in the communicative process of advertising.

Stefano Carlucci

Contemporaries but different

Ex-vocation versus re-production?

Can this cockpit hold
The vasty fields of France? Or may we cram
Within this wooden box the very casques
That did affright the air at Agincourt?
(William Shakespeare, 1599)

La scena deve assigliarsi il più
che sia possibile al luoco dove si
finge che sia avvenuto il caso di cui
E' composta la favola.
(Angelo Ingegneri, 1598)

These two epigraphs, almost coeval, illustrate two different theoretical and methodological approaches to one of the most remarkable factors of the theatrical event: the dialogical and mutable relationship between the singular physical space in which every play must be staged and that “insubstantial pageant” (Shakespeare) to which the dramatical text refers. Here I examine on various levels the explicit differences, but also point out some unpredictable likenesses, between those dramatic conceptions embodied in the original London Globe Theatre, on the one hand, and the Teatro Olimpico in Vicenza, on the other. As George Kernodle said: “At first glance the Italian perspective stage and the Elizabethan stage, seem totally unrelated, indeed at opposite extremes ... But neither the theatre of Shakespeare nor any continental theatre of the Sixteenth Century can be considered alone.... Yet these theatres were not unrelated” (Kernodle 1944: 3).

It is in any case clear that each theatrical play is intended to be performed in the presence of an audience, ideal or not, within a concrete and therefore limited space, so the interpretation process which follows this production of meaning will involve all the senses, sight at first: “Le theatre est bien en effet cette pratique qui calcule la place regardé des choses: si je mets le spectacle ici, le spectateur verra cela, si je le mets ailleurs, il ne verra pas, et je pourrai profiter de cette cache pour jouer d’une illusion ...” (Barthes 1982: 86).

Sight, which can be considered at same time an inescapable vehicle and a polysemic instrument in the creation of sense in every form of theatre, tends to become in the Renaissance perspective theatres the privileged channel to realize the kind of direct persuasion demanded by practice. To accomplish this visual seduction, an active decodification or analysis must take place in the spectators, who can more easily understand scenery than they do any other part of the dramatic event.

The course of this practice will be emphasized in the Baroque theatre, to the point of conceiving the audience almost as a target to hit, and this fact will be materialised in the actual construction of seventeenth-century theatres, in which a more and more clear separation of the respective spaces and roles of actors and spectators will become the rule. Considering the five senses as waterproof compartments, each of them as an *hortus conclusus* could lead to potential misinterpretations. Barthes again: “Comme lieu de signifiante, le regard provoque une synesthésie, une indivision des sens, qui mettent leurs impressions en commun, de telle sorte que on puisse attribuer à l’un poétiquement, ce qui arrive à l’autre ... tous les sens peuvent donc ‘regarder’, et inversement, le regard peut sentir, écouter, tâter, etc. Goethe: ‘Les mains veulent voir, les yeux veulent caresser’” (Barthes 1982: 280). Sight, however, especially if intended in its double nature of seeing agent and observed object, deictically links actors, scenes and audience, contributing to the generation of meanings during the interpretation activity. Hence reducing sight to its mere physiological component deprives it of the status of language.

In the complex relationship between imagination and visibility the Olympic Theatre pursues, as the words of Angelo Ingegneri attest, a material and explicit resemblance of the scenes to the place to which the dramatic plot refers: the wood and stucco constructions behind the flowery *frons scaenae* try to reproduce the seven streets of Thebes, the location of *Edipo Tiranno*, Orsatto Giustiniani’s modern adaptation of Sophocles’ *Oedipus Rex*. Apart from representing the streets of Thebes, necessarily a theoretical exercise since probably no one among its builders had never seen the ruin of any ancient Greek city, the perspective buildings were a further interpretation of that recurrent idea of the ideal city so in vogue in the Renaissance: the Olympic Academicians wanted to erect Vicenza itself, but were only able to dream of doing so.

Any possible comparison between different ways of conceiving theatrical scenographies cannot ignore the fact that all of them are, in different forms, artistic expressions with common roots: “Le représentation ne se définit pas directement par l’imitation: se débarrasserait-on des notions de ‘reel’, de ‘vraisemblable’, de ‘copie’, il restera toujours de la ‘représentation’, tant qu’un sujet (auteur, lecteur, spectateur ou voyeur) portera son regard vers un horizon et y découpera la base d’un triangle dont son oeil (ou son esprit) sera le sommet” (Barthes 1982: 86). Actually the perspectival sceneries of the Teatro Olimpico connote deeply its dramatic possibilities, defining an interpretative course in some way pre-arranged, limited only to certain types of representation. This should be evident, since Angelo Ingegneri himself stated that without structural changes, mainly focused on the scenery, the Theatre would not have been very suitable for anything other than classical tragedy (Ingegneri 1585: 67).

This is the first landmark breaking point with Elizabethan theatres and their well-known flexibility: the Teatro Olimpico may be considered a delicate, pressed flower which can hardly endure even the slightest change of dramatical staging, should it differ from one for which it was originally created. In contrast stands the Elizabethan theatre: “With so many stage spaces, the multiple scenes of Shakespeare’s plays could be played through without interruption for scenery changes. The action moved from one playing space to another. In many ways it was the most flexible theatre ever developed” (Encyclopedia Britannica, Vol. 23).

The complicated dramatic essence of the Teatro Olimpico is a moot point as well as a subjective opinion based on the analysis of various attempts to conform its hardly negligible architectural and dramatic personality to different theatrical conceptions. For instance, its fixed three-dimensional scenes, probably constructed so as to last only for opening night, could not satisfy the fundamental need of Baroque plays, so as to appear chronologically near but dramatically distant.

Its uniqueness is one of the main reasons why, after the triumphal opening night (March 1585), the Olympic Theatre was piratically abandoned, left in its medieval shell, in a sort of dramatic lethargy. Because of its ephemeral status the Olympic Theatre has been compared to a minor character in Alessandro Manzoni’s *I Promessi Sposi*: an old servant of Don Rodrigo, who spent most of his life alone and neglected, except for some special occasions, when his classy manners were useful for receiving impor-

tant guests. In the same way, the Olympic Theatre, for more than three centuries, lived beneath a growing layer of dust, occasionally removed only to reflect and take advantage, however briefly, of its decaying beauty. It was a costly dramatic machine, difficult to maintain, but also an infallible weapon, perfect for amazing noblemen and dignitaries: an instrument that could “play its part” even without live actors.

In contrast to the architecturally existing presence of these theatres, which are still alive, the Elizabethan theatres were not able to survive beyond their building period; they occasionally burned down or were destroyed on purpose. It must be said, however, that they were not the ugly and bare structures described in some critical studies; that notion has been properly laid to rest. They were public structures, open to different social classes. But the Olympic Theatre, as all other Academic Italian theatres, was a private structure, far removed from even the perception of common people. It was a theatre only for the few persons invited to its rare performances; intended only for those who could experience its dramatic significance: “And by their very size, their capacity of holding large numbers of people, the English theatres were public theatres in the classic sense, more truly vitruvian in the spirit than any courtly or academic adaptation, with its limited audience” (Yates 1969: 129).

Paradoxically, sixteenth and seventeenth century Italian theatres somehow betrayed the spirit of that ancient theatre they wanted to recreate. The Olympic Theatre copies the forms of a Greek theatre, but it is much smaller and is covered, hidden; in a sort of architectural impersonation, it plays the role of an ancient theatre while differing greatly from it: “... the altered social structure of Renaissance Italy placed theatre in a very different social context from that of ancient times, and the physical configuration of the new theatres not surprisingly reflected this” (Carlson 1987: 38).

Carlson’s words summarize that renewed interest for classical drama which led to renewed building of theatrical buildings for the first time since the fall of the western Roman Empire.

The Olympic Theatre can be considered one of the most interesting results of that historical trend. It was built inside a medieval castle, the use of which varied over the centuries: from river control station, to prison, to monastery. Sometimes it is regarded as the first modern theatre; but it cannot be described as a complete theatre building: in the sixteenth century, theatres were not yet able to exist solely for the presentation of plays

or the like. The Olympic Theatre, in spite of its gorgeous interiors, could not reveal its dramatical identity through an architectural façade; it thus existed, protected, but hidden by its anonymous significance.

As regards this point, Elizabethan theatres had to coexist with the levels of society in which they were built. The City banned construction of public theatres within their boundaries; they were consequently decentred and marginal but, at least, visible.

They were inevitably a litmus test of the contradictions of the Umwelt by which they were generated, and differing from their contemporary Italian counterparts. Almost 10% of the population of London went to theatre at least once a week, making theatres a living part of society as well as a source of profit. By contrast, Italian theatres were private, were secluded from everyday life, and often a drain on their creators' purses.

From this point of view the Olympic Theatre can be considered more like the ephemeral parades typical of the Renaissance, and even the subsequent English court masques: the only actual difference is that the Olympic Theatre is still there. Practically unchanged since 1585 and thanks to the permanent, symbiotic relationship with its medieval shell, this wonderful "larva" keeps on surviving, but will never break its cocoon to fly away, for without its prison it cannot exist.

The only Elizabethan theatre in existence today is a drawing the interiors of the original Swan Theatre by Joannes de Witt; the actual, physical buildings, spread all over the world, are reproductions, copies, and translations of the Shakespearean Globe. The Globe Theatre (building) is dead, but its idea remains alive and changing day by day.

The relationship between actors and audience in the Elizabethan theatre was characterized by much interaction. In early reports of Hamlet productions, an explicit, dialogical intercourse is said to have taken place among them. This active participation of the audience will diminish during the following centuries, in which these dialogues will become actors' monologues. The influences of continental dramatic theories finally broke down that spatial and performative balance, a direct derivation of the medieval absolute concept of space, distinctive of the Elizabethan theatre: the represented space was only a part of the real one and not an artificial alternative to it. Applying a clear separation of roles between an audience, which beholds, and the whole cast on the stage which in the act of playing is seen, scenery in the seventeenth century becomes in general a drawing; the two

worlds are physically and metaphorically separated by a curtain, limited by a cornice.

There were some significant exceptions, such as the representation Bernardo Buontalenti stages in Florence in 1600 on occasion of the wedding of Maria de Medici and Henry IV of France: “It was marked by a pomp and splendor characteristic of the Baroque to come, but the most remarkable novelty, was the effect achieved by placing spectators on the stage and thus continuing the court in the realm of a fictitious, illusionistic world” (Bernheimer 1956: 225).

The evolution of the English stage began in private theatres, such as the Blackfriars Theatre, in which the unifying Italian principle, usually materialised by a square surrounded by houses, was approached via the presence of little symbolic scenes without any illusionistic aim. This process will end in Restoration Theatre in which the difficulty of finding a compromise between unification and the presence of different places was faced by Dryden in 1668: “By the variation of painted scenes, the fancy, which in this case will contribute to his own deceit, may sometimes imagine it [the stage], several places with some appearances of probability; yet it still carries the greater likelihood of truth if those places be supposed so near each other as in the same city or town; which may all be comprehended under the larger denomination of one place.”

Even the Olympic Theatre, in all its uniqueness, connotes itself as an experiment in which illusionistic results, attained by the application of perspectival principles, are linked to non-illusionistic screens. The Olympic Theatre was not a public theatre; nor was it a political instrument used to express a prince’s dreams of centralizing power. In its multifocal streets are represented the ideal, but mostly unachieved, aspirations of a club of equals, no one of which could see all the streets at the same time.

To conclude: it is evident that the relationship between real and the fictitious worlds was solved in different ways; but one must bear in mind that even the most realistic drawings inevitably interpret the reality that is their object. Hence the results of this process will always be different from the object itself. In the same way, any kind of perspective or realistic scenery will be able to reconstruct a street – for example, those of the Olympic Theatre; but they will always be perceived as artifice: “The realism of even the most advanced artist was a realism of method which still dealt with highly imaginative content” (Kernodle 1944: 78).

Sémiotisation et actualisation des connaissances

Approche cognitive

1. Introduction

Le présent travail est une approche cognitive des transformations qui modifient un savoir lors d'une activité contextuellement située: "donner des instructions graphiques ou orales à un pair pour faire un noeud plat", réalisée par des enfants de 5 à 10 ans, dans laquelle des significations peuvent être la source d'incompréhension. L'objectif, essentiellement méthodologique, est de délimiter des observables sémiotiques – graphiques et verbaux – et de les interpréter cognitivement, afin de pouvoir caractériser le geste mental impliqué dans la production spontanée des instructions.

A cette occasion, les processus sémiotiques sont placés au centre des réorganisations de la représentation mentale. Le savoir actualisé dans une situation donnée est considéré comme issu de réorganisations signifiantes, du fait de la sélection et de l'organisation de certaines informations, aussi bien dans le savoir que dans la situation. Afin de caractériser ces réorganisations, un double problème méthodologique se pose, celui de les caractériser à partir d'observables sémiotiques, et celui de les caractériser en tant que processus.

On se propose de rechercher la filiation des unités signifiantes, et de définir formellement leur signification à partir de leur contexte observable (Caron-Pargue 1983: 45–52; 1987: 153–173): à partir de l'analyse des tracés graphiques dans le cas du dessin; et dans le cas du verbal, à partir de la théorie des opérations énonciatives de Culioli, en interprétant cognitivement l'opération énonciative basique de "repérage" (Culioli 1982: 95–114).

2. La tâche

Des enfants, de 5 à 10 ans, doivent donner des instructions graphiques ou verbales à un pair afin que celui-ci réalise un noeud plat. Pour chaque tranche d'âge, la tâche a été effectuée par 10 couples d'enfants pour les instructions graphiques, et 10 pour les instructions verbales.

Pour chaque couple d'enfants, l'un des deux enfants apprend à faire le noeud plat. L'expérimentateur lui montre gestuellement comment faire le noeud, étant placé à côté de lui, sans parler. Puis dans un deuxième temps, l'enfant qui a appris à faire le noeud, donne des instructions graphiques ou verbales pour que le second enfant du couple réalise le noeud plat.

Chaque enfant du couple dispose de deux cordes de 1 cm de diamètre, et de 1 mètre de long. Le dessin fini est transmis à l'autre enfant par l'expérimentateur; dans le cas du verbal, les enfants sont placés dos à dos, de façon à ce qu'ils puissent s'entendre, sans cependant se voir.

Dans tout ce qui suit, les exemples graphiques sont présentés dans la figure 1, et les exemples verbaux dans le tableau 1.

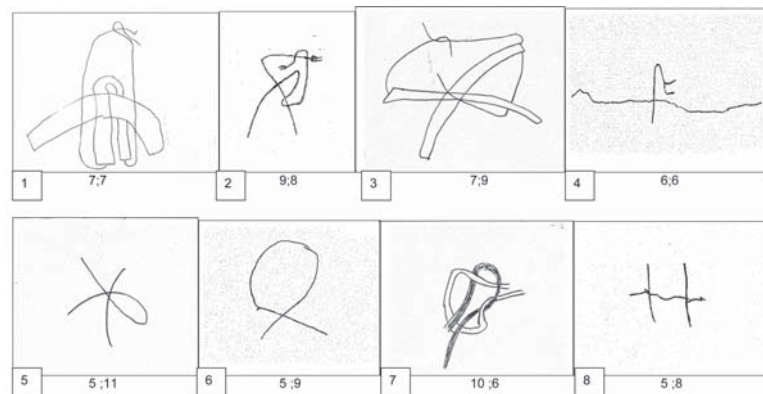

Figure 1. Exemples de produits graphiques (l'âge de l'enfant est indiqué sous le dessin).

3. Les unités sémiotiques et leur structuration

3.1. Leur identification

Par définition, toute production graphique ou verbale, achevée, constitue une unité sémiotique globale; elle doit être considérée comme satisfaisante

- [1] 5(G1). A : Tu mets ta corde comme ça...ta corde comme ça (pause) tu mets ta corde comme ça après (pause) tu fais un autre nœud (pause) mets ta corde comme ça
B : elle est comment ta corde ?
A : sur celle-là
- [2] 5(G5). A : on fait un nœud (pause) et après ..et après tu fais un autre tout pareil
- [3] 5(G6). A : Tu croises (pause) je fais un pont après (pause) je passe dedans (pause) je recommence
- [4] 5(G7). A : Je croise (pause) je croise encore
- [5] 5(G8). A : Mets ta corde dessus l'autre (pause) tourne l'autre corde à l'autre côté (pause) mets ta corde en haut (pause) et fais un autre nœud (pause) et tu serres
- [6] 6(G1). A : croiser la corde – passer en dessous (pause) on croise encore et on passe dessous (pause) et on tire
- [7] 6(G5). A : tu prends ta corde – tu mets l'autre sur ta corde que t'as étendue – après tu fais un nœud (pause) après tu fais encore un autre nœud
- [8] 7(G2). A : Tu mets les deux cordes l'une sur l'autre (pause) la corde qui est derrière tu la passes dessous la corde qui est devant – tu fais un nœud et tu tires

- [11] 8(G7). A : Je croise – je passe la corde dessous (pause) je fais un nœud – je serre
- [12] 8(G8). A : Prends les deux cordes l'une sur l'autre – puis celle en dessous tiens la et prends la dans la main droite (pause) et puis ...et puis l'autre corde prends la dans la main gauche et fais un nœud
- [13] 8(G9). A : Tu as deux cordes dans la main tu les mets chacune ... une dans chaque de tes mains – après tu les croises et tu prends la corde et tu la retournes sur l'autre corde – maintenant il faut monter les cordes ...maintenant il faut monter les cordes – tu les croises – tu fais un nœud puis tu serres
- [14] 9(G1). A : Je mets les deux cordes l'une sous l'autre – celle qui est dessus je la passe dessous celle qui est dessous – je prends les deux bouts (pause) je prends les deux bouts que j'ai dans la main – je fais un nœud avec – je prends les deux autres qui sont en dessous et je tire
- [15] 9(G2). A : Tu prends les deux cordes une dans chaque main – t'en mets une en dessous de l'autre – t'en prends un morceau en bas – tu ne le lâches pas et tu prends l'autre de l'autre côté ... un morceau – après tu les croises – celle de gauche tu la mets en dessous de celle de droite – tu tires – tu prends les deux autres cordes et tu tires
- [16] 9(G8). A : Tu mets la corde l'une sur l'autre – tu fais un nœud (pause) quand tu as fais le nœud tu remontes les cordes – tu refais un nœud en haut (pause) et après tu tires sur les deux cordes
- [17] 10(G5). A : Nathalie tu prends les cordes des deux mains tu... celle que tu as dans la main gauche tu la mets dessus ça y est – tu la prends la corde que tu viens de mettre celle qui dépasse du côté droit tu la passes dessous l'autre ça y est ? on recommence
- [18] 10(G10). A : Tu prends une corde dans chaque main et tu ... tu les ... tu prends le milieu de chaque corde tu les mets l'une sur l'autre - tu fais un nœud (pause) tu gardes tes deux cordes – tu refais un autre nœud – tu le serres – tu prends les quatre bouts de corde et tu serres

5(G6) désigne le sixième groupe d'enfants, qui a passé l'expérience, pour la classe d'âge des 5 ans ; A est l'enfant qui sait faire le nœud, et qui donne des instructions à l'enfant B

Tableau 1.

et suffisante du point de vue de l'enfant. Sa signification est l'ensemble des instructions nécessaires pour faire le nœud plat. La comparaison des productions au sein d'un même médium représentatif, dessin, ou verbal, fait apparaître d'une part des unités sémiotiques élémentaires, constituées par exemple d'une simple boucle (cf. fig. 1₅ et 1₆), ou d'une croix pour le dessin (cf. fig. 1₄, 1₈), et d'une verbalisation archaïque pour le verbal (cf. Exemple 4), où seul le croisement est indiqué. Et d'autre part des unités complexes formées d'unités élémentaires séparées, juxtaposées, ou bien d'unités partiellement ou totalement intégrées, dont il faut préciser les critères de reconnaissance. Les critères de reconnaissance sont simples dans le dessin: ou bien le dessin est composé de plusieurs dessins élémentaires, juxtaposés (cf. fig 1₉, 1₁₀, 1₁₁, 1₁₃, 1₁₄, 1₁₅), ou bien plusieurs unités sémiotiques élé-

mentaires reconnaissables sont intégrées dans un seul dessin (cf. fig. 11, 12, 13, 14, 17, 112). Dans le verbal, l'unité sémiotique globale peut se décomposer en une succession d'énoncés élémentaires (cf. exemples 6, 9, 11).

La décomposition des unités complexes en unités élémentaires, permet d'identifier les étapes signifiantes de la fabrication du noeud. En effet, la signification d'une unité sémiotique est modifiée si elle appartient à une structure plus ou moins complexe. Sa signification ne correspond plus alors qu'à une partie des instructions, au lieu de correspondre à leur ensemble. Les étapes principales de réalisation du noeud plat le décomposent en deux noeuds simples, et décomposent chaque noeud simple en croisement et passage, comme le montrent les exemples indiqués ci-dessus. Mais certaines de ces étapes peuvent être décomposées à leur tour, comme le passage du premier noeud simple (cf. fig. 115, et exemples 3, 13). De plus, la plus petite unité élémentaire, la "boucle" (cf. fig. 16), permet de dissocier sémiotiquement la fonction des deux cordes, l'une étant la corde qui agit, qui bouge, pour faire le noeud, alors que l'autre est immobile.

En outre, des unités "pragmatiques" sont identifiables dans ces décompositions: "pour initialiser le noeud plat", unité représentée dans le dessin par deux traits parallèles (cf. fig. 19, 110, 113, 114), et verbalisée par "avoir" ou "prendre" une ou les cordes (cf. exemples 7, [13], 17, 18); "pour terminer le noeud plat" en "serrant le noeud", en "tirant les cordes" (cf. fig. 110, 115, et exemples 5, 6, 8, 18); ou encore se positionnant "entre les deux noeuds simples" pour "monter les cordes", ou "prendre l'autre bout", ou "garder les cordes" (cf. fig. 110, 114, et exemples 5, 9, 17, 18).

3.2. L'intégration des unités sémiotiques

Trois modes d'intégration des unités élémentaires qui composent les unités complexes peuvent être répertoriés: l'effacement de séparations, l'intégration locale par continuité, et la démarcation d'unités plus larges plus ou moins structurées.

3.2.1. L'effacement de séparation entre deux unités se fait par un repérage des deux unités l'une à l'autre: L'opération de "repérage" (Culioli 1982: 95-114) a pour fonction de modéliser une relation orientée entre deux éléments a et b, allant du repère a vers le repéré b. Elle peut s'interpréter cognitivement en termes de mise en perspective attentionnelle, et

par l'implication automatique, $a \rightarrow b$, d'une façon proche de la notion de "point de référence: orienté vers une "cible" de Langacker (1987).

Le repérage du second noeud par rapport au premier noeud₁ → noeud₂, peut être marqué par l'unité pragmatique située entre les deux noeuds simples: pour le dessin, dans la quatrième unité de la fig. 114, dans laquelle le passage du premier noeud est précisé, et les ficelles "montées", pour commencer le second noeud (voir aussi fig. 110; et fig. 115 dans laquelle les flèches indiquées à partir de l'unité 3 assurent la continuité entre le passage et le croisement du deuxième noeud); dans le verbal, par "prendre (par en dessous le croisement) le bout de la corde qui est dessus et prendre l'autre bout" (cf. exemples 9, 12, 14, 15), ce qui est une façon spécifique de faire le noeud. Le repérage entre les noeuds peut également être marqué: par un procédé de répétition à l'identique, par exemple du croisement (cf. fig. 18, et exemple 4); par répétition du noeud, de façon symétrique (cf. fig. 112, 113), ou à l'identique (cf. fig. 111, et exemple 2), parfois positionné en haut (cf. Exemple 16). Ce repérage est parfois marqué dans le dessin par un dédoublement d'une des cordes (cf. fig. 13, 14), ou par un doublement des traits de l'unité focalisée, par exemple du premier noeud (cf. fig. 11), ou du croisement (cf. fig. 13). Dans le verbal, ce repérage peut être marqué par une différence de choix lexicaux tel que "les cordes" pour le premier noeud, et "les bouts (de ces mêmes cordes)" pour le deuxième noeud (cf. exemples [9], [14]).

Le repérage d'une des deux cordes par rapport à l'autre, marqué par le tracé graphique des deux cordes, l'une étant rectiligne, l'autre ondulée, amène à les interpréter comme étant l'une "immobile" et l'autre "motrice" au sens où c'est elle qui dirige *le faire du noeud*. La corde motrice étant la plus détaillée, et constituant à elle seule une unité élémentaire (cf. fig. 16), est focalisée, de ce fait "corde motrice → corde immobile". On peut remarquer la corde "motrice", qui effectue un passage "dessus-dessous", dans le dessin du noeud fini (cf. fig. 17; aussi fig. 110, 115). Ce repérage est marqué dans le verbal par une différence de choix lexicaux, par exemple "ta corde" positionnée "sur celle-là: (cf. exemple 1). On peut cependant noter, dans le dessin, un changement de corde motrice à l'issue du premier noeud (cf. fig. 112, 113, 114, 115); et dans le verbal, des choix lexicaux inverses (cf. exemple 7), "ta corde" étant "étendue", et "l'autre" étant positionnée dessus; dans ce dernier cas le noeud serait effectué par la corde de dessous.

3.2.2. L'intégration locale par continuité est marquée dans le dessin par la complétion de proche en proche des unités graphiques juxtaposées, par exemple une unité figurant un croisement suivie par une unité figurant à la fois ce même croisement et le "passage" qui suit. On aboutit souvent, bien que pas obligatoirement, à l'intégration complète des unités successives en une seule (cf. fig. 19, 110, 114, 115). Dans le verbal, le marqueur de continuité sera le lien établi par la dénomination d'une corde en position de "terme de départ" (Culioli loc. cit.), dont le critère de reconnaissance est une anaphore qui renvoie à cette corde. Dans l'exemple 10, "la corde" lors du premier croisement est "terme de départ", marqué par l'anaphore "la" du premier passage, ce qui assure leur continuité et leur intégration à l'intérieur du premier noeud. Une continuité analogue est visible dans l'exemple 16, le "terme de départ" étant "celle que tu as dans la main gauche", avec l'anaphore "la".

3.2.3. La démarcation de grandes unités correspond souvent aux deux noeuds simples; elles peuvent être composées de plusieurs unités disjointes, non intégrées, ou localement intégrées. Dans le verbal, d'une manière générale, cette démarcation est marquée par l'ouverture et la fermeture d'un site, dont le critère de reconnaissance est l'utilisation de termes pluriels, ou génériques, tels que "les deux cordes", "les deux bouts", "une corde dans chaque main".

4. *Discussion / conclusion*

Le présent travail permet de repérer de nombreuses façons de se représenter la façon de faire un noeud plat. Outre la caractérisation du type de "passage" (*passer sur, dessous, dessus dessous, dessous dessus, retourner par dessus, croiser, prendre par dessous*), l'intérêt de la méthode est de qualifier le mode de structuration des gestes élémentaires en unités mentales: de façon disjointe, par intégration locale ou progressive, avec unicité ou non de la corde motrice. L'une de ces représentations correspond à la réalisation du noeud plat par deux noeuds simples identiques, et successifs, à l'aide de la même corde, résultat déjà attesté par Stroecker (1991: 215-233) et Caron-Pargue (1987). D'une façon générale, le geste mental actualisé en situation n'est pas un décalque du geste appris, mais une reconstruction qui résulte de focalisations attentionnelles et d'implications automatiques, plus ou moins structurées. Il nous paraît évident que la méconnaissance de

ces phénomènes peut entraîner de nombreuses incompréhensions communicatives, et de nombreuses erreurs pédagogiques, susceptibles de limiter et de retarder un apprentissage, et de limiter sa plasticité.

Au delà du présent travail, des études complémentaires sur la façon dont s'articulent les différents types de structurations, qualifiés ci-dessus, peuvent déboucher sur une meilleure connaissance de la continuité et de la coordination des mouvements. Par exemple, le geste mental qui consiste à "prendre par dessous le croisement la corde qui est dessus" pour effectuer avec elle le second noeud simple, s'effectue avec une main, la main droite, alors que la main gauche tient les cordes et rattrape le bout de la corde immobile; de même le changement de corde motrice entre les deux noeuds peut préserver une action continue avec la même main; tandis que dans certaines organisations des unités, l'unicité de la corde motrice peut nécessiter une coordination élaborée des deux mains.

Les résultats obtenus s'appuient sur une double approche verbale et graphique de la représentation des gestes. Il ne s'agit pas d'une étude de traduction, mais bien de deux études indépendantes de la production graphique et de la production verbale. La méthode utilisée s'appuie essentiellement sur la recherche d'une filiation dynamique entre unités observables, au sein d'un même médium représentatif, interprétée en termes cognitifs de traitement de l'information. Nous avons utilisé l'évolution avec l'âge pour établir cette filiation, mais plus généralement, celle-ci pourrait être établie à un âge donné, en fonction de l'acquisition d'expertise, en référence aux travaux d'Inhelder, réalisés dans le cadre Piagétien (Inhelder et Cellier 1992). La caractéristique principale de notre méthode est de caractériser formellement la signification à partir des observables. La cohérence des résultats obtenus indépendamment dans le verbal et le graphique est à souligner. Au delà des retombées en ce qui concerne les aspects cognitifs, elle invite à de plus amples investigations dans l'un et l'autre médium représentatif.

La prévision des tendances et la sémiotique

Pouvoir, risques et décision

1. Le modèle

La première question est celle-ci: les modèles de prévisibilité existent-ils ? Cette question touche directement aux conditions de formulation de ce que dans l'univers de la mode, du design, de l'architecture et maintenant plus en général dans l'univers des biens de grande consommation on appelle les tendances: un concept ambigu, qui touche d'abord à la prise de décision entre interprétation et mécompréhension.

Or, une tendance est tout d'abord un modèle, en même temps prédictif et prévisionnel; nous reprenons ici donc l'idée de vérifier :

- ce que c'est qu'un modèle « tendanciel »
- si le système des tendances peut être défini véritablement un « système »
- à quoi correspond et à quoi peut servir pragmatiquement une prévision
- quels sont les marges de crédibilité de la tendance, comment elles peuvent être contrôlées ou être à risque de mécompréhension.

Un modèle il faut le construire par analogie: on suppose une situation X énigmatique et on reconstruit un espace de simulation dans lequel on répond aux interrogations posées par X. Abstrait ou concret, un modèle permet de définir une morphologie qui peut être utilisée pour des fins prévisionnelles; la description qui s'enclenche, soit-elle de nature qualitative ou bien quantitative, met en jeu des grands axes catégoriels de construction (statique/dynamique, stable/instable, local/global, etc.), mais surtout souligne la nécessité d'une validation à travers les principes hjelmsleviens d'adéquation, d'exhaustivité et de simplicité.

Pour garder son statut d'hypothèse falsifiable qui prend la place de la pure intuition, un modèle doit satisfaire un principe de généralisation : dans ce cadre, un modèle construit pour faire des prévisions correspond justement à une représentation des tendances, c'est-à-dire, à un paradigme projeté par l'interprétation des dynamiques culturelles spécifiques d'une synchronie, prêt à être utilisé pour construire le futur proche, où il y aura une appropriation syntagmatique qui va le traduire de suite en diachronie.

Un modèle de ce type est nourri par deux dynamiques culturelles spécifiques: d'un côté l'état des choses dans le système de tendances en tant que tel, la portée et la dénomination de ce qui est actuel; de l'autre côté l'analyse du contexte, de la sémiosphère de l'actualité, dont la tendance est un des acteurs.

Cependant, entre le discours des médias et les représentations que les acteurs sociaux donnent de la société dans laquelle ils vivent, il y a un processus de « régulation mutuelle »: le modèle tendanciel s'organise en réponse à une situation de référence complexe, dans laquelle phénoménologies stylistiques, façons de se conduire et « boom » socioculturels se croisent. Dans l'espace ambigu de ces deux textes – médiatique et social – on reconnaît toute la fragilité du modèle, son énergie synthétique et productive, et finalement sa nécessité prévisionnelle, qui n'exclut bien sûr pas l'espace pour le libre gaspillage (et investissement) du malentendu.

Pour définir un modèle, il faut sous-entendre une différence qui empêche la reproductibilité exacte et assure le progrès du système. Cette différence est une réduction de l'information, une discrétisation du continuum des possibles.

« Il est donc naturel pour nous », écrit Hume (1757: 51), « de chercher une règle par laquelle les sentiments divers des hommes puissent être réconciliés, ou du moins, une proposition de décision, qui confirme un sentiment, et en condamne un autre ».

La recherche de la règle produit le modèle, parcours de connaissance qui impose un principe de cohérence à la relation à la valeur du sujet percevant. En 1995 Jacques Fontanille écrit : « Si la compréhension présuppose l'altérité et installe une intersubjectivité, l'explication les suspend, à la perspective de l'appropriation de la signification par un observateur se substitue la perspective de l'informateur, dont on ne retient que l'activité de construction, et dont on implique l'activité d'attribution ».

Le sujet qui élabore un modèle prévisionnel pour le système des tendances est donc, dans ce sens, un véritable sujet épistémologique, dont la recherche, du contrat à la sanction, peut adopter apparemment une position aussi débrayée que embrayée. Dans un contrat de confiance, sélectionner ce « qu'il faut faire savoir », c'est-à-dire l'union avec un objet de valeur, la tendance à encourager, résulte d'une compétence cognitive sélective, qui impose la cohérence à travers la réduction et l'imposition de la régulation/stabilisation.

Le sujet de l'énonciation alterne alors sa position d'observateur/informateur, externe/interne, avec la position du destinataire. Les effets pragmatiques sur le système de la mode/des tendances seront de trois types :

- Régulation: Le fait de maintenir en équilibre une situation à travers l'exécution répétée de la proposition du sujet cognitif;
- Cumulation cyclique: Où le feed-back de la réception modifie les propositions de base;
- Cumulation didactique: Quand les effets des messages proposés sont mémorisés pour permettre d'élaborer de nouvelles stratégies.

2. *Le système*

Si la prévision de la mode peut paraître illusoire, Roland Barthes en 1967 reconnaît que sa structuration ne l'est pas. C'est-à-dire : si le fait que l'acteur multiplie les variantes empêche de percevoir une structure d'ensemble, de même ces variantes sont clairement identifiables du point de vue des traits plastiques et figuratifs, et leur alternance forme un système. Aujourd'hui, toutefois, la déstructuration des signifiants ne ramène plus à un seul système, mais à une explosion/prolifération de plusieurs systèmes, dont la durée (et la cyclicité) est autonome ; tout cela rend encore plus difficile la prévision. Néanmoins, il nous semble possible de situer au delà des modèles de répétition, sur l'axe continuité/discontinuité, une isotopie fondamentale et à larges mailles, s'il est vrai qu'aujourd'hui le système des tendances semble reposer essentiellement sur l'assomption, de la part de ceux qui concrétisent la stratégie de l'offre, d'une position dans le modèle de simulation ordonnée par cette opposition: où la continuité sous-entend une confiance par rapport à son style et la discontinuité une rupture continue de la règle qui vient d'être créée. Pour le récepteur/ destinataire/ consommateur, il s'agira de focaliser son choix de style par rapport à son

dynamisme plus ou moins grand, où, alors uniquement et à posteriori, une mode/tendance imposera des contraintes spécifiques.

3. La prévision

Pouvoir faire des prévisions : la futurologie n'est pas une science nouvelle, et encore moins exacte, et elle a été récemment (les derniers cinquante ans) englobée dans les territoires plus ou moins heureux du marketing. Elle explicite son action, comme on sait, à travers la recherche de nature qualitative ou quantitative qui devrait servir à classer les motivations de la conduite humaine.

On a déjà observé comme les raisons de la variation de la tendance doivent être positionnées au carrefour de l'offre et de la demande, dans leur régulation réciproque. Chester Watson écrit à ce propos (dans un article qui reste fondamental): « Pour être utile, il faut bien qu'une théorie indique également la tendance générale de la variation nécessaire pour établir le moment dans lequel on remarque les premiers signes d'un nouveau changement » (dans Ragone 1988 :293). La valence de mode/de tendance touche cycliquement les objets et la façon de se conduire, en déguisant ou en exaltant l'aspect fonctionnel, en tous cas en se posant au-dessus de ce dernier aspect ; elle élabore la relation des signes bien avant de s'attacher à la nature de l'objet-énoncé même.

On dira alors que, même si aujourd'hui un modèle verticale de décision du changement ne peut plus être proposé dans le système de la mode, et si horizontalement il n'y a pas assez de coordination pour avoir l'imposition d'un style, pourtant on remarquera un principe commun d'alternance de valeurs (rupture → normalisation → désémantisation) suffisamment généralisable (Figure 2).

4. Les tendances

La question est de chercher à comprendre comment faut-il construire une alternance, et comment au juste sa manifestation est formulée en termes de tendance. En tout cas, après l'émergence d'une tendance il y a une logique, un schéma conséquent qui peut être parcouru de nouveau a posteriori/anticipé à priori. Tout cela intéresse aussi bien l'ÊTRE que le FAIRE, ainsi qu'un sujet percevant en relation à un objet perçu: par conséquent

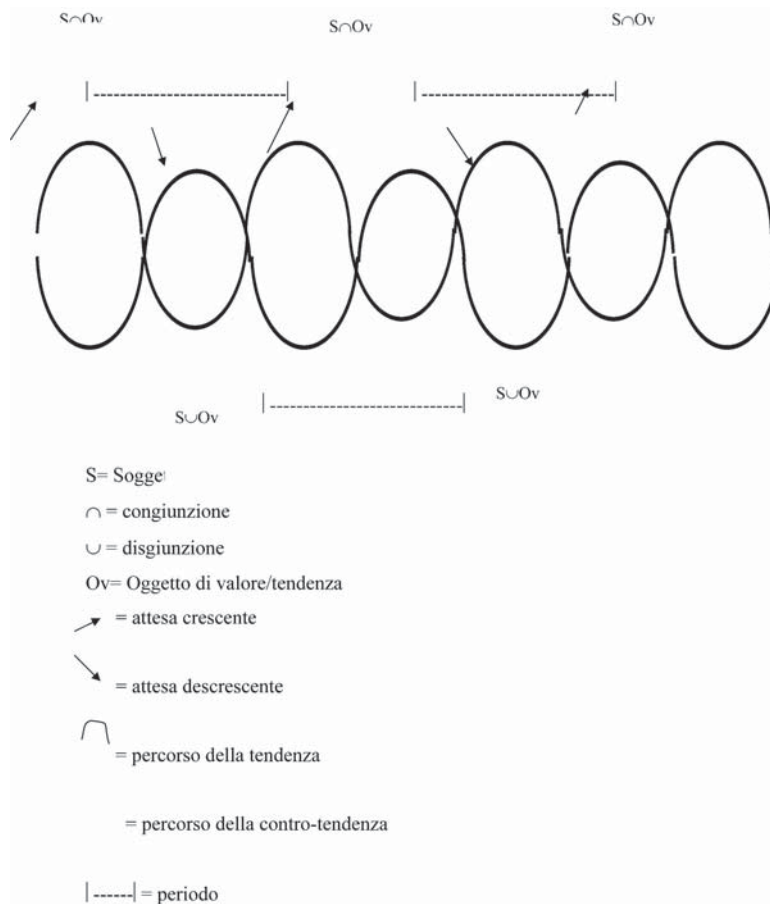

Figure 1.

on assistera à l'implication d'une deixis, une opération de focalisation/occultation qui établit la direction de la relation. Reconnaître la tendance signifie notamment retrouver de traits qui renvoient à un parcours thématique commun. Ces traits possèdent un principe de cohérence qui peut être identifié par itération : éléments, signes, figures, motifs qui convergent vers une même thématique, ce qu'en sémiotique on appelle isotopie (cf. Greimas et Courtés 1979 : 188).

La redondance peut se trouver aussi bien au niveau de l'expression que du contenu (notamment, dans notre cas, à niveau des traits vestimentai-

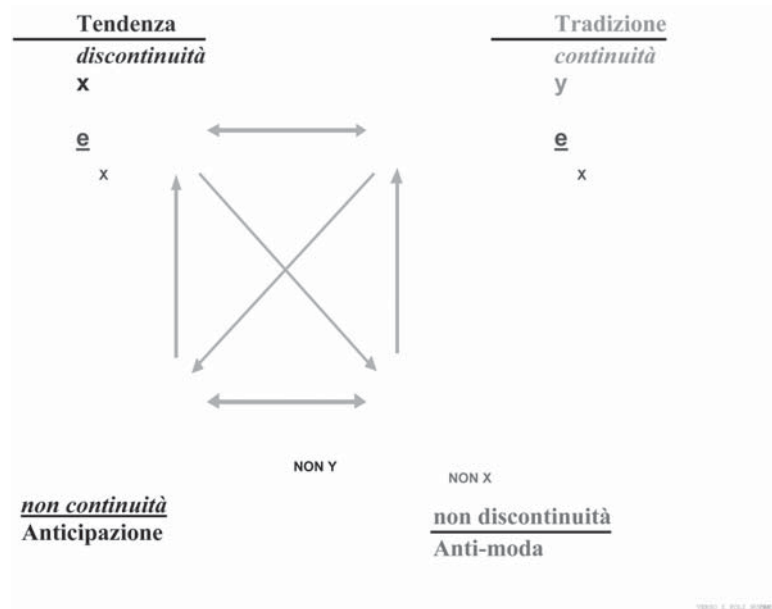

Figure 2.

res, des valeurs cognitives ou pathémiques, ou encore pragmatiques qui lui sont connectés), et encore elle peut se rendre concrète par des « acteurs » qui représentent sa manifestation syncrétique (les vedettes du moment, des symptômes de grande importance pour décoder l'isotopie/tendance). On atteindra alors un vecteur prospectif/prévisionnel, à partir d'une localisation spatio-temporelle « avant/après ». En ce cas, on pourrait s'affronter avec l'épistémologie sémiotique qui fonctionne essentiellement de façon rétrospective. Cependant, il s'agit d'un faux problème car l'analyse des tendances, dans son application, se base principalement sur une évaluation que le sujet cognitif exprime à propos du présent : c'est à partir de cette évaluation qu'on formule les attentes auxquelles il faut attacher les schémas prévisionnels.

De toute façon le problème de la tendance reste celui de sanctionner, c'est-à-dire d'attribuer une valeur à l'existant et à son futur immédiat. La logique sanctionnée sera quand même partielle, dans le seul but de pouvoir l'étendre globalement comme deixis représentative. Le mouvement de la sanction répond généralement à un principe d'alternance qui produit un

rythme de la tendance – avec des cycles, des cours et des recours – mesuré sur la cognition d'une conjoncture par rapport aux valeurs proposées : car la mode est tout d'abord une conduite, consensuelle ou polémique, contractuelle ou rebelle, par rapport à un ensemble de valeurs qui sont, à bon droit, les tendances, dont la saturation produit inévitablement une nouvelle attente et de nouvelles valeurs.

5. *Le rythme*

L'histoire – car il s'agit de cela – est faite partiellement de cours et recours, et proprement l'histoire des tendances : toutefois le mouvement n'est pas du tout linéaire. À côté de la mode on assiste à l'évolution du social, et la qualité des valeurs placées dans le signifiant « mode » évolue aussi, en déterminant une différente qualification du consentement.

Pourtant, un modèle de prévisibilité rythmique se charge de la nécessité de transformations continues que le sujet percevant doit évaluer. Ces transformations s'inscrivent sur un axe de temps (apparition d'une certaine tendance dans une certaine période) qui comporte implicitement une organisation intérieure, un « point de vue » sur les frontières de temps et de transformation.

Cette organisation est caractérisée en sens aspectuel, là où l'aspectualité présuppose qu'un temps soit orienté, qu'il ait donc un début et une fin. Une tendance peut vivre un temps très bref ou peut s'enraciner dans le tissu social (on peut prendre comme exemple dans le domaine des vêtements, le blazer qui a été introduit par Armani dans la mode pour femme au début des années 80 et qui est devenu, dans toutes ses applications et infinies variations, un genre éternel et ce que l'on appelle sémiotiquement un motif). Du point de vue aspectuel, il faut différencier au moins trois phases dans une tendance :

- Phase inchoative: il s'agit du moment initial où la rupture avec la continuité se manifeste plus visiblement et que, par opposition, un nouveau champ sémantique s'ouvre;
- Phase durative: C'est la phase de la reconnaissance et de l'appropriation, de la diffusion, pendant laquelle la tendance multiplie comme un écho ses traces dans les différents espaces textuels, mais elle ne se régénère pas : elle se fixe ou se sature;

- Phase terminative: C'est la phase qui correspond à la perte de la valeur de mode ; si la tendance est suffisamment compatible avec une diffusion auprès d'une large cible, elle pourra facilement résister en changeant sa nature et en se transformant en motif qui revient et même en configuration. Si, au contraire, elle est peu réalisable, si l'on ne peut pas facilement l'assimiler, elle disparaîtra définitivement et ne laissera que des traces dans le mouvement contradictoire de la tendance antithétique qui va émerger.

La tendance contrôle l'image et l'interaction réciproque entre sa proposition et sa réception. Aujourd'hui, la variabilité d'un champ sémantique de tendance dépend fortement des oscillations d'identité soit au niveau micro-social (l'image d'une marque, d'un styliste) soit au niveau macro-social (l'image d'une femme, d'un homme, d'une conduite, présentée comme gagnante). S'il est vrai, alors, que la tendance est un modèle investi d'une valeur d'actualité, étant donné que les modèles sont excessifs en qualité et quantité, on prévoit que dans le futur proche il n'y aura plus et le temps et la raison de vérifier sa reproductibilité.

6. *Excès et insuffisance*

Il faut de nouveau souligner que le sujet de l'énonciation « tendancielle » se manifeste dans une situation de référentialisation interne, où la prévision doit assurer ses conditions de transmissibilité. Quand Nelson Goodman (1954) élabore sa propre théorie de la projection, il renverse exactement dans ce sens-ci la perspective. Toutefois, s'il est vrai que la démarcation entre les prédictions (inductions de projections) valables et pas valables repose sur le monde et sur comment le discours décrit le monde, il faut revenir à la conclusion – peut-être décevante – qu'une tendance s'installe (soit elle confirme sa prévision) si et seulement si un contrat local de confiance se réalise (perspective de l'énonciation) et si, dans une perspective énonciationnelle, la narrativisation d'un énoncé objet est reconnue fonctionnelle à l'attente du destinataire, au point d'arriver progressivement à sa saturation. Le principe de vérification de la tendance consisterait alors, banalement, dans le besoin de régler intérieurement la courbe de jonction à laquelle on empêche de s'enfuir vers les bornes de l'excès et de l'insuffisance imaginaire.

Le regard sémiotique n'est que partiellement d'aide pour traverser un terrain quand même sapé, fragile, facilement explosif. Aujourd'hui, on vit dans une période de totale emphase communicative : l'intertextualité

a atteinte, dans notre conscience, des niveaux maximes d'expansion, et il s'agit d'une tendance en hausse, qui n'a pas du tout l'air de vouloir se fixer.

7. Conclusion

La tendance est un des agents responsables du tourbillonnement communicatif. Mais contrairement à ce qu'on attendrait, elle n'en profite pas. Dans les années où la communication est une stratégie et le consensus est un facteur réel de succès, il est impensable d'imaginer une rhétorique naïve et une découverte de la tendance, une créativité pure ou une sociologie « en rose ».

L'interaction ne se joue plus à coups de symboles – comme il se passait encore au début du décennie passé. Au contraire elle se « structure » grâce à l'image et à ses constructions : ainsi conçue comme une proposition des signes, c'est véritablement l'image qui a une fonction régulatrice dans l'interaction réciproque entre celui qui propose et celui qui, on pourrait dire, dispose. C'est une représentation de valeurs qui se résout en production de compétence relativement au contexte social, en inspirant une sanction positive et une action cohérente aux fins stratégiques de celui qui propose.

Aujourd'hui, il est donc nécessaire de savoir non seulement ce qu'on fera ou où l'on arrivera, mais encore comment cela a été fait, selon quel logique et quels buts. Pourtant, à la question initiale : Des modèles, existent-ils pour le système des tendances ? On répondra sans aucun doute affirmativement, avec la seule ambition démesurée – d'inviter à soustraire la sensibilité créative aux plages fumeuses du mystère et du je ne sais quoi, d'un air du temps par rapport à laquelle nous considérons qu'il faut absolument repérer un principe d'intelligibilité.

Symbolic vs alphanumeric representations in human machine interface design

1. Introduction

Communication amongst humans and machines can be hindered when vital information is indistinguishable or invisible to the user. However, by following the mass production trends, the majority of automotive interfaces fall into the category of non-intuitive designs. Prior to commencing the design and modelling of the interface components, we proceeded in a series of user-tests that aimed to identify the appropriate method for conveying vehicle's information to the driver. A comparative study demonstrated the characteristics of symbolic versus alphanumeric representations rendering the first as the most capable for establishing a robust and swift communication with the user. The choice of visual feedback is essential for developing an automotive navigation/guidance interface since comprehensible and accurate information can affect and alter a situation from imminent collision to accident avoidance.

Overall, the paper is organised as follows: The next Section offers a succinct overview of the differences between alphanumeric and symbolic representations. In turn, Section 3 elaborates on the symbols utilisation and contribution in interface design. Section 4 highlights the importance of the simplicity in the overall interface design so as to improve human-machine communication. Subsequently, Section 5 contains a detailed illustration of the HUD design philosophy and implementation process. Finally the paper concludes with an outline of the important design aspects investigated during this study with regard to symbolic representations in HMI designs and presents a tentative plan for future work.

2. Alphanumeric vs. Symbolic Representation

Alphanumeric interfaces have been heavily used in the last decades as description method for real-time navigation. This reflects the original military origins of the HUD design as a mean of increasing targeting accuracy of military aircraft. Despite the fact that these interfaces serve a particular and well-defined purpose in that environment, their non-adjusted deployment in the automotive field can be inappropriate. A number of tests have shown that HUDs overloaded with information, especially those using textual output, can create the effect known as cognitive capture (Ward & Parkes 1995). The term cognitive capture describes the lack of attention and consequently situational awareness when switching from the HUD interface to the actual driving environment and vice versa (Gish & Staplin 1995). It could be argued that alphanumeric information can be much more suitable in some cases, e.g., in defining exactly the vehicle's coordinates in a navigation system. On the other hand, the amount of information that drivers need to process in this manner can substantially delay their reaction to a possible collision incident. Comparative studies of symbols and alphanumeric data in HUDs have conclusively demonstrated that symbols are interpreted much faster by humans (Shekhar et al. 1991).

Thus, symbolic representation is a significantly faster way to provide the user with information that would otherwise need a considerable number of words to be described. Provided that letters are primal symbolic representations of sounds (Daniels & Bright 1996), any word has definitely more symbols than an iconic symbol which can include the same meaning in only one entity. Humans, initially try to focus, to read and understand, and then to react. For reducing or even eliminating visual clutter, the conformal type of symbology for navigation information has been proposed. In short, conformal symbology simulates the visual transformations of external objects to give observers the perception that the symbology is part of the external scene (Gish & Staplin 1995). By this approach, it is also feasible to achieve minimal interference between the projected information and the critical details in the actual road scene.

The final HUD design developed for this research utilises simple geometric shapes as symbols in order to minimize the effect of cognitive capture and issues associated with it. Additionally, the symbols have been colour-coded depending on the vehicle's distance to the object of interest

(a road turn or other vehicles for example). Symbol size variability also indicates the speed of the vehicle in relation to the lead vehicles (i.e. indicates the pace of approach). A detailed discussion on this is included in the following section. A comparative example of alphanumeric representation versus conformal symbology is depicted below in Figure 1.

Figure 1. (a) alphanumeric VS (b) symbolic representations.

3. Symbols in interface design

In order to design an interface design that incorporates symbolic representations it is necessary to define the borderlines between symbols and icons. The use of symbolism can assist users to apprehend complex information. To this end, Webber suggests that: “A symbol is a story or picture told or presented by a familiar sign that may be read at a glance” (Webber 1927). Hence, any image, after a process of extensive simplification of shape details and colours, can be effectively transformed to symbol as illustrated in Figure 2. The intermediate transformation stages between an image and a symbol are effectively known as icons.

In the interface under investigation images from the surrounding scene (i.e. vehicles, barriers, lanes) have been directly represented in a symbolic form to avoid overwhelmingly complicated shapes and colours that would demand more visual attention (i.e. a stylised outline of the real-life object). In a typical iconic representation the eye would investigate the details of the icon distracting the user from the main task of driving. Similarly, an unrecognisable or abstract symbol would have the same effects, as the driver would require more time in order to interpret or identify the meaning of it. A compilation of iconic representations in symbolic form would therefore be the ideal visualisation of information.

Figure 2. Example of simplification sequence from image to icon and finally to symbol.

4. Simplicity of representation

A flexible and easily comprehensible HUD interface that incorporates symbols depends largely on the simplicity of the representation of the real events and objects. Although contemporary instrumentation panels entice the customer with aesthetically appealing simplified interfaces, real-life usability proves the contrary. In both cases, simplicity is a considerably difficult task to achieve as over-simplified systems could be equally annoying for the user. A recent example is the BMW's i-drive system which imposed simplicity through a generic deduction of buttons, monitors and LEDs. While the overall design provides the driver with a spacious minimal dashboard, the operational complexity of the interface has been substantially raised as all the functionalities have been assigned to a central rotating button as presented in Figure 3a.

Over-simplification had a negative impact on the vehicle models equipped with this interface and forced the company to release versions in which some of the functionalities have been placed in their initial positions. At the antipode is the contemporary Mercedes vehicle which has an overwhelmingly equipped dashboard that requires a considerable amount of time to identify and utilise the panel's functionalities (Figure 3b). Therefore, depending on the situation or level of the menu-structure, some interfaces need to be carefully redesigned in order to achieve simplicity. Simplicity could be broadly defined as the absence of unnecessary elements and that could be implemented through thoughtful thinking (Maeda 2006). A misconception of simplicity can be translated as boring or shallow. Simplicity is amazingly hard to achieve, since it reflects the essence of any information provided.

The philosophy of simple interface design is easily understandable therefore it adheres to the logic of “simple and effective”. During the simplification process of the incoming data and their presentation to the user, a coherent hierarchy irrelevantly to the complexity of the original information has to be followed. It is of major importance that coherence and logically expected reactions are enhanced and promoted by the interface.

Figure 3. (a) BMW oversimplified i-Drive and (b) Mercedes' cluttered central instrumentation panel.

Therefore simplicity in automotive interfaces has to be the mean of transferring essential information to the driver so as to minimise distraction from overwhelmingly presented visual cues. In Human Machine Interaction, simplicity does not imply a design style; it stands for effective and solid piece of information provided in timely manner. However, this can be commonly misinterpreted as reduction. On the contrary, simplicity requires solemn thought and considerable effort as Almqvist et al. state: “A modern paradox is that it's simpler to create complex interfaces because it's so complex to simplify them” (Almqvist et al. 2000).

5. Proposed HUD Symbolology

The interface design presented in this paper addresses primarily the problem of spatial and situational awareness under low visibility conditions. In adverse weather conditions, drivers' response times are predominantly associated with comprehension of the current situation and possible options/solutions available. In this vein, the proposed interface adheres to the dictum of the three stages of human understanding namely: see → analyse → react. Following the above sequence of events during the processing

of an alert, it was useful for this study to cluster them in these three main aforementioned categories. Consequently this three-tier categorisation (see, analyse, react) was also utilised to define the design characteristics of the proposed interface components. A correlation between human knowledge assimilation, collision stages and symbolic representation of the collision stages is offered in Figure 4.

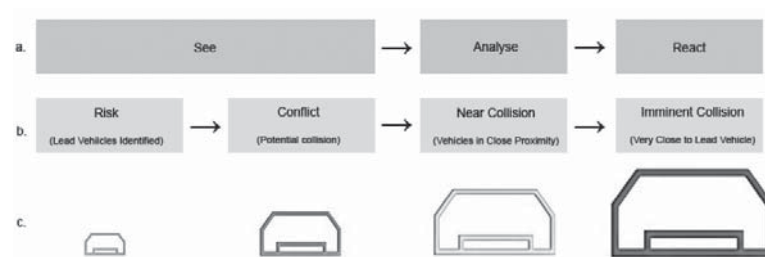

Figure 4. Correlation between (a) human knowledge assimilation, (b) collision stages and (c) symbolic representation of collision stages.

Each category relates mutually to a different phase of human understanding and knowledge forming. Notably, during a potential accident, any information provided should be comprehended in milliseconds by the human brain in order to allow for effective reaction in the face of impending danger. Therefore a piece of information should be selected according to its relative significance at that particular moment otherwise “processing-bottlenecks” can create an impediment to human reactions (Endsley et. al. 2003).

This observation drives the following considerations on the development of the HMI elements that notify the driver of the potential dangers present under low visibility conditions. Notably, instant comprehension of a symbol’s meaning can effectively reduce or even by-pass completely the time-consuming analysing/thinking period. To this end Jung (1964: 256) observed that a person “never perceives anything fully or comprehends anything completely”. In the same work, the author further notes that collection of information through the senses may provide a wealth of different sensor conduits (hearing, touching, and so on) but it still remains questionable to what degree the incoming data are taken into account. As such, “seeing” is not always “believing”, as the human agent may ignore the data received by its own “sensors”. As an intuitive example, one may con-

sider a vehicular interface that provides predominantly visual information in an attention-demanding environment (i.e. under low visibility conditions), where the driver can easily miss information cues; in such a case it is crucial to highlight the absolutely necessary information in a distinguishable and timely manner.

In view of designing the proposed HUD display four pieces of information were identified as the most vital for collision avoidance in motorways, namely *lane recognition (pathway symbol)*, *lead vehicle detection (b1 & b2)*, *sharp turn notification* and *traffic warning* (depicted in Fig. 5). In particular the above information reflects the main obstacles that may be involved in a collision in a motorway environment under low visibility (e.g. lead vehicles and traffic congestion are typically the expected objects on a motorway). Furthermore the sharp turn, lane width and lane trajectory are structural characteristics of the road that can affect the driving behaviour if they are misjudged or neglected. The aforementioned pieces of information are, in turn, visually represented in the HUD design by four symbols (Fig. 5). Prior to commencing the design and modelling of these four symbols, valuable comments were gathered from drivers during informal interviews (Charissis & Papanastasiou 2006).

Figure 5. (a) Lane recognition (pathway symbol), (b1) lead vehicle detection (b2) lead vehicle detection in the same lane, (c) sharp turn notification and (d) traffic warning.

Notably, special care was taken to prioritise incoming information according to the level of importance and then display the most relevant cues promptly and predominantly. To exemplify the significance of this prioritisation, consider that it would be inappropriate during an imminent collision for the HUD to indicate for instance the engine oil-temperature. In this case, even if a potential engine failure was fast approaching, the top priority for the system should be to inform the driver about a potential collision and suggest possible avoidance manoeuvres. As soon as the

life-threatening situation has been overcome, the mechanical or infotainment issues could then be indicated. The shape and functionality of the symbols have been modelled according to the most relevant real-time data that offer information on other objects in close proximity as well as road characteristics. Defining the type and significance of information (quality) is the first step to providing sufficient and vital information to the driver. The evaluation trials of 40 users demonstrated that drivers could process the incoming information effectively (through the symbolic HUD representations) without affecting their response time to a potential accident scenario.

6. Conclusions

This paper has presented a novel design approach for an automotive full-windshield HUD interface which aims to improve the driver's spatial awareness and response times in near-zero visibility conditions. In its final form, the prototype interface design aims to present information in a timely and intuitive manner. Following the design mantra of distilling and simplifying (visually) the incoming information (derived from the vehicle's sensors) (Charissis & Papanastasiou 2006b) the HUD's design aims to minimise visual clutter and consequently the cognitive capture effect. In particular, this paper offered a description of the HUD interface elements that are based on minimalist visual representations of real objects. Evidently a simplification of the visual cues can potentially shorten the learning curve and offer a compact form of interactive guidance for motorway environments. In our future plans we intent to investigate further new symbolic representations and expand the interactivity of the system with the use of *direct manipulation interface* techniques.

The Mexican semiosphere

Musical intertextuality as a cultural expression of Latin American artistic signification

Latin America is a region integrated by language, by religion, and by artistic and cultural realities. Latin American countries moreover share a common past in their history of conquest by the Spanish and Portuguese empires. Among the identity processes of Latinos are forms of musical expression whose rhythmical-melodic units correspond to those of ancestral structures.

Here we approach manifestations of musical intertextuality as cultural expressions of the Latino people, in which one finds processes of creolization and dialogism (Bakhtinian “polyphony”). The signification of these processes is conceived in terms of a basic, relatively stable structural principle governing the internal organization of sense within that semiotic space which Lotman (1996) called the “semiosphere”. This basic nuclear structure manifests as intertextual processes operating within a narrow zone that delimits inside from outside,

1. Transdisciplinary approach, because the methodology includes the perspective of the analysis and musical theory, sociological aspects of consumption, discourse analysis and semiotics of culture.
2. Creolization within this Semiosphere and intertextuality.
3. Musical minimum structures pitch/rhythm.
4. Ideological-cultural operation of the use of “Spanglish”.

The first three aspects encourage understanding between Latino countries, whereas the fourth is a symptom of misunderstanding between them.

1. *Semiosis of Latin American musical production*

The semiosphere establishes an internal organization that generates meanings – in this case, the kinds of music described in Figure 1: Northern music (including drug-traffic songs), *gruperá* music, Colombian *cumbia*, Brazilian samba, tango, and folkloric music of each country that constitutes the nucleus of Latin American culture. In this sense, a relation obtains between nucleus and periphery, where the borderlines that delimit interior/exterior are complex relations that can appear as processes of intertextuality. Also, it is a sum of translations from other types of music, as it travels from the periphery and ancestral time of Afro-American cultures: blues, rock, gospel, pop-rock; Anglo-Saxon parades and marches, techno and rock (with all of its variants).

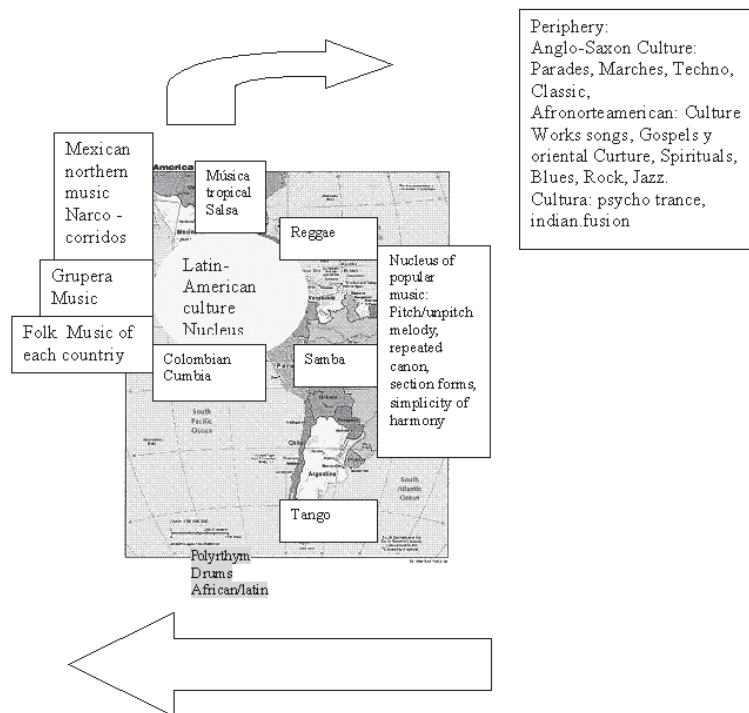

Figure 1. Nucleus-to-periphery movement of Latin American musical styles.

Lotman (1998) defines the nucleus-periphery concept as “a space of culture organized in a certain way that always includes some nuclear formation and a structural periphery ...” (1998: 76). Here, the characteristics of the nucleus include idiomatic, loosely pitched instruments and African rhythms. Moreover, Latin musical expression is a “creolized” one – to borrow a term from linguistics – a hybrid system that is different from the original. In Lotman’s conception (ibid.: 33), the nucleus-periphery phenomenon may also obtain in the field of culture, whose organization has a system with deep roots in societies and elements connected over time and space. According to Schuller (1978: 76), the term “creole” was used in New Orleans, in zones of French colonization of this part of America, and designated those of European ancestry born in the United States. A “creole” musical system, too, has both regionally-determined and European characteristics, the fundamental organization of which is both harmonic and rhythmical-melodic. Harmony is triadic and encoded with the letters A, B, C, D, E, F, G. Melody is centered in the main voice and can be measured metrically. In this case, it is executed generally by instruments forming the rhythmical nucleus of piano, bass and drums.

On the left side of Figure 1, types of traditional musics are located by region, with some possible some omissions, given the wide cultural diversity of every Latin country. This heterogeneity is, however, is a characteristic of folk music. The scheme on the figure illustrates dynamics of globalization, whose movement is combined with other dominant influences; these last include music distribution companies that showcase their products primarily by the Internet and commercial radio. In Mexico, these influences are mainly *grupera* music, *northern* music (regional Mexican), *cumbia* from Colombia (which mainly attracts listeners of socio-economic level), and “tropical” music, which is the dance music typical of beaches and other coastal areas.

Shared musical characteristics establish points of contact and relationships that help to establish identity and living cultural spheres. One aspect of the musical systems that we are analyzing here is that they use mostly major tonalities, a feature that supports the dominant social system (cf. Leeuwen 1999). Most of them use an organization of discourse (language and ideology) and, especially, drug-dealing songs and/

or northern music (discussed below), which have messages concerning government and to leaders of drug-traffickers.

*2. Minimal structures of pitch and rhythm:
The skull of Jade-Cráneo de Jade*

Within the distribution of harmony, the voices are laid out in traditionally western style, in tertian harmony (including 7th), with strong emphasis on the tonic note. In some regions, characteristic instrumentation includes bandoleón (for *tango* and *huapango*), piano, bass, drums, electric guitar and vocals.

Figure 2. Relationship between musical drum beats and the African god, Changó.

As to the rhythms in tropical music/salsa, the minimal structures are drawn from rituals of Santería. A typical rhythm may be seen on the left side of Figure 2, a description of the ternary-based *changó*; on the right side of the figure, we see that this rhythm corresponds to Orisha, the god of thunder and lightning, fire, war, dance, all music, and masculine beauty (protector of soldiers, etc.). In traditional folkloric music, the *huapango tamaulipeco* (from Tamaulipas, one of Mexico's states) corresponds to this same basic rhythmical structure. Therefore, it corresponds to dialogic voices within a musical text that are interdependent in different musical manifestations. In this sense, we have one of the symbols concretely delimited to music-producing subjects. We have included examples from linguistics and fusion music, in the lyrics of a song by Molotov. Such expressions are easily identifiable in clear semiotic processes, which on the reception side include competition from whomever listens. This type of public constitutes a nuclear group of a

large enough population to occupy a position in the culture of our country. Its nucleus, as in some other Latin American societies, is music with ancestral rhythmic cells, in particular, tropical songs and *salsa*. These can be identified by characteristic meters and syncopated rhythms; the melodies follow an easily outlined pattern, and the harmony is based on tonic/dominant relations. In all these aspects, we may speak of understanding/misunderstanding; understanding, because they are common, culturally defined communication schemes among Latin Americans. On the other hand, misunderstanding has often occurred, leading to unfortunate experiences that differ on ideas concerning sovereignty and integration. For example, the conception of different models (such as Chavez's misunderstanding of Bolivar); the Brazilian model (of president Da Silva); and the moves toward pragmatic models (United States). The failure of economic reforms in Latin America has caused a lack of definition in various governments there. For our concerns in this paper, however, we shall not dwell on those.

3. Ideological-cultural reflection in the use of "Spanglish"

People who speak Spanglish transgress linguistic norms, by using a new, creolized language. Latin American immigrants perceive a great resistance between subjects of American identities and themselves; they get an impression of greatness and power, along with a sense of coldness, distance, and impersonality. By contrast, Latin subjects are focused on people and intimate social relations (Massey and Sánchez 2002). Conditions of production and discursive reception are included in this process. In this regard, Haidar (2002, 2006) proposes a scheme of implicative relations among social formation, discursive formation and ideological-formation (Figure 3). Pecheux (in Haidar 2006) makes reference to the imaginary formation of social subjects, and its interlocutor refers to discourse-language manifestations (aggression and discrimination). In orthodox Marxism, "formation" is defined as a complex of contradictory economic structures; and according to Pecheux (1978), each of these elements has a structural combination. In this sense, social formation represents a complexity of superstructures corresponding to a whole social totality, historically determined, which interacts with a given economic

structures in several ways of production, and generates social classes and social groups.

However, these authors articulate their conception of social formation with ideological categories defined as “a complex set of attitudes and representations that are neither individual nor universal”, but that is related directly to class positions and discursive formations (Pecheux, in Haidar 2006). This author conceives that conditions of production and reception of language are like imaginary formations of sociological-ideological-discursive conditions that are implied mutually and included in the formation of subjects, which depend on one, concrete economic structure, with its own ways of production and setting of social relations. This social formation implies a perception of reality in which it may take part, as a force confronting other forces in the ideological conjunctions characteristic of a social formation (Pecheux 1978).

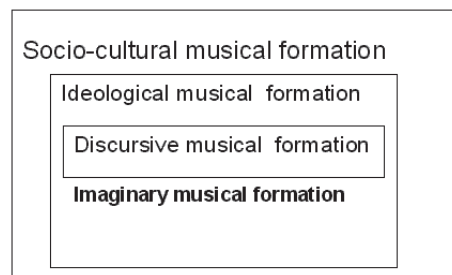

Figure 3. Implicative relation of discourse (from Haidar, 2006).

A given ideological formation determines what “it can and must say”; for that reason, some of these strategies have to regulate the lyrics (contents) of songs. Popular compositions are automatic constraints that creators apply to themselves. In this case, if *northern music* (regional Mexican) exceeds these automatic controls in *narcocorridos* (a musical discourse and style) so as to redeem itself in a cultural transgression, these musical genres constitute types of enunciation whose meaning admits concepts that can be judged and categorized as false/true and as “reasonable or unsuitable”. Such would be songs by activists opposed to a regime, regulated by the kind of auto-control (censure) usually omitted in a given declarative situation. Such constraints apply not only to the

content but also to the form. Moreover, we can see a process of Americanization (globalization) in the use of language, which is frequently legitimized in literary works that use Spanglish and the portray the life situations that Latinos are forced to face.

Some types of music constitute an identity discourse for a great number of people, from Baja California to the Yucatan peninsula. One example is a rap style in non English-speaking zones, which is successful because it is anchored in oral tradition in the discursive sphere and developed by contact with Spanglish-Chicano people. Therefore, these discursive manifestations also imply an imaginary creator (composer), whose formation expresses unconscious and conscious contents of a daily reality lived in bicultural processes. At the same time, the creator is also collective, since such songs are the implied artistic expressions of Spanish-speaking migrants. As such, they are signs of creolized culture. Language, with its argumentative statements and specific conclusions, is present in the lyrics of songs. They are macro-operations of discourse (with narration strategies, description and demonstration) in object-subject language schemas and musically creative songs that reconstruct the social subject at the level of superstructures.

4. *Conclusions*

In Latin America we find examples of artistic cultural expressions that support understanding between countries. In this regard, we have analyzed musical characteristics that, even though specifically Mexican, may be extrapolated to Latin America at large. In this type of musical text one can identify rhythmical structures that underlie a Latino cultural unit. Thus, it is not surprising to find lyrics opposed to dominant countries like the United States. However, understanding the relationship between Mexico and other countries is complex. For such purposes Lotman (1998) proposed concepts such as dialogism, production/reception of the artistic subject, cultural and border translation, *partenaire*. Latin artistic production is to be understood as a phenomenon nuclear for these same societies and peripheral for countries. Also, it shows creolized characteristics that allow us to identify it as a “text” (Lotman 1996), that signifies towards an audience and constitutes itself as a *partenaire* constructing a

dialogic relation; proving this point are examples of music with African rhythmic roots in Santería and other rituals.

Don't call me gringo,
You fuckin beaner
stay on your side
of that goddamn river
don't call me gringo,
You beaner.
No me digas beaner,
Mr. Puñetero
Te sacaré un susto
por racista y culero.
No me llames frijolero,
Pinche gringo puñetero.
Now I wish I had a dime
for every single time
I've gotten stared down
For being in the wrong side of town.
And a rich man I'd be
if I had that kind of chips
lately I wanna smack the mouths
of these racists.
Molotov(2001), *El frijolero*.

español*. México: Alfaguara. 2000

Figure 4. Examples of artistic and linguistic manifestations in "Spanglish".

Latin America can find examples of cultural expression, especially artistic-musical ones, that can promote, by cultural translation, understanding between countries.

The semiotic border between Mexico and the USA, seen as a form of musical-cultural domination, constitutes the scene of alternative production of creolized musical systems. Nucleus-periphery relations of social movements also have repercussions in musical semiotic-discursive processes, which become materialized in peripheral musical genres.

One aspect of neo-Confucian structure in decision making

A yin-yang-based system theory

1. Introduction

Some ancient Chinese philosophers believed that everything in the universe was made up of two forces, called yin and yang. Lin (1999), a proponent of Yin-Yang theory, states: “At the beginning of the universe, the *Ultimate Nothingness* gave birth to the *Great Ultimate*. Then, they became a pair, *yin* and *yang* in the broader sense, and they began to interact with each other.” In other words, the concept of yin-yang describes two, primal, separate yet complementary forces found in all things in the universe. According to Mou (2003), *yin-yang* reflects not only the collective wisdom of ancient Chinese people concerning the fundamental features of the universe, but also influences later metaphysical thought in various of the Chinese schools or movements. *Yin-yang* is also a sign system used by Chinese people to convey feelings, thoughts, and ideas. It is therefore a major branch of Chinese Semiotics.

From the viewpoint of Chinese philosophers, since *yin-yang* is an encompassing, yet flexible, systematic concept; it hence can be used to explain many phenomena of our daily life. Using the notion of *yin-yang* as it applies to the workings of *wu-hsing* – the five agents: plant life, fire, earth, metal, and water – people can effectively explain many of the changes taking place, and in turn, relate them to nature, the human body, psychology, philosophy, historical changes or scientific findings. Chinese medicine is but one of the well-known scientific practices based on the theory of *yin-yang* and *wu-hsing*.

Derived from Chinese systematic thinking (De Bary et. al 1960; Wu 1972) and western systems-theory, the Neo-Confucian System Theory

(NCST) is composed of three subsystems (Lin 1999): the *Yin-Yang*-based system, the *Wu-Hsing*-based system, and the Triadic Talents,¹ i.e., Earth, Humans, and Heaven (see Figure 1). Among these, the *Yin-Yang*-based system is the one fundamental to development, in that it first simplifies space, which is of infinite dimension, into a pair of *yin-yang* forces. Due to its nature as an interactive system, it can then be developed into other pairs of *yin-yang* hierarchically, according to related axioms and by the ordering order of Earth-, Humans-, and Heaven-positions after the first *yin-yang* pair in Earth position. The *yang* of Earth position further splits into two patterns as another pair of *yin-yang* Human-positions, accompanied by a *yin-yang* pair of the Human-position, split further from the *yin* of the Earth position; these first and second splits lead to the creative evolution of *Four Scenarios*. The process continues with a third split – that of the Heaven position – producing the scenarios of *Eight Trigrams (Ba-Gua)*, which can be modeled effectively after these three pairs of *yang* and *yin* begin to interact.

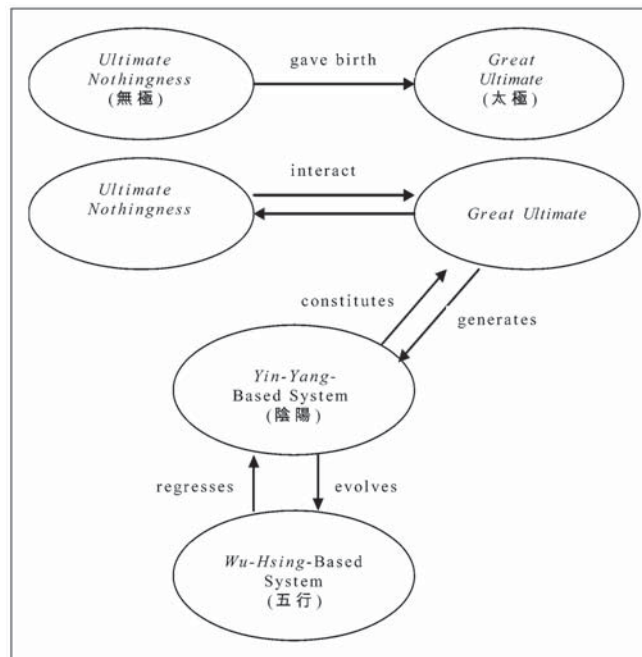

Figure 1. The figure of NCST.

Senge (1990) advocated the view, highly relevant here, that systematic thinking explores things as wholes. Flood (1999) later pointed out the link between systematic thought and the study of complexity and uncertainty. As well as breaking through the limits of linear thought,² the NCST is capable of simplifying and structuring complex systems. The NCST has been used as a framework for academic research and as an analytic tool for business management in modern China (Chen et al. 2006; Lin 2001; 2002; 2003a; 2004; 2005; Tsai et al., 2004); and the concept of *yin-yang* is also widespread in many fields of social-science research in the west; e.g., in total quality management (Cunha et al. 2002), strategic project management (Curtis 2001), currency systems (Lietaer and De Meulenaere 2003), strategy innovations (Perlitz 1994), computer science (Sodan 1998), social behavior (Sodan 1999), and intercultural communication (Yuan 1997).

Past research, however, has not yielded rich enough insights into the core values of *yin-yang*; and in turn, it seems that no unified, guiding law or principle governs the theoretical and empirical application of *yin-yang*. Accordingly, the concept or theory of *yin-yang* somehow fails to be adequately emphasized or even fully realized. Issues as to how *yin-yang* can be effectively applied in modern management science remain relatively unexplored.

In this study, starting from a discussion of the concept of *yin* and *yang* as *Two Patterns* (two interactive forces) and following with construction of *Four Scenarios* and *Eight Trigrams*, the authors propose related axiomatic definitions, operational definitions, axioms, and laws that serve as a theoretical foundation for the *Yin-Yang*-based system. The authors illustrate how they can also be used to model the structure of qualitative decision-making, and in turn, as an analytic tool for business management.

2. *The Yin-Yang-based system*

More than two thousand years ago, *yin-yang* school emerged in China as explanations of how and why nature operates in such opposing ways. This ancient pair of seemingly opposite terms, which is the most influential dualism in the East, has gone on to surpass its religious content, and is now located in the realm of modern Chinese psychology and philosophy. Starting from systems theory, Lin (1992a; 1992b; 1997) has discovered similarities between *yin-yang* dualistic philosophy and economic duality. For

westerners who want to better understand Chinese thought, it is crucial to understand the *yin-yang* logic prevalent in “*Great Ultimate* thinking”. The *Yin-Yang*-based system theory is composed of the following axioms:

AXIOMATIC DEFINITION (1): That situation in which the human being senses no existence of system, order, and structure is called “*Ultimate Nothingness*”.

AXIOMATIC DEFINITION (2): That situation in which systematic order and structure can be recognized initially or has been recognized by human beings is called “the *Great Ultimate*”.

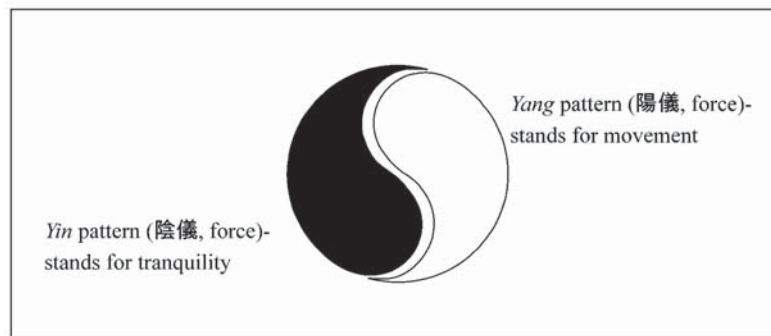

Figure 2. The Great Ultimate sketch.

Figure 2 is a general sketch of systematic thinking based on *yin-yang* logic as applied to the *Great Ultimate* system. The latter is pictured as a circle. The S-curve in the center divides the circle into two sectors, the white one standing for the *yang* pattern, the black one for *yin*. On one hand, this segmentation denotes benign interaction between the two patterns, but on the other hand, it indicates separation and scission between the two patterns. It also highlights the continuous movement and influence of *yin* on *yang* and *yang* on *yin*.

AXIOM (1): The *Great Ultimate* (system) is composed of two interactive forces, i.e., *yin* and *yang*. Multitudinous interactions between these two forces engender myriad objects and things (subsystems or small great-ultimates) in the universe. Through this two-way interaction, *yin* and *yang* can in turn transform those objects and things.

OPERATIONAL DEFINITION (1): The *Great Ultimate* splits forces up into two patterns, the movement-dominated force as *yang* pattern, and the tranquility-dominated force as *yin* pattern.

Inspired by Brugha's dichotomy (1998a, 1998b, 1998c, 2000), we present a qualitative decision structure for the *Yin-Yang*-based system theory. In spite of several differences between the latter and Brugha's dichotomy,³ the *Yin-Yang* system may be graphed as shown in Figure 3.

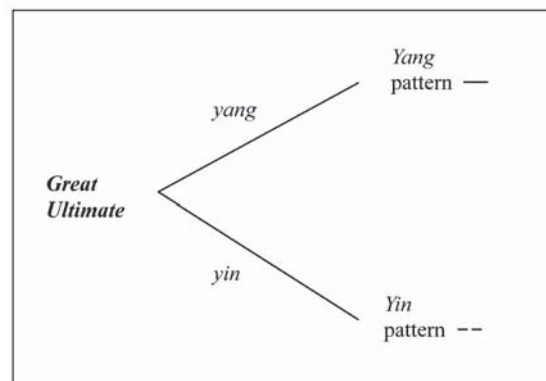

Figure 3. Yin-Yang system.

AXIOM (2): *Yin* and *yang* are separate forces, but are not necessarily hostile to each other.

AXIOM (3): The initial generation of *yang* and *yin* is ordinal.

AXIOM (4): The *Yin-Yang*-based system is an open system.

AXIOM (5): After interaction, *yin* and *yang* have a two-way, causal relationship.

AXIOM (6): The *Yin-Yang*-based system is an evolving system.

AXIOM (7): When insufficient reciprocity occurs, such internal changes of system would make the *yin* and *yang* *Gua*-transformation into a new phenomenon.

Generally speaking, a theorem must be deduced from axioms (Hunt 1991); nevertheless, laws are usually induced from observation and living experience. The question of whether any theorem can be deduced from related axioms of the *Yin-Yang*-based system theory remains to be explored. To engage problems that cannot be solved by the above axiomatic system,

Lin (1994) has also induced four laws from historical literature and opinion,⁴ to serve as complements to the above axioms:

LAW (1): Interaction between the two forces of *yin* and *yang* would cause the creative evolution of myriad objects and things.

LAW (2): Where one of the two forces is lacking, no singular system exists.

LAW (3): Under appropriate situations, *yin* can change its role into *yang* and vice versa.

LAW (4): The system can only be stable if the two forces of *yin* and *yang* are dynamically balanced. Conversely, a dynamically unstable system will result from a dynamic imbalance between these two forces.

There are two different situations where one is *yin-yang* in dynamic imbalance and the other is *yin-yang* in dynamic balance. The former continues changing until it reaches dynamic balance, and the latter can change, by certain external or internal motivation, to a state of dynamic instability. When all *yin* and *yang* pairs in the *Great Ultimate* reach overall dynamic balance, the system achieves the situation of harmony (Lin 1999).⁴ At this stage, the system remains dynamically stable unless there is a change of external environment or of internal motive.

3. *From the Two Patterns subsystem to the Four Scenarios subsystem*

OPERATIONAL DEFINITION (2): In the input (Earth-process) and output (Humans-process) structure, the *yin* and *yang* patterns of the “Earth” position can apply forces that further develop the system into four situations, namely, what we call the *Four Scenarios*.

Other stratifying principles, such as the WSR (*Wuli Shili Renli*) approach (Gu and Zhu 2000) differ from that of the *Four Scenarios* in the *Yin-Yang*-based system. The former adopts a three-level analytic method, whereas the latter embodies I-P-O (Input-Process-Output) structure. Yet another stratifying principle, proposed by Brugha (1998a, b, c; 2000), is a system for analyzing qualitative decision-making based on dichotomous answers to three simple questions: “What should be done?”, “Where should it be done?”, and “Who has the problem?”. But it neither fits into I-P-O structure nor meets the needs of the *yin-yang* stratifying principle. In this sense, and based on the ordinal principle of Earth-position and

Humans-position, the *Four Scenarios* structure may be sketched as in the middle part of Figure 4. As we can see, there are four situations (2^2) in the *Four Scenarios* structure.

Stratifying principle <i>Four Scenarios</i>	First split (Earth position)	Second split (Humans position after Earth position)	Symbol
Real scenario	<i>yang</i>	<i>yang</i>	☰
Pseudo-scenario	<i>yang</i>	<i>yin</i>	☱
Righteous scenario	<i>yin</i>	<i>yang</i>	☲
Useful scenario	<i>yin</i>	<i>yin</i>	☷

Table 1. Properties and symbols of Four Seasons.

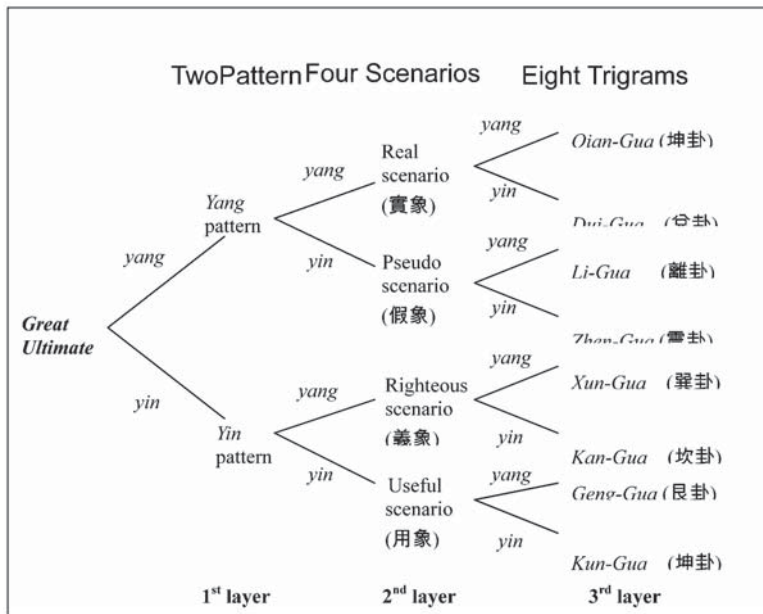

Figure 4. Eight Trigrams structure.

4. From the Four Scenarios subsystem to the Eight Trigrams subsystem

OPERATIONAL DEFINITION (3): Any single situation in *Four Scenarios* can apply forces of *yin* and *yang*, derived from the following “Heaven” position, to further develop the system into *Eight Trigrams*.

The terminology used in this paper and corresponding western designations are shown in Table 3.

5. Decision-making structure in business management

Based on operational definitions of the *Yin-Yang*-based system theory proposed above, the *Great Ultimate* may split hierarchically into three pairs of *yin* and *yang* by order of “Earth” position, “Humans” position, and “Heaven” position. Since *yin* and *yang* interact with each other in the content of each single pair, there exists a two-way, causal relationship.

When an organization or a company is treated as the *Great Ultimate*, its first *yin-yang* stratifying principle would come up with the most fundamental production factors: the inputs of labor and the owner’s equities of the Earth-position. Here, the movement-dominated force of labor input, which operates production equipment and processes raw materials, is considered to be the *yang* pattern. The tranquility-dominated force of owner-equity input – hiring of laborers, purchases of raw materials and production equipment, drawing upon borrowed money – is considered to be the corresponding *yin* pattern. These two forces usually interact in the form of combination of different quantities and percentages resulting from the decision-making of management.

Different decision-making domains depend upon the focus of management. Specialized operation and synthetic management are two major types of management philosophy in business. Management based on specialized operation pursues higher productivity and competitiveness. It is a *yang* pattern with movement-dominated force in the Humans-position. By contrast, synthetic management takes greater account of risk-factors, diversification, and financial stability. It is a *yin* pattern with a tranquility-dominated force in the Humans-position. The first pair of *yin-yang* patterns, developed from Earth-position, can then individually connect with this second pair of *yin* and *yang* forces, internally developed from the

Stratifying principle <i>Eight Trigrams</i>	First split (Earth position) (地位)	Second split (Humans position after Earth position) (人位)	Third split (Heaven position after Earth & Humans position) (天位)	Symbol
<i>Qian-Gua</i> (乾卦)	<i>yang</i>	<i>yang</i>	<i>yang</i>	☰
<i>Dui-Gua</i> (兌卦)	<i>yang</i>	<i>yang</i>	<i>yin</i>	☱
<i>Li-Gua</i> (離卦)	<i>yang</i>	<i>yin</i>	<i>yang</i>	☲
<i>Zhen-Gua</i> (震卦)	<i>yang</i>	<i>yin</i>	<i>yin</i>	☳
<i>Xun-Gua</i> (巽卦)	<i>yin</i>	<i>yang</i>	<i>yang</i>	☴
<i>Kan-Gua</i> (坎卦)	<i>yin</i>	<i>yang</i>	<i>yin</i>	☵
<i>Geng-Gua</i> (艮卦)	<i>yin</i>	<i>yin</i>	<i>yang</i>	☶
<i>Kun-Gua</i> (坤卦)	<i>yin</i>	<i>yin</i>	<i>yin</i>	☷

Terminology	Western vocabulary
<i>Ultimate Nothingness</i> (darkness)	(It seems to have no corresponding concept.)
<i>Great Ultimate</i>	system
<i>yin</i> (tranquility-dominated)	antithesis (but its meaning is limited)
<i>yang</i> (movement-dominated)	thesis (but its meaning is limited)
<i>Two Patterns</i>	two patterns (but its meaning is too broad)
<i>Four Scenarios</i>	four scenarios (but its meaning is too broad)
<i>Eight Trigrams</i>	eight scenarios (but its meaning is too broad)

Table 3. Terminology of the Yun-Yang-based system theory and its corresponding Western vocabulary.

Humans-position, resulting in the *Four Scenarios* (operational definition 2).

Rewards in the form of a paycheck for labor input are the most basic and important expenditure, and may be deemed a *yang* pattern of production outcome. Profits from specialized operation or earnings from synthetic management are less urgent and necessary objectives than are paycheck rewards; thus, they are considered to be *yin* patterns of production-activity outcome. This third pair of *yin* and *yang* is located in the ‘Heaven’ position. These three pairs of *yin* and *yang* together constitute the *Eight Trigrams* (operational definition 3).

People in management positions play the key role in connecting fundamental inputs to pursuant outcomes. The achievement of desired outcomes encourage repetition of the fundamental inputs. Since activities involved in any single path, through fundamental inputs on the way to pursuing outcomes, cover all possible management decisions, the *Eight Trigrams* can be used as a decision-making structure in business management. The *Eight Trigrams* structure, shown in Figure 4, may be practically applied to business management, as sketched in Figure 5.

Among the *Eight Trigrams*, the *Qian-Gua* causal chain can be used as a detailed illustration of how it works when the major concern of a company is to satisfy employees’ most fundamental and important needs (paycheck rewards). As we can see, employees are one of the most important resources of any company. Optimal quantity of qualified labor input is usually the domain of recruitment and selection, which is one function of the personnel department. After recruiting qualified employees, the company equips them with the assets needed to achieve the goals of specialized operation. The source of capital depends on the annual budget and is an important determination made by the financial department. The achievement of goals of specialized operation brings added value and covers the cost of employees’ paychecks. Satisfaction with salary in turn stimulates employees to work hard in pursuing future goals. The *Qian-Gua* causal chain can be expressed as follows:

$$\frac{A}{C} = \frac{A}{B} \cdot \frac{B}{F} \cdot \frac{F}{H} \cdot \frac{H}{J} \cdot \frac{J}{K_1} \cdot \frac{K_1}{L_1} \cdot \frac{L_1}{C}$$

where,

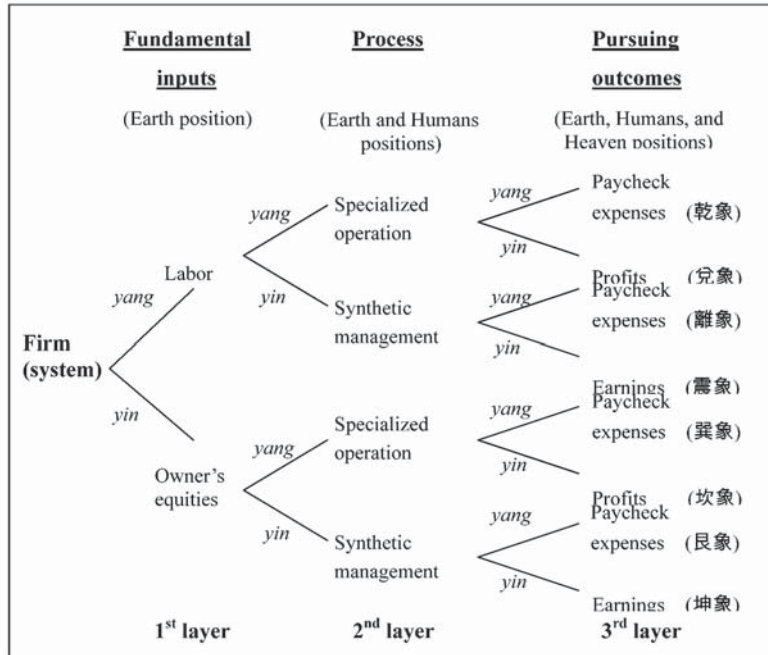

Figure 5. Eight Trigrams decision-making structure in business management.

- C: labor input
- L_i : real-assets inputs in specialized operation
- K_i : fixed-assets inputs in specialized operation⁵
- J: mechanical and electrical equipment inputs in specialized operation
- H: total-production value in specialized operation
- F: value-added in specialized operation
- B: labor costs
- A: paycheck expenses

The right-most item, with denominator (C), is labor input as a *yang* pattern of the Earth-position shown in Figure 5. Along with L_i , K_i , and J, they are the most decisive production-factors input when management is focus on specialized operation. Hence decisions regarding the “proportion or percentage of K_i / L_i and J / K_i ” are the key ones made in the pursuit of higher total-production value (H) or higher value-added (F). Combined

with efforts to decrease the consumption of raw materials and operating expenses, a company would be able to obtain higher value-added and, in turn, distribute labor costs (B) and employees' paychecks (A). The other seven causal chains of the *Eight Trigrams* may be implemented in similar fashion.

6. Conclusion

In this study, two axiomatic definitions, three operational definitions, seven axioms, and four laws have been proposed to elaborate a *Yin-Yang*-based system theory, as evolving from *Ultimate Nothingness*, *Great Ultimate*, *Two Patterns*, *Four Scenarios*, and, finally, to *Eight Trigrams*. To illustrate the latter, a decision-making structure based on the *Qian-Gua* causal chain was described, which may be taken as a model for business management. With this study, the authors have sought both to contribute to theoretical investigation of the Neo-Confucian System Theory (NCST), and to demonstrate a practical application of the *Yin-Yang*-based system theory. The other subsystem of the NCST – the *Wu-Hsing*-based system theory – will form the subject of future research.

Notes

1. According to Lin (1999), the active of the *Great Ultimate* would generate two patterns of Heaven and Earth through the corresponding operation of *yin-yang* two patterns. The active interaction of two patterns of Heaven and Earth then generates water, fire, plant, metal, land and Humans. The positions of Heaven, Earth, and Humans in one kind of operation correspond to *yang*, *yin*, and harmony, respectively. Harmony is a relatively active force that activates two relatively passive forces, namely *yang* and *yin*, in a passive system. These three forces of *yang*, *yin*, and harmony constitute the operating system in the *Yin-Yang*-based system theory, which is one of the subsystems of NCST.
2. In facing complicated problems, one is used to thinking about them in terms of manageable segments first, and coordinating them later. This so-called linear thinking is the mainstream of modern thought. Although linear thinking can solve many complicated problems, improper segmentation can cloud our perception of the problem as a whole. In addition, linear thinking tends to make phenomena too complicated to be conceiv-

able, even when only two or three variables are involved. Senge (1990) calls this “dynamic complexity”.

3. The eastern *Yin-Yang*-based system theory and that of the West are both derived from a common dichotomy. But these two decision-making structures differ in terms of stratifying principles, dichotomous content, and stratifying outcomes.
4. The term “harmony”, as used in this study, is almost equivalent to the meaning of “*Chung-Ho*”. Harmony is an important analytic concept in Chinese culture. According to Lin (1999), harmony is a relatively active force that activates two relatively passive forces, namely *yang* and *yin*, in a passive system. These three forces of *yang*, *yin*, and harmony constitute the operating system of the *Triadic Talents*. In contrast, equilibrium refers to temporary concordance of two different and independent forces. It seems there is no significant active harmonic force involved in either mechanical equilibrium or homeostatic equilibrium. That is why, in Lin’s opinion, harmony can only conditionally encompass equilibrium.
5. Management can privilege either specialized operation or synthetic management. When a company is managed with specialized operation in mind, the real assets inputs (L_1) are composed of fixed assets, current assets, and intangible assets. Among these, the value of fixed assets inputs (K_1) can be calculated after deducting those asset-values that do not contribute to the total production value, such as value of proprietary land, construction in progress, equipment in transit, and “fixed assets being rent or lent”. Of course, a company based on synthetic management will have different real-asset (L_2) and fixed-asset (K_2) inputs.

Ethniktag: Ever-changing understanding

Introduction

This study elaborates a semiotic approach to interactive communication through an evolutionary reconstruction of signification that focuses on various possibilities of perception and evolution of the “plastic signifiant”. First, we define the artistic expression “Ethniktag” and its evolutionary construction. Then, we study its manifestations on two Internet blogs, “Maddart” and “Traddam”.

Ethniktag is an artistic expression that indicates a mix of “Tag und Graf” with plastic folk art, such as inscriptions in acrylic, as well as drawings and graphs closely resembling writing, scrawled on cloth that is attached to wood. Conceptually, *Ethniktag* relies on mathematical, geometrical and topological articulations (addition, multiplication, subtraction, division, rotation, removal, etc.) in the forming of symmetric, asymmetric, almost crystalline, asymptotic figures. This conceptual art establishes a plural signifier that evolves in five stages: (1) modus operandi; (2) imprint (*l’empreinte*); (3) pictorial choreographies (*les chorégraphies picturales*); (4) virtual plastic editing (*le montage plastique virtuel*) according to simple mathematical and geometrical rules; and (5) real plastic editing (*le montage plastique réel*) following both mathematical and topological rules.

1. The plural signifiant

Picture 1 represents the modus operandi, i.e., the consecutive steps in the production of a painting. The color progression (from signifiant–2, signifiant–1, to signifiant O) shows, on the one hand, the growth of the large black surface surrounding the elements of the plastic statement; and on the

Picture 1. Modus operandi.

other hand, the function of contrast in the perception of the signifying set (black, white, red, orange).

Picture 2. L'empreinte.

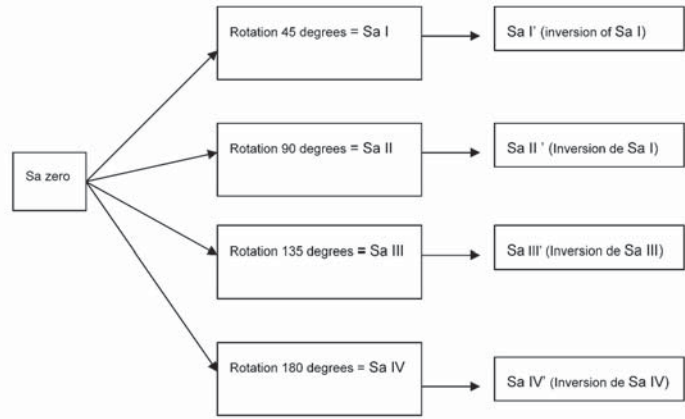

Picture 2 indicates the dual nature of the medium – painting attached to wood – which allows for at least two levels of expression. The first is the visible level, which is directly registered on the cloth; secondly, the “hidden” one, is the imprint of this registration on the wood.

2.1 Pictorial choreographies (topological variations)

The point of departure of the pictorial choreographies is the “signifiant zero”. This last refers to constituent plastic units, independent of the spatial position of the pictorial object. The use of topological variations around the zero-signifier is done by rotation (from 45 to 180 degrees), which combined with inversion creates eight different *signifiants*. These pictorial moves, as depicted in Figure 1, offer the receiver several perceptions of the same object, as kinds of “pictures of the picture”. These rotations moreover create a different logic of meaning by redefining the terms /top/, /bottom/, /left/, /right/.

Picture 3. The rotation.

Sa = *signifiant*

Figure 1. *Rotation and inversion based on signifiant-zero.*

Picture 4. *The inversion.*

2.2 Virtual plastic editing according to mathematical and geometric rules

If video editing is a way of assembling fragments of a movie into a coherent whole, plastic editing is a mode of assembling paintings involving dual spaces: the real and the virtual. The *addition* of plastic signifiants links two categories of figures, symmetric and asymmetric. Symmetric figures (Sa I + Sa I', Sa II + Sa II', etc.) are shown in pictures 5–7; pictures 8 and 9 display asymmetric figures (Sa I + Sa II', Sa III + Sa IV', etc.).

Picture 5.

Picture 6.

Picture 7.

Picture 8.

Picture 9.

In the tensional scheme of post-Greimassian semiotics, as developed by Fontanille and Zilberberg, a given value is constituted by the combination of two dimensions or “valences”: *intensity* and *extensity*. The extensity is that area to which intensity applies. It corresponds to the quality, variety, and spatial area of a phenomenon. The intensity and extensity may vary in strength, on a continuous scale going from no-strength to maximal strength. For each valence, Fontanille distinguishes two sectors: an “at-one” sector (low strength) and a “tonic” sector (high strength). He writes (2000: 103):

Sur le principe de base selon lequel les schémas assurent la solidarité entre le sensible (l’intensité, l’affect, etc) et l’intelligible (le déploiement dans l’étendue, le mesurable, la compréhension), on pourra définir l’ensemble des schémas discursifs comme des variations d’équilibre entre ces deux

dimensions, variations conduisant soit à une augmentation de la tension affective, soit à une détente cognitive. L'augmentation de l'intensité apporte la tension, l'augmentation de l'étendu apporte la détente.

[Based on the principle by which the schemes ensure solidarity between the sensible (intensity, affect, etc.) and the intelligible (deployment in space, the measurable, comprehension), we will be able to define the totality of discursive schemes as variations of equilibrium between these two dimensions, variations leading either to an augmentation of affective tension or to cognitive relaxation. The increase of intensity brings tension; the increase of space brings relaxation.]¹

In the asymmetric picture, we have high extensity and high intensity. The correlation between both dimensions is converse, because the increase of extensivity on the plane of the expression is accompanied by an increase of intensity on the plane of the content. In the symmetric figure, we have high extensity and low intensity. The correlation between the two dimensions is reversed, because the increase of extensity is accompanied by a decrease of intensity. The operation of *multiplication* produces asymptotic and quasi-crystalline figures.

Picture 10. *The operation of multiplication: Quasi-crystals.*

Why “quasi-crystalline”? The figure obtained is a set of patterns. Every motive is constituted by the smallest discernible entity, which is repeated periodically by translation. The periodical repetition of the motive by translation is defined by a base of linearly independent vectors; the dimension of each one is equal to the spatial dimensions in which the pattern

repeats. Why “asymptotic”? Because, following the rule of reproduction, the zero-signifier aims towards infinity, but without ever reaching it. The term “asymptote” is used in mathematics in reference to the possible properties of a curve reaching towards infinity.

Picture 11. *Multiplication: Asymptotic.*

The next operation is *division*, which concerns the fragmentation of the plastic signifiant into its lesser constituents (Sa I/2, Sa I/4, Sa I/6, Sa I / 8). This fragmentation, as shown in pictures 12–14, is accompanied by a “zoom” effect, which allows the dynamics of the plastic space to be seen, and which also reveals “clumping” (paints applied in a thickened form) and “dry passes” of the paintbrush (those made with small quantities of paint).

Picture 12.

Picture 13.

Picture 14.

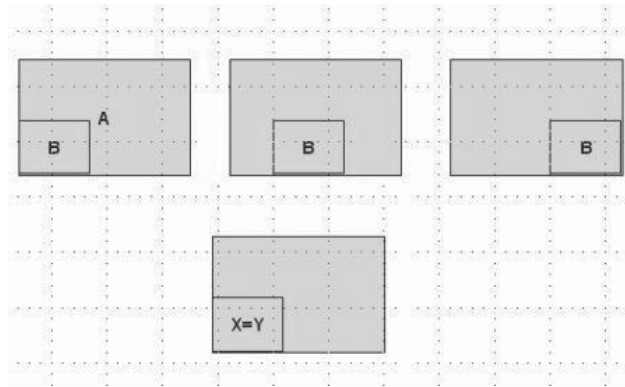

In other words, division focuses attention on the perceptible and kinetic properties of the gestural imprint. In Fontanille's words (*ibid.*):

... l'interprétation visuelle est alors, dans ce cas, conforme à la pratique herméneutique telle que la tradition philosophique la définit, en ce sens qu'elle consiste à retrouver à travers les propriétés plastiques de l'image, certaines propriétés cinétiques de la pratique de production.

[Therefore, visual interpretation, in this case, conforms to hermeneutic practice as defined by philosophical tradition, in the sense that it consists in recovering, through the plastic properties of the image, certain kinetic properties of the practice of production.]

2.3 Real plastic editing: Superimposition of paintings

The superimposition of two paintings – A (positioned in the background) and B (in the foreground) – has a dual effect: the subtraction of a surface (X) from painting A, and the addition of a surface (Y) to painting B. This pictorial interaction is accidental; the two superimposed paintings were produced at different times.

Picture 15. *Superimposition of paintings.*

Surface X is equal to surface Y, and painting A can be superior or equal to painting B. We notice that the signifier sets obtained by this superposition forms a new *signifiant zero*, which may follow the rules of the 3rd and 4th planes (rotation, inversion, division, multiplication). The *removal* of

painting B, which was once positioned in the foreground, creates new perceptions of the set and a new zero-signifier.

Picture 16. With painting B removed.

2.4 From diptychs to triptychs

In the composition of triptychs, each pictorial object can occupy different positions (center, right, left). The use of a flexible paradigmatic axis produces two types of construction: a *motivated construction* marking continuity with the rest of the constituents; and an *arbitrary construction*, marking a break with the other constituents of the triptych

Picture 17.

Picture 18.

Picture 19. Triptych “movement” (2007), acrylic, 183 x 51 cm.

These bridges between art, mathematics, geometry and topology allow for a multiplicity of interpretations and perceptions of the same object. This systematic approach also affords us an objective view of a subjective mode of expression: painting. But, as Aharon Katzir-Katchalsky has noted (1972: 249), “... il existe une différence essentielle entre les formes symboliques de l’art et celles de la science. Les symboles de l’art sont uniques, spécifiques et irréductibles, tandis que les symboles de la science sont globaux, reproductibles et susceptibles de généralisation. [There exists an essential difference between the symbolic forms of art and those of science. The symbols of art are unique, specific, and irreducible, while the symbols of science are global, reproducible, and amenable to generalization.]

Having explained the rules of construction used by *Ethniktag*, we now turn to placing this grammar in an interactive space, by studying an example of Web 2.0: the Blog.²

3. *Maddart and Traddam on Web 2.0*

Web 2.0 is a new version of the World Wide Web. According to a definition on the website Wikipedia, Web 2.0 refers to:

... a perceived second generation of web-based communities and hosted services which aim to facilitate collaboration and sharing between users ... [Also] the transition of websites from isolated information silos to inter-linked computing platforms that act like software to the user. Web 2.0 also includes a social element where users generate and distribute content, often with freedom to share and re-use. The result is a rise in the economic value of the Web as users can do more online.

3.1 Interaction

Interaction may occur through a moderator. The user can leave a public comment published on the Blog (by clicking on the “comments” link) or send a private message by emailing the moderator (on the profile web page), or with the aid of other users, via email sent directly from the Blog. Surfers can also use a *Digg*, an on-line tool allowing Internet users to share and promote web pages with other users of the service through a user-based ranking system.

Interaction with the content: with a subscription to the Really Simple Syndication (RSS) feed, the surfer can consult the updated content of blogs without checking them manually. Subscribers to RSS are informed of each new post almost in real time and may read it directly on their aggregator (a web application that assembles together various syndicated Blog contents).

The Blog offers four navigation possibilities. The first is by scrolling through horizontal or a vertical presentations of the main page. This operation transforms the view of the picture by an alteration to its framing.

Secondly, one may consult Tags and archives. The user can display marked posts grouped by a common isotropy (photos, paintings, drawings, videos, text, etc.) or consult the archives of the Blog, a monthly messages classification, by date of publication. Thirdly, one may click on a picture (for instance, on Traddam), thereby increasing its size and/or changing its background colour from black to white.

Picture 20.

Picture 21.

Fourthly, hypertext may be used on the posts. The hypertext is a system containing information connected by hyperlinks, allowing automatic jumps from one piece of information to another, linked one. This new dimension of language involves a hyper-reader that transforms the traditional act of reading by creating an interaction between the reader and the active information medium: the web page. Using hypertext, you can find examples of a possible dynamic organization of information through links and connections:

Painting / pictorial choreographies
29 / 11 / 7 / 18
Monochrome / colour / rotation 90 degrees
Painting / triptych
Triptych / number
To water / water / waterfall / water face
Before / after (diachronic evolution of a painting)
Separated / contact
Black / white (changing background colour)

The hypertext function allows the significant whole to be reached by several anchor points in a network of meaning similar to the “polyphony” of Mikhael Bakhtin, and “la pensée nomade et rhizomatique” developed by Gilles Deleuze and Felix Guattari.

3.2 The contributions of *Ethniktag* and multimedia

There are two categories of viewer: those who are aware of the encoding rules and distinguish the components of the plastic editing, and those who see only one unified picture. Using mathematical, geometric and topological rules, *Ethniktag* allows for different manipulations of paintings so as to proffer a multiplicity of perceptions and evolutionary constructions: real and virtual plastic editing; superimposition of paintings; pictorial choreographies; diachronic genesis,

Multimedia products essentially stand out from traditional supports by a polysensory adjacency between the screen and the user. Indeed, alone in front of the screen, the Internet user experiences the plastic evolutions of the statement in close proximity. The multimedia medium offers the receiver an individualized exchange, which is endowed with an intimacy greater than that of the distanced, even if collective, experience of the television screen.

Thus, multimedia products represent a multiple system: in the same medium we find pictures, active interaction between users and moderators, manipulation of the view of the expression, resulting in a modification of the view of the contents.

4. Conclusion

While it is interesting to play with a painting by reproducing it in different ways, there is ultimately only one work of Art: the original painting, which, subjected to the ravages of time, inevitably becomes degraded in its physical structure (Benjamin 2006: 179):

... à la reproduction même la plus perfectionnée d'une oeuvre d'art, un facteur fait toujours défaut: son *hic et nunc*, son existence unique au lieu où elle se trouve. Sur cette existence unique, exclusivement, s'exerçait son histoire. Nous entendons par là autant les altérations qu'elle put subir dans sa structure physique, que les conditions de propriété par lesquelles elle a pu passer.

[... in even the most perfect reproduction of a work of art, one factor always is lacking: its *here-and-now*, its unique existence at the place where it is found. From this unique existence alone its history unfolds. By that we mean, as many alterations as it could possibly undergo in its physical structure, [were as many alterations] as the conditional properties through which it was able to pass.]

Notes

1. All French-to-English translations by Rick Littlefield.
2. We are working on two others examples of Web 2.0. One is an interactive website Ethniktag.com, which includes the surfer in the reconstruction of signification by a direct application of the aforementioned rules; the other is a virtual world called "Second Life".

Children's understanding and use of visual codes in their drawings about environmental phenomena

1. Introduction

Visual communication, i.e. the use of images (visual representations) for the construction of messages, constitutes an autonomous system of meaning making, parallel to language, with its own specific conventions, codes and "grammar" (Kress & van Leeuwen 1996: 2; Lister & Wells 2006: 64; Pintó & Ametller 2002: 333). Specifically science-related texts use visual images as a central rhetoric means for analyzing, describing, and understanding scientific phenomena (Cifuentes & Hsieh 2004: 110; Mathewson 2005: 529; Roth & Bowen 2003: 429), independent of the scientific specialization of the public they address. In such texts, information is visually represented in various forms, such as diagrams, tables, chains, pyramids, circles, etc (Mathewson 2005: 530). These conventions present different aspects of information, highlighting or suppressing particular entities, and organizing individual elements in space, in a manner that represents their interrelations (Kress et al. 2001: 99).

Visual images are currently used as a primary source of information in science texts addressed to students (Ametller & Pintó 2002: 285; Kress & vanLeeuwen 1996: 30; Testa et al. 2002: 235) and are considered as an important tool for understanding scientific concepts and phenomena (Kress et al. 2001: 59; Pintó & Ametller 2002: 333). However, an image is valuable as a teaching and learning device only if the students are familiar with the necessary codes for interpreting it and capable of using the avail-

able semiotic resources in order to understand signs and construct new meanings about the represented facets of reality (Britsch 2001: 153–154).

Nevertheless, the skills involved in reading and producing visual representations are not taught in school (Pozzer-Ardenghi & Roth 2004: 236; Kress et al. 2001: 141; Kress & van Leeuwen 1996: 15). However, the students from an early age, and with little or no systematic support, develop the ability to recognize and use the codes of “visual grammar” in parallel with other available means of communication (Britsch 2001: 153; Kress & van Leeuwen 1996: 18). When asked to produce visual representations (e.g. drawings) about a scientific concept or phenomenon, they are prompted to construct messages to convey ideas and meanings that could not be expressed by other means of communication (Kress et al. 2001: 26–29). Thus, a socio-semiotic analysis of students’ visual representations can reveal a lot about the semiotic resources they use in their drawings for interpreting relationships between objects, concepts, and phenomena (*ibid.*: 118).

Given the significance of images in the construction of meaning in learning science and the lack of systematic training in understanding and producing visual representations, crucial pedagogical questions arise about the types of images that the students can interpret and produce. Previous research has suggested that the students prefer narrative readings, i.e. they tend to attribute a story structure to images and mainly focus on certain elements such as vectors, or synthetic structures (Pintó & Ametller 2002: 334). Moreover, the students need guidance in order to produce visual representations of complex phenomena. In particular, while they seem to be capable of representing concepts, they face significant difficulties in representing relationships between concepts, and hierarchic, antithetic, or causal structures. Therefore, it is suggested that science teaching should engage in familiarizing students with the visual language of science, in order for them to develop the necessary skills for reading and producing visual images (Cifuentes & Hsieh 2004: 132; Mathewson 2005: 538; Pintó & Ametller 2002: 341; Pozzer-Ardenghi & Roth 2004: 237–8; Testa et al. 2002: 251).

At the same time, researchers agree that more research is required concerning the students’ use of visual language in an attempt to educate future citizens for the information and knowledge society (Pintó & Ametller 2002: 341).

The present study presents the results of a socio-semiotic analysis in a pedagogical perspective of primary pupils' drawings about environmental issues. It aims at exploring the pupils' readiness to use the visual language of science and its specialized codes when visually representing the mechanisms involved in particularly important, topical and complex environmental phenomena, such as the stratospheric ozone depletion and global warming due to the enhanced greenhouse effect.

2. Method

The research sample consisted of 40 fifth and sixth grade pupils, who attended primary schools in Greece. The pupils participated in individual, semi-structured interviews. After a preliminary discussion about ozone depletion and global warming, each pupil was asked to produce one or more drawings representing their causes, mechanisms, and consequences. Pieces of A4 paper, pencils, and felt pens of different colours, were given to the pupils, who were invited to use them as they felt most appropriate. After the completion of the task each pupil was asked to explain his/her drawing. The interviews were recorded and consequently transcribed verbatim.

The pupils' drawings were analysed along three axes, which were based on a scheme combining the socio-semiotic, epistemological and pedagogical perspectives developed by Koulaidis, Dimopoulos, Sklaveniti & Christidou (2002: 132–144) and Dimopoulos, Koulaidis, & Sklaveniti (2003: 193–200). These axes include (see Figure 1):

1) The *type*, concerning the degree to which the drawings attempt to represent elements of the environment according to the human visual perception, or adopt conventions of the scientific visual language. Thus, a drawing can be a) *realistic*, if it represents entities as perceived by the eye (e.g. sketches), b) *conventional*, if it involves codified representations following specific conventions of the scientific visual language (e.g. diagrams, maps, etc.), or c) *hybrid* if it includes both realistic and conventional elements.

2) The *function*, according to which drawings are distinguished as *narrative*, *analytical*, *classificational*, or *metaphorical* (Kress & van Leeuwen 1996: 56–112). *Narrative* representations depict events, or processes of change evolving in time and/or space. They involve one or more vec-

tors, i.e. distinct lines indicating the direction of evolution. *Analytical* representations emphasise the constant structure of an object or system, for instance the constituent parts of a whole, by focusing on the relationships between the depicted elements in terms of a part-whole structure. The meaning of an analytical image corresponds to linguistic expressions such as “this is” or “this consists of”. *Classificational* representations involve elements which are interconnected by relations of subordination, i.e. taxonomies. The subordinates constitute one category and their equivalence is visually realised by their symmetrical allocation in the image. The use of classificational images in scientific texts emphasises hierarchical relationships, or unifies entities under a certain, common feature. *Metaphorical* representations imply a symbolic meaning, i.e. different from what is literally represented. The symbolism may refer either to specific elements, or to the whole of the image. Moreover, often it is not possible to attribute a single function to pupils' drawings, since they frequently integrate more than one of the functions described above. Such drawings are recorded in the present analysis as *combinations* of functions.

3) The *formality* of the visual code, that is the degree of its elaboration and abstraction. The “visual grammar” employed in science texts generally uses a high formality code, which aims at downgrading the superficial variability of external features and at representing precisely entities and processes, by eliminating multiple readings. Such aims can be accomplished for instance by the use of symbols for chemical substances, or the restricted use of colour in diagrams. Formality can be estimated using different markers which record particular elements of the representations that contribute to their level of abstraction. In pupils' drawings the elimination of multiple readings is mainly accomplished by controlling the following markers: a) Introduction of *elements of the scientific visual code*, such as symbols (letters or digits), or geometrical shapes. When both symbols and geometrical shapes are involved in a drawing, formality (according to this marker) takes its maximum value. When no such element appears in a drawing, this marker takes its minimum value. b) *Colour differentiation*: This marker is related to the variety of colours used in a drawing. A broad variety of (3 or more different) colours tends to lower the formality, while a restricted use of colour (e.g. exclusive use of pencil) raises the formality of an illustration. Each formality marker can take 3 different values: 1 for low formality, 2 for moderate formality, or 3 for high formality. Accordingly, the overall for-

mality of a drawing is estimated by adding the formality values of the two markers (elements of the scientific visual code and colour differentiation) and is considered as low if its value is 2 or 3, moderate (value equal to 4), or high (value equal to 5 or 6).

3. Results

The analysis of the conceptual content of the drawings reveals mental representations of ozone depletion and global warming similar to those documented in previous relevant research based on other techniques, such as questionnaires (Boyes & Stanisstreet 1993: 533) and interviews (Koulaidis & Christidou 1999: 562). The present analysis focuses on the characteristics of the visual code in the pupils' drawings and not on their conceptions of the two phenomena reflected in their illustrations.

Fifty drawings were collected in total, since the pupils had the opportunity to produce more than one illustration each. In the following paragraphs the results yielded from the analysis of the drawings are presented, according to each of the three axes presented in the previous section (see Figure 1).

3.1 Types of pupils' drawings

The pupils' drawings were in their vast majority hybrids (47 instances, 86%), that is they integrate realistic and conventional representations of entities of the natural world (see Appendix, Figures 2, 3 and 4). The realistic elements typically concern representations of living things (human beings, animals, plants), objects of everyday life (e.g. refrigerators, cars, garbage), or other elements of the natural or man-made environment (e.g. icebergs, clouds, industries). On the other hand, elements that are usually represented conventionally include solar radiation, the location and transportation of pollutant gases in the atmosphere, or the ozone layer and ozone hole(s). Seven drawings (14%) involve exclusively realistic representations. No instance of purely conventional representation has been recorded.

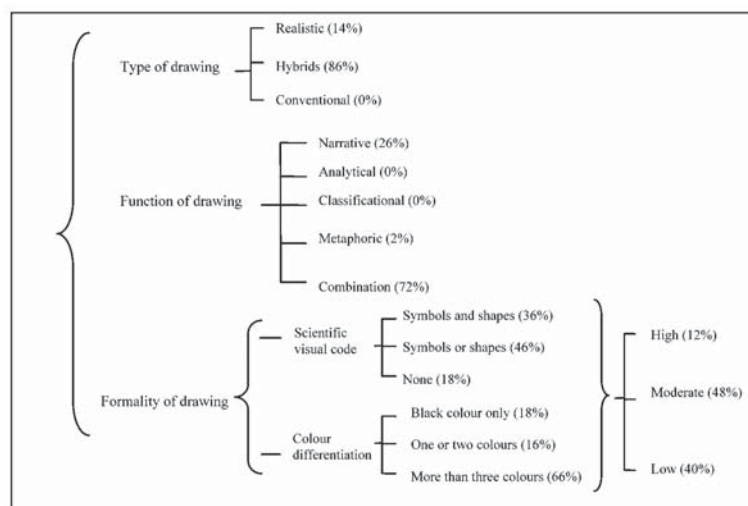

Figure 1. The axes of analysis of pupils' drawings and the relevant percentages.

3.2 The function of the pupils' drawings

As far as the function of the pupils' drawings is concerned, the analysis has indicated that in majority they tend to integrate a combination of different functions at the same time (36 instances, 72%). All of these combinatorial drawings are primarily narrative, i.e. the pupils represent the evolution of events in time and space (see Appendix, Figures 2, 3 and 4). Typical events that are depicted in pupils' drawings include pollutant gases moving into the atmosphere, and solar radiation reaching the earth and being reradiated or reflected back towards the atmosphere and space. A considerable number of drawings, apart from the narrative function incorporate the function of classification, which mainly refers to the juxtaposition of different sources of pollution (e.g. cars, garbage, industries, etc.). When an analytical function is also present, it largely concerns the representation of the globe as a whole composed by different parts (see Appendix, Figure 2), or the depiction of the atmosphere as a mixture of different gases. Elements with metaphorical function in pupils' combinatorial drawings involve monstrous figures representing gaseous pollutants, or magnifying glasses focusing on important components of illustrations.

Thirteen drawings (26%) implemented a purely narrative function, while in one instance a purely metaphorical function was recorded.

3.3 The formality of the pupils' drawings

In their vast majority the pupils' drawings presented an overall moderate (24 instances, or 48%, see Appendix, Figures 2 and 3), or low (20 instances, or 40%) formality in regards to the visual code employed. On the other hand, the number of drawings that systematically introduced an elaborated visual code, presenting a high formality, was rather restricted (6 instances, 12%, see Appendix, Figure 4).

However, this general trend was not equally reflected on the two markers of formality employed here. The pupils typically introduced symbols (e.g. terms corresponding to pollutant gases, or digits), and/or geometrical shapes such as lines, or vectors that denote direction. Thus, in regards to this marker, the pupils' drawings exhibit a high, or moderate formality. Conversely, the majority of the drawings include a variety of three or more different colours, hence lowering the overall formality of the visual code in respect to the relevant marker (see Appendix, Figures 2 and 3).

4. Discussion and conclusions

The results of the analysis presented in the previous section suggest that even before graduating primary school the pupils seem to be familiar with basic rules of the "visual grammar" to which scientific texts are amenable. Therefore, they use codes and conventions of the scientific visual language in order to graphically describe and explain the complex mechanisms underlying stratospheric ozone depletion and global warming. Interestingly, this observation even includes the cases of representations which are not conceptually compatible with the scientific view.

Images play a principal role in teaching and learning science. The present study implies that it is important for science teaching to focus on the development of pupils' relevant visual skills. In this perspective, school science textbooks, which have an extensive influence on teaching and learning science, can have an effective role in regards to the visual messages that they familiarise the pupils with in the school context. Therefore, introducing appropriate visual representations in science textbooks can enhance

and promote the pupils' emergent ability to use codes and conventions of the scientific visual language, hence to understand the meanings expressed through its use.

More particularly, the analysis of the drawings concerning the two environmental issues, has revealed a remarkable readiness of the pupils to use visual and graphic conventions normally used by experts, although these conventions co-exist with realistic elements (in hybrid drawings). This tendency could be supported by enhancing the use of scientific visual conventions in primary school science textbooks, where realistic images dominate (93.3%, see Dimopoulos et al. 2003: 203).

Similarly, the pupils' tendency to produce narrative images –parallel to their preference to read images in a narrative manner (Pintó & Ametller 2002: 334)- could be moderated by decreasing the frequent use of narrative representations (24.5%, see Dimopoulos et al. 2003: 205) and by introducing more systematically classificational and analytical images (8.7% and 64.4% correspondingly, see *ibid.*) in science textbooks. The pupils seem to be quite familiar with these functions, although they use them in combination with the narrative one.

Moreover, a greater emphasis could be given to more elaborated visual codes in school textbooks, where a low formality code is usually introduced (55.5%, see Dimopoulos et al. 2003: 209), since a considerable number of pupils' drawings introduced more specialised visual codes.

In conclusion, visual literacy, and more particularly the skills related to the production and interpretation of visual messages, emerges as a relevant and important challenge for science education. However, more extensive and systematic research is needed in order to determine the pupils' readiness to use the scientific visual language in relation to a wide range of scientific concepts and phenomena. Such an insight would support crucial decisions regarding the inclusion of teaching goals related to visual literacy in science curricula, ultimately aiming at familiarising the pupils with the rigorous, accurate, and abstract world of science.

From death to rebirth

The misunderstanding of carnivalesque spaces in funerary rites in east Asia

The investigation of carnivalesque spaces in funeral rituals in East Asia sheds light on the differences in cultural perceptions of death and life. Traditionally, funeral rituals in East Asia include music and dancing to please the dead (Yi 1996: 205–206). In Southern China there are death rituals in which hosts and guests perform music, dance, drinks, food (especially rice) and play comic games (Hee 2004: 19–39; Grimes 2000: 241). In Japan, also, music, dancing, drinking and playing games have been part of death rituals since at least the early Yamato period around the fourth century C.E. (Yi 1996: 206). Further, Mongolian and many other minorities in northern parts of East Asia today have such traditions of performing music and dancing, and drinking in death rituals, sometimes near the grave of the dead (ibid.: 207). In Korea, according to historical records, such carnivalesque funerals were practiced from the second century B.C.E. until the 7th century C.E., before Buddhism came to that country. Guests at a traditional Korean funeral ritual still enjoy drinking alcohol, eating food and rice cakes, playing games and telling jokes. Interestingly, the Korean ritual includes a comic play about a monk and a woman giving birth to a baby, a dramatization transmitted in mask dances and theater plays as well (ibid.). This means that spaces of traditional funeral rituals in East Asia were not simply sad and silent spaces for the dead, but rather a kind of carnivalesque space for communities to celebrate the rebirth of the deceased (ibid.: 206; Hee 2004: 22–23). Such traditional carnivalesque spaces in funeral rituals in East Asia differ markedly from current funeral traditions of Buddhists and Confucians, both of which tend to austerity. Instead, such carnivalesque spaces are rather similar to the spaces of death ritual in Southeast Asia, where they also enjoy music and dancing, drinking and games (Huntington and Metcalf 1979: 46–47).

Nevertheless, the identification of carnivalesque spaces in funeral rituals, especially in East Asia, has not attracted much scholarship. Further, the identification of the carnival funeral tradition in Chinese minorities, Japan and Korea has been wrongly treated as a “barbaric” tradition in China-centered historical records and scholarship. Moreover, those Buddhists and Confucians who promote austerity in funerals have refused to acknowledge the significance of the cultural identity of carnival-like spaces in death rituals, even criticizing and prohibiting the tradition as unworthy and a travesty of the Confucian canon (Yi 1996: 206–207). As a result, it is currently practiced mostly by the lower classes, especially in Southern China, Okinawa in Japan and Southern Korea at the level of folk cultures. Thus, the cultural identity of carnivalesque funerals, in Korea and many other areas in East Asia, has been marginalized and misunderstood.

Where did such carnivalesque spaces come from? How did the carnival traditions perceive death differently from Buddhists and Confucians in East Asia? How did carnivalesque traditions become folk traditions in non-official cultures? To answer these questions, this study traces the identification of the carnivalesque funeral tradition in terms of the changing perceptions of the dead body, especially the bones of the dead, through an interdisciplinary view of semiotic changes in burial systems in a cross-cultural context in which Buddhism and Confucianism came into China, Japan and Korea. To trace the identification of carnivalesque spaces of death rituals, I begin with one of the well-known folk carnivalesque funerals, *dashiraegi*. This type of funeral, which was practiced for a thousand years in Korea, enacts a comic play of giving birth to a baby in folk death-ritual which accompanies music and dancing.

Dashiraegi has a long historical background; as noted earlier, it was performed at least since the second century B.C.E. up to the beginning of the Three Kingdom period in Korea. Currently it is performed in Southern regions and islands in Korea. However, until the beginning of the twentieth century, the *dashiraegi* tradition was performed almost nationally. As indicated by the literary meaning of *dashiraegi*, “waiting the proper time”, “enjoying themselves together”, “to be born again” (Lee 2005: 8), the tradition centers on the rebirth of the dead. Interestingly, *dashiraegi*, also has been practiced in a secondary burial system, after a dead body has passed through particular stages of decomposition, called *chobun*

(*Hanguky Chobun* 2003: 226). Then why do they practice both *dashraegi* and *chobun*?

Chobun, a straw grave, refers to a temporary grave covered with straw thatch; it would be used until the flesh of unburied dead bodies, whose coffins were placed over logs, had completely rotted away. Two or three years later, the bodies would be buried after the bones are cleaned. By preparing *chobun*, people acknowledge the death and their hope that the dead person would resuscitate in the other world with a new and “clean” body. The decomposition of flesh normally is allowed to take place from 6 months to three years after death, depending on regional traditions. On the third day of the ritual, they bury the body, after very carefully collecting and washing them. This passage is called the “transitional period” by Anold van Gennep (1960: 148–149). Further, the burial and death ritual tradition of *chobun* is closely related to concepts of *feng-shui* (Chul-Sang 2007: 368–371), such that the bones are believed to possess the soul of the dead, and that a vital energy subsists between the deceased and the living. According to *feng-shui*, the basic principle underlying the relationship between the deceased and the living is the idea of reciprocity; this notion has remained the same since the remote times of antiquity in China (Unschuld 1985: 27). In this burial tradition, just as important as the selection of suitable burial sites is the continued integration of the ancestors in the daily processes of decision-making and exchange of resources among the surviving members of a lineage (*ibid.*). In this burial tradition, ancestors wish to have their bones nourished, in the grave, by influences of good “wind and water” (*feng-shui*); in return, prosperity and health is guaranteed to those descendants who arrange a suitable burial site and who cleanse and rearrange the bones in a proper fashion once the corpse has decayed (*ibid.*). In this way, *chobun* establishes a symbolic connotation of rebirth and prosperity for the family, through a relationship of reciprocity between ancestors and descendants, through the ideas of rebirth of the dead and reverence for the earth. I would further suggest that *feng-shui*, as a tradition in which the dead are believed to return to the Mother’s body, also has a strong connection with the Earth-Mother worship through the idea of rebirth, fertility and reciprocity between ancestors and descendants (Chul-Sang 2007: 371–372).

How, then, did carnivalesque traditions arise in “non-official” cultures? In east Asia, they took shape when the second burial tradition, as Earth-

Mother worship, encountered Buddhism and Confucianism. In Korea, where currently *chobun* is the normal funerary ritual, a secondary burial involves entombment; however, jar burials have been discovered throughout the country, and are believed to have been practiced from the Bronze Age (c. 300 B.C.E) to the Three Kingdom period, 7th century C.E. (Chul-Sang 2007: 371–372). These are also supposed to be the remnants of secondary burial systems, because most of the jars are too small to contain adult bodies. It is acknowledged that after they had been washed, the bones were placed in the jars. The jar burial tradition in Korea has diminished considerably, replaced by newer systems such as the cremations of Buddhism and the single-burials of Confucianism. A secondary, bone-washing ritual was also practiced in Okinawa (Japan), usually one to three years after death. The old system of burial in Okinawa prior to the adoption of Chinese-style tombs was to place the body in a small wooden casket on the beach; then, after washing, the bones were placed in a small urn and secreted in a cave or niche along the beach. They believed this constituted the Okinawan paradise; the latter has been replaced by the paradise of the Buddhists (Lebra 1966: 99). In Southeast Asia such secondary burial has been practiced since prehistoric times, perhaps beginning at the end of the Neolithic period, when individuals were interred in earthenware jars and placed in caves (*South Asia* 2004: 263). In the Bara tradition in Indonesia, a secondary burial custom in a death ritual is strongly connected with the theme of sexual intercourse and rebirth (*ibid.*). In China, when the *feng-shui* of a grave is believed to be detrimental to the fortunes of the family, exhumation is carried out; if this occurs before a new grave has been found, all the bones are placed in an earthenware jar prior to burial (De Groot 1964: 1058).

The decline of carnivalesque funerals in East Asia may signify Earth-Mother worship changing from an official to a non-official culture, with the rise of new burial systems (Buddhist cremations, Confucian single burials system, and the like). This constitutes a case of contextual presupposition and misunderstanding, such that carnivalesque funerals in East Asia have come to represent otherness under the canons of Buddhism and Confucianism.

To sum up: carnivalesque funerals in East Asia include rituals oriented toward the rebirth of the dead in a secondary burial system based on *feng-shui*. Relative to rebirth, *feng-shui* is a tradition in which the dead are seen

to return to the Mother's body, to the womb, in a form of Earth-Mother worship. In semiotic terms, such carnival-like funeral spaces may be considered lexical terms in a system of Earth-Mother worship, which may be drastically misunderstood when viewed through the lens of Buddhism and Confucianism.

Manipulating communication through images

The semiotics of political “taste”

We consider the mere exhibition of some busts on the walls of a modern agora insufficient for the final aim, namely, to be elected. The objects accompanying a candidate are significant parts within the *mise en discourse* of a poster, because they become elements of a narrative link within an implicit story, creating some (non)verbal possible worlds (Biocca 1991: 71).

1. Shaping political promises: Political intertextuality (from manipulation to self-persuasion)

Posters are meant to manipulate the voters through the politicians' intention to communicate a political promise. The discourse of promising opens onto something that refers to the other's desire, which may be suggested through the (conceptual) metaphor of the food.

Any relation of legitimacy between voters and a candidate is built on the verb *to promise*. Being a commissive verb (Austin 1975: 157), *to promise* has a compulsory control over its subject, imposing at least the condition (Searle 1969) of sincerity on the part of the agent. Trying to avoid any possible link between himself and a lie, a candidate builds up his political discourse on some explicit and implicit narrative links. Reinterpreting Greimas's narrative semiotics, namely, actantial model, we will provide a scheme of political intertextuality (Figure 1). Taking into account that our inter-texts (a lollipop, a shaft, and a hot red pepper) have as “raw” materials not only words, but objects as well, we prefer to talk about a process of iconic political intertextuality in election posters.

Some remarks concerning the terminology used and the elements within this scheme of iconic political intertextuality are necessary. The

Figure 1. Political intertextuality: A Greimassian approach.

word *object* is used according to the Greimassian approach, namely, it is an object of value, which is semantically specified as [+/- concrete], [+/- abstract], [+/- human], [+/- animate]. Our final aim is to (re)build the new abstract object (the meaning of iconic power) that is formed of a *helper-object* (positive symbolic position) ↔ the election object (candidate) ↔ a *blocker object* (negative symbolic position).

The relationship between these objects is a *transactional* one, forming what in visual arts bears the name of an eccentric dynamic system (Arnheim 1995) where the two textual “partners”/ centers enter an instance of “give-and-take” relation (↔). The argumentative function of an image, mentioned by Jean Michel Adam and Marc Bonhomme (2004: 281-282), is brought forth, namely, the *conceptual topics* which become the indices of collective knowledge, of some cultural symbolic significances and of an implicit ideology, stored within the voters-citizens’ *memory*. Thus the rule of transfer (Domenach 2004: 83), specific to (self)persuasion, installs itself through the use of some already existing layers, which the two French authors qualify as: archetypal conceptual topics (psychological and mythological structures) and sociocultural conceptual topics (a group’s prejudices and stereotypes). The recourse to the citizens’ memory must be accompanied by the voters-spectators’ *imagination*.

2. Political identity through metaphors

Having as its final result a positive or negative image of at least one of the entities, a *metaphor* (Gr. *metaphora*, derived from *metapherein*, formed of *meta* – “over, across, beyond” and *pherein* “to carry, bear”) becomes, actually, an argument that establishes the structure of reality (Perelman

& Olbrechts-Tyteca 1993), thus, an instance of (re)shaping one's identity. Our empirical data two election posters are formed of some political pictorial metaphors and we will adopt M. Danesi's theory (2002) on metaphors because of its implied relation to Peirce's typology of signs (icon, index, symbol).

2.1. The sweet taste of political promises: A lollipop

We consider that a (non)verbal message launched in the 2004 Romanian election campaign by the J(ustice) T(ruth) Alliance (Alianța DA) is significant for the understanding of a political promise.

Figure 2. *Would you believe in eye candy? (Justice and Truth Alliance.)*

The verbal utterance – *Would you believe in eye candy?* – *Vrei să fii dus cu zahărelul?* – and the image of a *lollipop* are actually the embodiment of Danesi's three layers of metaphorical reasoning, layers governed by a cognitive flow:

- the layer of a metaform: an association-by-inference process: the minimal parts of a lollipop (a stick and a wrapping);
- the layer of a meta-metaform: indexicality in reference in a culture-specific way: idiomatic expressions (*to believe in eye candy and to give the shaft*);
- the layer of a metasymbol: a trace to the historical past of Romanian culture: the *shaft* (as the stick of the lollipop) – Vlad Dracula/ The Impaler.

Within the transactional context implied by the interrogation (*Would you believe in eye candy?*), there is, as well, a third seller who holds the truth and who, through his rational action, seems to downplay the opponent's plans. This is obtained by two discursive procedures: an idiomatic expression and a pictorial metaphor.

A. *An idiomatic expression.* Having as theoretical background Permyakov's process¹ of decoding an idiom, taking into account the linguistic, logico-semiotic and object-image planes and Lakoff's motivational alternative² for the interpretations of idiomatic expressions, our analysis will focus on the meaning of the Romanian idiomatic expression *a fi dus cu zăhărelul* (to believe in eye candy). But the visual metaphor (the stick of the lollipop = a shaft) sends us towards two implicit Romanian idioms *a da țeapă* (to give the shaft: to use unethical methods) and *a trage în țeapă* (to impale).

- *the linguistic plane.* The *Abridged Academic Dictionary* (*Mic dicționar academic*) identifies the two objects as follows: *zăhărel* as the diminutive of *zahăr*/ sugar and *țeapă* as a piece of wood or metal pointed at one end, used in buildings, for haystacks, or as a battle weapon, or as an instrument of torture.

- *the logico-semiotic plane.* The notion/ signified (B – to swindle) is semiotically represented by the idioms (meta-metaforms)/ signifiers (A_{1-2}) built on the explicit objects *shaft* (*țeapă*) and *candy* (*zăhărel*).

A_1 = *to believe in eye candy* (*a duce cu zăhărelul*). It is the first signifier used by the JT Alliance and it has the following signified: to abuse of someone's good faith, using deceiving words and promises.

A_2 = *to give the shaft* (*a da țeapă*). This second signifier is a colloquial expression, has the same signified, but conceptually it implies the syntagm *unethical methods*.

- *the object-image plane.* The fact that the JT Alliance uses two different idioms for the same meaning (B) makes us think of a conceptual synonymy, although a certain conceptual antinomy can be perceived at the level of the structure of the two objects mentioned. The motivational links (L_{1-2}) are based on the functional values of a candy and a shaft, namely, an ingredient used to sweeten and an instrument of torture.

L₁ – The first motivational link, which associates *to believe in eye candy / a duce cu zăhărelul* (A₁) with *to swindle* (B), is centered, in the situational context of elections, on the candidates' speech act of *to promise*.

The negative connotation of this expression, which hides the candidate's intentionality to abuse the voters' good faith using deceiving promises, can be related to the etymology of the word *sincerity* [L. *sincerus*, without wax]. Charles Larson (2003: 261) mentions two ancient meanings of this word. The former is used for "wax layers in order to preserve" and *to be without wax* would mean "to be pure, fresh". The latter sends to the unorthodox habit of the carvers in stone that, in order to hide their imperfections, would cover them with a thick layer of wax that finally will fall down, but unfortunately this will happen when the respective carver is dead so that he might not give account for his action. During the long periods of history, this lasting camouflage instrument has taken the form of a *mask*, that is often associated with negative significances (... a disguise, a pretence). In the 20th century, the word *image* is used, the modern ages turning into that period where everyone strives after showing a self's *image* that should be the most *convincing, interesting* and *seductive*.

L₂ – The second motivational link – A₂ (*to give the shaft/ a da țeapă*) – L₂-B (*to swindle*) – is based on a disastrous extralinguistic reality for which the political opponent party (The Social Democrat Party) is responsible.

For a better understanding of the Romanian idiomatic expression *a da țeapă* (*to give the shaft*), one should associate it with a third motivational link, based on a particular Romanian cultural context, namely, the expression *a trage în țeapă* - *to impale*. Thus, a shaft becomes a *metasymbol* and the encyclopedic knowledge guides us in understanding this conceptual link: historical intertextuality obtained through the implicit image of Vlad Țepeș/ Vlad Dracul/ Vlad the Impaler³. Known for his brutal means of punishing boyars, thieves and criminals, Turks, Saxons and those who conspired against him, Vlad Țepeș/ Vlad the Impaler becomes the sign of justice within the Romanian cultural context.

B. *A visual/ pictorial metaphor*. In order to downplay the strong points of the opponent, in our case the Social Democrat Party, the JT Alliance candidate brings to surface certain implicit axiological markers that are associated with the object *lollipop*.

The presence of a *shaft* instead of a stick creates a metaphor *in praesentia conjoined* based on allotopy (Klinkenberg, 2004: 373-380). The image obtained is actually a violation of combination and selection restriction rules, through the presence of a *stake* (the perceived entity) in place of a *stick* that could have been the right choice as a part of the isotopy of a *lollipop* (the conceived entity).

The visual metaphor of a lollipop hides a synecdoche: the wrapping is the part standing for the whole, the content not being visible to buyers/voters. If we refer again to the sincerity condition stipulated by J. R. Searle, then another conceptual metaphor is created: WRAPPING (source domain) = ELECTION PROMISE (target domain). The wrapping of a lollipop seems to have the same role of the wax in ancient times: the more striking the wrapping/ the promise is, the quicker it will catch one's attention, and finally it will be bought/ voted.

The unwrapping/ decoding process presents a dichotomy between reality and appearance: the content which is hidden within the wrapping does not have the sweet taste of a candy/ promise (lie), but it hurts because of the pointed end of a *shaft* (reality). Using implicit and explicit binary opposed items, the two political actors get the two contrary axiological markers: honest merchant *versus* dishonest merchant. Although the colour blue (Chevalier and Gheerbrant 1995: 79), metonymy for the Social Democrat Party, is considered to be the symbol of hope, in this election poster, it gets a new meaning, being the sign of swindling. The colour orange (ibid.: 122), the metonymy of the JT Alliance and the symbol of equilibrium, becomes the colour of truth in this *mise en discours*. The space occupied by each of the two colours in the geography of this image is significant for the nonverbal representation of the concepts of truth and lie: whereas the "blue lie" of the Social Democrat Party will always be revealed and it will not last forever (a *lollipop* is an object to be consumed during a certain time interval), the "orange truth" of the Justice and *Truth* Alliance will exist forever, because it is identified with the background, metaphorically standing for the Romanian reality.

Figure 3. *Vote for him!* – Traian Băsescu.

2.2. The pungent taste of political promises: A red hot pepper

In the 2004 election campaign for the seat of mayor of Bucharest, Traian Băsescu used a very surprising helper-object as a source domain in the building of his political identity, namely, a red pepper.

The pictorial metaphor (Băsescu = a red hot pepper) is constructed on undercodedness, namely, on the same process of reshaping the cognitive incompleteness/ flow through some cultural-specific connotations. The presence of such a *metaform* (red hot pepper) as an inter-text having a synesthetic effect and belonging to the social code of food in the system of political advertising motivated us to talk about the semiotics of political taste. Jean-Jacques Boutaud (2003: 109) considers that any visual communication of taste is based on a double absence: the absence of a sense of taste in favour of a sign and the complete absence of savour/ flavour in favour of value, based on an axiological calculus. Our analysis, being governed by intertextuality, is supposed to go deeper than the visual image of taste as it is rendered by the signifier /red hot pepper/.

2.2.1. *The macro and micro-semiotic levels of the signifier /red pepper/*

A. *The macro-semiotic level.* At this level, we may talk about a relation of inclusion into the class of vegetables, that is the signifier spices, which becomes the signified for the signifier of this type of pepper. Thus the red pepper is known for its hot, sharp pungency. Its musty flavor combines with floral, spicy and hay-like notes to give red pepper its characteristic flavor profile.

Together with other visual elements of taste (meat, pasta, potatoes etc.), the red pepper forms the paradigm of recipes which brings along cultural dimensions of different cuisines. Hence the macro-semiotic level seems to be narrowing itself when choosing one way of preparing the red pepper, and we would like to mention the ways in which the Romanian cuisine uses this type of spice, namely, the red hot pepper hides a layer of a meta-metaform, imposing a certain convention of a recipe. Our traditional food is considered not to be spicy, and actually the only ingredient to make it hot is *ardei iute* (red hot pepper), used on the side, especially with one type of dish, called borsch (borş), actually a Central Eastern European local culinary heritage. As Claude Lévi-Strauss (*apud* Ashley et al 2004: 30) states that cooking occupies a truly essential place in native thought: “not only does cooking mark the transition from nature to culture, but through it and by means of it, the human state can be defined with all its attributes.” Dishes belong to a ritual of eating, where some etiquette codes are activated because the minimal units (ingredients) of that particular dish and their display constitutes a link between the respective society and its social actors. The mental image of the representation of a plate of borsch and a red pepper on the side stirs a certain topical calculus in the mind of a Romanian: a) the atmosphere of an informal setting of a table; b) any difference of social strata seems to be ignored: the subjects/ social actors may be considered friends, enjoying their meal; c) it stirs appetite/ action.

B. *The micro-semiotic level.* The micro-semiotic level of this signifier turns this [food] source domain into a pictorial metaphor where the minimal units (colour, form and texture) send towards the secondness dimension of metaphorical layering, namely meta-metaform. Thus, the red pepper, which is usually perceived as a relevant element of a recipe isotopy, develops several visual metaphors, belonging to an allotopical rhetoric, through its being part of three different social representations: education, transport, and nature.

Red pepper – visual metaphor. At the level of graphic representation, we observe a visual metaphor *in praesentia conjunct/ conjoint* where parts of the conceived and the perceived objects form a unity. The interpenetration of elements belonging to different entities of reality (food *versus* transport or school), creates a semiotic allotopy: the perceived signifier /red pepper/ takes the place of some relevant parts (a road, a mark, the green colour of

Figure 4. *Red hot pepper – Traian Băsescu.*

traffic lights, and the trunk of a tree) of some conceived elements/ types which become the primary indexical signs of some social isotopies (school, transport, and nature).

These images advertise neither the product /hot pepper/, nor some private or public institutions; hence these minimal units of the plastic sign / red pepper/ constitute only a part of the topical calculus, based rather on some encyclopedic knowledge about this spice, which activates a certain axiological calculus of praising. The question to be answered refers to the beneficiary of this iconic representation of positive valorization. In order to find the answer to this question, the red pepper should be analysed as a conceptual metaphor as well.

Red hot pepper – conceptual metaphor. The Romanian socio-political context is the other part of the topical calculus that should be taken into account: in the 2004 election campaign, the elongated form of a red pepper was compared to Traian Băsescu's lock of hair covering his bald part of his head. Thus, the perceived and the conceived elements of the visual metaphors are the metaphorical parts of an election situational context:

- the conceived elements are the contents of Băsescu's promises: modernized schools, safe and proper roads, a proper management of traffic lights, places for leisure activities.
- the perceived element /the red pepper/ stands for a lock, a synecdoche of the political candidate. Both the red pepper and Traian Băsescu become the domains of a conceptual metaphor, built on an ontological

correspondence (the red pepper and Bănescu's lock share the same minimal unit, namely, the long form) and epistemic correspondences (the red pepper is known for its hot pungency, whereas Bănescu is known as a very active candidate). The above-mentioned signified of progress associated with the conceived elements of the iconic context/ election promise is actually the proper interpretation of the following political portrait: *He is Traian Bănescu. For many people, he is as quick-tempered as a red hot pepper. Because he is quick in his deeds, and cruel in his talk. [...] And everything he touches does he burn!*)

This linguistic message used in the 2004 election for the Mayor of Bucharest has two more interpretations besides the ones already presented:

- on the one hand, it is built on the device of a Romanian homophonic pun: *ardei* (a noun: pepper) and *arde(-i)* (a verb + a 3rd person plural pronoun: burn them/ punish them). This latter word of the pun was used in the election campaign for Presidency in November 2004, in the following syntagm: *Arde-i la vot!* (Burn them with your vote!). This derived political idiom, built on the lexical substitution of the lexeme *bottom* in the expression (a *arde la fund* = to slap one's bottom), has as its signified the concept *punishment*. The cognitive flow between the two parts of this idiomatic expression has as a driving force the strategy of intra-discoursal voices, its cognitive support being the meaning of the word (red) pepper (*ardei iute*). The only change between the political context in June and November 2004 is the rational agent behind this action of punishing (*arde-i*): whereas in *Totul arde!*, Traian Bănescu's punishment takes the form of a process of revealing the corrupted politicians, in *Arde-i la vot!*, the punishment is performed by citizens who are demanded not to vote for the opponent candidates.

- on the other hand, the link between Bănescu and a red pepper can be interpreted considering the social code of table etiquette (meta-metaform layer). When talking about the macro-semiotic level of the signifier /red pepper/, we have mentioned the informal setting of an eating ritual and the lack of a difference between social strata that could be inferred from the cuisine isotopy of the Romanian borsch (*borș*) and the red pepper. These two conceptual implications also apply to Traian Bănescu, a former oil tanker captain, who is known to have an unpolished form of charisma, ready to adapt himself to any social context; be it, to counter-attack his

opponents using informal language, to dance with belly-dancers, or to hold babies in his arms.

3. *Conclusion*

The paper was an attempt to prove that political metaphors having as their metaform/source domain some objects of taste (lollipop, red hot pepper) are actually caught between different levels of intertextuality. They materialize into subjective interpretations which should take into account the situational, cultural and social contexts in order to be decoded.

Notes

1. Being against the grammatical rule of composition, where the whole is formed of its parts, Permyakov (1979: 32-51) mentions three distinctive planes that interact in the process of decoding an idiom: 1) the grammatical/ linguistic plane: idioms cannot be reduced to separable semantic units, 2) the logico-semiotic plane: idioms are signs of objects that send certain concepts; 3) the object-image plane: the realia plane where the ethnic, geographical, historical and other unique features of idioms are manifest. It has an emotional character.
2. Rejecting the classical theory on idioms, where anything that is not predicted from the context is arbitrary, and starting from the theory of cognitive models, George Lakoff (1987: 448) offers the following *motivational alternative*: “The relation between A and B is *motivated* just in case there is an independently existing link, L, such that A-L-B “fit together.” L *makes sense* of the relationship between A and B.”
3. Vlad was called Tepes (the Impaler) only after his death (1476). He ruled in Wallachia between 1456-1462 and in 1476. In 1462, having been defeated by the Turks, Vlad took refuge in Hungary. In 1476, with the help of the Hungarian king Matia Corvin and the Moldavian prince Stephen the Great, Vlad took over the Wallachian throne again for a month. A battle followed, during which Vlad was killed.

Aurel Codoban

Body of language and body as language

Constituent problems of gesture semiotics

It is said that Friedrich II undertook an experiment through which he was trying to discover the primordial language, spoken in Paradise, by raising children to whom no one has ever spoken. As is well known, the result of this experiment was the death of the subjects. This experiment is absolutely revealing for the way in which the West situates the body outside the sphere of communication. For it is almost impossible for these children not to have interacted with their caretakers, not to have gesticulated, howled or expressed their happiness or sadness. Five centuries after Friedrich's experiment, the story of a miracle with an opposite meaning might have constituted a privileged occasion for making acceptable the presence and importance of the body in the sphere of human communication. We are thinking about the story of Helen Keller who, blind and deaf at birth, still managed to learn to communicate with others and even to write poetry.

Communication has still not been related to the body, even though man's non-verbal communication abilities were scientifically founded by Charles Darwin in 1872 through the observation of the identity of the fundamental facial expressions – joy, sadness, anger, etc. – between different races and their similitude with those of certain superior primates. The universality of emotional expressivity and the innate character of this type of communication should have drawn our attention to the preeminence of non-verbal over verbal communication and to transform the body in a subject of communication.

Modernity has continued to endow the soul or the consciousness with the attribute of communication by considering it essentially verbal, until Freudian psychoanalysis, at the beginning of the twentieth century, shifted our perception of the relationship between body and soul, and the impor-

tance of the former for communication. This shift brought about by psychoanalysis transforms the body into a body of language. Freud observes that hysterical paralysis appears not according to the nervous system but to the description of the body in words (Freud, 1950). When Freud analyzed the atypical paralyzes peculiar to hysteria (Freud 1972) he observed that they appear through projection or representation and ignore the actual anatomy of the nervous system. It is as if the lesion does not affect the trajectories of the nerves but the words denoting different parts of the body: paralysis appears without nervous lesions, but according to the common words denoting different parts of the body.

This means that in hysterical paralysis the body is homogeneous with language, is symbolic, not anatomical. In such cases the “thinking” of the body is guided by reasons such as that of Freud’s patient Elisabeth von R.: “This cannot go like that”. She does not utter it in language, represses it as idea, and paralyzes it according to the meaning of the words. Here we are faced with a body which speaks in its own way, and which, through its movements, bypasses conscious repression and holds the discourse of the unconscious.

But this relationship between the body and language expresses itself at the same time through dreams and different modifications at the level of speaking: bungled actions, metaphors or metonymies, etc. Due to the fact that, essentially, psychoanalytical cure is a spoken cure, it privileges what the patient can say, his verbal discourse, somewhat leaving aside gestures and body language as such. Thus, even though Freud discovered the signifying capacity of the body, he still believed that the verbal cure was the most significant, leaving body language at the periphery of the sphere of communication. Such a solution underexposes the Freudian idea of the body of language and renders ungraspable the idea of body as language, related to the expression of the unconscious through motility and pantomime. This is because in Freud the opposition between the psychic and the biological organism maintains the metaphysical attitude of Western thought, identifiable also in Saussure who distinguishes the signifier and the signified as idea of consciousness and voice of the body.

Until the beginning of the twentieth century Western thought was governed by the hierarchized, metaphysical dualism of soul and body, through which the body was excluded not only from communication but also from the sphere of culture in general. The body has been religiously and philo-

sophically devalued and kept at bay through discipline and will, through the stringency of ritual – starting with the religious ones which see the body as the signifier as such and ending with those of politeness – and through the aesthetical idealization of its artistic representation. Moreover, for a long period of time, it has been considered even the adversary par excellence in our Christian-Platonic Western culture. The metaphysical consequence – apparent in Greek thought and imported into Christianity despite its Jewish background – is the asymmetrical relationship between body and soul: the body is but a container for the soul, which is incomparably much more valuable. Christianity is par excellence a religion of the embodied God, of a God which incarnates as man. Such a representation, with all its extraordinary spiritually human potential, illustrates the Orphic-Platonic idea of a superior soul which comes to inhabit a body that, as container is essentially inferior. Christianity took from Judaism the idea of the resurrection of the body at the end of times, an idea inconceivable for the Greeks although, at the same time, the body was denigrated. And, the whole of Western philosophy has followed Christianity's lead: against practice and reality, philosophy excluded the body from the field of communication.

But in the second half of the twentieth century the body became omnipresent in our civilization's practices and discourses. Now more than ever the body is perceived, theoretically and practically, as the location and the means of numerous signifying systems: the expressiveness of the voice, gestures, behaviors or, from another perspective, cosmetics, clothes, signs of social status, of institutionalized relations, of politeness and etiquette, of feelings and attitudes, related to roles and social positions, signs of arts or of its own vitality. This generalized inversion of the asymmetrical relationship between body and soul is customary of the Western world – for the profit of the body, along with the corporeality of our days determines the body to enter the scene of communication and imposes the idea of body as language.

This is why an explanation of the miraculous story of Helen Keller could be formulated only now within the paradigm of postmodern corporealism, which, at the same time, does not accept an essentialist perspective upon the body but regards it in its becoming. Thus, in the terms of Thomas Sebeok's semiotics, the exchanges between the mother and the child of substances and energy before the birth take place as a biological

communication (Sebeok 2003: 14). This communication continues after birth through direct interaction between the body of the mother and that of the child in the whole sphere of maternal relations. Pupils are educated firstly through gestures and only after that through words. The bodily interaction between the mother and the child appears as the main form of communication and institutes itself as the basis upon which other forms of communication are elaborated. At the beginning of human existence there is a primacy of gestures over verbal language, for the relation is in this case anterior not only to the content of communication but to verbal communication as well. Thus, the explanation of the miracle is that, as in the case of mother-child relationship, Helen Keller has learned body language through physical interaction with her tutor. The mother-child interaction becomes in this way the basis for communication as such, including verbal communication. In the context of this relationship the individuation of language and its individual incorporation as well as the collectivization of the body, through learning a language that belongs to all, takes place.

Society subjects bodily interaction to a strict codification, to a ritualisation which tends to transform the body into a semiological entity by transforming it into a signifier intermingled within a system of communication and exchange (advertising, commercials, music videos, etc.). Cultures go as far as to exchange the meanings of the gestures with completely new ones. Thus Freud considered the gesture of nodding to be the search of the infant for the mother's breast. Upon this primordial corporeal relationship, society constructs its meanings and significations. The cultural over-determination of gestures overturns gestural meanings; in the case of Turkish and Bulgarian culture, nodding expresses negation.

But the situation is not always the same. At the level of anthropogenesis there is presupposed a preeminence of body language over verbal language, which could offer us some hints and explanations for the apparition and evolution of verbal language. The upright posture anchored this relation: by freeing, as Leroi-Gourhan observes (1964: 65), the phonic apparatus, it has freed the hands for gesturing as well. The spreading of verbal language has resulted in the reduction of the communicative utility of gestures, mimicry, and ritualized behaviors in general. And the evolution of man, especially in the Western modern world, has imposed strong norms and tight censure upon the body and spontaneous expression. In this context, verbal language has gained in front of body language and linguistics has

gained the possibility to explain many gestures following the codification of the gestures of the body.

Now, in a civilization that overrates the body and body language in general, the realm of gestures comes to be separated and basically situated at the same level as language. The use of gestures is not that dependent on language, as it was the case in Modernity, and gestures are usually considered just as important as words for the representation of meaning. In our times the body has ceased to be a sub-product when compared to language, or a primitive form of expression; the body is used along with language and can complement it in communication, rendering possible new signifying structures. Thus, touches – from those who use them in place of words, by caressing and massaging – introduce a type of gesture which, ever since the deciphering of Helen Keller's enigma, bring to the attention of the Western world an entire domain of the sensuous that has been completely ignored. The eye and the ear, essentially social senses, are also senses of the soul, and texts are the product of a mixture between the eye and the ear.

Now, with this idea of body as language, with the eye and the ear along the newly (re)discovered senses of smell and taste, a new sense enters the scene of communication – tactility, with its organ, the skin. Skin has the same embryonic origin as the other sense organs and the nervous system: all come from the ectoderm, the third embryonic layer, the one richest in receptors of our sense organs. “After the brain”, says Ashley Montagu, “the skin is undoubtedly the most important of our organs... A being can live blind, without taste or smell but cannot survive a moment without skin.” (in Gérard Leleu 2005: 18) The skin, this sense organ long overlooked in Western culture, is par excellence the sense of the body, the only sense that produces a double sensation, active and passive at the same time, interior and exterior, which gives the mind the possibility to represent its body. The body is truly the ego-skin, as Didier Anzieu notes following Freud.

Such a structural transformation of the spheres pertaining to culture can offer us the measure of the change in Western civilization once the presence of the body is acknowledged in communication. In its distinction from verbal language, which represents the content, and is digital, unmotivated, and arbitrary, body language represents continuity, i.e., the analogical, the motivated. Most often the image of the body constitutes the basis for face to face relationships: starting from it, the Other forms his or her impressions and passes judgments on us. Glances, mimicry, and some-

times gestures and even howls, represent the *phatic* function; they open the channel that renders communication possible. And the body language of the sender has most often a more direct influence upon the receiver than does verbal discourse.

Thus, such signifying intentions or signifying systems, located in the body or passing through it, can express better than verbal language the reactions of the subject; they can impress the co-speaker in various ways and propose or impose a relationship. They can regulate such a relation, engage the symbolism of a ritual or, finally, play a linguistic role by sustaining verbal language (but, in this case too, by privileging the relation). If we differentiate the functions of the communicative relation according to Watzlawick's (1972: 238–252) distinction between relation and content, we observe that the communicative functions that can be realized by the body are those pertaining to relation. In body language the *phatic* function is essential. Even in hysteria – paralysis, deafness – somatization has the function of establishing contact; that is, it engages a relation where it was missing. From this comes the truth of the well-known idea that verbal language normally transmits information, whereas body language expresses interpersonal attitude, which, in connection with the content of communication, functions as meta-communication.

In order to offer a diagnostic of the changes produced by the body for the sphere of communication, it is necessary to bring to light the communicative functions that cannot pertain to body language. The first of these would be the metalinguistic one, which is highly disputed among the specialists. Of course, one can explain a gesture through another, and generally attitudes serve as metacode for gestures – we can determine that a gesture is obscene only from the attitude of the person gesticulating. Thus the metalinguistic function can be viewed as a borderline between body and verbal language: the body can show amazement, but it cannot ask questions – Only consciousness can do that. Primates can learn to sign, but they cannot pose questions. The metalinguistic function is closely related to language and hence peculiar to man. Here the digital aspect of verbal language gets strictly differentiated from the analogical one pertaining to the body, and is superior to this last.

If we insist on making the body a hero at war with the soul, as some authors do, we could say that, against the plural meanings and senses which the body was forced to embody, it has raised the opacity of its own mate-

riality and constantly hijacked transcendence towards immanence, transforming spectacle into the spectacular. But the human body, which differs from the biological organism, can be thought only along with its existence, with its everyday life. The body enters the sphere of communication only because it has become language, just as the soul did centuries ago, and not because of its biological reality. “Society” is what proposes the signifying systems and imposes the “speaking” of certain languages. The problem is, Why is this happening *now*? Why are we *now* interested in the meanings of the body, but were not earlier?

Probably the best answer to this question can be offered by another function of the body in communication – the poetic function. Along with the desacralization of the world, the body, freed from the task of representing other exterior symbols, has constantly grown in its poetic function through its presentation in mass media of the Western world. The poetic function describes the numerous situations in which the body becomes a self-referential object, that is, in which it becomes a poem: make-up art, perfumes and lotions, body painting or dance. The body becomes an artifact as well in the plastic surgeries undertaken by Orlan or in the performances of Stelarc and in other experiments of this type. Of course, in this aesthetical self-representation nothing happens other than the fact that the *phatic* function takes the body as its starting point and thus communication communicates the body, not the soul. Which means that here, in Baudrillard’s terms, we are facing a signifier which signifies itself, a *simulacrum*.

The presence of the body in the public space and the interest in communication as constitution of a relation, not as transmission of information, is the consequence of a profound desacralisation of life in ethics, politics and law. The sacred “principle” of life seems to be filtered through the plurality of the bodies to be reversed in its nudity, stripped of determinations and metaphysical meanings, in the scene of the public space. Still, its key players remain the bodies. Communication as relation is a celebration of pure vitality, the vitality of naked life, of life without determinations. Spectators appreciate communicative force more than the arguments and the content of communication. The triumph of the body in the sphere of public space is the triumph of the analogical (image) over the digital (text), of imagology over ideology, in short, the triumph of ostensive ideology.

To what extent might a semiotic approach avoid misunderstanding?

A study of hospital patients

Introduction

The aim of this paper is to investigate if suitable use of signs in communication might improve people's comprehension. It is well known that the exchange of information – *communication* in its widest meaning – can result in problems, resulting in miscomprehension by the addressee. Semiotically speaking, communication can be understood as a way to influence the audience by means of signs, that is, to make them understand where they are supposed to be led. From this point of view signs are indicators with which to start a process of interpretation (Schulz 2004). The advantage of such a conception of the communicative process is that it might explain how misunderstanding and non-comprehension arise: it's mainly about the clarity and distinctiveness of signs as they are uttered by the communicator and understood by the receiver.

We will go deeper into this semiotic model of communication, and introduce the concept of a tailored communication. Moreover, to support our theoretical model, we will report on a study we conducted in Ticino in summer of 2006.

1. A semiotic model of communication

There are of course many definitions of the concept of *communication*, depending on the field and on the perspective we take. For this reason, I shall outline our theoretical starting point.

First, we can say that communication is any intentional behaviour which is enacted with the intent to make something known to someone else. Note that we take intentionality to be a specific characteristic of communication. The sender wants to inform his addressee about something. He wants to say something to him and to create a habit change in him. But intention alone does not suffice. We must provide our addressee with conditions that permit him to understand our message. Therefore it is important to note that communicating is a form of influencing and that this influence can be considered a case of communication only if it is produced by gaining understanding. Thus communicating means *to allow the other to perceive something by which – with his/her knowledge about the respective situation (along with his/her additional knowledge) as well as his/her “Weltanschauung” – s/he can understand where the one communicating wants to lead him/her.*

We can summarize what we have explained till now in the following way:

- I want to communicate to the addressee (A) my intention (I).
- We hypothesize that there are many utterances (U_1 - U_n) in order to realize my intention.
- After having analysed the specific situation, I say that in order to realize my intention the best way is using (for instance) U_3 .
- Therefore I use U_3 .

What does this conceptualization of *communication* have to do with semiotics? When could we start to talk about signs? It is in fact precisely at this point that we could introduce the concept of *sign*. In fact, these utterances we have chosen are nothing other than signs, and they allow the addressee to understand. Therefore, these signs are indicators, which the speaker gives in order to make the addressee understand; thus, understanding happens both because of a correct use of signs and the addressee's (correct) process of interpretation.

Till now we have spoken about how could we make our receiver understand, but as we said, our communications don't always reach always this goal and the interpretation of the message can be problematic. Misunderstanding sometimes occurs. So, starting from our position, where does misunderstanding take place?

Previously, we have seen that understanding happens both because of the right use of signs and the addressee's process of interpretation. In the same way, misunderstanding in communication is due to a mistake in the use of signs and hence in the process of interpretation. Therefore, in this problem, signs play an important role, because they are not merely packages of information, but are more like premises for certain conclusions, and interpreting really means to draw conclusions on the basis of systematic association. To decrease misunderstanding we have to intervene with appropriate use of signs: only if we choose the proper signs can we bring forth correct interpretation.

Let's refer back to the second and the third point of our semiotic model – the two most related with the use of signs. Some signs are more suitable than others for conveying what the sender wants to say. More suitable means also that we have to take into account the differences of people's process of interpretation. There is surely a common structure, but at the same time, every person is different. Hence we can speak of the need for *tailored communication*. Tailored communication has to do with choosing the most proper signs by taking into account the real-life situation of the addressee. When we want to communicate something, we should always analyze a situation, and moreover, the specific needs of that situation must be indicated. We have to recognize and indicate which needs are present, so as to recognize and use the most suitable signs.

This goes particularly in health-care settings, where information is often not understandable by a patient. To apply a tailored communication in such cases, we should first of all identify the needs of the target audience and then give information in a way that respects these needs.

2. Method

To confirm our model, we report the description of a study we conducted for the EOC (Ticino association of hospitals). This study encourages deep reflection about the importance of tailored communication, above all in health settings.

Responding to the growing interest all over Europe about patients' rights, the EOC has constructed an informative leaflet to distribute to its patients. In our study, we evaluated this leaflet as to how well it increased the patient's knowledge about this topic (see Colombo 2006). We first

wanted to know the kinds of patient we were dealing with, according to their age, education, profession, nationality and so on. In this way we could hypothesize a list of their needs, which we used as a term of comparison for our analysis.

We also ran readability and comprehensibility tests on the leaflet, testing it for suitable use of signs. First of all we quote a definition of “readability”: it is a measure of the accessibility of a piece of writing and/or associated page layout, indicating how effectively it will reach a given reading audience (<http://en.wikipedia.org/wiki/Readability>). In order to test it, we took some pages of the leaflet as a sample, then evaluated it according to the “Gulpease index”, a typical way of measuring the difficulty of a text written in Italian (<http://www.eulogos.net/it/glossario/default.htm>).

This index is a simple rating between 0 and 100, where 100 means high readability and 0 means low readability. In general:

- < 80 = hard to read by people with an elementary school degree
- < 60 = hard to read by people with middle school degree
- < 40 = hard to read by people with a high school diploma

Figure 1 shows the scale with which we can evaluate a text according to the result of such a formula.

Now let us define what we mean by comprehensibility: it is the level of understanding of a passage or text. In analysing comprehensibility, we chose a functional linguistics framework having the following criteria (Clerehan et al. 2005):

- Organization or structure of the text (generic structure)
- Function of each “move” in relation to the reader (rhetorical elements)
- Technicality of vocabulary used in the text
- Purpose of the text (metadiscourse)
- Role-relationships expressed in the text
- The use of headings
- Density of information in the text (lexical density)
- Validity of factual content
- Visual aspects of text

We submitted some pages from the EOC leaflet to this test, in terms of these nine elements.

Figure 1. Representation of the Gulpease index.

After handing out the leaflet, we tested to see if knowledge was increased and if the text was really understandable. This second study was a Randomized Controlled Study, and its purpose was to understand to what extent the communication channel impacted patients' knowledge about their rights. We tested to see if lack of knowledge, discovered in the first survey, had been remedied and if the leaflet was understandable by patients. We wanted to know, in particular, which channels might our communication and our patients' knowledge. We selected 100 patients

staying at the Regional Hospital of Lugano. The randomization criteria were the same as those of the first study, except of course of the period of hospitalization.

To 50 patients, while they were still hospitalized, we simply delivered the leaflet (control group) and to the other 50 patients we gave the leaflet along with a general introduction by a health professional (experimental group). Then we sent the same questionnaire of the first study to all these patients.

3. *Results*

Regarding the first study: analysis of the questionnaires revealed that an hypothetical target audience of the leaflet was composed mostly by females, between 71 and 88 years old, Swiss, with a medium/low educational level and retired. In response to our questions about patients' rights, we found that the least understood were those concerning informed consent, professional secrecy, the interruption of treatment, and the right to a second opinion. In response to this sample, we may hypothesize some needs:

- The leaflet should use everyday vocabulary
- The leaflet should use an "easy" linguistic structure (syntax)
- The leaflet should use a clear format
- The leaflet shouldn't report too much information

These first results were useful for us, because they permitted us to make a comparison between these needs and those which would result from the second study.

As for the readability test: we have found the index for this leaflet was on average about .57326. As we can see from Figure 1, this means the leaflet was too difficult to read by people with a medium/low education degree. Moreover, the comprehensibility test indicated that the major problems arose from technicality of vocabulary, poor use of headings, density of information, validity of factual content, and visual aspects of the text. These results show that the EOC did not investigate its target readership before writing the pamphlet. The authors failed to consider whether the patients might have problems in understanding it.

We have already asserted that every attempt to communicate is vain if we don't consider people's needs and don't apply a tailored communication. Our second survey gave us effective proof of this assertion. In fact,

knowledge of patient rights was not increased even when the pamphlet was explained by health care professionals. The analysis of data showed that there was no increase in patients' knowledge about their rights.

Conclusion

We hope our study has underlined the importance of tailored communication. It is not enough simply to communicate, without taking note of one's target addressees. In fact, people in the experimental group fared worse than those in the control group; this means that neither the leaflet nor the oral explanation provided by health professionals went very far in educating the target audience. It is not enough simply to dispense information without considering the information needs of patients and their real life conditions. It is not enough just to communicate with signs. In order to communicate in a way leading to better comprehension by the patients, we must use signs that have value for *them*, and not just for the medical establishment.

Dario Compagno

Misunderstanding or misperceiving?

The issue of authoriality in hypoiconic signs and texts

This is a preliminary study on intentional signs, those called *signa data* by Augustine; more precisely, on the influence that intention to mean has on interpretation. Textual semiotics offers hypotheses on immanent structures operating in interpretation, but reaching the author's will is not its duty, and – more notably – semiotical analysis is independent from any will of the text's producer and consequently from any inquiry on this topic.

If we want to understand the meaning of a text, its *intentio operis*, we should consider the role of its author. This is because what common sense calls "text" is something deliberately produced by someone, and because who thinks to be in front of an intentional expression elaborates that expression differently from a person who does not see any deliberate will to communicate behind it. If we narcotized this difference, adopting the same criteria for the study of both intentional and unintentional expressions, we would risk missing the core functioning of communication. My reflections start from the way Eco (1999: 375, emphasis mine) differentiates an *alpha* and a *beta* mode of interpretation:

To understand a sign as such, we must first bring perceptual processes into play, that is to say, we must perceive substances as forms of expression. But there are signs whose expression plane, in order to be recognized as such, must be perceived (even if by virtue of surrogate stimuli) through basic semiosis, so that *we could perceive them as signs even if we decided we were not dealing with the expression of a sign function*. In such cases I shall talk of alpha mode. On the other hand, there are cases where to perceive a substance as form *I must first of all presume that it is an expression of a sign function, deliberately produced with a view to communicating*. In such cases I shall talk of beta mode.

The alpha mode is basically the way we perceive ordinary objects. We can understand that a bird is a bird, or that a picture of a bird actually represents a bird, before wondering if that bird has a further meaning. Instead, whenever a person hypothesizes a deliberate view to communicate at the root of a phenomenon, he looks primarily for a formal correlation, whatever the substance perceived. And I would like to add that this search for a formal correlation points straight to the communicator's will. To recognize a dove in a photograph is somehow independent from wondering what that dove means; while interpreting a hand-drawn image of a dove often requires to suppose that someone wanted to draw a dove and not some other bird. These phenomena help explain what Eco meant by the two modes of interpretation. But there is more ...

For textual semiotics, a drawing of a dove carrying an olive branch, even if not produced with the aim of expressing a symbol of "peace", nevertheless keeps this conventional meaning. It is not important whether this potential could be given to the image creator or not; the reception of the text determines its meaning more than its production. The dove means peace in our culture, and this social meaning is not just stronger than the author's intention: social conventions are the *only* way a person can mean something.

If this is true, let me highlight the influence that the communicative act in which a sign or text is produced and interpreted has on its semantic potential. By taking a careful look, the connotation of "peace" attributed to a dove's painting can be seen as immanent to it by an interpreter only if he imagines an author establishing that signification. In fact a dove could also mean fertility (as in wedding releases), divine love and forgiveness, hope for resurrection (as in funerals and tombstones). A careful interpreter should wonder if the image's creator really wanted to convey a peaceful message by using the dove; moreover, nobody can take a real, living dove flying with an olive branch in its mouth as a herald of forthcoming peace (but of course in mystical interpretation, where some deity would be the author of the message). Intentional signs are different from natural ones, and they require a quest to find their producer's actual aim: any text presupposes a past production of it, and to this production its meaning is somehow bound. If what is at stake in interpretation is a single deliberate application of an otherwise diffuse semiotic potential, then the

most important element to be looked for in the analysis of a text is the motivation for its production.

Meanings that require a speaker, and meanings that can do without one

Eco (1999) brings back the notion of deliberate signification in semiotics that he himself put aside in the past (1976), when he wrote that natural and intentional signs are signs to the same degree (even if at that time he was already interested in recognized and unrecognized intentions). I am evaluating the possibility that humans adopt a peculiar *interpretative stance* whenever supposing the existence of an intentional producer as source of a sign. Daniel Dennett (1996) writes of an intentional stance that cognitive beings use when they imagine themselves in front of another cognitive being. This notion doesn't require the other being to be really cognitive; it simply describes the way someone thinks about something or someone else. A similar situation is that of an interpreter who is going to read something *as if* it had been deliberately imbued with meaning.

Let us suppose that a person feels something on his shoulder, where he cannot see it, and he thinks it is an insect. He hits it, only to recognize thereafter an harmless leaf. That person has used a general inferential capacity: he gave attention to some information offered to him by his tactile sense; he recalled the Cognitive Type or schema of a generic insect (Eco 1999), and acted accordingly. In this respect we could correctly talk of semiosis here; but it would also be correct to say that there has been no *communication* whatsoever between the leaf and the interpreter. As some cognitivist scholars write, not every acquisition of knowledge can be called communication, and it would be better, instead, to speak of misperception in cases like the one described above (Castelfranchi & Poggi 1998).

On the contrary, if while I am driving a car, the person sitting next to me says "light" and I understand "right" it's no longer just a matter of misperception. My interpretation is driven by a general hypothesis of intention-recognition. If I suppose the existence of an external purpose, I lead my attention to that will, and I interpret the sounds I hear as means for that will to communicate, aside from their signification as objects *per se*. Even if to me my passenger's intention is impossible to reach directly, I never doubt that this intention exists. The word "right" is direct evidence

for the fact that my passenger is not mute and that he apparently speaks English; but it becomes a meaningful clue for my driving only if I suppose a cooperative intention and a capacity to reason in him. In other words, a portion of the world must be caught by the interpreter as *a text produced by an author*. Hjelmslev (1961) talked about *catalysis*, the act of finding immanence through the recognition of a human language. That immanence is different from the visual impression or “taxi” of a thing, the phenomenological organisation allowing me to recognize a leaf. To understand a message requires an intentional interpretative stance.

Luis Prieto (1966) made a strong point that a raindrop is to rain as the sentence “it rains” is to *x*, where *x* is the information that it will rain, and not the rain in itself. Pragmatics differentiates further informative and communicative intentions working at the core of language (Sperber & Wilson 1986). I consider it misleading to say that the sentence “it’s raining” points to rain as a raindrop does, as if we believed the raindrop to speak. In feeling a raindrop falling on me, I take that as a drop, then as a raindrop, and so as evidence for rain to come; in hearing “it’s raining”, I wonder who says this and if he has evidence that I cannot see at the moment.

Recognizing iconic and symbolic representations

Often the interpreter correctly attributes or does not attribute an intended meaning to the phenomenon he experiences. Hence he differentiates properly intentional and unintentional signs, communication and (cultural) perception. But there are also chances that the interpreter will take an object for an intentional sign, or vice versa. Say, if I believe to have heard a voice, but it was only a whiff, or on the contrary I do not recognize someone talking because of a noisy environment, I make a different mistake than a misperception or a misunderstanding. In fact I adopt the wrong mode of interpretation – the wrong interpretative stance.

I would like to return your attention to a curious feature of realistic pictures. If a person sees a realistic iconic representation, and he does not understand it to be a representation, he will *take it for the object represented*. In ordinary life this rarely happens, because we deal with images that are usually somehow different from their objects, and we immediately assign them the correct status of intentional signs; but this fact only increases the effect of surprise arising from an unrecognized reproduction. A very

realistic image or an effective fake can inhibit the interpreter's expectations about a communicative (or deceptive) intention.

Something drastically different happens with words and other forms of arbitrary signification. If an interpreter does not see letters and words on a sheet of paper, he can *by no means confuse them with their object*. He will stop his elaboration at the perceptual substance, failing to see any meaningful form, and he will not reach the sign's object at all.

So there is a huge difference between iconic and symbolic representations, which arises clearly whenever the intention to mean, turning an object into an intentional sign, is not recognized. In front of a picture of an apple, if I fail to recognize its pictorial nature, I still see the apple; furthermore, I perceive it as a *real* apple. On the contrary, in front of the word "apple", if I do not recognize it as a word, I only see a confused ink scratch. For example, not everyone would read a word in the lines and dots sequence in Figure 1.

Figure 1. The word "apple" (in Morse code) and a fly.

On the contrary, someone might try to hit the fly next to it. The word "apple" in Morse could be confused with a *meaningless*, semi-recursive pattern; while the picture of the fly with a *meaningless*, living fly. The word "meaningless" here does not imply that the first substance is not recognized as a black and white pattern, or that the fly is not recognized as a fly. The point is that in both cases they do not mean anything but their existence; the interpreter does not suppose they are being used by anyone as a means of communicating (or in the latter case, for deceiving).

This phenomenon can be explained by saying that the beta modality of interpretation, the fact of recognizing an intentional view to communicating, has *two diverse effects* on iconic and symbolic representations. In the last case it permits one to reach the content of an otherwise opaque expression (but the term "expression" is itself problematic here; it would be better to talk about sensible experience or perceptual substance); in the

first case, it allows a pause before interpretation of the content as a concrete, present object. This implies that the alpha mode of interpretation (the non-intentional interpretative stance) is what permits one to describe the expression of a sign, but it also enables one to be fooled by visual resemblances, mimicry and illusions.

There can also be cases in which the interpreter attributes a non-existing communicative will to a portion of sensible experience. The strangest and rarest – but possible – happens when someone believes an original to be a fake, for example, by questioning the make-up of a gold ingot. Or the interpreter may see codes and messages where he actually should not; for example, by taking a bonfire as a smoke signal. In both situations an object is believed to having been turned deliberately into a surface for inscription. The gold ingot is an ingot-sign; the bonfire is not just a fire, or evidence for past ignition, or a clue for human presence: it was ignited *to be seen*.

Intentio operis and the author

The threshold between what has been consciously communicated or suggested and what the message means on its own, independently from the sender's will, is very thin. In order to overcome this problem, every text in semiotics is studied as if its meaning were not consciously communicated. What is in the text is important, that is, what the reader finds in it because of his cultural competence. But doesn't this approach lead to problems? I am evaluating the possibility that if we detached the text from its sender, if we considered its meaning independently from any possible communicator's intention, we risk losing the chance to give a justified interpretation to texts. Eco (1990) pointed out that what the author wanted to say, *but didn't say*, is of no interest for semiotics, and that we should focus on what the text means by its own codes. This is the well known distinction between the *intentio auctoris* and the *intentio operis*. But strictly speaking, the text in itself has no codes at all – it is a message that must be referred to codes known to the reader: “cane” to an Italian means “dog”, sometimes “sing!”, very rarely “cane”. One must make some hypothesis about the person who wrote the word, to avoid reading what the author could not have possibly wanted to write.

Some studies invite us to look for a reconciliation between *intentio operis* and *intentio auctoris*. Sperber & Wilson (1986) point out that the

receiver of a message must recognize it as such, and this requires finding a communicative intention in it. Besides, the responsibility for letting the reader get the communicative intention of a text must be placed on its producer (communication works thanks to an *asymmetric coordination* weighing on the author). Compagnon (2004) writes that the principle of coherence allowing textual analysis depends on the existence of an author organizing this coherence, and so he argues that it is impossible to get completely rid of the text's producer. The term *intentio operis* itself is an oxymoron, combining what cannot have a will with what cannot be turned into a thing, but to me it expresses greatly the paradoxical nature of words and texts: *means-meaning*, without which a man would not be man.

I believe that what the author of the text wanted to say, and *did say*, is one main interest of semiotics. Between what the text says, despite its author's purpose, and intentions, there is a core of deliberate signification. The New Criticism and Barthes (1977: 15–31) announced the death of the author. But by doing so, the author has been liberated from his duties, whereas we still need him to work for us, at least if we seek to obtain any justifiable reading.*

Note

- * I would like to thank Mirko Della Torre for his helpful suggestions regarding this paper.

Anna Czekanowska

Real vs. unreal, the literary vs. the musical message

**On the transmission of the Yakut epics,
*Olonkho***

To my close friends Eduard Alekseev and Aiza Reshetnikova

At the far, far and peak
of my long-gone years,
far away on the other side of the ridge
of my ridge
of my old, wreathed years,
far behind the brink
of the turbulent, earthly days
of my sunken years,
behind a line
of deadly ridges
of my past years,
when human tribes who entered into talks did not get to know one
another yet,
when the Yakut tribes,
who exchanged words did not know one another yet, when
my *Uranghai Sakha*
in furs like *Uras* ,
long-footed, loquacious, got together, but did not describe things yet,
when my prophets,
with a marked bone,
(when) the shaman from my country did not foresee (the future) yet,
the Hostess-Mother, my Earth, of the size of a grey squirrel's heel,
was being born
by stretching, expanding, growing;
like a chamois-soft ear of a deer
turned inside out,

spreading wide in all directions,
gradually expanding, as it appears

Noh!

(Translated from the Russian by Z. Przepiórkowska)

My reflections here focus on two Yakut heroic poems edited in two parallel languages, Yakutian and Russian, as elaborated by Nikolay Emelianov, Vasily Petrov and Sardana Oiunskaya, published by the Siberian branch of the Russian Academy of Science in Novosibirsk (1993 and 1996) and, analysed and commented on by ethnomusicologists Eduard Alekseev and Aiza Reshetnikova. I am very pleased to have this opportunity to contribute to the interpretation of these poems and would like to express my gratitude to my friends who delivered this material to me.

The first poem, *Mighty Erb Sogotokh*, is a tale about the progenitor of the Yakut nation; the second, *Kyys Debelye*, tells a story of women-warriors, who distinguished themselves in defending of their tribe. Both poems belong to the *Olonkho* epics, which are highly representative of Yakut literature, and have been studied for more than two hundred years. Yet, they still create many problems for scholarly interpretation, especially in the domain of musical transmission and its relation to poetry.

The first poem blends several, more or less related legends, which allow us to reconstruct the moral-aesthetic system, to reveal the stable plot structure and composition, and to present the poem's main "characters". The whole description is satiated with mythological concepts and images. The poem's main hero, *Erb Sogotokh*, is cast down from the upper world to the middle world, i.e., from the sky to the earth. The main hero of the second poem is a woman *Kyys Debelye*, who when expelled from the upper world to the middle one, settles there with her three sisters, defends them and fights with representatives of other groups. She is, however, not only a warrior but also an organiser of life in peace-time, who fights for the maintenance of moral values against her own children .

The plots of both *Olonkho* poems develop in three to four consistent parts:

1. Introduction, which in the first poem concentrates on description of the earth, and in the second poem, on admiration of the sky.
2. Outline of the basic conflict consisting of struggles between tribes and/or generations; includes the intervention of transcendental powers.

3. Solution of the basic conflict. The final parts of the poems have a happy ending, describing either a return to the south where the Yakuts originated¹ or a transcendental journey to the upper world, where conflicts can be happily resolved (see second poem).

4. The whole cycle ends with a concluding recitative (sometimes with a song).

Proper understanding of the legends requires some acquaintance with shamanistic beliefs, such as the idea of the threefold world: the upper, home of benevolent spirits; the middle, abode of people; and lower world, dwelling of evil spirits. In addition, there is the concept of constant correspondence between these three strata, although the conflicts concentrate mainly on the struggle between representatives of the middle (represented by the *Ayii* tribe) and lower (represented by the *Abaasy* tribe) worlds. The contradiction between two kinds of energy – horizontal (between people) and vertical (between the real and the unreal world) – is crucial to the structure under study. Indeed, the omnipotent power of the upper world dominates other forces, and the heroes, though brave and powerful, clearly remain at the disposal of the upper power. They may be sent to the earth with a special mission or be expelled; they may be brought up to the upper world (by good spirits – the white cranes); they may die and even be eaten by the enemy, but they may also be revived. In more abstract terms, one fights with internal human enemies that remain permanently at the command of the upper world. In more realistic terms, the permanent struggle is reduced to ethnic² and/or family conflicts, although moral aspects are distinguished as extremely important.

Proper analysis of *Olonkho* cannot exclude the musical aspect and its performance media. At the same time, it would be rather difficult to speak about the correspondence between poetry and music, since both kinds of transmission operate with different instruments and fulfill entirely different functions. Rigorous analytical studies contributed by philologists and folklorists help to explain the structure only to a limited extent only, concentrating basically on highly poetic descriptions and on metaphorical interpretations of the basic concepts of earth and sky, space and time, North and South. The verbal message conveys information about particular heroes (important ones and those of the second rank) and specifies their functions, but the characters and the power of their actions are still not

sufficiently articulated. Poetry presents visions and images, and reveals the values of the Siberian cosmological paradigm, namely, the cosmological-geographical orientation (North-South-East-West), which is crucial to the Siberian people. It cannot, however, fully express the dramatic dimensions of the arising conflicts. The verbal message keeps the listener at a certain distance; for it is not enough just to know the content, but one needs to be “taken” by its dramatic power and become really engaged. Music shapes the sequence of the dramatic plot, forms its dramatic axes, and puts the actors in the proper places. Thanks to music the participant can properly experience the dramatic profile of the plot, its points of tension and relaxation; that is, one learns how “to breathe” with the narrated story and participate fully in the event. Indeed, music transforms the listener into a participant.

Initial contact with *Olonkho* music is perhaps disappointing, both to Western-oriented listeners and to those competent in various kinds of Asiatic music. The former have problems in perceiving music created against the background of primary sound qualities such as tessitura, loudness, timbre (see Kondratieva and Mazepus 2002); the latter kinds of listener have difficulty identifying the characters marked by the verbal text. The inexperienced listener has evident problems in discovering correspondences between the verbally exposed content and its musical expression, as well as difficulties in relating the indicated “characters” and/or episodes to concrete musical motifs. The relation between content and music, apparently quite simple, is in fact complex and transmitted in an indirect way.

The first example of divergence between poetry and musical transmission is present in the recited parts of the introduction. The listener is surprised by this recitative, since the way in which the tale is performed differs clearly from what is expressed by the poetry³ for the narrator recites monotonously and quite fast, almost without pauses, while short breaks correlate only with his breathing (this fast way of reciting is called in Russian “skorogoworka”). He does not articulate any repetitions, which are so spectacularly exhibited in the poetic text. His way of performance is closer to recited conjuration than to poetry.

Indeed, it is difficult to correlate this highly poetic text with the way it is performed. *Olonkho* poetry concerns basic ideological concepts of the Yakut belief system, concentrating especially on the opposition between the real and the unreal worlds (see text fragment, below), either conceiving these concepts in abstract terms,⁴ or appealing directly to the senses,⁵ but

always operating with a dynamic that concerns not only the world's creation, but also seasonal changes. Compare the text presented below:

That very,
 primordial Mother-Earth of mine,
 was bound together with roots,
 reinforced with grass,
 wrapped with trees,
 covered with dormant black taiga,
 where the grey bear sets its lair,
 covered with impassable black taiga,
 which a fully grown elk readies before heat, –
 this is how primordial Mother-Earth
 continued to be created, as it appears,
 Created like that?
 with trees which die by falling,
 with waters which shallow when evaporating,
 with cuckoos which lapse into silence after finishing their cuckooing,
 with fish which swim away after shedding their scales,
 with pine trees which shed their needles after turning yellow, with cattle
 herds which grow small after degenerating, with people are born late,
 my central primordial Mother-Earth
 continued to be created and born
 exactly like this, as it appears,

(Nooh!)

(Translated from the Russian by Z. Przepiórkowska;
 see *Erb Sogotokh*, ed. Alekseev 1993: 79.)

The text above poses evident problems for the listener's perception. First, it is really surprising to find poetry appealing to spiritual powers recited in such a monotonous way. The situation totally changes with the emergence of dramatic effects and actors' performances (monologues and dialogues), which operate with much greater emotional engagement. Here music starts playing an important role. It establishes the sequence of the dramatic plot, as well as the consistency of composition (main action, formulae), and classifies particular actors (those of first and second rank). Music also evokes certain associations with the current repertory of folk songs (lullabies, laments), thus helping to stress the difference between the real and the unreal worlds.

According to Yakutian scholars, the most evident contrast lies between the two styles of singing mentioned above: *djiretti* and *degeren* (local terminology). These differences may be seen in the distinguishing of heroes into those with transcendental references (*djiretti*) and those presenting lower-rank, non-transcendent characters (*degeren*). Also noted have been the similarities between *djiretti* singing and shamanistic performance, which is most impressive when it is presented by a Tungus hero, although authentic shamanistic singing is quite different. More important for the *djiretti* style is the contrast of tessitura and manipulation of timbres, by means of strong tremolo and breathing effects.

The difference between the two styles *djiretti* and *degeren* is usually described as that between a recitative (*djiretti*) and a song (*degeren*); and between performance limited to fewer (*djiretti*) or more sounds (*degeren*). This characteristic is, however, evidently too general, and does not reveal satisfactorily the variety of reciting styles. These styles may operate in more or less extended tonal space, additionally developed during execution, and further enriched by a variety of timbres and various degrees of emotional engagement.

The songs performed in the *degeren* style differ by the use of more stable intervals (e.g., perfect fourths). Examples of this style permit one to follow the motifs and their references to concrete characters. This style is widely used for satirical description, allowing specification of the evolution of particular characters.

The phenomenon of the “epic breathing”, a term proposed by Alekseev (1993), is important for the creation of particular moods and feelings; this fascinating phenomenon has still not been thoroughly investigated. Manipulation with halted breath is in these cases crucial. Just as important are the breath pauses in the narrator’s speech, their frequency and context. It goes without saying that these breaks do not correspond with physiological needs only. They appear in certain parts of the text, being absent in others, referring to certain dramatic episodes which also coincide with the projection of form. Most important, however, is the relation of these breaks to the comments complementing them. The variety of such exclamations – “Noo”, “Noo-Yes”, “How excellent!”, “Just that”, “What a magnificent bird!” – deliver additional information and bring the listener and/or participant closer to the evaluation of narrated events. The main question concerns, however, the character and function of these spontaneous “comments” and

manifestations. The explorer would be happy to know not only how they are related to certain moods and connected with concrete situations, but first and foremost, to what extent are they regulated by established rules, and to what degree they are really spontaneous.

Conclusion

At this point, our conclusions cannot lead to definite statements. The study demands still more advanced work, specifically as concerns the musical expression of dramatic effects. This additional work requires more field research and also more specialised analytical instruments. The latter should help to identify particular performance phenomena (timbre effects, way of breathing, manipulation of tessitura) in their cultural context. Indeed, more detailed analysis of performance phenomena should be done in consultation with acousticians (see Kondratieva and Mazepus 2002 ; and Mazepus 2004, who established objective analytic criteria on the basis of spectral analysis). At the same time, local performers should be enlisted to comment on the achieved results, using their own cultural terms. This is exactly an area that needs to be controlled by comprehensive field research.

What is most needed at this moment, is the recorded documentation of the full text (still to be found in archives), possibly with transcribed music, though I fully understand the immense difficulties of such work. This kind of documentation, not limited to singular examples, would make it possible to follow the narration's flow and to investigate better the effects of the "epic breathing" mentioned above.

The simplest interpretation of the *Olonkho* tradition points to historical facts and to the migration of Turkic speaking people to Northern Siberia. This kind of interpretation cannot, however, clarify the vitality of this hybrid (Turk/Tungus) phenomenon. The cohabitation of different traditions being historically superimposed cannot explain its cultural importance. One should turn to belief systems and to their power, in search of the authentic source of consistency between that symbolic thinking so clearly exhibited by poetry, and some specifics of musical performance in the way of narrating and articulating. The shamanistic bias is evident in the both cases, although it is expressed quite differently in each, and operates with different instruments. The divergence concerns basically the level

of the structure's development, which is probably transformed in poetry while remaining closer to tradition in musical performance. The remoteness of the latter is probably an outcome of deeper contact with an area of beliefs and conjuration practices that have long remained unchanged. One may assume that the poetry, preserving the rudiments of shamanistic beliefs, so clearly exhibited by the appreciation of the shaman's energy and subordination to his spiritual power, expresses such beliefs and practices in an already transformed way, maneuvering with sophisticated instruments and treating universal concepts in an abstract manner; whereas the musical performance is still "in the power" of traditional rules. One may assume also, that this kind of "co-habitation" and still-preserved reference to shamanistic practice keeps this tradition alive. It is highly probable that the non-performed verbal text will survive as an archive source only, while the performed practice, though not without evident changes, will continue.

A general interpretation of the *Olonkho* poems, and its inclusion in interdisciplinary discussion (with psychologists and sociologists), may also contribute to better understanding of contemporary motivations for maintaining this art in a globalised world. Yet, what is more important is the proper explanation of the *Olonkho*'s nature, which should help to predict accurately its further development. The historically embedded co-habitation of quite different traditions⁶ needs more investigation and special studies on its shamanistic roots. This kind of exploration should not only explain the durability of the *Olonkho* tradition, but also help us to understand better the essential values comprising the Yakut people's identity.

Notes

1. Confirming the historical fact (7th century AD), namely, that the Yakut migrated from the area of Lake Baikal and Altai Mountains to Northern Siberia.
2. In certain cases it is possible to identify special musical motifs and relate them to the particular groups, either Tungus or Mongols.
3. Comp. musical example nr. 1 in Alekseev's edition of *Erb Sogotokh* (1993), along with the recorded example of it included in this book, and example nr. 11, as heard on the recording *Yakutskije Pesni*; see Alekseev's commentary in *Melodija* 30–39: 765–766.
4. Usually with the help of numbers (the sky has eight levels), and with division and multiplication procedures.

5. Comp. the metaphor, “as soft as the chamois-leather entry of the deer’s ear”.
6. Turkic-Mongolian, Tungus and Russian. These epics provide researchers with excellent material for comparative studies in the very extensive perspective of North-Eastern Asia .

Ivan Darrault-Harris

Compréhension / Mécompréhension

Un défi pour la psychosémiotique: Les énigmes du comportement adolescent

Notre proposition de communication affrontera (avec les moyens théoriques et méthodologiques de la psychosémiotique que nous avons, en France, avec le soutien de Greimas, fondée dans les années 1980) les redoutables problèmes d'inintelligibilité des comportements et discours de la population des adolescents, l'adolescence étant redéfinie comme une période prolongée de la vie, comprise aujourd'hui entre 11/12 ans et 25/26 ans.

Cette mécompréhension de tels comportements a des conséquences éducatives et politiques graves en ce qu'elle alimente souvent chez les adultes des réactions de rejet, voire de pure répression, réactions interdisant de mettre en place un véritable plan de prévention, une efficace politique de sanction (aux sens juridique et sémiotique) des comportements à risque.

A partir d'exemples de séquences comportementales (conduites à risques, conduites addictives, tentatives de suicide, agressions, destructions gratuites) et de discours adolescents problématiques (tags, injures, agressions verbales amis aussi écrits intimes, autobiographiques), on s'efforcera de construire un modèle sémiotique génératif des comportements et discours adolescents faisant apparaître leur grande spécificité et les raisons éventuelles de leur inintelligibilité.

Une première conséquence de cette analyse amènera à proposer un modèle génératif renouvelé des productions signifiantes en acte et en discours. D'autre part, l'analyse proposée dans notre contribution, grâce à l'effort de modélisation accompli, pourra éclairer, de manière beaucoup plus générale et transférable à d'autres phénomènes sémiotiques, les conversions perturbantes reliant les strates successives du modèle généra-

tif, conversions inattendues, voire “court-circuitantes” qui nous permettent de rendre compte des effets de mécompréhension visibles à la surface comportementale.

Je n’ai plus aucun espoir pour l’avenir de notre pays si la jeunesse aujourd’hui prend le commandement demain. Parce que cette jeunesse est insupportable, sans retenue, simplement terrible... Notre monde atteint un stade critique. Les enfants n’écoutent plus leurs parents. La fin du monde ne peut être loin.
(Hésiode, *Les travaux et les jours*, 720 avant J.-C.)

L’inintelligibilité immédiate caractérise de très nombreux objets sémiotiques: littéraires (ainsi la poésie hermétique – Gongora, Mallarmé – est un genre à soi tout seul), plastiques (l’art contemporain propose régulièrement ses compositions énigmatiques), musicaux, etc.

Dans tous ces cas, l’intelligibilité peut être un gain non négligeable de la description et de l’analyse sémiotiques, dans la mesure même où la sémiotique entend mettre au jour *l’engendrement de la signification* au sein de ces objets.

Le parcours génératif ainsi élaboré pourra faire apparaître non seulement les strates successives de cette génération du sens mais aussi les dispositifs responsables de l’inintelligibilité régnant à la surface observable pour le spectateur/lecteur de l’objet.

On se souvient ici de cette œuvre majeure qui ouvrit le XX^{ème} siècle, la *Traumdeutung* de Freud, où celui-ci montre que le niveau *manifeste* du rêve, incohérent et inintelligible, est le produit d’opérations de déplacement et de condensation à partir du niveau *latent* constitué d’idées parfaitement claires, immédiatement comprises. C’est donc pour tromper la censure de la conscience que ces idées limpides sont transformées en images extravagantes appelant une analyse qui reconstitue le parcours de la signification onirique: le rêve, nous dit Freud, est un *rébus*.

Retenons pour notre part que l’inintelligibilité est un effet sémiotique de surface qui n’hypothèque en rien l’intelligibilité potentielle du parcours génératif sous-jacent. Nous partirons ici d’un fait banal, quasi quotidien, à savoir l’incompréhension qui semble très souvent s’attacher aux comportements des adolescents, à la fois pour les adultes qui en tentent la lecture

interprétative et pour les adolescents eux-mêmes, bien démunis quand on leur pose la question de la signification de ce qu'ils font et/ou disent.

La *psychosémiotique* entend s'attacher à de tels comportements énigmatiques (constitués de séquences d'actions accompagnées d'effets passionnels et, éventuellement, de discours verbaux). Dans la mesure même où ces comportements peuvent mettre en danger la santé, voire la vie même des adolescents, une analyse sémiotique aboutie pourrait alimenter de manière efficace une politique de prévention de ces actes incompris.

Ainsi, contrairement à l'éthologie ou à la psychologie, qui partagent toutes deux le comportement comme objet, la psychosémiotique cherche à modéliser l'engendrement de la signification comportementale et non à en désigner les causes. La *causalité* est donc remplacée par la *conversion* rendant compte du passage d'un niveau génératif à un autre.

La psychosémiotique accorde, suivant en cela la leçon de la phénoménologie, une importance très grande au corps considéré comme *instance de base* du processus d'énonciation verbale et non verbale. Et elle recherche la théorisation de l'articulation entre le corporel et le psychique, au sens où Freud parlait de *réalité psychique*, se séparant par là et de la médecine et de la psychologie.

1. L'adolescence et la double mutation

L'adolescence est une période de la vie humaine caractérisée par la mutation brutale et incontrôlée du corps (la croissance, non linéaire entraîne une dysharmonie de la transformation, avec des paliers et des accélérations quelquefois fulgurantes). Cette mutation corporelle, bien visible, s'accompagne d'une mutation psychique invisible mais tout aussi radicale, avec l'apparition d'affects inédits, le réveil de fantasmes typiques, l'avènement de processus cognitifs nouveaux.

Ce que nous voudrions précisément montrer, à partir de l'exemple privilégié des comportements et discours adolescents, c'est la spécificité des relations que l'éthosémiotique entrevoit, avec l'aide déterminante de la psychanalyse, entre le niveau *a quo*, celui du corps et du psychique en mutation, et le niveau ultime, *ad quem*, des significations manifestées, réalisées dans les discours verbaux et non verbaux – souvent peu intelligibles – que les adolescents nous donnent à voir et entendre.

Nous ne pourrions nous attarder longuement sur la mutation de l'instance de base, le corps, non-spécialiste que nous sommes du processus physiologique de la puberté, d'une extrême complexité et comportant encore de larges zones inexplorées. Nous relèverons toutefois que la révolution qui touche le corps, le rendant sexuellement mature et propre à la procréation, est unique dans l'existence humaine: période, donc, d'exceptionnel intérêt pour travailler les relations corps/productions sémiotiques. Nous apparaît également pertinente, pour la première et la dernière fois dans l'existence de l'individu, la discontinuité du processus de croissance, tant au niveau des décharges hormonales elles-mêmes qu'à celui, par exemple, de la poussée staturo-pondérale (un adolescent peut grandir de quelque 12cm en moins d'une année). La puberté, enfin, produit des effets corporels invisibles et d'autres bien visibles, morphologiques, épidermiques, spectaculaires: ainsi la discontinuité, voire le déséquilibre, de la croissance des membres par rapport au tronc peut produire, on le sait, de curieuses silhouettes transitoires.

Si nous quittons le corps proprement dit pour l'espace psychique, nous rencontrons chez l'adolescent la survenue imprévisible – et souvent détachée des situations effectivement vécues – de bouffées émotionnelles à la fois intenses et inédites, ce qui accroît d'autant leur caractère indicible. Il faudra revenir sur ce problème, aigu à l'adolescence, de la grande difficulté à mettre en discours verbal les affects, les émotions.

D'autre part, il est largement admis que le temps de l'adolescence, psychiquement (mais le lien à la transformation pubertaire est évident) est un temps de quête d'identité sur fond de deuil à faire d'une identité à perdre: celle qui se soutenait du corps et du psychisme de l'enfant. Visant, donc, la construction d'un modèle éthosémiotique des comportements et discours adolescents, notre hypothèse centrale est double: (1) sur le plan de la forme même du modèle, il ne peut s'agir que d'une stratification de niveaux, depuis le niveau de base constitué à la fois par le corps et le psychisme (au sens de la "réalité psychique" freudienne) jusqu'au niveau de surface où se perçoivent les productions sémiotiques non verbales et verbales; les relations entre niveaux superposés – de la profondeur à la surface – ne sont pas des relations de causalité, mais de conversion sémiotique. (2) Sur le plan du contenu modélisable, les niveaux basiques seront donc constitués et du corps et du psychisme, deux entités dont l'articulation restera à définir, constituants qu'ils sont de l'instance d'énonciation. Les niveaux supérieurs

du modèle devront faire apparaître la distribution des “choix” sémiotiques adolescents entre la sphère du verbal et/ou celle du non verbal.

Le modèle devrait permettre la formalisation de l'*engendrement spécifique de la signification* chez l'adolescent, tout en respectant l'infinité des styles individuels et socioculturels possibles. S'y donneraient à lire aussi les aléas, troubles voire pathologies de cet engendrement de signification, selon, par exemple, le court-circuitage de tel ou tel niveau ou bien encore les perturbations de conversion sémiotique entre niveaux: la relative indécidabilité des affects illustrerait ce dernier point.

2. *L'articulation sémiotique corps/psychisme*

Dans la perspective éthosémiotique qui est la nôtre, un premier problème à résoudre réside dans la nécessité d'articuler *corps* et *réalité psychique*, lesquels constituent ce que nous avons appelé l'instance de base de l'énonciation verbale et non verbale du sujet. Si ces entités, on l'a rappelé, sont engagées toutes deux dans un processus de transformation (avec abandon, donc, de la forme et du contenu antérieurs), elles n'en sont pas moins redoutablement hétérogènes, et toute hypothèse d'articulation entre les deux prend le risque de revenir à une étiologie biologique du psychisme et, au-delà, du comportement. Or on sait que la recherche des substrats physiologiques du comportement constitue un trait nodal de l'éthologie, science dont l'éthosémiotique entend se distinguer avec netteté.

C'est ici la psychanalyse qui nous offre l'élégante solution de ce premier problème, avec le concept décisif de fantasme qui permit à Freud, dès 1897, d'abandonner sa théorie initiale de la séduction et de poser simultanément l'existence d'une “réalité psychique”: tournant décisif de la naissance de la psychanalyse. Reconnaissons ici notre dette à l'égard de la lecture pénétrante et si suggestive que P.-L. Assoun (1997) fait de Freud dans le premier tome de *Corps et Symptôme* (la Clinique du corps).

Freud, dans les textes allégués par l'auteur, s'interroge sur les relations entre le symptôme organique (que la médecine réduirait à la maladie organique), les transformations introduites dans le corps à cette occasion et l'écllosion de la névrose, “objet de déni et signe d'impuissance pour la médecine” (34). “Il arrive assez fréquemment que, chez des personnes qui sont disposées à la névrose, sans souffrir précisément d'une névrose déclarée, une transformation corporelle (*Körperveränderung*) – par inflam-

mation ou lésion – éveille le travail du symptôme, de telle sorte que ce symptôme donné par la réalité se fait le représentant de tous ces fantasmes inconscients qui guettent l’occasion de s’approprier un moyen d’expression” (35).

P.-L. Assoun commente: “L’événement du corps organique produit donc l’éveil du symptôme qui ‘sommeillait’. On se souvient de l’image des chiens qui dorment: c’est ici l’événement organique qui produit le déclic et fait sortir la névrose de sa torpeur” (1997: 36). Plus loin: “La maladie (d’organe) fait la névrose, comme l’occasion fait le larron – et le bénéficiaire, ici, c’est le fantasme, dont le commanditaire n’est autre que le ‘désir’ (*Wunsch*)!” (37) Mais comment, nous objectera-t-on, passer d’une analyse de ce que Ferenczi dénommait justement “pathonévrose” à l’éthosémiotique du comportement adolescent, sans tomber dans une injustifiable pathologisation de la période adolescente, en suggérant quelque “névrose de croissance”?

Nous pouvons tout d’abord répondre que pour Freud la névrose, bien plus qu’une pathologie, est une forme d’existence psychique. Puis que s’il n’y a point, à l’adolescence, de lésion, d’inflammation, de déchirure corporelle, interprétées comme “effet de castration réel” (37), il y a bien nécessité d’assumer une perte irrémédiable, celle du corps infantile, d’accueillir et de faire sien un nouveau corps : “... quelque chose de ‘neuf’ qui arrive au corps doit être régulé, qui mérite une position originale, entre ‘névrose de transfert’ et ‘névrose narcissique’”, ajoute Assoun (38).

Ainsi nous sentons-nous autorisé à faire fonds sur l’analyse freudienne de ce drame à trois personnages (le(s) fantasme(s), les symptômes organiques, le travail du symptôme) pour penser la relation fondamentale entre le corps adolescent en transformation et la réalité psychique en l’espèce du *fantasme*, lequel trouve dans la mutation corporelle un plan d’expression inespéré. Et le sémioticien ne peut qu’être sensible

- à la survenue d’une mise en relation dramatique entre ces instances organique et psychique du sujet, sorte de médiation homogénéisante;
- à l’avènement de la sémosis: le fantasme “aux aguets” est une sorte de contenu dépourvu d’expression, une entité sémiotique mutilée et condamnée à l’existence virtuelle. Le fantasme accèdera à la réalisation sémiotique pleine quand, à l’occasion d’une expression corporelle à saisir, il pourra constituer ce tout sémiotique de la névrose.

Freud, rappelle Assoun, se réfère de manière très générique aux fantasmes, sans rien dire de leur contenu. Ne pourrait-on, chez l'adolescent, entrevoir quelque fantasme récurrent s'étant emparé du corps en transformation pour advenir à l'existence sémiotique?

N'oubliant pas la leçon de Freud, qui confère au fantasme une existence transversale (de l'ordre de l'inconscient, du préconscient et du conscient), nous avons rencontré chez l'adolescent, au cours de notre expérience clinique, de multiples manifestations d'un fantasme que nous avons dénommé, "fantasme d'auto-engendrement". Ces manifestations, on le verra, se donnent tant sous les espèces de l'acte que du dire, du non verbal que du verbal, tant la période de l'adolescence est, à nos yeux, un temps où s'impose la prégnance de l'alternative agir/dire.

Le *fantasme d'auto-engendrement* peut donc tout autant constituer la base générative (au sens sémiotique du terme) d'une conduite à risques que d'un écrit auto-biographique intime. Mais le fantasme, encore une fois, doit l'activation de son existence au corps en mutation, dans le permanent "devenir autre". D'où la quête d'identité adolescente qui nous apparaît comme un effort considérable d'assomption, voire de maîtrise des transformations (corporelles, perceptives, émotionnelles, affectives, cognitives, etc.) qui adviennent au sujet.

3. *De l'usage d'un tel modèle*

Il reste à donner quelques brefs exemples de l'opérativité de ce modèle en construction dans la quête de l'intelligibilité des comportements et discours adolescents. On a saisi que l'instance d'énonciation du sujet adolescent est instable, du fait même de la mutation corporelle, de la survenue imprévisible d'affects inédits, des tentatives d'assomption psychique (plus ou moins efficaces) du devenir si peu contrôlable du sujet.

Si l'on accepte l'importance et la pertinence du fantasme d'auto-engendrement chez l'adolescent trouvant expression dans la mutation pubertaire, on peut comprendre, par exemple, certaines conduites à risques de l'adolescent comme un essai de réalisation de la séquence fantasmatique où le couple parental serait détrôné, déposé pour permettre enfin, comme l'écrit une adolescente, "de se faire nêtre (sic)" (Darrault-Harris 1988). La prise de risque mortel constitue une séquence d'actes sur ce point exemplaire: ainsi, par exemple, les adolescents héroïnomanes s'injectaient-ils

quelquefois sciemment une overdose pour la reprendre immédiatement dans la seringue (jeu de la “tirette”): “je me tue, je me ramène à la vie”: on prend ainsi le risque de se tuer pour se donner naissance, pour en quelque sorte “réinitialiser” son existence. Et le franchissement, en mobylette, la nuit, d’un feu rouge, sans lumière ni casque, est un scénario figurativement différent mais syntaxiquement identique.¹ Dans l’un et l’autre cas, le “coup de fouet” de la réinitialisation aura un effet de courte durée et la répétition, en escalade (même en linguistique la synonymie est impossible!), imposera sa loi. Et bien des tentatives de suicide chez l’adolescent nous apparaissent-elles comme la conséquence du désespoir de l’auto-engendrement réalisé: si présider définitivement à sa naissance est impossible, en revanche, mettre fin à son existence est à la portée de tout un chacun.

4. Une autre voie

Fort heureusement, on le sait bien, l’immense majorité des adolescents ne se tourne pas vers l’acte à haut risque pour tenter une impossible résolution de la programmation fantasmatique.²

Il est très frappant que constater, aujourd’hui plus que jamais, que l’adolescence est bien une période de redécouverte de l’écriture sous toutes ses formes, y compris celles que permettent les nouvelles technologies de communication. Ainsi, pour commencer, le goût de se donner une signature, cet idéogramme exprimant toute l’identité, acte d’énonciation quasi sans énoncé qui peut revêtir la forme murale des tags. Passion, aussi, pour l’épistolaire dans ses mutations actuelles: SMS, courriels, interventions dans les forums sur Internet, etc. Et toujours ce goût de l’écrit intime, qui explose littéralement dans la création des blogs, nouveau genre qui permet d’ailleurs de cumuler autobiographie et épistolaire en mobilisant une communication multimédia.

Il existe donc, fort heureusement, un autre parcours possible, une autre *conversion* sémiotique du fantasme d’auto-engendrement, radicalement distincte. C’est bien là que nous plaçons ce phénomène de l’intérêt assez subit et original que porte l’adolescent à l’écriture, ou, pour être plus précis, au discours autobiographique. C’est la découverte de la fonction « miroir » de l’écriture qui fascine l’adolescent, non le miroir bien réel qui lui renvoie les éruptions acnéiques démoralisantes, mais le miroir symbo-

lique qui, comme dans les contes, est un témoin narcissique fiable, euphoriquement déformant.

Si l'on y regarde de plus près, le discours auto-biographique permet à l'adolescent(e) de réaliser symboliquement ce que lui dicte dangereusement le fantasme, si d'aventure s'impose le passage à l'acte: l'énonciateur adolescent, dans l'écrit intime (ou l'oral intime de la si longue conversation téléphonique avec un pair proche³) projette un "je" dont il est le responsable de l'existence, qui est lui-même mais aussi, comme nous l'a appris Rimbaud, un « autre ». Belle dérive symbolique du fantasme accompagnée, cette fois-ci, d'apaisement et de résolution.

Aussi pensons-nous depuis longtemps que l'ouverture à l'écriture, pour les adolescents en difficulté de quête d'identité, dans la tentation de l'acte, est une voie de remarquable résolution, ainsi dans les ateliers d'écriture qui leur sont proposés ici ou là, dans les quartiers difficiles, les foyers, voire l'univers carcéral.⁴

Mais il est aussi patent qu'entre la voie de la conversion sémiotique du fantasme dans le passage à l'acte plein de risques (se mettre en échec scolaire fait partie de cet itinéraire de conversion) et celle qui conduit du fantasme aux pratiques d'écriture existent de multiples formes intermédiaires, transitoires, l'adolescent ayant le génie de se situer, souvent, dans l'entre-deux indécidable.

Ainsi le corps peut-il être lui-même considéré comme une surface d'inscription: tatouages, piercings, scarifications, traces, signes réversibles ou indélébiles seraient les indices d'une écriture qui impose au corps la marque d'une maîtrise, voire d'un asservissement: faire sien ce corps qui mue et quitte l'ancienne enveloppe infantile. Illusion du contrôle d'un corps qui tente de s'échapper de toutes parts.

De l'écriture sur soi au *tag*, il n'y a qu'un pas: le tag est bien toujours, nous l'indiquions, une forme de signature répétée en frises – signe logogrammique que recherche typiquement l'adolescent et qui le dirait tout entier: le tag conjoint l'acte symbolique d'écriture et l'acte presque toujours délictueux, risqué, voire dangereux; le tag ne dit rien du monde ni même du sujet: c'est la trace d'une quête de pure énonciation. Du tag éventuellement rageur, il est aisé de passer à l'*injure*, "taggage verbal" de l'autre, justement *acte de langage* (qui peut aussi constituer un délit) conjoignant magnifiquement le *dire* et l'*agir*.

Ces formes sémiotiques intermédiaires (et tout particulièrement les pratiques d’“écriture” sur son propre corps) sont autant d’exemples du phénomène – pour nous central à l’adolescence – de conversion sémiotique d’une parole souvent impossible en acte d’ostension à l’aide du corps: ponctuation emphatique du piercing, qui souligne les entrées sensorielles du corps (oreilles, yeux, nez, lèvres,...) mais aussi souvent le nombril, par où la vie fœtale entra.

Pour rester dans la sphère du langage et l’illustrer quelque peu, si le linguiste est sensible à l’extrême rareté des moyens d’expression linguistique des affects dans les sociolectes des jeunes – et tout particulièrement en Français Contemporain des Cités (cf. Goudaillier 2001) – il est attentif, a contrario, à la créativité langagière des adolescents, cette créativité étant pour nous un phénomène, là encore, de conversion ultime du fantasme d’auto-engendrement: le sujet qui s’est symboliquement fait lui-même (le self-made man n’est-il pas toujours le grand mythe américain, adolescent, de la réussite?) se doit de se forger un idiome qui dit son identité irréductible aux signifiants de la langue adulte.

Et l’accélération de la mutation corporelle, de la croissance peut se lire convertie dans une extrême accélération du temps de la langue, de la *diachronie*: il faut des décennies, voire un bon siècle pour qu’un mot entre dans la langue, y vive et en sorte pour rejoindre le cimetière des mots, les dictionnaires historiques. Une trouvaille adolescente une verlanisation (dégage de là! > gagedédale!), une expression soumise à l’apocope (“un demtroche” < “démoulé trop chaud”), une métaphore (une fille attractive est peut-être encore, à l’heure où nous écrivons, un “saumon”; on connaissait un “thon”, tout juste le contraire) ont une durée de vie très limitée, au grand désespoir des adultes, condamnés à ne réutiliser qu’une langue adolescente déjà morte!

5. Pour conclure

En résumé, tout se passe donc comme si l’adolescent, confronté à la fois à la révolution corporelle de la puberté et à la transformation psychique du “pubertaire”, vivait aussi et nécessairement une importante perturbation de la production de signification verbale et non verbale supposant des déséquilibres, des lacunes, des impossibilités, des court-circuits, des processus de compensation et de conversion.

Et ce sont bien ces conversions subtiles, inattendues, du corps et du psychisme qu'il faut retrouver dans les comportements et les discours des adolescents au terme du parcours sémiotique souvent inédit, complexe, de leur engendrement.

Cette recherche d'une modélisation comportementale – trop rapidement esquissée – appuyée, de manière forte, sur la psychanalyse, doit à l'évidence servir la lecture, la compréhension des productions sémiotiques multiformes des adolescents. Cette quête prend un sens particulier dans une actualité politique et médiatique souvent entachée de démission sémiotique: à quoi bon perdre son temps à tenter de comprendre l'insupportable, donc l'incompréhensible, ainsi la violence considérée a priori comme dépourvue de sens? Alors qu'il est si simple et rapide et efficace d'organiser répression et punition, en sacrifiant la quête du sens?

Moyennant quoi les adultes se mettent dans l'impossibilité de penser, de concevoir et de mettre en œuvre tant la *prévention*, par exemple, des conduites à risques que la juste *sanction* des actes transgressifs.

Notre psychosémiotique, modestement, entend lutter efficacement contre cette démission sémiotique et rappeler au monde des adultes ce devoir imprescriptible de réception et de lecture des faits, gestes et discours adolescents. Ce devoir de sémiotisation est la condition même de leur admission et intégration dans l'univers de l'adultité.

Annexe

Voici la représentation du *modèle génératif* rendant compte de l'engendrement des significations non verbales et verbales adolescentes, qui met en relief la grande tripartition des "choix sémiotiques": du côté de l'acte, voire du passage à l'acte (tentative de réalisation des fantasmes); du côté, au contraire, de la réalisation symbolique, avec la création des langages adolescents, le goût du discours épistolaire et autobiographique; entre les deux, mêlant l'agir et le dire, la pratique si fréquente de l'injure, y compris dans sa fonction ludique.

Notes

1. Chacun garde en mémoire la séquence du film de N. Ray (avec James Dean), *La fureur de vivre*, où un groupe d'adolescents conduisent des voi-

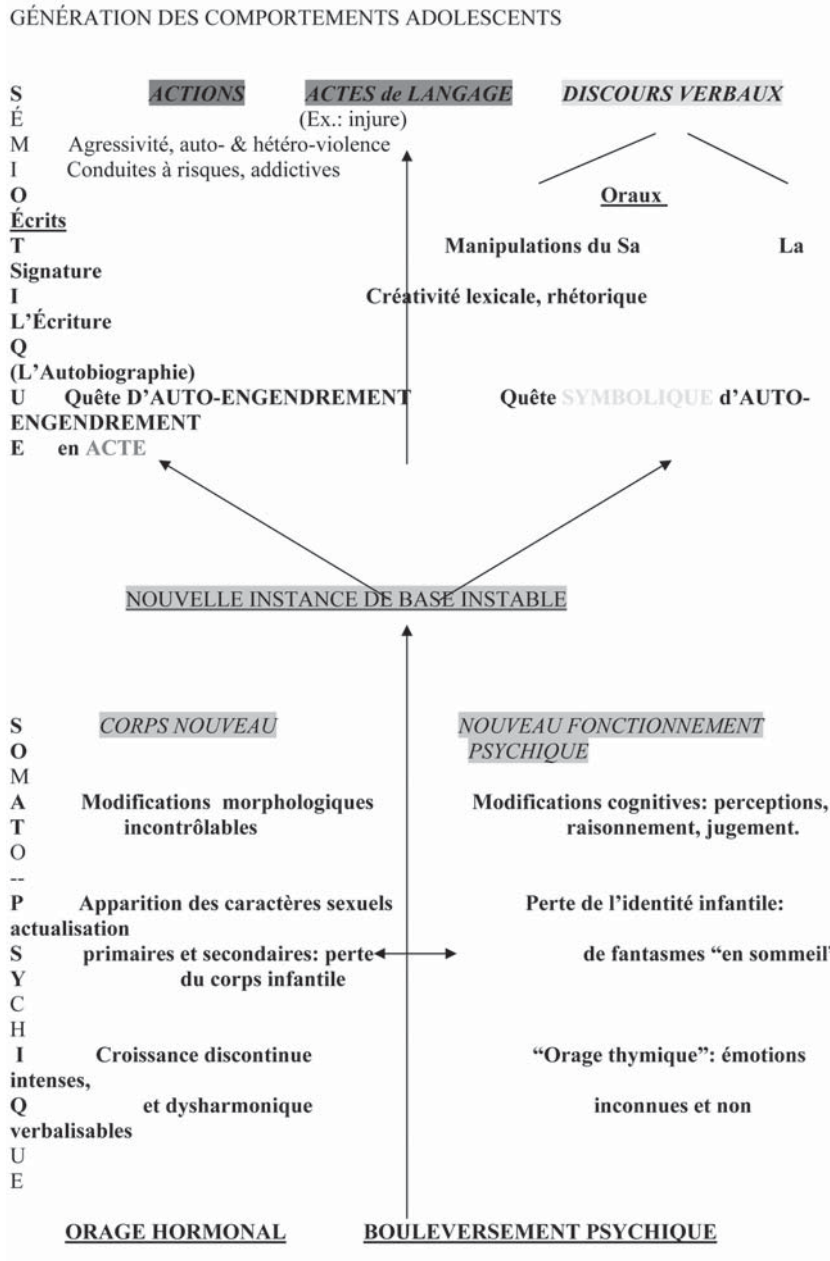

Diagramme 1.

tures “empruntées” vers un ravin en s'éjectant au dernier moment. L'un d'eux ne peut y parvenir.

2. Il n'est pas inutile de rappeler ici que 80% des adolescents vivent bien leur adolescence, et qu'un très petit nombre, heureusement, présente un tableau réellement psychopathologique.
3. Signe des temps, les adolescents ont abandonné cette pratique de la communication téléphonique interminable pour se tourner vers la communication écrite des SMS ou des interventions via Internet.
4. Nous avons pu mener une réflexion et recueillir une expérience sur les ateliers d'écriture destinés aux adolescents, y compris dans les établissements scolaires, grâce à la collaboration d'écrivains profondément engagés dans cette démarche: François Bon, Jacques Séréna, Valère Novarina.

Erasing the signs of the Other: Zionism and the Palestinians

In a passage in Conrad's *Heart of Darkness* the protagonist, Marlow, recalls his early childhood passion for maps, tracing it back to his vocation for travel: "At that time there were many blank spaces on the earth, and when I saw one that looked particularly inviting on a map (but they all looked like that) I would put my finger on it and say, When I grow up I will go there." (Conrad 1998: 142)

This paradigmatic image pictures iconically the way colonial discourse forms. Colonial discourse would provide the European imperialistic expansion with an ideological and moral legitimation through the myth of the civilizing mission, a myth all the more necessary inasmuch as, in Marlow's words again, "the conquest of the earth ... is not a pretty thing ... What redeems is the idea only" (ibid.: 141–142). Here it is clearly shown how, in order to allow European conquerors to take possession of those lands and "make them exist" through an act of "baptism" (Calefato 2006: 14), it was first necessary to construe them as "blank spaces" and erase the signs inscribed on them by the peoples inhabiting them. Here I shall analyze how signs of the Other were erased in a quite peculiar form of colonialism: Zionism.

That Zionism is a form of colonialism has always been maintained by its main victims, the Palestinians. For the past twenty years, though, this assertion has been confirmed by a new generation of Israeli scholars widely known as "new historians" (Shlaim 1995). Despite that, even now the hegemonic discourse among Western intellectuals and public opinion refuses – sometimes rabidly – to equate Zionism with colonialism. An exemplary epitome of this hegemonic discourse and of the grand narrative which constitutes the Zionist mythology is Jacob Tsur's *L'épopée du sionisme* (the title itself is quite eloquent). Tsur states that not only is Zionism "the Jewish people's movement of national liberation" and that "it constitutes an inte-

gral part of the wider historic process of the emancipation of the nations” (Tsur 1977: 9), but even that “theirs was one of the first rebellions staged against Western imperialism” (14).

Zionism’s colonialistic character has been quite evident ever since the beginning. The “back to Zion” idea indeed was primarily conceived in the chancelleries of Europe’s Great Powers. Napoléon Bonaparte was the first to propose, during his Egyptian Campaign, to settle Jews in Palestine (Weinstock 1970: 39), a project which would later be revived by Alphonse Lamartine and by Ernest Laharanne, Napoleon III’s personal assistant. In the mid-nineteenth century the “back to Zion” idea gained some following also in Britain, where its main proponents were George Eliot and leading politicians such as Henry Palmerston, Benjamin Disraeli and Anthony Ashley Cooper, Earl of Shaftesbury, who in 1854 coined the famous slogan “A people without a land for a land without a people”.

In Eastern Europe’s Jewish communities the foundations of Jewish nationalism were laid by two rabbis, Yehuda Alkalai from Bosnia (1798–1878) and Zvi Hirsch Kalischer from Lithuania (1795–1874). Inspired by the national revival of the Balkan peoples, Alkalai and Kalischer conceived the idea – by then quite weird to most of the Jews themselves – that Jewry was a nation, and that in order to anticipate the Messiah’s coming they had to buy land in Palestine and settle there *en masse*. However, an accomplished elaboration of Jewish nationalism had to wait until the 1860s, when a German journalist, Moses Hess (1812–1875), wrote the pamphlets *Rome and Jerusalem: The Last National Question* and *A Colonization Project for the Holy Land*. In Hess’s opinion, hatred of the Jews would prevent their assimilation by European societies, thus the “Jewish question” had to be faced as an unsolved national question, whose only solution would be the establishment of a Jewish State in the Middle East. Such a state – he argued – would prove useful to the European powers, favouring their interests and helping to spread “civilization” in the “barbarous” East. Already in these first theorists’ thinking, then, the Jewish “national revival” was considered viable only through a form of colonization overseas, seen as part and parcel of Europe’s imperial expansion.

The ideas exposed by these early Zionists remained without consequence, however, until the pressure of Russian antisemitism gave them new life. Following the assassination of Alexander II in 1881, rumours spread that Russian Jews were responsible for the killing, fuelling a whole

series of bloody pogroms that plagued many Russian Jewish communities and ended up in atrocious massacres. The czarist authorities encouraged this bloodshed, using Jews as scapegoats for the appalling conditions of Russian masses. Shocked by these tragic events, the Russian surgeon Leib Pinsker wrote in 1882 the pamphlet *Self-emancipation: A Warning to His Folk by a Russian Jew*, wherein he invited his coreligionists to colonize a “Promised Land” and rebuild their nation there. If most of the Russian Jews preferred to emigrate to America or to the British dominions, that same year hundreds of them took seriously Pinsker’s warning and moved to Palestine, where they bought some land and established the first Zionist settlements. Zionism would have probably remained a minority movement of no consequence had it not been for the Austrian journalist Theodor Herzl. Herzl wrote in 1896 the pamphlet *Der Judenstaat*, where he appropriated the idea that Jews were a nation and proposed as a solution to the problem of antisemitism that all Israelites moved to an overseas territory and established there a State of the Jews. From a theoretical point of view Herzl simply repeated Hess’s ideas; the novelty of his contribution was that he elaborated a detailed political strategy based on the *realpolitik* of his time to implement his plans. Herzl saw his project as part and parcel of Europe’s colonial expansion, and he thought that the European Powers would have all the best reasons to favour the establishment of such a State in the Middle East: “We should there form a portion of the rampart of Europe against Asia, an outpost of civilization as opposed to barbarism” (Herzl 1936: 30). The first settlers to be sent there would be members of the lower classes, as the “poorest strata alone form the strongest human material for acquiring a land” (ibid.: 57), and the masses would be mobilized by the myth of the “return to Zion”. As Herzl wrote in his diary: “If my conception is not translated into reality, at least out of my activity can come a novel. Title: the promised land” (Herzl 1960, vol. I: 3). In 1897 Herzl gathered in Basle the first Zionist Congress, which founded the World Zionist Organization (WZO) and took as its aim the establishment of a Jewish settlement in Palestine. Herzl then began lobbying the European governments to get their support for his project.

In those years, Zionism appropriated Lord Shaftesbury’s slogan “a people without a land for a land without a people”. Reality, however, was quite different. Palestine at the time was inhabited by more than half a million Arabs (mostly Sunni Muslims, but there were also Christian, Jewish

and Druze minorities), 4/5 of whom were peasants living in small villages. After 1858, when an Ottoman reform had introduced private property of land, capitalistic relations of production had gradually taken over the ancient semifeudal regime of production, turning many tenant *fellahin* into hired labourers. Towards the end of the nineteenth century the opening up to foreign markets had brought about an exponential growth of trade, so that in a short span of time subsistence agriculture gave way to export-oriented production, and the increase of demand in turn fuelled the agricultural production and the expansion of cultivated land. Thus, besides developing as a major crossroads for the trade of raw materials coming from Asia, Palestine became a crop supplier for Europe. Far from being an “a thinly populated province of the Ottoman Empire, sadly neglected and backward” (Tsur 1977: 31), as Tsur depicted it drawing on the traditional orientalist stereotypes, Palestine was a country in full economic flourishing, with a developing commercial and agrarian bourgeoisie. In the Arab regions of the Ottoman Empire those developments were at the origin of an Arab cultural and political renaissance which paved the way for the rising of early Arab nationalism (Pappé 2004: 14–49).

Herzl was not unaware that Palestine was inhabited by Arabs. He simply considered them irrelevant, in the same way as European conquerors in Africa saw that continent as made up of “blank spaces”. In order to write the epic of the Jews’ return to the Promised Land, it was first necessary to erase the Palestinian Arabs, to ignore deliberately their presence, so that that land which had been presented as empty could really become so. In his personal diaries Herzl explicitly wrote that Zionism could not succeed without the dispossession and expulsion of the local population: they had to “expropriate gently ... spirit the penniless population across the border by procuring employment for it in the transit country, while denying it any employment in our country” (Herzl 1960, vol. I: 88).

Several Zionist settlers did indeed arrive in Palestine with the conviction that it was an empty land (Morris 2001: 42–43), and for many of them the discovery that the truth was rather different had a shocking effect. Soon some exponents of the so-called “culturalist” current sharply criticized this attitude (this movement was the only one not aimed at establishing a State but rather at the revival of a “cultural homeland” for Jews). One of them, Ascher Ginzburg, debunked the orientalist image of Palestine propagated by the likes of Herzl: “We abroad are used to believing that Erez Yisrael is

now almost totally desolate, a desert that is not sowed ... But in truth that is not the case. Throughout the country it is difficult to find fields that are not sowed. Only sandy dunes and stony mountains are not cultivated.” (Ginzburg, quoted in Morris 2001: 42)

But such warnings could not be accepted by other Zionists, for they would have had to disclaim the whole premises of their project, which rested – in Edward Said’s words – on the erasing of a concrete reality in favour of a future aspiration (Said 1992: 9). Hence, ever since the beginning the relations between the early Zionist settlers and the local population took the form of a power relation between colonizers and colonized. Frantz Fanon explained, in his *Les Damnés de la terre*, that the colonial world is “un monde manichéiste” in which “le colon fait du colonisé une quintessence du mal” (Fanon 1976: 10). And indeed, in the diaries and letters of the early settlers Arabs are described as “a people in the process of degeneration” (Ginzburg, in Morris 2001: 43), a “hypocritical and false race” (ibid.), a “semi-savage people, which has extremely primitive concepts” (ibid.). “Parfois” – Fanon continued – “ce manichéisme va jusqu’au bout de sa logique et déshumanise le colonisé. A proprement parler, il l’animalise. Et, de fait, le langage du colon quand il parle du colonisé, est un langage zoologique” (Fanon 1976: 11). In the first Zionist settlements indeed the colonisers used to call Arab hired labourers “mules” (Morris 2001: 48), and Ginzburg remarked how the settlers’ attitude towards the tenants was “exactly the same as towards their animals” (quoted in Morris 2001: 48). The orientalist prejudice was mirrored also by their representations of the country; Herzl, for example, described Jerusalem as a heap of “musty deposits of two thousand years of *inhumanity*, intolerance and uncleanness” (Herzl 1960, vol. II: 745, my emphasis), and Chaim Weizmann, who succeeded him as leader of the WZO, depicted the country as come “one of the most neglected corners of the miserably neglected Turkish Empire” (quoted in Said 1992: 85).

As Said remarked (2003: 307), in the Zionist version of Orientalism there takes place a bifurcation of the myth of a consistent, static “Orient”, such that European Jews, once considered of that same “Orient”, now construed themselves as assimilated to the “West”, assuming its position of dominant epistemological subject and leaving to the Arabs the role of “Orientals”, incapable of development and a passive object of knowledge and dominance. Construing the Arabs as uncivilized barbarians and Pales-

tine as a desert waiting for redemption allowed Zionist settlers to perceive themselves as the redeemers of the Land of Israel and the representatives of a superior civilization fully engaged in a civilizing mission. It is revealing that Tsur proudly vindicates this assumption, maintaining that the settlers “bringing with them experience and knowledge acquired during their long generations of exile in Europe, dreamed of making these benefits accessible to their neighbors” (Tsur 1977: 86). In this perspective, as David J. Goldberg remarks, “the white man’s colonial burden and the Jewish mission coincide” (Goldberg 1996: 78).

An analysis of the material bases of colonization also confirms the colonialist character of the Zionist settlement. Gershon Shafir (1996) has shown how the peculiar features of Zionism were simply the result of the particular conditions of its development, and that there were no qualitative differences in comparison with other forms of colonialism. This evolution developed in three different stages. In the early settlements the colonists were not supported by any Power, and the only way for them to acquire land was by purchase. The Zionists’ goal was to install huge Jewish masses in the country, i.e. to establish a “pure settlement colony” (Shafir 1996: 86), a colonial pattern wherein the natives are excluded from the settlers’ society and the labour market. This pattern, however, soon had to be abandoned, as the early agricultural settlements proved economically inviable: the settlers’ enterprises were simply unable to compete with the Arabs, whose salaries were quite lower than those of Jewish immigrant labourers. Initially funded by Rothschild, the first period’s settlements evolved towards the “ethnic plantation colony” pattern (Shafir 1996: 84), wherein a numerically limited settlers’ population owns the land and employs a low-waged native workforce. The problem of these kinds of settlement was that they would never attract huge masses of colonists. A solution was found in circumventing the market through the creation of exclusively Jewish settlements run by a collective of colonists (*kibbutzim* and *moshavim*); these would create the conditions allowing masses of Jewish workers to immigrate to Palestine and gain access to a totally separate labour market which would be protected from the competition of Arab workers. This state of affairs was legitimized by the ideology of the Jewish “conquest of labour”. But such a pattern of colonization required huge funds: since 1909 the WZO had supplied them, in a sort of national pact where Jewish proletarians took the burden of doing the job of colonization while bourgeois

Zionists provided the funding and the diplomatic support. Such were the socio-economical bases of the intensive development of Zionist colonization, which after 1917 could take off thanks to the support of Britain, which meanwhile had laid its hands on the country.

Despite the separate development policy, however, *the pure settlement colony* pattern could not fully succeed, since only a part of the settlers were engaged in *kibbutzim*, and Jews remained a minority throughout the Mandate period. Hence the Arab workforce continued to be employed, at least partially, by Jewish enterprises until 1948. The result was an *ethnic plantation colony* whose aspiration was to evolve into a *pure settlement colony*. As a consequence, the Zionist leadership policy towards Palestinians wavered between ignoring them, thus negating their existence as a people, and considering them “natives” that at most could be recognized as subaltern partners. Here again Fanon’s words are illuminating: “Le peuple colonisé se trouve alors réduit à un ensemble d’individus qui ne tirent leur fondement que de la présence du colonisateur” (Fanon 1976: 215). Precisely this collective depersonalization was the Zionist policy towards Arab Palestinians. The 1917 Balfour Declaration, which rendered official British support to the establishment of a Jewish national home in Palestine, fully endorsed these premises, for it did not recognize any political rights of Palestinian Arabs, guaranteeing only the respect of their civil and religious rights. It is worth highlighting that the political dispossession of Palestinian Arabs went along with their complete linguistic erasure; in the Declaration they were even denied a name; by then 93% of the local population, they were defined as “the non-Jewish communities in Palestine” (Balfour 1928: 19). Several Zionist leaders’ official declarations imply such a depersonalization/erasure of Palestinian Arabs. In 1918 Chaim Weizmann stated that “the present state of affairs would necessarily tend towards the creation of an Arab Palestine *if there were an Arab people in Palestine*” (quoted in Said 1992: 27, my emphasis); Ber Borochov, one of the founders of Labour Zionism, wrote in 1906 that “Palestine’s native inhabitants do not constitute an independent economic and cultural type ... [they] are not one nation” (quoted in Goldberg 1996: 132). In the early Mandate years, though, since the settlers’ community was still far from being numerically relevant, the political attitude that prevailed in the Zionist leadership (at the epoch hegemonized by the so-called “General Zionists”) was that of negotiating with the official Palestinian leadership, but allowing them only a subaltern

status. Indeed, according to a witness, in the 1921 official meeting between Weizmann and Jerusalem's mayor, Musa Qasim al-Husayni, the president of the WZO spoke to the latter as "a conqueror handing to beaten foes the conditions of peace" (Morris 2001: 105). In the following years, however, things changed for the worse, following the considerable demographic strengthening of the settlers' community and the conquest of hegemony over the *yishuv* by Labour Zionists, who were the main advocates of Jewish exclusivism and who rejected direct negotiations with Palestinian Arabs in order not to recognize them as a national community. The very few (confidential) contacts between Labour Zionists and Palestinian notables took the form of sharply asymmetrical power relations, consisting mainly in the corruption of politicians and journalists so that the latter softened their hard stance towards Zionism. The Zionist Right's (the so-called "Revisionists") attitude towards Palestinians was based on the same premises. Its founder and leader Zeev Žabotinskij also espoused the civilizing mission: "We are going to Palestine first of all for our nation's sake, and secondly *to expunge systematically* any trace of the 'Oriental soul' still existing there" (quoted in Gresh 2004: 43, my translation and emphasis). However, he also acknowledged that in Palestine there existed another nationalist movement whose claims were legitimate, thus justifying the "moral superiority" of Zionist claims on the basis of racial theories (Goldberg 1996: 181). His conclusion was that Zionism would have to assert its claims with massive colonization and with the force of arms: "in blood and fire Judea will arise", was his movement's slogan.

Colonization, especially after the endorsement of the "conquest of labour" policy, implied the eviction of the Arab tenants living on the lands bought by the settlers, and consequently their transformation into hired labourers or their emigration to towns, where they would join the unskilled, low-waged workforce. Palestinian *fellahin* realised from the start that the Zionist endeavour would lead to their dispossession, and they immediately showed deep hostility towards the newcomers. In the 1920s the pro-Zionist policy of the British administration and the arrival of tens of thousands of new settlers put in jeopardy the landless *fellahin* (about 30% of the whole). This situation sparked a whole series of peasant uprisings (in 1920, 1921, 1929, 1933 and most of all in 1936–39) whose political and economic goals were totally silenced by the Zionist leadership, which in public tended to minimize the scope of the revolts and to ascribe

them to religious fanaticism, to the action of a handful of agitators or to a presumed innate irrationality of Palestinian peasantry. In Jacob Tsur's paradigmatic account their motive was "intractable hostility" and a "virulent anti-Zionism" (Tsur 1977: 54), and they were not deemed determined by any political or economic causes. In short, as in the tritest Orientalist tradition, Arabs were shown as irrational and prey to ancestral impulses. The process of erasing the signs of the Other passed through a systematic process of emptying his/her signs of all meaning.

The culmination of this process of erasure was the 1948 *Nakba*, the expulsion of 800,000 Palestinian Arabs by Zionist militias during the civil war and the First Arab-Israeli War (see Morris 2004; and Pappé 2004: 123–241). In blood and fire, the slogan "a land without a people for a people without a land" had become a reality.

In his 1882 lecture *Qu'est-ce qu'une nation?* Ernest Renan showed how all the factors that from Herder onwards had been proposed as the foundations of a nation – race, language, culture, religion, geography – were not by themselves either necessary or sufficient. On the contrary, he acknowledged that nations were something historical and dynamic, the output of the interaction between "la possession en commun d'un riche legs de souvenirs" (Renan 1882: 11) and "le consentement, le désir clairement exprimé de continuer la vie commune" (ibid.). Jews were not a nation in a cultural, linguistic or geographical sense; but the Zionist movement, elaborating the myth of the return of Jews from the Exile to the Promised Land, turned the Diaspora's vicissitudes and biblical events into the narrative of a nation, giving it material reality through colonization and British support. Anti-Jewish persecutions in Europe and the Shoah served to exhort many Jews, who otherwise would have never considered moving to Palestine, the "consentement" to become Zionists, and the long war of 1947–49 provided the new-born nation "le capital social sur lequel on assied une idée nationale": "un passé héroïque, des grands hommes, de la gloire". Palestine, in the Zionist mythology now sanctioned by the State's ideological apparatuses, was a desert that Jews had made blossom and brought back to History, in perfect accord with a classical colonialist tradition: "le colon fait l'histoire. Sa vie est une épopée, une odyssée. Il est le commencement absolu" (Fanon 1976: 17). The founding myths of the State of Israel fit pretty well Roland Barthes's definition of myth as "*parole dépolitisée ...*, [qui] ne nie pas les choses simplement, il les purifie, les innocente, les fonde

en nature et en éternité” (Barthes 1970: 217). All narratives are necessarily based on ellipsis, and the narration of a nation is no exception. As cleverly stated by Renan, “l’oubli ... et même l’erreur historique, sont un facteur essentiel de la création d’une nation” (Renan 1882: 4). Palestine became a palimpsest from which the previous narration had to be erased so that the myth of the return of the Jews to the Promised Land could be written. On the other side of the coin, it was denied that the expulsion of 800,000 Palestinian Arabs had ever taken place; their flight was attributed either to elusive orders from Arab leaders or to the population’s “spontaneous” will. The numerous massacres committed by Zionist armed groups were not to be talked about – the Deir Yassin massacre being the sole exception, since it had been perpetrated by the opposition militiamen. Part and parcel of erasing the signs (and the bodies) of the Other was the razing of about 370 Arab villages and of entire neighborhoods, so that on their ruins the settlements destined to lodge new Jewish immigrants could be built. The destruction of villages went along with a renaming of all Israeli-controlled Palestine’s toponyms: the country’s place names were “Judaized”. This process of erasing took place also in the legal system, especially in the two juridical pillars of the State of Israel: the Law of Return (1950) and the Law on Nationality (1952). The first granted citizenship to all Jews (and their consorts) who “returned” to Israel; the latter, which established the procedure to gain citizenship, defined the Palestinians still living within the country’s borders *a negativo*, as “those who are not included among the beneficiaries of the Law of Return”. In order to expropriate the land owned by Palestinians a complex juridical system was set up, wherein stood out the Law on Absentees’ Property (1950). This law stated that whoever had not registered in the course of the October-November 1948 census (i.e. almost all the refugees) was to be considered an “absentee”, whose land could be confiscated. If an “absentee” happened to return, he/she was to be considered a “clandestine”, and as such was liable to immediate expulsion. Yet some refugees remained within Israel’s frontiers. To prevent their return home a special oxymoronic definition was coined: they were labelled “*present* absentees”, thus allowing the army to prevent by force their return home and judicial authorities to confiscate their lands (Kimmerling-Migdal 2003: 172–173). Put under military rule until 1966, with their freedom of movement strictly limited, they were confined to reserved areas, in practice becoming “invisible”. Even today, although they number

more than a million, they are not recognized as a national minority. In short, Palestinians became the perturbing element, the stifling of which allowed the Jewish State to present itself as the legitimate result of the long struggle of a national liberation movement.

In his re-reading/actualization of Renan through the prism of psychoanalysis and deconstructionism, Homi Bhabha (1990a) has shown how those who have been marginalized or dispossessed by the narrative of the nation can reappear to disrupt its apparent solidity, creeping into the interstices which inevitably open on its surface. The illusion of having ultimately cancelled Palestinians from history fell apart in the mid-1960s, when the emergence of guerrilla organizations and the founding of the PLO marked their unexpected reappearance. Like Banquo's ghost, they had come back to disturb the sleep of the State that had dispossessed them.

After the 1967 War, when the conquest of the Gaza Strip and the West Bank put under Israeli control more than a million Palestinians, the Zionist leadership again had to face the old dilemma about what kind of colonial pattern to develop. The answer was a mixed one. In order to prevent the 1948 refugees from returning home (the dread of an influx of hordes of colonized has always been a traditional nightmare of colonizers: "cette démographie galopante, ces masses hystériques, ces visages d'où tout humanité a fui", wrote Fanon [1976: 11]) the Occupied Territories, apart from East Jerusalem, were not annexed, but transformed into a protected market to draw on low-waged workforce. The juridical regimes were differentiated: Israel remained a *pure settlement colony*; the Occupied Territories became an *ethnic plantation colony*. New colonizers, prompted by religious messianism, began to settle the newly-conquered lands. To continue ignoring the Palestinians was no longer possible. However blatantly Golda Meir could maintain that Palestinians "did not exist" (quoted in Hirst 2003: 392), her statements were disproved in those same years by the attacks and hijackings of the *fidā'iyyun*, whose faces masked with balaclava helmets or *kefiyah* embodied "the *unheimlich* terror ... of the Other" (Bhabha 1990b: 2); these opposed the materiality of their bodies to any renewed effort of foreclosing on them. The traditional Zionist policy of erasing the Other then took the form of moral delegitimation (the rhetoric on "terror") and of the effort to eliminate physically the PLO, first in the Gaza Strip, in the West Bank and in Jordan in the 1967–70 period and then in Lebanon in 1982. In the mid-1970s, having restored the colonial order in Gaza and the

West Bank, for a brief moment Israel could try again the strategy of co-opting a subaltern local leadership; but the project failed, and the Likud, in power from 1977 onwards, began using the settlers as an instrument to control the Occupied Territories. In 1987, when the Intifada began, the efforts to erase the Palestinians were once again frustrated. The young boys whose sole weapons were a sling and a stone were a sign that Israeli soldiers were able to interpret only through the “terrorist” stereotype, and the consequence was an incredibly violent repression wherein the self-evident asymmetry in power relations shocked the entire world and put seriously into crisis the traditional Zionist discourse. Many soldiers from the reserve refused to serve in the Occupied Territories, and gradually the State’s founding myths (and, in part, Zionism itself) ended up being put into question: it was in this new climate there emerged the “new historians”. Within the ruling class, however, the rethinking of Zionism was fairly limited. The Right clung to the refusal of any concession or negotiation, since it could think of the Other only as absent or non-human; in 1988, for instance, the Likud PM Yitzhak Shamir declared that Palestinians had to be “crushed as grasshoppers ... [and] smashed against the boulders and walls” (quoted in Hirst 2003: 78). But in 1992, Labour’s victory and the subsequent Oslo “peace process” seemed to mark the emergence of a new attitude, apparently based on dialogue and on the assumption of a point of view closer to that of the Palestinians. This new attitude, however, was not based on a rethinking of Zionism’s colonialistic premises, but simply on a strategic revision. Rabin, Peres and later Barak (and also Netanyahu, in his brief interlude) recognized Palestinians as partners in negotiations, but only on a subaltern status: their claims and rights were subordinated to the military, economic and political needs of Israel. Technically, there occurred only a shift from direct control of the Territories to indirect control (see Kimmerling-Migdal 2003: 355–397; Pappé 2004: 243 and following). The limits of such an attitude brutally came to light in 2000, when the Camp David Summit failed and a second Intifada, much bloodier than the previous one, burst out. Since then Barak, and then Sharon and Olmert, have turned again to the old strategy of erasing and dehumanizing the Other. In 2002 the IDF Chief of Staff General Moshe Ya’alon compared Palestinians to a cancer, adding that although “some will say it is necessary to amputate organs”, at the moment he was just “applying chemotherapy” (quoted in Kimmerling 2006: 165). That same year, MK Rafael Eitan pub-

licly described Palestinians as “cockroaches” (quoted in Hirst 2003: 71). Once again, Palestinians either are not human or they do not exist. “There is no one to talk to” has been the catchphrase of recent years, and the several “peace initiatives” which have been proposed have all been based on an asymmetrical definition of reciprocal relations which was even sharper than in the Oslo process. This policy of erasing the Other has also meant more and more ruthless repression. The Israeli governments have continued with a policy of intensive colonization of the Occupied Territories, and have added to that the construction of a wall that will enclose the Palestinian population in tiny *bantustans* planned to stop any aspiration to self-determination and to neutralize the “demographic threat” posed by their high birth-rate. But even these extreme forms of erasing must surrender before the materiality of the Other. An effective solution of the conflict will be possible only by a rethinking of the premises of Zionism, thus making it possible to think of the Other not in terms of absence, but in terms of his/her irreducible, material presence.

Ledia Dema

Fragmentation discursive et communication littéraire

Comme ce titre l'indique, je souhaite traiter de la communication littéraire et de quelques spécificités de son fonctionnement dans le cas des discours fragmentés. Il convient de souligner que le morcellement discursif peut être envisagé sous différentes perspectives, selon le domaine d'application que l'on adopte. Ainsi, peut-il être considéré comme un phénomène de communication: c'est le cas en narratologie, où le narrateur détient toute l'information et la fait circuler parmi les autres instances, mais la fragmentation discursive peut également faire partie d'un processus de coopération textuelle dans la construction de la signification globale du texte (en sémiotique). Dans ce cas, elle peut être vue comme une "stratégie" de coopération entre l'énonciateur et l'énonciataire d'une œuvre littéraire, car, "il se noue entre le lecteur et le texte une série de relations complexes, de stratégies singulières qui, le plus souvent modifient sensiblement la nature même de l'écrit originaire" (Eco 2004). Dans cette perspective, il s'agit d'examiner la signification de l'organisation discursive du texte dans son rapport à l'instance de l'énonciation. Je souligne que nous sommes ici dans la sémiologie de la signification. Le sens rentre dans un jeu de coopération entre les deux pôles énonciateurs, ce qui peut nous amener à concevoir l'hypothèse selon laquelle l'énonciataire est pris dans des opérations corrélatives à celles de l'énonciateur dans le processus de la construction discursive. Selon L. Panier auquel je me réfère, les textes "sont traversés par l'histoire de leur rédaction qui est tout à la fois celle de leur réception".

Il est clair que, dans mon optique, je dissocie l'instance de l'énonciation de celle de la communication. Si l'énonciation constitue "le cadre implicite et logiquement présumé par l'existence de l'énoncé", l'énonciateur est le destinataire implicite de l'énonciation; il est différent du narrateur, qui, lui, est un actant obtenu par la procédure de débrayage et installé explicitement dans le discours. De même, l'énonciataire correspond au destinataire

implicite de l'énonciation à la différence du narrataire qui est reconnaissable à l'intérieur de l'énoncé. Comme le soulignent les auteurs du DRTL, auxquels je me réfère, "ainsi compris, l'énonciataire n'est pas seulement le destinataire de la communication, mais aussi le sujet producteur du discours, la 'lecture' étant un acte de signifier au même titre que la production du discours proprement dite." En me situant du côté de la réception du texte, je m'interroge donc, sur la manière dont la structuration de l'œuvre (en l'occurrence sa forme morcelée qui présuppose une instance d'énonciation qui se diffracte) contient en germe des postures ou des places à occuper par le lecteur. On peut se demander quelle intensité de coopération postule alors cet éclatement du texte et quels effets de sens produit sur lui une forme, à première vue, chaotique. Enfin, on peut s'interroger sur la façon dont le texte convoque le lecteur à contribuer à l'émergence de la signification. Afin de répondre à ces questions, il faut tout d'abord avoir en vue quelques propriétés de ce que j'appelle un discours fragmenté et le lien qu'il entretient avec l'acte d'énonciation.

Tout texte est, en effet, le produit d'une énonciation qui constitue un acte de structuration du sens. Du moment où il manifeste une signification articulée et mise en discours, le texte témoigne d'un acte d'énonciation. Dans le cas des discours fragmentés, on assiste à une rupture de l'homogénéité énonciative, et par là, à une diffraction et à une position complexe de l'énonciateur. Ainsi, peut-on reconnaître certains observables de la fragmentation comme des collages, des simulacres de coupures, des passages en italiques, des changements de narrateur, des micro récits introduits au sein d'un récit global, des chapitres sans noms ou d'autres formes, plus ou moins complexes, qui créent une hétérogénéité énonciative. Toutes ces marques apparentes de la fragmentation du discours, qu'elles soient ou non manifestées d'un changement typographique, dans les macro éléments d'un discours (division en parties, chapitres ou d'autres formes plus atypiques) renvoient dans leur fonctionnement à des phénomènes de narration que l'on retrouve sous le nom de changements de points de vue, de mise en perspective, de focalisation etc. Or ces ruptures qui peuvent être de différents types: discours rapportés, formes de polyphonie, d'intertextualité, intrusions de morceaux de discours appartenant à une autre temporalité ou à un autre genre, etc., contribuent à construire des effets de sens les plus divers pour l'énonciataire. Elles forment des failles dans le discours et entraînent des changements de types de saisies pour le lecteur

par le montage des figures qu'elles suggèrent. Si l'on regarde du côté de la production, relevant des procédures de la textualisation, ces différents choix se rapportent à l'énonciateur et à l'organisation syntagmatique des programmes narratifs qu'il est obligé de faire, compte tenu des contraintes de la linéarisation des structures narratives. Notamment, la programmation textuelle (disposition des programmes narratifs) et la programmation temporelle (mise en ordre chronologique des divers programmes) relèvent d'une intervention de l'énonciateur et de sa compétence discursive. Elles laissent cependant une marge stratégique dans l'organisation du discours, grâce à l'élasticité de celui-ci. Dans le cas des discours éclatés qui m'intéressent, ces deux procédures, auxquelles on peut également rattacher l'anaphorisation, sont largement exploitées. Aussi bien la programmation textuelle que celle temporelle créent des effets de sens les plus divers chez le lecteur tout en l'interpellant, en le convoquant à établir des liens, à faire des interprétations entre les différents segments de texte qui se dessinent et les figures qu'ils mettent en place. Car ces ruptures créent en même temps une segmentation du texte par le découpage et leur mise en discours. Elles présupposent donc une division préalable du texte en segments ou entités provisoires. Parfois celles-ci constituent des entités à part entière, parfois elles se combinent entre elles en créant des entités plus larges entre lesquelles le lecteur est convoqué à établir des relations pour faire émerger un tout de signification ou discours, au sens donné à ce terme par Jacques Geninasca (1997). D'après cet auteur notamment, le discours est la prise en charge, la saisie/construction qu'effectue l'instance énonciative à partir de l'objet textuel. L'actualisation de certaines virtualités de cet objet et l'organisation discursive que l'énonciataire fait par l'acte de lecture permettent l'émergence d'un ensemble signifiant. Une telle conception du discours a aussi des répercussions sur la communication littéraire. Celle-ci "n'a rien à voir avec la transmission de messages, elle présuppose, en revanche, de la part de l'auteur-lecteur et du lecteur-auteur, l'exercice d'une stratégie de cohérence en même temps que l'expérience d'une cohésion perceptive, ou [...] sensible." La cohérence discursive proprement dite est, d'après Geninasca, davantage "une question d'interprétation qu'une question formelle." En d'autres termes, la signification d'un discours "est tout entière dans l'acte d'énonciation" (Geninasca 1997: 93-94), la composante de l'énonciation étant ici prise du côté du lecteur. Car, en effet, chaque lecture correspond à un parcours interprétatif aux étapes définies: procédure

de découpage; établissement de l'organisation textuelle; interprétation sémantique des relations spatiales; et enfin, instauration des relations propres à la structure discursive (ibid.: 15, 16). Ces considérations qui ont une validité sur le fonctionnement général du discours, sont également valables dans le cas des discours morcelés. Dans ceux-ci, l'effet d'énonciation produit est différent à cause de la fragmentation du discours. De ce fait, les différentes formes de découpages qui présupposent des formes d'agencement des figures constituent un dispositif relationnel préalable à toute interprétation, et fonctionnent comme des propositions de segmentation du tout en parties, d'une part, et d'articulation de ces parties, d'autre part. Tout en déroutant le lecteur, la fragmentation l'amène cependant à trouver une cohérence de sens, à adopter une saisie sémantique au détriment et/ou à côté d'une saisie molaire. Rappelons que la saisie molaire "s'arrête aux grandeurs constituées que définit un savoir associatif, socio-culturel ou idiolectal: figures, configurations, parcours figuratifs d'une sémiotique du monde naturel, concepts, ensembles conceptuels" et la saisie sémantique, "concerne les virtualités relationnelles des propriétés de ces grandeurs" (ibid.: 59). En d'autres termes, par les corrélations sémantiques que le lecteur doit établir à partir de la morphologie textuelle entre différents pôles d'énonciation et des ensembles de figures qu'ils mettent en place, on peut émettre l'hypothèse que la mise en discours des textes morcelés guide le lecteur vers un autre système de sens, non pas linéaire, mais textuel. Par exemple, cela peut amener le lecteur à voir dans les disjonctions et conjonctions successives que provoque la mise en discours des différents découpages un principe paradigmatique d'organisation narrative. Si nous partons du postulat qu'à chaque point du syntagme se profile un paradigme possible, nous pouvons reconnaître dans les différents découpages des projections de paradigmes dans le syntagme, mélangeant par conséquent différentes strates de temps, d'espaces, d'acteurs. Afin d'illustrer ces différents points, nous avons choisi d'analyser un extrait tiré d'un roman d'Ismail Kadaré, auteur contemporain albanais. Il s'agit de *Vie, jeu et mort* de Lul Mazrek (2002).

L'organisation narrative et temporelle de ce roman est intéressante. Des effets de sens sont produits par la mise en place de deux temporalités qui suggèrent une lecture du roman aussi bien diégétique que sémantique. Le découpage, lié à des positions énonciatives diverses, met en place trois formes principales de narration. À partir de l'actualisation des relations

entre ces trois entités, *Vie jeu et mort de Lul Mazrek* met en place l'histoire d'un procès, et par là, l'affrontement d'un certain nombre de Discours et de systèmes de valeurs. En effet, par le recours à des procédés d'intertextualité et des procès énonciatifs mis en scène, l'organisation du texte global permet de percevoir une dimension dialogique qui confronte des voix relevant de divers Discours: ainsi, peut-on reconnaître le Discours officiel du régime communiste, celui de la démocratie naissante et celui mythique, inscrit dans le savoir commun. La lecture paradigmatique à laquelle invite l'organisation textuelle, permet de mieux faire sortir l'incompatibilité de ces Discours.

Les trois formes principales de narration que l'on y trouve concernent tout d'abord un premier récit, chronologique, qui raconte l'existence d'un jeune homme, L. Mazrek, qui rêve de devenir acteur. Pris dans un laps de temps comprenant l'échec de son rêve (pas reçu au concours de l'École d'Art dramatique) et son nouveau statut de soldat (affecté à accomplir son service militaire dans les gardes-frontières), le récit principal raconte donc sa vie, entremêlé à celle d'une jeune fille, V. Morina, et à celle du ministre chargé de la Police secrète en Albanie communiste. Ce récit va prendre des allures d'énigme, de mystère, même si le titre indique déjà comment l'histoire se termine. Le titre raconte, en effet, en raccourci, l'existence de son héros. Ainsi, la fin du récit est dite avant que le récit lui-même ait commencé. Par conséquent, tout intérêt anecdotique est éliminé: le roman se joue dans le remplissage vie-mort et n'est qu'une inscription d'écart et d'énigmes qui ne détruisent pas la certitude de la boucle thématique qui enserré l'ensemble. L'attention est ainsi déplacée vers le deuxième terme de ce triptyque: le jeu. En effet, face à une situation "aussi criante que lourde de conséquences", devant laquelle l'État albanais, le Ministre, le Bureau politique et jusqu'au Guide suprême s'inquiètent: le nombre d'évasions ne cesse d'augmenter – on fera appel à l'acteur. Mazrek devra jouer un rôle de tragédie, son propre rôle, celui que lui-même ose à peine s'avouer. Il est placé au cœur du triangle entre les éléments duquel va se jouer le drame: l'homme, la femme et l'État. Ce dernier est perplexe: doit-il présenter l'évasion comme une faute pardonnable, ou, au contraire, doit-il montrer les dents? Le nœud est là: "Le tout est de savoir quel camp parviendra à décourager l'autre." Lequel gagnera: les fuyards ou l'État? De cette tension entre les deux, surgiront les moyens les plus absurdes, les plus inimaginables: radars, femmes, chiens, jusqu'à folie extrême: travestir le crime ... en

spectacle théâtral. Mais cela ne ressemble-il pas à du déjà vu? “Un cadavre qu’on traîne et des habitants qui le contemplant.” C’était déjà dans l’Iliade des Grecs. Exhiber les cadavres pour faire cesser les évasions, voilà la solution que l’État communiste trouve en réponse aux tentatives des jeunes de quitter le pays, et c’est ce rôle-là que Mazrek devra jouer, sous les yeux de la femme qu’il aime. Tel est le sujet, syntagmatiquement parlant, de ce premier récit.

Or ces crimes travestis en spectacle théâtral, ne vont être élucidés que grâce à un deuxième récit, imbriqué au premier. Logiquement postérieur au programme narratif principal que nous venons de voir, – il raconte le procès qui a lieu dix ans après –, ce deuxième récit n’apparaît pourtant pas dans la même ligne chronologique que le premier. En effet, le roman oppose clairement des espaces de temps disjoints: celui “d’avant” la chute de la dictature auquel appartiennent la plupart des événements du récit principal, répartis en treize chapitres intitulés et celui “d’après” la chute du système auquel se rapportent les “extraits d’instruction ultérieure”, introduits de façon non régulière, mais au fur et à mesure que l’intrigue principale avance. Ces morceaux rompent la chronologie du récit global en introduisant des ruptures dans la narration. La programmation temporelle qui dispose les divers programmes narratifs sur la ligne temporelle selon la catégorie antériorité/postériorité n’est pas suivie ici car nous n’avons pas une représentation chronologique de l’organisation narrative. En ce qui concerne la relation entre les deux récits, il est important de souligner le rôle de sanction que le second joue par rapport au premier en termes de schéma narratif. Ce récit sanctionne les épreuves qui ont lieu dans le récit principal en les qualifiant notamment de “crime contre l’humanité”.

Ensuite, de par les nouveaux éléments qu’il apporte, il joue un rôle déterminant à l’élucidation de l’énigme pour le lecteur. Ce deuxième récit, introduit comme nous l’avons dit plus haut au fur et à mesure que l’intrigue avance, entretient la curiosité, ralentit le rythme, et apporte des témoignages nécessaires à la compréhension du premier. À cause des ruptures introduites par les extraits de l’instruction ultérieure, l’intrigue elle-même gagne en épaisseur. Nous pouvons reconnaître ici le principe du code herméneutique dont parle Barthes (1974). Selon lui, le code herméneutique “doit disposer dans le flux du discours des retards (chicanes, arrêts, dévoitements); sa structure est essentiellement réactive, car il oppose à l’avancée inéluctable du langage un jeu échelonné d’arrêts: c’est, entre la question et

la réponse, tout un espace dilatoire, dont l’emblème pourrait être la ‘réticence’, cette figure rhétorique qui interrompt la phrase, la suspend et la dévie.)” Libérés de la pure succession chronologique qui aurait dû voir se succéder l’ “après” à l’ “avant”, les événements sont donc rapprochés différemment. La valeur du roman réside notamment dans la manière suivant laquelle s’assemble en sa totalité le matériau des événements. Une combinatoire s’opère qui détruit la chronologie de la fiction. En ce qui concerne la narration de ces deux premiers récits, nous pouvons souligner quelques différences: le premier récit est fait dans une narration ultérieure par un narrateur hétérodiégétique (cf. terminologie définie par Génette). Racontant à la troisième personne, il prend en charge ouvertement presque l’ensemble du récit. En revanche, les “extraits d’instruction ultérieure” d’où le narrateur principal est absent, apparaissent comme des récits à la première personne, assumés directement par les actants eux-mêmes. Dans le roman, ils apparaissent notamment dans les chapitres IV, VI, VII, VIII, XII. Ces passages sont notés en italiques et sont clairement indiqués comme émanant de l’instruction.

Une troisième forme apparaît au chapitre IX qui occupe une place à part. Constitué lui-même de trois parties intitulées: Le chœur des ombres, Hector, Komos: Pour une lamentation commune avec les touristes. Ce fragment est cependant singulier et n’apparaît qu’une seule fois dans le roman. Il est clair qu’il appartient à une autre temporalité que celle diégétique du récit principal. On peut attribuer ces fragments à un autre énonciateur, délégué, qui appartient à un récit différent: celui de l’Iliade. Ce n’est pas une citation mais un extrait de mythe qui s’introduit et fait partie de la structure discursive du récit global. On y trouve l’utilisation de la première personne du pluriel (Nous-les ombres) et la première personne du singulier (Je-Hector). On ne peut cependant que s’interroger sur le statut de ces éléments figuratifs qui appartiennent à un discours mythique. À quel titre sont-ils convoqués et quel type de rapport entretient ce discours avec le reste du récit? En effet, une deuxième temporalité se profile si l’on tient compte du rapprochement dans le texte de deux blocs discursifs appartenant aux extrémités de l’axe temporel: l’Antiquité; chapitre IX, et les temps modernes, ceux-ci étant divisés en deux périodes avec un intervalle de dix ans au milieu. Cette forme d’intertextualité que constitue le chapitre IX, et qui consiste dans la convocation d’un récit mythique au sein d’un autre récit, contribue à construire donc un autre type de temporel-

lité qui n'est plus une opposition avant vs après mais passé vs présent. Elle permet en même temps une saisie sémantique du discours. En effet, tout au long du récit se fait sentir en filigrane une superposition parfois partielle, parfois complète de deux histoires: celle du récit principal et une autre, qui relève du mythe et qui est inscrite dans le savoir commun ou l'Encyclopédie dont parle Eco. Si l'on s'interroge sur le type de relation qu'on peut établir entre ces deux récits, on peut constater que sur le plan figuratif, une certaine relation de "continuité" et d'analogie est supposée par le Discours officiel vis-à-vis du récit principal. Continuité de l'espace: dans le texte, Butrint, lieu du récit principal ne serait "rien autre qu'une reproduction de Troie." Continuité également des acteurs: "ses tout premiers habitants avaient été des Troyens en fuite: Andromaque, par exemple, la femme d'Hector, parmi des centaines d'autres." Et enfin, une analogie de l'action elle-même: un cadavre qu'on traîne et des habitants qui le contemplent. Or cette prétendue relation de similitude qui légitimerait le programme narratif du récit premier: travestir le crime en spectacle théâtral au nom d'une "tradition" qui remonterait depuis l'Antiquité, est par deux fois niée: d'abord dans l'extrait de l'instruction ultérieure. Ensuite, par le chœur des ombres et Hector. Sous forme d'un témoignage directement assumé, l'opération de dénégation porte sur le statut attribué à tort par le Discours officiel aux figures du récit mythique: "Nous pouvons être tout ce que vous voulez, sauf une chose: celle que vous imaginez. Nous n'avons jamais quitté Troie. Vous nous prenez pour des Troyens en fuite? Jamais il n'y en eut." À Hector ensuite de démentir à son tour et de rétablir la vérité en utilisant la première personne.

On peut retenir que la convocation d'une autre temporalité hétérogène à celle du récit principal et de l'Iliade comme figure de valeur par le Discours officiel cherche à avoir une valeur de légitimation visant à le placer dans une continuité mythique qui rendrait légitime sa ligne d'action. Or, la convocation de cette même figure par l'énonciateur global produit l'effet l'inverse: une rupture et toute négation d'une quelconque continuité.

En conclusion de notre analyse, on peut dire que l'organisation discursive du récit global, dépendante comme on vient de le voir, de la corrélation établie entre ces trois configurations par l'acte énonciatif: d'une part, celle chronologique racontant l'histoire de L. Mazrek, d'autre part, celle fragmentée racontant le procès des faits qui ont lieu dans ce récit principal, enfin une configuration singulière, faite d'une mise en scène

d'instances énonciatives appartenant à un récit mythique, permet de faire dialoguer trois Discours: celui officiel du communisme, celui de la démocratie naissante et celui mythique, ancré dans le savoir commun. On ne peut que constater que le concours des voix s'installe ici sous le signe de la discordance. Il se développe dans le sens de l'exclusion, par disqualification de l'un des discours (celui officiel du communisme). De l'autre côté, s'agissant cette fois non de jugement mais de reconnaissance, car il n'est toutefois pas d'objet de valeur sans un acte de reconnaissance et de valorisation, une stèle commémorative où est inscrit: La Patrie affligée à ses filles et fils infortunées se rajoute au kommos pour une lamentation commune intemporelle réunissant ainsi le discours mythique et celui de la démocratie naissante.

La signification est, par définition, relationnelle. Aussi ai-je essayé d'en établir quelques-unes, assez au moins, je l'espère, pour comprendre que, face aux tentatives d'altération des mythes, mémoire commune à toute l'humanité, aux déformations que l'humanité fait subir à l'histoire et qui témoignent des mensonges dont le régime communiste s'est servi comme alibi pour justifier ses crimes, la voix de la vérité se fait entendre. Venant de la profondeur des siècles, elle ne résonne que plus fort plus. En conclusion, nous pouvons affirmer encore une fois que la fragmentation discursive, loin d'être uniquement un phénomène de communication, crée des entités de discours capables de faire émerger une cohérence de sens.

Rhétorique de l'image dans le discours scientifique

1. Introduction

L'enquête sur l'image scientifique me semble très décisive aujourd'hui pour ceux qui visent à se mesurer à des enjeux théoriques et méthodologiques tels l'étude des pratiques productives des textes. La sémiotique des images de tradition greimassienne s'est passée pour un long moment de l'analyse de la *production des textes* pour analyser, en revanche, *l'image en tant que texte*, c.-à-d. en tant que *système* de relations chromatiques, eidétiques et topologiques. La sémiotique greimassienne ne prenant pas en compte la technique de production de l'image, voire le médium et donc le *support* des formes, a étudié les textes photographiques sans faire trop de différences par rapport aux textes picturaux (voir Fontanille 2004; et Basso Fossali & Dondero 2006). Dans les dernières années la sémiotique de tradition gréimassienne a dépassé cette approche et a commencé à enraciner l'analyse des images dans leur contexte et dans leur histoire de production. En effet, pour analyser les images scientifiques on doit forcément partir de leur situation de production et de la diachronie de leur genèse. Les images dans le discours scientifique doivent être étudiées à l'intérieur d'une chaîne de transformations qui vise à construire, étape après étape, une référence. Pour étudier les images scientifiques il serait nécessaire, pour nous les sémioticiens, de suivre toute la chaîne de construction du processus à détecter, comme le font les anthropologues des sciences dans les laboratoires. Comme l'affirme Latour (2001: 78): "La connaissance ce n'est pas explorer, mais *pouvoir revenir sur ses pas* en suivant le chemin que l'on vient de baliser."

De plus, dans le cas de l'image scientifique il est nécessaire de prendre en compte pas seulement la technique et l'histoire de la production, mais aussi les objectifs et les pratiques d'investigation laboratoriale de la

discipline qui les produit. Ce qui est nécessaire si on veut faire une sémiotique du discours scientifique, c'est de considérer les images non comme des *résultats* mais en tant qu'*opérateurs provisoires*, des étapes en succession au cours d'un processus d'investigation qui n'a pas de fin définitive mais différents recueils et alignements de traces et des encadrements qui changent selon les disciplines et les systèmes de pertinence choisis. Ce qui nous intéresse en effet c'est la genèse des images qui génèrent d'autres images, ou d'autres outils de visualisation. Ce n'est jamais une image isolée, l'image scientifique ; l'image isolée on peut la trouver dans les livres des philosophes, ou des vulgarisateurs, mais pas dans un essai scientifique – même si on ne pourrait pas distinguer *à priori* entre images de la vulgarisation et images de la recherche scientifique: il peut s'agir tout à fait des mêmes images, *c'est leur densité d'enchaînement qui change*. C'est sur la correspondance entre modification des paramètres et configuration visuelle qui se joue la vérité de l'image scientifique. La vérité d'une image dépend de réglés de paramétrage, ou mieux encore, la référence se construit à partir *des différentes images qu'on obtient en transformant, d'approximation en approximation, le paramétrage*. On pourrait affirmer, en suivant encore Latour (2001) que "La référence n'est pas ce que l'on désigne du doigt ou ce qui, de l'extérieur, garantit la vérité d'un énoncé, mais ce qui demeure *constant* à travers une série de *transformés*".

2. Analyse des images en astrophysique

Ce que je me propose avec cette recherche c'est d'étudier quelques images des astres en partant de l'ouvrage d'un de plus importants astrophysiciens vivants, Jean-Pierre Luminet, directeur de recherches au CNRS, qui travaille à l'Observatoire de Paris Meudon. Le livre en question s'intitule *Le destin de l'univers* (2006). Ce livre, qu'on peut considérer comme étant un "popular science book" d'un très haut niveau, est intéressant notamment pour son genre discursif hybride. Le genre de cet essai est à considérer comme un compromis réussi entre, d'un côté, l'explication didactique pour des étudiants et, de l'autre, la tentative de développer des études d'avant-garde sur des thématiques que, même les collègues, jugent délicates, comme p. e. les trous noirs et les situations extrêmes de la matière.

Je me propose d'étudier les différentes stratégies de représentation des trous noirs, qui ne possèdent pas encore une iconographie bien établie et

acceptée, et des photos consacrées à la formation et à l'explosion des étoiles qui, au contraire, possèdent une codification représentationnelle fixée depuis longtemps à l'intérieur de la communauté scientifique. Les types d'images et les types d'agencements rhétoriques entre elles qu'on trouve tout au long du livre sont très divers et dépendent principalement des objectifs que ces agencements visent. Ces premières images représentent des phénomènes bien connus et ne posent pas de problèmes de stabilisation iconographique aux astrophysiciens. C'est une série des nébuleuses, astres qui évoluent rapidement et ont une durée de vie très brève, dont la détection à travers différentes longueurs d'ondes visualise leur composition chimique. Leur évolution et leur âge n'ont pas été étudiés seulement à travers leurs compositions chimiques, mais aussi à travers leur vitesses de rotation et leurs diamètres. La stratégie représentationnelle de ces images est bien de rendre "commensurables" de millions d'années, des vitesses de rotation différentes et des transformations chimiques en des rapports

Figure 1. Nébuleuses planétaires.

visuels codifiés. Ces images sont toutes construites sur la base de milliers de photographies qui sont assemblées par le biais d'un système de dispositifs enchaînés qui traduisent des rapports spatio-temporels, des températures et des vitesses en des rapports chromatiques, luministiques, eidétiques et topologiques. Comme on le voit dans cette première image, les nébuleuses planétaires, résidus de gaz éjectés par une petite étoile agonisante, sont les astres les plus spectaculaires; cela est dû justement au fait que leur gaz intercepte le rayonnement émis par la surface incandescente de l'étoile centrale. Ce rayonnement transporte plus d'énergie que la lumière visible, dans ce cas ultraviolet, et ce rayonnement est capable d'*exciter* les atomes de la nébuleuse. Sous le bombardement incessant des photons, les électrons sautent sur des orbites d'énergie supérieur, puis retombent en émettant un rayonnement à la couleur caractéristique: ces parcours et ces sauts sont représentés à travers la fluorescence du gaz. Chaque atome qui constitue ce gaz (hydrogène, carbone, oxygène) absorbe la radiation ultraviolette et la réémet dans d'autres longueurs d'onde dont la couleur est en quelque sorte une signature. En effet, c'est dans les régions internes à la nébuleuse, les plus proches de l'étoile centrale, donc les plus exposées au rayonnement ultraviolet, que l'oxygène et l'azote sont excités et rayonnent dans le vert/bleu. Dans les régions périphériques, le rayonnement ultraviolet est affaibli par l'absorption et ne parvient plus à exciter que l'hydrogène, qui réémet dans la couleur rouge, ici la couleur du refroidissement. On s'aperçoit que *la profondeur spatio-temporelle du ciel est saisissable à travers la mise en image des transformations chimiques*. Plus précisément, en ce qui concerne les couleurs des objets qu'on vise à représenter, elles dépendent des transformations chimiques enregistrées et des longueurs d'ondes affectées. Mais le système de couleurs n'engendre pas un rapport "un à un" avec le système des éléments chimiques. Au contraire, la progression des couleurs dans un spectre du bleu au rouge trouve codification avec les transformations progressives des températures et avec les forces d'excitations des éléments chimiques. Or, la codification n'est jamais fixée entre un élément et une couleur, elle est engendrée par le rapport entre deux transformations sur des échelles, chromatiques et chimiques: une transformation a comme corrélat l'autre. L'hydrogène n'émet pas toujours en rouge; sa couleur dépend de la position relationnelle de l'hydrogène par rapport aux autres éléments concernés et à leurs températures.

On peut avoir aussi d'autres codifications qui p. e. rendent compte des vitesses de rotation; dans le cas de la rotation d'une galaxie le rouge est codifié comme la couleur d'un parcours d'éloignement par rapport au bleu que dans ce cas signifie la "direction la plus proche de nous". La partie d'une galaxie qui est colorée en rouge dans ce système de codage ne peut pas être datée en soi, mais par rapport aux intensités de rotation représentés dans l'image par les configurations topologiques d'autres couleurs. Il apparaît clairement que photographier ici signifie mesurer et aussi dater (en effet l'âge qu'on détermine à travers de calculs dans le domaine de la relativité générale est toujours mise en relation et comparaison avec l'étendue et la dilatation des diamètres des astres qui nous ont été fournies à travers les images – et vice-versa).

On s'aperçoit très vite ainsi qu'il manque un référent visuel à nos images; sur l'image on ne peut pas obtenir de reproduction d'un objet; l'objet est construit par le biais de l'image, où les enregistrements d'émissions et réémissions de rayonnements dans différentes longueurs d'onde témoignent d'une transformation chimique et d'un fonctionnement qui nous permettent de nommer, caractériser et dater un astre.

Pourrait-on encore nommer ces photos des images indicielles, à savoir des images qui stratifient les traces qui les ont constituées, et qui grâce à ces traces deviennent des images "fiabiles"? Oui, bien sûr, mais il faut se rappeler que ces traces ne proviennent pas d'un objet déjà constitué et autonome, mais des filtrages, de démontage, de distribution et de ré-assemblage des processus d'*exploration* et de *réponse* que les images fixent provisoirement. L'indexicalité renvoie donc à une construction qui se fait à travers des processus de démultiplication, distribution et réassemblage de traces diverses.

Dans notre cas, la comparaison et la superposition entre différentes longueurs d'ondes d'émission deviennent un instrument de mesure elles-mêmes; en effet les différentes images captées selon différentes longueurs d'onde s'ajustent dans une même image et forment une *image composite* qui provient de *superpositions de captations* dans différentes longueurs d'onde et sert à visualiser et donc à connaître, reconnaître et à décrire certains fonctionnements que sans elle seront complètement abstraits et sans support. L'image permet aux théories d'être éprouvées, parce qu'elle est produite par des recueils de données qui, grâce à elle, deviennent perceptible et "comparable".

Ces images peuvent montrer – à travers leurs modulations eidétiques, chromatiques, etc. – ce qui va changer au fur et à mesure qu’on manipule les paramètres de détection. Les différentes visualisations croisées, comparées ou superposées, peuvent servir comme instruments de vérification/falsification.

Une autre problématique qu’il me semble intéressant d’aborder est soulevée par l’image de la nébuleuse du Crabe qui pose la question de la *correspondance* entre différentes observations à des moments différents. Le texte de Luminet nous dit que cette image est composée de 24 clichés individuels pris par le télescope spatial Hubble et *superposés* à des clichés du Very Large Telescope de l’ESO au Chili, et qui est donc la plus précise jamais effectuée. La précision et la fiabilité de cette image proviennent paradoxalement du fait qu’elle est un mosaïque qui rassemble des situations différentes (les 24 images de Hubble ont été prises en Octobre 1999, en Janvier 2000, en Décembre 2000 p. e.). Cette image est faite d’une multitude de points de vue différents composés ensemble et superposés, mais tous supposés être des points de vue sur la *même* nébuleuse. Mais on doit bien avouer que la condition de “mêmeté” de cette nébuleuse nous est donnée par l’image elle-même. Elle-même fournit le support et la configu-

Figure 2. Nébuleuse du Crabe.

ration, donc la référence spatiale et temporelle, aux événements divers qui s'assemblent en elle. Comme l'affirme Bordron (2008): "la vérité d'une image n'est pas son accord avec *ce qui est*, mais bien son accord avec *ce qui par elle est fait image*. L'image fournit en effet à *ce qui est* sa condition d'unicité (de 'mêmeté') et, réciproquement, cette unicité ne peut se réaliser que si *ce qui est* devient image".

En ce qui concerne la densité d'enchaînement dont on a parlé au tout début de notre présentation du livre de Luminet, on s'aperçoit que ces images, montrées isolées et abstraites de leur processus de formation, sont enchaînées selon le registre de la vulgarisation (c'est-à-dire pas enchaînées!) et révèlent évidemment des iconographies et des théories bien acceptées dans le domaine. Elles sont présentées dans l'ouvrage de Luminet comme des "images finales" qui interrompent la chaîne de construction de la référence en la fixant.

Les quatre photos du "même" reste de supernova, baptisé Cassiopée A, exemplifient un cas un peu différent. La première est une image prise dans le domaine radio, la deuxième dans celui optique, et les autres deux ont été prises par le télescope *Chandra* aux rayons X. On peut essayer de dater une étoile à partir des relations entre domaines de rayonnement qui la captent; p. e. en ce qui concerne ce reste de supernova, la mesure de sa vitesse d'expansion, captable en radio et en rayons X, permet de calculer qu'elle a dû exploser vers 1680. Une telle explosion devrait laisser un résidu compact de type étoile à neutrons, qui a longtemps été cherchée, en vain, jusqu'à ce que le nouveau télescope X *Chandra* la découvre! On voit bien qu'en changeant de système de détection on arrive à découvrir et/ou à valider des hypothèses, notamment l'explosion que la supernova a subi vers 1680. Cette série d'images qui nous montre diverses étapes du processus de détection rend évident le fait que pour décrire entièrement un processus on doit traduire entre elles toutes les techniques utilisées et tous les différents résultats. Les

Figure 3. Différentes images de Cas A.

domaines de détection fonctionnent comme des *points de vue* et il s'agit donc de trouver les relations entre eux les plus porteuses de sens. Il n'y a pas une astronomie plus puissante que l'autre, chacune a son domaine d'efficacité et le bon domaine on le découvre grâce aux relations entretenues avec les autres domaines. Cette série d'images met en scène le rapport entre les différentes puissances de ces domaines et l'effort progressif pour la détection. Il s'agit ici d'un autre type d'agencement entre images par rapport à celui des premiers deux cas: c'est un agencement qui révèle les ajustements successifs ainsi que, à rebours, les fautes de la détection. Aucune image ne montre l'erreur ou la faiblesse d'une particulière détection: c'est leur mise en succession qui le révèle.

3. *A la recherche d'une iconographie pour les trous noirs*

Tout le système d'agencement d'images change dès qu'on rejoint des objets en train d'être étudiés et dont on cherche à construire une iconographie adéquate. Dans l'ouvrage de Luminet, le système et la typologie des images changent lorsqu'on commence à approcher les sursauts gamma et les trous noirs. Ces images montrent la difficulté du travail de l'astrophysicien: elles ne montrent pas les résultats de la détection, mais les approximations de la recherche. Les agencements entre les images deviennent plus denses et talonnent de près le parcours de l'investigation scientifique. Par exemple, les astrophysiciens ont fait l'hypothèse que les champs gravitationnels très forts dans la formation des trous noirs permettent une grande libération d'énergie dont seulement le domaine gamma pourrait rendre compte. Le problème majeur de l'astronomie gamma est le manque de résolution de ses détecteurs. Pour résoudre cette faiblesse les astrophysiciens consacrés à ces problématiques ont fait l'hypothèse que les sursauts gamma soient suivis d'une émission de lumière dans d'autres longueurs d'onde, un phénomène appelé *rémanence* ou *contrepartie*. En effet, on fait l'hypothèse que, après le cataclysme ayant créé un sursaut, les sources doivent refroidir et devenir visibles d'abord aux rayons X au bout de quelques heures, puis en lumière visible après quelques jours, voire en radio après quelques semaines. Cette image permet la visualisation de la première localisation exacte d'un sursaut gamma aux rayons X. Cette image montre la rémanence du sursaut dans divers domaines de fréquences: le sursaut gamma se produit bien dans le domaine gamma, puis perd son énergie et passe successivement dans le

Figure 4. Première localisation exacte d'un sursaut gamma en rayon x. 27 février 1997.

domaine X, visible et radio. La captation de ces lueurs résiduelles en rayon X permet d'abord de les identifier à des astres précis, puis la mise en œuvre des techniques de la spectrographie dans le domaine optique permet de mesurer le décalage vers le rouge de la lumière émise par les sources lointaines; plus ce décalage (entre le rouge et le bleu/vert) est grand, plus la source est distante et plus le "temps de regard en arrière" est profond. Le rapport entre le bleu et le rouge dans l'image paramétrée montre le temps de refroidissement du sursaut. Cette image montre une véritable cartographie de la sensibilité des différentes longueurs d'ondes à un "même" phénomène. Les sursauts gamma on a pu les considérer comme des sources de mesure et de datation certaines quand les images prises à d'autres longueurs d'onde nous l'ont confirmé.

Dès qu'il s'agit d'expliquer dans les détails la formation d'un trou noir, au tout début, les photos disparaissent. Comme on le voit dans cette image, ce sont les équations de la relativité générale qui permettent de construire des images qui mettent en scène différents points de vue possibles pour explorer l'intérieur d'un trou noir (ici il nous est montré que très près d'un trou noir les concepts d'intérieur et d'extérieur sont inversés en raison de la forte courbure des rayons lumineux). En effet toute explication de ces images est fondée sur des hypothèses sur les rapports entre ondes gravitationnelles et géométrie et toute légende commence avec cette phrase: "Selon la relativité générale...". Il semble impossible de filmer ou de photographier un trou noir puisqu'il ne laisse échapper aucune matière,

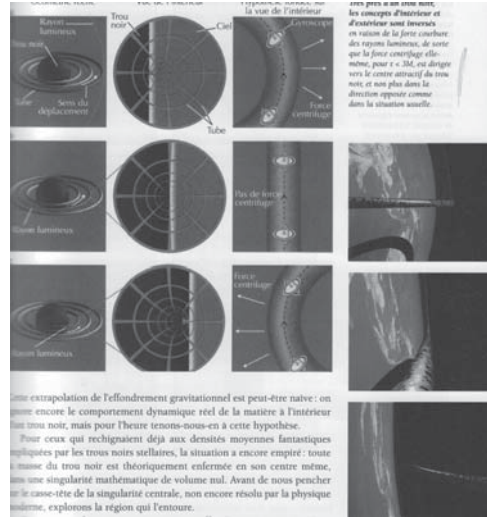

Figure 5. Inversion des concepts d'intérieur et d'extérieur très près d'un trou noir.

aucun rayon lumineux. Cependant, un trou noir convenablement éclairé est capable de renvoyer une image grâce aux trajets particuliers suivis par la lumière émise dans son voisinage par une étoile ou par une série d'anneaux matériels en orbite autour de lui. Pour arriver à configurer des iconographies, les spécialistes des trous noirs se sont appuyés non seulement sur les équations de la relativité générale, mais sur des images de quelque chose de bien connu, à savoir les anneaux de Saturne en en calculant les différences en termes de champs de gravitation et de courbure de l'espace-temps. Par rapport aux anneaux symétriques de Saturne, ils ont fait l'hypothèse que la forte courbure de l'espace-temps autour du trou noir manifeste une distorsion importante de l'image du disque. Luminet et son équipe ont donc dû faire du bricolage pour construire une nouvelle iconographie. Cette photo montre schématiquement les contours d'un disque circulaire entourant un trou noir sphérique. Ce qui est étonnant c'est que pour cette figure Luminet ne parle pas du tout de schéma, mais bien au contraire de photographie, d'image "reçue" et "révélatrice" des façons dont les corps, selon leur nature, réagissent aux ondes électromagnétiques. Celle-ci est une image qui représente la dynamique de la formation d'une photographie calculée. Les astronomes considèrent comme des photos non seulement

Figure 6. Distorsions optiques au voisinage d'un trou noir.

les images qui recueillent et mesurent la lumière renvoyée par des astres et traduite enfin en configuration visuelle, mais aussi toute image qui visualise le “recueil” des calculs des équations. Cette figure montre comment des hypothèses sur la géométrie peuvent être traduites en une photo (dans l'image à droite). Entre les deux parties de l'image, au centre, c'est indiqué qu'il y a une plaque photographique. Luminet explique que cette photo “est prise à grande distance”. On s'aperçoit que pour les astrophysiciens, même des expériences de pensée comme celle-ci, peuvent être considérées comme des photos. Enfin Luminet nous montre à nouveau le même résultat dans un autre système projectif, qui est considéré encore une fois une photo. Ces images calculées des trous noirs Luminet les décrit comme : “des photographies calculées point par point dans le cadre de la relativité générale”, et il précise qu'il s'agit d'intégrations numériques les plus exactes possibles.

Figure 7. Apparence lointaine d'un trou noir sphérique entouré d'un disque d'accrétion.

Conclusions

Tout au long de cette étude on a observé différents types d'images et d'agencements rhétoriques entre elles, qui changent en accord avec le niveau plus ou moins expérimental de la recherche. On a pu distinguer:

1) des photos "prototypiques" qui mettent en scène des résultats définitifs et définitoires, présentées "isolées" selon un mode explicatif et didactique. La plupart de ces images sont composites, à savoir des images construites à partir de prises de lumière à des moments différents, qui visent à configurer une mêmeté de l'objet dans le temps;

2) des images en série qui mettent en comparaison les résultats des différents moyens de détection, selon les différentes longueurs d'ondes. Ces images montrent non seulement un objet, mais aussi l'évolution technique d'une discipline, les efforts de la recherche, les parcours construits sur des erreurs et des approximations dont enfin nous sont présentées des possibles solutions. On pourrait affirmer que ces images mettent en scène une *comparaison diachronique* des outils et montrent le développement scientifique comme une suite de problèmes de "production iconographique" à résoudre. On est dans ce cas sur un autre niveau énonciatif par rapport au niveau qu'on vient de décrire dans la première section: il s'agit ici d'un type de communication adressé plus aux collègues qu'à un public élargi. On voit bien que plus on avance dans l'expérimentation, plus on multiplie les images corrélées qui se traduisent l'une l'autre. Dans les articles "pour les collègues", à savoir les comptes-rendus ou les articles "de découverte" les agencements entre différentes images d'un même processus sont encore plus denses.

Dans le volume de Luminet on trouve aussi un autre type d'images, qui ne sont pas agencées entre elles, mais qui diffèrent fortement des images de la première section. Sur ce cas, pour des raisons d'espace, je dois passer très vite (voir Dondero 2007b). C'est le cas des "vues d'artiste", employées très souvent par les astrophysiciens lorsqu'ils doivent expliquer des processus et des fonctionnements des astres qui ne sont pas compréhensibles à travers des images "paramétrées" et "contrôlées" comme celles qu'on a pris en considération jusqu'ici. Pourquoi ils les appellent vues d'artistes?

Si le contrôle de la genèse n'a souvent pas d'importance dans l'image artistique, au contraire l'image scientifique doit être reproductible, justifiée et justifiable. En effet, en partant des distinctions du philosophe Nelson Goodman (1968) entre autographie et allographie j'ai déjà affirmé

(Dondero 2007a) que la photographie artistique est un exemple d'image *autographique* comme c'est le cas du tableau, parce qu'elle ne possède pas une notation, un alphabet de signes, une grammaire, bref, la photo et le tableau ne peuvent pas être "exécutés" et re-exécutés comme c'est le cas, en revanche, de la partition musicale (là on a un alphabet de signes, une notation, des exécutions dont on peut mesurer l'exactitude). Dans le cas de la photo scientifique on a par contre une partition, obtenue par prélèvement et calcul, qu'on doit littéralement *exécuter*. Il existe une contrôlabilité et manipulabilité de l'image scientifique qu'on ne trouve pas dans la photo artistique (en témoignent les pratiques de droits d'auteurs, et l'impossibilité de la moindre modification dans la phase du tirage). La photo scientifique, à travers cette contrôlabilité, se pose de l'autre côté des pratiques de sémantisation de l'image artistique qui joue sur la sacralisation des originaux et sur l'unicité; bien au contraire les pratiques de manipulation de l'image scientifique demandent d'être *partagées, partageables et modifiables*. Il nous semble que les astrophysiciens utilisent les "vues d'artiste" – qu'ici on assimile aux fonctionnements des images artistiques – quand ils sont censés visualiser des phénomènes dont ils ne peuvent pas assurer la manipulabilité et l'articulabilité des propriétés; en effet les vues d'artiste doivent être interprétées comme des "globalités", des blocs fixes *définitifs*. Au contraire, les images scientifiques reçoivent leur efficacité grâce au fait qu'elles peuvent être manipulées transformées, essayées, vérifiées.

À la recherche d'un temps perdu

Quelques approches sur l'oreille du 21^e. siècle

1. "L'écouteur" de musique

Le 20^e. siècle se caractérise tout d'abord par l'avènement de la schyzophonie (Schafer : 1977), c'est-à-dire, du son écarté de l'espace et du temps de sa production. Il s'agit du son capturé, phonofixé, amplifié, téléphoné (transmis à distance), remodelé (Chion 1994) : du simple enregistrement sonore, on avance vers l'obtention de la haute-fidélité acoustique ; ensuite, à la deuxième moitié du siècle, le son devient portable, en vertu des nouvelles batteries, qui permettent de garder de l'énergie pendant toute une journée. Il fallait ajouter que les plusieurs espèces de médias existants peuvent emmagasiner des informations sonores dans des différents types de support en même temps (le disque noir, le cd etc.). Encore, plus récemment, le support physique habituel – le disque – se subdivise en d'autres formats, de plus en plus minuscules et dont le contenu est devenu quasi "invisible" (ou presque).

Vers la fin du 20^e. siècle, on vérifie une succession des transformations dans le champ technologique, qui se passent dans un temps vertigineux : Dans le cas particulier de la musique, le support matériel "visible" et "tactile" semble disparaître jour après jour. Les gestes qui témoignent le contact direct avec les machines de reproduire de la musique sont devenus assez discrets : l'acte de prendre un disque dans les mains, de le manipuler, de le mettre dans la machine reproductrice (tourne-disque, ordinateur) sont pratiquement éliminés des habitudes quotidiennes. Le fonctionnement se fait par des petites pressions avec un seul doigt. Le rituel de l'écoute n'a

quand même pas disparu, mais la théâtralité des gestes est réduite, sinon, au moins, très distincte.

Par conséquent, l'aura (au sens benjaminien) qui caractérise l'objet matériel (le disque) est sensiblement diluée : Dépourvus du corps qui donne visibilité au média sonore, les nouvelles technologies nous offrent, par contre, d'autres possibilités, comme celle de confectionner l'album soi-même, selon le goût personnel de chacun. (Il faut bien remarquer que, dans ce cas, le projet esthétique de l'auteur ou de l'équipe de production a subi une transformation radicale, pour ne pas perdre sa fonction : Il suffit de rappeler que les jaquettes étaient autrefois un composant très important du produit final : le projet artistique du disque.) Et faire son propre album se traduit, la plupart des fois, par l'acte de capturer des fichiers virtuellement : aujourd'hui une partie considérable des auditeurs de musique s'utilise de l'internet non seulement pour écouter de la musique, mais aussi pour la copier. L'accès aux différents sites et leurs répertoires, appartenant à tous, malgré l'animosité des maisons d'édition de disques. Par conséquent, des nombreux morceaux sont gardés dans l'ordinateur, sans que pour autant ils soient nécessairement écoutés : il y a une disproportion entre le temps de copier et le temps d'écouter de la musique... surtout s'il s'agit d'un ouvrage de longue durée. Il arrive même qu'un fichier soit oublié sans jamais être écouté.

On voudrait également remarquer la prolifération des médias, à tout instant devenues usées et vétustes, remplacées sans cesse par la technologie la plus récente, transforme l'auditeur en "consommateur vorace" : il cherche frénétiquement des nouveaux "hits", qu'il télécharge par Internet. Après avoir fait la copie, généralement en MP3 ou en MP4, de basse définition acoustique, il se promène avec un petit appareil, "collé" au corps, à travers lequel il écoute des morceaux en mouvement, dans un paysage sonore bruyant. Encore, les façons de se répliquer les originaux manquent en qualité technique, même si le travail du studio est le plus sophistiqué et rigoureux.

On vérifie, donc, un éparpillement de signes sonores et musicaux qui n'arrivent jamais à être décodés, puisque la captation elle-même incarne un plaisir plus excitant que la fruition de l'œuvre. Le processus de la communication se convertit en "incommunication", en mal-entendement, en des fragments de sens. Autrement dit, l'auditeur se transforme en "collectionneur obsessionnel" de signes, ceux-ci convertis en gigabits.

Les appareils portables, à chaque jour plus petits et capables de stocker une quantité démesurée de données se révèlent comme la panacée de l'individu qui est obligé de passer sa journée en circulation – ou immobile dans les embouteillages en effet, ce sont les modalités de consommation musicale les plus courantes : la musique d'ambiance – Muzak – et les portables personnels). Cette nouvelle situation de réception quotidienne nous offre des éléments importants, qui contribuent à la réalisation des diagnostics très précis des changements de sensibilité et de comportement face aux différentes musiques, dans un espace-temps prédéterminé.

En ce qui concerne l'écoute dans un endroit fixe (la salle de séjour des maisons) on pourrait dire qu'il a été remplacé par le "home theatre" : l'espace auparavant consacré à l'écoute "hi-fi" de la musique a été converti en salle de cinéma individuelle, sans que pour autant la qualité sonore soit respectée : l'image et la distribution des canaux semblent d'être le plus important que la définition de la bande des fréquences. Encore, le temps qu'on utilisait auparavant pour l'acte ritualisé de fouiller des jaquettes des disques sur les étagères des magasins n'a pas disparu : désormais sont les boîtiers des DVD qu'on cherche frénétiquement.

Ainsi, les possibilités de l'écoute individualisée "à la carte" ont augmenté, si on considère la quantité des sources disponibles (pourvu que l'auditeur connaisse les sites). Des appareils comme I-Pod ou Mini-Disc permettent d'accumuler une quantité gigantesque de fichiers sonores, qui peuvent être écoutés pendant des heures successives, grâce aux nouvelles batteries. Par conséquent, l'acte d'entendre sans interruption peut devenir une habitude, bien que cela ne soit pas conseillé par les médecins... De leur part, les récepteurs "clauriaudients" (Schafer 1977)¹ remarquent une situation curieuse : si, d'un côté, il existe la possibilité de connaître un répertoire gigantesque, d'autre part, l'accès à l'objet matériel devient plus difficile : les magasins de disques disparaissent, petit à petit et les sources qui fournissent les fichiers musicaux (sauf des éditeurs très soucieux) n'offrent pas des renseignements sur les interprètes et moins encore des informations techniques concernant l'enregistrement.

Toutefois, si l'habitude d'écouter de la musique chez-soi a disparu, l'histoire de l'écoute par l'intermédiaire des médias sonores pose toujours des questions. L'étude de l'écoute à travers des anciens médias, comme le disque noir et sa masterisation digitale, nous permettra d'étudier des questions comme, par exemple : De quelle façon et dans quelle mesure certaines

oeuvres musicales demeurent dans la mémoire, plus précisément, dans le contexte d'une culture où le trait le plus marquant est justement l'éphémérité ? Comment se font la fixation et la disparition des genres musicaux, surtout à partir de la fin du 2^e. millénaire ? Pour analyser cette situation, nous prendrons l'exemple du fado.

2. *La vocalité dans la performance*

Bien que l'expression "musique populaire" demeure un concept insuffisant (González 2001), on ne peut pas nier qu'elle conduise à une nouvelle approche théorique : celui de la "performance médiatisée" techniquement (Zumthor 1990),² qui donne origine à la "chanson des médias" (Valente 2003), c'est-à-dire, la chanson composée *pour* les médias, *avec* et *à partir* des médias. La chanson des médias est marquée par la "présentité" de la performance en direct, ou dans le studio (ici, elle est médiatisée par des microphones de captation et des effets électroacoustiques). Elle peut avoir une version écrite, sur partition conventionnelle, bien que la forme la plus courante soit l'enregistrement sonore direct, à partir des schémas ou de l'improvisation.

Il faut ajouter que la performance médiatisée crée de nouveaux modèles d'interprétation et de style, quelquefois très remarquables comme qualités du *son* qui, d'après le compositeur François Delalande (2001), est une catégorie primordiale pour la sémantique musicale : la prise du son, la distance du microphone, des effets d'écho, parmi d'autres peuvent instituer un style personnel ou même d'une époque.

On dirait également que le travail en studio peut renforcer, surtout dans le cas du chanteur, des effets vocaux, des traits distinctifs (respiration, prononciation etc.). La voix, même enregistrée, affirme sa présence, à travers le corps de celui qui énonce le message poétique : "... la présence, non seulement la voix, mais le corps entier est là, dans la performance. Le corps par sa matérialité même, socialise la performance, de façon fondamentale" (Zumthor 1990: 73).

Cet ensemble de traits distinctifs peut créer des références, des modèles, des prototypes, même des "voix-mythes". C'est le cas d'Alfredo Marceneiro ou d'Amália Rodrigues. C'est juste parce que la voix dépasse le langage, comme remarque Zumthor : "Le langage est médiatisé, porté par la voix. Mais la voix déborde le langage : elle est plus large que lui, plus

riche. Il est évident, chacun en fait la constatation dans sa pratique personnelle, qu'en ampleur de registre, en envergure sonore, la voix dépasse de très loin la gamme extrêmement étroite des effets graphiques qu'utilise le langage. La voix, ainsi, en utilisant le langage pour dire quelque chose, se dit elle-même, se pose comme présence" (ibid.: 55).

Ces voix vont constituer le nouveau "vocabulaire" des codes culturels, qui ne s'aperçoit pas consciemment. Dans le cas particulier du fado, tous les petits détails ont, sûrement, des fonctions très importantes pour la préservation du genre musical.

3. *Quelques petits mots sur le fado*

Le fado est un genre musical traditionnel portugais qui prend la forme d'un chant généralement de ton mélancolique dont accompagnement usuel est fait par une guitare portugaise (*guitarra*) et une guitare (*viola*). Le fadiste chante aux "casas de fado" (maisons de fado) ou dans des grandes salles de spectacle. En effet, le fado est connu par un esprit langoureux et triste, mais cela n'est pas une règle : on peut trouver une grande somme de titres dont le thème est satirique, soit l'exemple du "Fado do Olho" (Fado de l'œil), l'une des variations du Fado "Pedro Rodrigues".

Cette chanson qui, selon José Ramos Tinhorão (1994), est née au 19^e. siècle, au Brésil, comme une espèce de danse piquante et, dans le cadre de chanson traditionnelle de Lisbonne, comme elle est connue actuellement, a probablement apparue vers les années 1820 ou 1840 au Portugal. Comme on peut observer, il s'agit d'une chanson presque bicentenaire et qui a survécu des impacts importants, comme "l'invasion" du rock (comment on appelle d'habitude l'avènement genre).

Le fado peut être classé comme un genre "nomade", grâce à sa "mouvance" (Zumthor, 1983), c'est-à-dire, il a des propriétés internes qui lui permettent de se transformer, dans un procès continu de (re)sémantisation constant. Le fado plus ancien, nommé "castiço" (racé) est le fado plus proche de l'oralité : en tant que musique, il n'y a que deux fonctions harmoniques (tonique et dominante). Les textes doivent s'adapter à une mélodie que change où la tessiture est étroite, mais qui accepte l'improvisation et des mélismes. Le fado "castiço" est classé en trois catégories : menor (mineur), corrido (rapide) et Mouraria, d'après le musicologue Rui Vieira Nery (2004).

Il y a d'autres fados "castiços" qui n'appartiennent pas à ce groupe, puisqu'ils acceptent un nombre plus grand de fonctions harmoniques, y incluses des modulations. Quelques-uns sont très fameux, comme le "Pedro Rodrigues", "Fado bailado" (Fado dansé) et admettent des versions "nomades", c'est-à-dire, avec des nouveaux textes quelquefois, très contrastants l'un de l'autre. On peut citer comme l'exemple le plus achevé du "fado castiço" Alfredo Rodrigo Duarte, plus connu comme Alfredo Marceneiro (parce qu'il était menuisier), lui-même compositeur et chanteur.

L'autre variation du fado est le "fado-canção" (fado-chanson), plus récent et qui correspond aux caractéristiques ordinaires de la chanson : des strophes, des couplets, des modulations harmoniques etc. Le fado-chanson n'accepte pas des textes différents (sauf des adaptations à d'autres langues, comme "Avril au Portugal", "La maison sur le port") et des changements de la mélodie ; les orchestrations, par contre, sont bienvenues. Il est bien connu à travers les grands succès d'Amália Rodrigues, comme "Gaivota", "Coimbra", "Foi Deus", "Nem às paredes confesso". En effet, Amália n'est pas seulement l'incarnation du fado, mais l'exemple le plus accompli du fado (et de la chanson, en général).

4. La performance du fado : Un cas très particulier

Parler du fado, c'est plutôt parler du chanteur de sa façon de l'énoncer ; puisque chanter un fado c'est différent de chanter d'autres genres musicaux, comment affirme Camané, l'un des plus réputés fadistes de l'actualité : "Le fado est dans le sang de celui qui le chante et plus tôt ou plus tard va le dominer. ... Chanter le fado, c'est envoyer un message, un sentiment : il faut savoir le type de message qu'on va adresser aux gens... Et chanter un fado traditionnel est précisément le plus difficile, parce que la musique est très simple ; ainsi, il faut bien créer une façon de délivrer les paroles, parce que rien n'est évident . Créer une chanson est très difficile et développer son style peut prendre longtemps"; et ensuite : "le fado est un don, un héritage, un état d'esprit et une forme très portugaise d'être dans la musique" (*apud* Neves 2006: 260–261). Fadiste et chanteur sont des choses différentes, et Camané réclame d'être fadiste et pas un chanteur.

D'autres noms également respectés, comme Mísia et Cristina Branco se jugent chanteuses, qui peuvent explorer d'autres genres. (En effet, Mísia

a enregistré des boléros et des tangos, tandis que Cristina Branco a choisi des compositeurs brésiliens.)

Normalement le fado doit être écouté en plein silence: La séance du rituel fadiste débute juste quand quelqu'un alerte: – “Silêncio ! Vai se cantar o fado !” (Silence ! On va chanter le fado!) et avec des instruments musicaux sans amplification électrique. Il faut reconnaître que la réalité a changé la tradition. Aujourd'hui il est très difficile de trouver des spectacles à vive voix. Les micros sont présents même dans les petites salles. Cela a posé des changements dans la performance, parmi lesquelles, l'expansion du territoire où la séance a lieu. Mais cette condition ne pose pas de problèmes, même pour des fadistes plus puristes : Pour Maria da Fé (Maria da Conceição Costa Gordo, née à Porto, en 1945), une des plus réputées cantatrices de fado de l'actualité, la technologie n'a pas détruit le fado. Les techniques du studio et ses effets spéciaux n'ont fait que permettre l'introduction des “petites” voix dans cet univers : “Avoir une bonne voix n'est pas suffisant pour chanter le fado : il faut absolument savoir chanter, avec toute son âme et cela n'est pas une chose qu'on apprend ; c'est quelque chose qui naît avec nous. Ensuite, la personne saura si elle réussit ou pas à cet art. (Le fado est comme ça : on n'apprend pas, on n'étudie pas, on essaie de faire le mieux, jour après jour...). Pour y arriver, il faut ‘vivre’ le fado. Le fado est ‘un chemin’ que Dieu l'a montrée et l'a fait suivre” (in Castro D'Aire 1996 : 92)

Mais aux débuts de la musique phonofixée, l'acte de capturer la performance était un sacrifice douloureux : Maria Alice, une des premières cantatrices du fado médiatisé se craignait des difficultés de chanter pour les microphones de l'époque : il fallait chanter pendant des heures qui ne finissaient jamais, sans couleurs de la voix : “Je me sentais affligée, parce que j'aimais chanter librement, avec toute la puissance de ma voix et il me disait qu'il fallait moduler la voix, apprendre à respirer et à coordonner les entrées avec les guitares.”³

Quand même, ce sont des vieux enregistrements qui ont fait l'histoire du fado et de leur performance : Si auparavant la transmission orale était le seul moyen de faire passer des morceaux traditionnels aux générations futures, l'avènement du disque – notamment le disque noir, en vinyl, a été l'instrument pour apprendre le fado, à partir des performances emblématiques. Ainsi, Cristina Branco a connu le fado lorsqu'elle fête ses dix-huit ans, quand son grand-père lui a offert un album d'Amália Rodrigues.

Elle est immédiatement tombée amoureuse par Amália et par le fado. Il faut ajouter que pour les générations plus jeunes, le fado était pratiquement excommunié, parce qu'il a été associé à la dictature de Salazar. Autrement dit, après 1974 le fado a quasi disparu du paysage sonore.

Ce qu'on voudrait remarquer ici, c'est le déplacement du modèle oral vers la version médiatisée techniquement ; immuable, certes, mais claire et didactique. Les disques de Marceneiro et d'Amália sont devenus des modèles pour le fado "castiço" et le fado chanson.

Pour n'aller pas très loin, on aimerait finir avec un exemple très inquiétant : les plusieurs versions du fado "Perseguição" (Persécution) et ses performances. Il s'agit d'un fado "castiço" qui date aux environs des années 1920, l'un des morceaux plus préférés par les audiences. Le texte a subi des différentes variations sémantiques et idéologiques, ou même des textes tout à fait nouveaux. La performance, de sa part, rejoint non seulement la déclamation presque libre, comme celle de Maria Alice (1926), l'inflexion mélodique d'Amália Rodrigues, avec toutes les nuances et couleurs du phrasé, mais aussi les mélismes de Maria da Fé, sans oublier les gestes vocaux qui la phonofixation en direct permet, comme c'est le cas d'Eugénia de Melo Castro. Le titre présenté par Camané montre des paroles différentes sans pour autant oublier la référence parodique.⁴

De ce fait, on pourrait conclure les différentes possibilités que la médiation technique du son peut offrir à l'interprète (dans ce cas, les chanteuses) des changements de style, d'énonciation et, par conséquent, permet des changements au niveau esthétique. Ainsi, l'écoute et le langage changent : Si Maria Alice n'était pas libre pour chanter dans le studio comme d'habitude en direct, Amália essayait d'optimiser les ressources technologiques, tandis que Maria da Fé peut se permettre tous les mélismes et effets vocaux, sans se préoccuper avec des conditions techniques.

Après tout ce qu'on a présenté ici, il ne reste que récupérer les mots de Paul Zumthor (1990: 54), qui a bien réfléchi sur le domaine de l'oralité et peut-être aussi sur le fado :

La voix et une chose, c'est-à-dire qu'elle possède, outre les qualités symboliques que tout le monde lui reconnaît, des qualités matérielles non moins signifiantes, qui se définissent en termes de ton, timbre, ampleur, hauteur, registre. Cela est tellement vrai que la coutume, dans les différentes sociétés, attache souvent un sens propre à certaines de ces qualités ... Les sociétés humaines, contrairement (peut-être) aux sociétés animales, ne semblent

caractérisées par le fait qu'elles identifient comme un objet, comme quelque chose qui est là, jeté devant elles, et autour de quoi se cristallise le lien social ... et (dans la mesure où il s'agit du langage) une poésie.

Notes

- * Cette recherche est partie composante du projet *La chanson des médias: Mémoire et nomadisme*, financé par la Fapesp et le CNPq.
1. D'après Schafer, "clauriaudience" est la faculté qui permet d'écouter tous les événements sonores avec clarté, en connaissant tous ses fonctions.
 2. Zumthor ainsi définit l'origine du concept : "Le terme performance s'impose absolument, dans les sens qu'on lui donne aujourd'hui à la suite des Anglo-Saxons: la performance est virtuellement un acte théâtral, où sont engagés tous les éléments visuels, auditifs et tactiles qui constituent la présence d'un corps et des circonstances dans lesquelles il existe" (1990: 61).
 3. Online source : http://pt.wikipedia.org/wiki/Maria_Alice
 4. Pour bien comprendre ce panorama, on a sélectionné un ensemble de versions du même fado, *Perseguição* : Amália Rodrigues (1945) ; Camané (2003), *Mais um fado no fado* (*Perseguição*, version Júlio de Sousa) ; Eugénia de Melo Castro (2000) ; Maria Alice; Maria da Fé (1991).

Jesús Octavio Elizondo Martínez

Stigma and visibility

Iconic representations of indigenous people in the Mexican press

The editorial approach to indigenous issues in Mexico appears to be based on abstract criteria, since the concepts used to refer to them include such terms as “the people”, “cultures”, “poverty”, “violence”, “the fight”, “justice”, “equality” and so on. But we don’t find references to the actual subjects, the real people that through their actions give sense to those abstract concepts. In other words, the journalistic approach is not based on a pragmatist (pragmaticist) approach, but rather on a strictly iconic one.

Let’s define iconic and pragmatist. According to Charles Sanders Peirce (1839–1914) all phenomena can be described through the sign functions defined by Peirce in the framework of the Philosophical categories or “modes of being”. One axis of the scheme is made of the so-called categories of Firstness, Secondness, and Thirdness. Firstness is for something perceived but without reference to anything else; Secondness is the category where two elements meet in a mutual relation, when something refers to something else as in the world of physical phenomena, where matter smashes into another thing. Finally, Thirdness is a mode of being where it is possible to conceive all phenomena mediated by signs in the frame of culture. From Thirdness, Mankind can describe what happens in the other two categories, because through cultural sign systems we establish a triadic relation between ourselves and objects.

The other axis on the framework refers to the triadic relation of knowledge, which includes (i) the sign, or *representamen*, which deals with what we perceive from reality; (ii) the *interpretant* of signs, which refers to the logical capacity of the subject; and (iii) the referenced object, which we infer from the last two. When we put together these two axes we get a total of nine sign functions: qualisign, sinsign, legisign; icon, index and symbol; rhema, dicisign and argument (cf. Elizondo 2006: 108).

Let us focus on the object at the level of symbol, as social consensus, such as the signs or national flags. The index points at an object, as when we see smoke and relate it with the presence of fire. The icon is that sign which we perceive as somehow resembling its object, as do visual images. It is important to conceive Peirce's classification as formed by elements that are not mutually exclusive, but on the contrary, complement each other in the interpretation and description of phenomena.

The nature of photography may be established such that "photographs are indices (footsteps of light) that can become icons (if the operator decides to maintain a resemblance relation) and/or symbols (when they get sense through a certain consensus)", in the words of Catalan photographer Joan Fontcuberta (1990: 26). The indexical nature of photography is beyond question. What is important here is its editorial usage by those in charge of forming a newspaper, who in their effort to probe the veracity of the facts mentioned in the accompanying text, actually misuse the photographs, by reaffirming the symbolic function of negative values associated with indigenous issues, such as violence, poverty, exclusion, etc. What is questioned here is journalism as a social practice that manipulates objectivity and veracity, values that constitute the very foundations of journalism.

We will use the pragmatist approach as a tool to give sense to abstract concepts (like poverty, marginality, justice). We shall assess the practical effects of these concepts in the world, thus seeing, for instance, both the men and women in poverty, the judges and authorities in charge of enforcing the law, and their fair or unfair actions. In short, it seems that abstract concepts are used in editorial approaches to national social issues to the effect of building a general discourse without any pragmatic platform. Photography is used as such a platform: men and women are shown to illustrate the abstract concept, as is common to propaganda and political discourse.

Up to this point, we have described a well established use of news information in the press. The semio-pragmatist view highlights the correlation between abstract terms and their practical implementations in press photography. Something about this seems contradictory. Think of a photograph that illustrates an article in the press: the level of "expression" allows us to get acquainted with the formal aspects of the photograph: size, shape, place within the newspaper, etc. At the "content" level we see iconographic

representations of people, subjects, objects, landscapes and many other figurative elements. As mentioned before, journalism must provide a reasonably objective panorama of facts. When a photograph of an indigenous woman is used to illustrate the problem of poverty in Mexico, a serious professional mistake is made. It leads to a series of diverse semiosis that will be described next, in the frame of a connotative semiotic analysis.

At the connotation level we can point at the concepts, ideas, values, symbols that we associate through an inferential mental process carried out with the indexical signifieds. It is possible to draw all the sign-thoughts (as in Peirce) with which we associate the message, in order to achieve sense from our experience through the construction of a chain of significations (a specific semiosis). This helps us to understand the sense of the message in a specific context and time. It is important to notice that this specific semiosis is the result of emotions, feelings, memories and the cultural baggage of each individual.

When we see a press article with an accompanying photograph, we tend to relate – through an inferential process – the subject to the content of the iconographic reproduction, since the latter has been put there to accomplish that referential sign function.

The issue is as follows. The referential function of the index takes place when an interpretant perceives a sign and makes an association with the object. That is the process by which we see a photograph and associate it with the subject photographed. So far, everything is fine. It seems, however, that the editorial intention is not to suggest the association as we have described it, but rather to link the elements in the content of the photograph with the abstract and general motif of the news. As a result, what we see in the photographs is read as a culturally constructed social symbol, comprised of a general, ready-made abstract issue. This inference allows the stigmatization of persons photographed, since the semiosis that allows us to give sense to the phenomena, requires our association with social symbols which are culturally learned in order for us to make a reasonable explanation of the photograph. In other words, when photographs are used as an illustrative tool, the indexical sign function inherent to any photograph must be preserved, in the case of a picture of the person mentioned with his/ her name underneath, a landscape of the place mentioned, and so on.

Especially delicate is the case of people photographed as an “example” of what is said in the written text. Most commonly in journalistic practice,

people are treated as things to fit as visual elements of the symbolic function. This function is often fulfilled by the rhetorical strategy of “synecdoche” (to take a part as the whole). Synecdoche works fine for the iconic function, but it is inappropriate for the symbolic one. In visibly representing social actors, the written press must always respect people’s personal identity. This is a fundamental ethic.

Anthropologist and sociologist Irving Goffmann brought the ideas of stigma and visibility from the Greek tradition into contemporary social discourse to define those people that have been marked with a negative sign that determines their personal and social identity. “The Greeks, who were apparently strong on visual aids, originated the term stigma to refer to bodily signs designed to expose something unusual and bad ...” (Goffman 2003: 11). A stigmatized person is no longer an individual with full rights, but a person diminished and rejected. “An attribute of this sort is a stigma, especially when this person produces in the others, as reverse effect, a broad discredit” (ibid.: 12). Stigmas of race, nationality, and religion are particularly unfair since they apply to people that inherited them from their families or communities.

“The term stigma will be used to refer to an attribute deeply discredited; but what is really needed is a language of relations, not of attributes” (ibid.: 13). I propose Semiotics to be that language of meaningful relations and “not of attributes” that Goffman foresees as necessary to approach the study of stigmatized identities. In everyday discourse we use metaphors to refer to them. In Mexico, one of those terms is “Indian”, which is used to refer to all indigenous groups despite the great differences among them. This term was first used – or misused – by the Spaniards around the year 1517, when in the quest for a new ocean route to India they found themselves in America.

One characteristic of the visibility of a stigma has to do with the fact that the stigmatized person tries to hide the signs that may reveal his or her stigmatized identity. In doing so, such persons will gather as much of the information flowing in their context as possible, in an attempt to neutralize it. However, this attempt has terrible consequences, a paradox that the Greeks found most important.

In the next part of the paper a sample of a larger research project entitled “Discrimination against Indigenous People in Mexican Mass Media” will be shown. This project was made by a group of professors under my

supervision during the last semester of 2005, by request of the National Commission for Indigenous Peoples Development, a federal institution of the Mexican government. In 2005, the Mexican population reached 103.3 million, 10% of which was categorized as Indigenous.¹ Mexico is the 11th most populated country in the world, according to the National Institute of Statistics, Geography and Information Technology (INEGI).

The first step of the project consisted in monitoring the press. We identified all words and images related to the indigenous scope. In doing so, the visibility of this vulnerable group was able to be measured according to the registries found in diverse journalistic venues. Our aim was to identify the *sense* of the messages, their *social significance* in the time analyzed, and in the Mexican social context. To do so required putting these messages in their printed context: place on the page, section or journalistic supplement, etc. We identified those words and images referring to Indigenous people and the values associated with them. In other words, we obtained objective information on one hand, and values, beliefs and symbols related to the note, on the other. By means of the analysis, we sought to identify the “clichés” or symbols – functioning as *logical interpretants* – which we found to be associated with the Indigenous people. At a second moment of the investigation, during the qualitative study, we reconstructed the *sense* of the narratives on one hand, and their *social sense* on the other, so as to identify the whole from the isolated messages, and thus to establish their relation with other cultural representations by means of the construction of connotative chains or specific semiosis.

Fourteen newspapers sold nationwide were reviewed during the monitoring work. These are: *Diario de México*, *Diario Monitor*, *El Economista*, *El Financiero*, *El Sol de México*, *El Universal*, *Excélsior*, *La Crónica de Hoy*, *La Jornada*, *La Prensa*, *Milenio*, *Ovaciones*, *Reforma*, *Rumbo de México*, *Uno más uno*.

The volume of the *corpus* shows how little interest the informative agenda gives to issues referring to indigenous affairs in Mexico. In all the newspapers analyzed, practically all the information consisted in informative notes. The natives, either from a personal standpoint or through organizations, were the source of reports related to themselves, although this happened in only a couple of occasions.

In the documents of the International Convention for the Elimination of All Forms of Racial Discrimination of the UN, one reads the following:

... the expression racial discrimination will denote all distinction, exclusion, restriction or preference based on reasons for race, color, lineage or national or ethnic origin that it has by object or annular result or to reduce the recognition, we enjoyed or exercise, in conditions of equality, the fundamental human rights and liberties in political, economic, social, cultural the sphere or in any other sphere of the public life.² (Rodríguez Zepeda 2004: 62–63)

Discrimination is, in a fundamental sense, a structural mechanism of social exclusion. Discrimination as exclusion consists of a systematic conduct and even a culturally standardized form of social scorn towards a person or group of people, due to his or her belonging to a group being socially stigmatized, resulting in exclusion from the main sources of rights and well-being of society. (Cf. *Ibid.* 2004: 20.) Rodríguez Zepeda establishes that discrimination is synonymous with limitation of access to rights and opportunities, and that it constitutes a mechanism of social exclusion originating in a framework of cultural representations, stereotypes and stigmas.

When the systematic scorn towards a stigmatized group happens to the facts, a form of specific inequality is fed and reproduced. For that reason, the fight against discrimination is a particular form of the fight by the social equality, because it implies the restitution of the ideal conditions of equality that have been undermined, and for that reason it must articulate politically and discursively as it leaves from the fight by the rights of the person ... under the language of the rights. (Rodríguez Zepeda 2004: 31)

In the case of ethno-cultural differences, for example, the policies against discrimination do not have to look for a right balance between:

the ethnicists' affirmation of the difference and the homogenizing pretension of the blind conceptions to the differences. Policies must offer an alternative to the present debate between the policies that recognize differences, and the universalist's liberal visions, that try an affirmation of rights over the ethnocultural differences, either sexual or of other different

natures ... the logical frame of the non-discrimination is still the national State. (Ibid.: 11)

In the particular case of Mexico, it is expected that the application of the Federal Law to Prevent and to Eliminate Discrimination – approved in 2003 – will introduce important transformations in the debate of a new Federal Law of Radio and Television. The task for us is to take the proper steps, the concrete actions towards a democratic culture, from civil society to the mass media, and to put pressure on government officials to reinforce democratic practices and policies.

The visibility that a social group acquires in mass media depends, to a great extent, on the policy of each medium; more specifically, to the policy on general abstract issues. By means of semiotic analysis, we have seen how when reading photographs of Indigenous people in the national press, we reach out for fixed symbolic elements in culture, like racial stigmatization – linguistic and cultural – of a specific group, in order to give sense to our experience. In the case study, we have presented the results of analysing monitored material, for the purpose of identifying the frequency of the presence of subjects related to indigenous populations in the Mexican press. These subjects, as we have seen, are always referred to with negative connotations; save for a few specific cases, that is the norm. Finally, we have established what we consider to be some basic principles of nondiscrimination, which must serve as a guide for the work to include diverse ethno-linguistic groups in the dominant institutions, in the effort to spread democratic values.

Notes

1. I am grateful to Professor Eva Salgado for the quantitative information presented here.
2. Adopted and opened to signing and ratification by the UN General Assembly in its resolution 2106 To, of 21 of December of 1965. Take effect: 4 of January of 1969, in accordance with Article 19. See Rodríguez Zepeda 2004: 62- 63.

Thomas Bernhard's infectious style

A pragmatic use of disease in literature

Introduction

The Austrian author Thomas Bernhard (1931–1989) suffered his entire adult life from a serious lung disease in combination with a heart condition. For many years, his life was prolonged only by means of heavy medication. In this paper I argue that the experience of a fatal disease played a decisive role in the elaboration of his style. The texts I use to argue the importance of disease in the style of Bernhard's prose are his autobiographical novels. I propose that his style has epistemological and ontological implications. Epistemologically speaking, his style is anti-foundationalistic and anti-sceptical. According to Vincent Colapietro (2004), these epistemological positions are typical of "the pragmatic turn". Bernhard's style has important performative aspects as well, and these considerations call for a new way of studying the author with regard to his style. Among literary scholars, the author has long been disregarded. In this paper, I propose that the author ought to be studied again, not as a biographical entity, but as a biological organism with a consciousness. A study of Bernhard's style calls for cooperation with neurophysiology. Accordingly, in this paper I will introduce Antonio Damasio and refer to the elaboration of his neurophysiology by Floyd Merrell.

1. Bernhard's style

When considering Thomas Bernhard's writing, we could speak of a *physiology of style*. His sentences are unnaturally long; the autobiography *Die Ursache: Eine Andeutung* (1975), for instance, opens with these two sentences:

Die Stadt ist, von zwei Menschenkategorien bevölkert, von Geschäftemachern und ihren Opfern, dem Lernenden und Studierenden nur auf die schmerzhafteste, eine jede Natur störende, mit der zeit *verstörende* und *zerstörende*, sehr oft nur auf die heimtückisch-tödliche Weise bewohnbar.

Die extremen, den in ihr lebenden Menschen fortwährend irritierenden und enervierenden und in jedem Falle immer verheerender auf die Verfassung dieser Wetterverhältnissen sich immer verheerender auf die Verfassung dieser Menschen auswirkende Salzburger Architektur andererseits, das allen diesen Erbarmungswürdigen bewusst oder unbewusst, aber im medizinischen Sinne *immer schädliche, folgerichtig auf Kopf und Körper und auf das ganze diesen Naturverhältnisse ja vollkommen ausgelieferte Wesen drückende*, mit unglaublicher Rücksichtslosigkeit immer wieder solche irritierende und enervierende und krankmachende und erniedrigende und beleidigende und mit grosser Gemeinheit und Niederträchtigkeit begabte Einwohner produzierende Voralpenklima erzeugen immer wieder solche geborene oder hereingezogene Salzburger, die zwischen den, von dem Lernenden und Studierenden, der ich vor dreissig Jahren in dieser Stadt gewesen bin, aus *Vorliebegeliebten*, aber aus Erfahrung gehassten kalten und nassen Mauern ihren bornierten Eigensinnigkeiten, Unsinnigkeiten, Stumpfsinnigkeiten, brutalen Geschäften und Melancholien nachgehen und eine unerschöpfliche Einnahmequelle für alle möglichen und unmöglichen Ärzte und Leichenbestattungsunternehmer sind.

As these first two sentences of his autobiography demonstrate, it is impossible to read this text without pausing to draw one's breath in places which are not in accordance with the meaning of the sentence. Thereby, the text eloquently demonstrates the pain and difficulty that a person with serious lung disease must endure. This breathing difficulty is a characteristic of Bernhard's style and is repeated throughout his work.

1.1. What is style?

If we look at style from the point of view of a pragmatic theory of communication, as in Sperber and Wilson's *Relevance. Communication & Cognition* (1995: 217), we could say that style is the regulation of the relationship between speaker and hearer. Pertinent in the communicative relationship is the building of a context which regulates the inferences that a hearer or listener makes. Style is important in building a context, especially with regards to a poetic text:

From the style of a communication it is possible to infer such things as what the speaker takes to be the hearer's cognitive capacities and level of attention, how much help or guidance she is prepared to give him in processing her utterance, the degree of complicity between them, their emotional closeness or distance. In other words, a speaker not only aims to enlarge the mutual cognitive environment she shares with the hearer; she also assumes a certain degree of mutuality, which is indicated, and sometimes communicated, by her style. (Sperber & Wilson 1995: 217–218)

With regards to what the speaker can expect to achieve, Sperber & Wilson say the following:

... a communicator cannot directly present an audience with an assumption. All a speaker or any other communicator can do is present a stimulus, hoping that its perception by members of the audience will lead to a modification of their cognitive environment and trigger some cognitive processes. (Ibid.: 150)

The reader, on his or her part, infers an intention from the context shaped by the style and prefers the inference that takes the least effort.

The aim of the “physiological style” in the opening sentences of Bernhard's autobiography is to regulate and build mental pictures and affective stimuli which might have effects on the representations of the world for the individual reader. The means of communication, however, are not the creation of a primarily cognitive context, but operate by both cognitive and affective means. Sperber and Wilson (1995: 224) maintain that, “Utterances with poetic effects can be used (precisely) to create (this) sense of (apparently) affective rather than cognitive mutuality.”

Thus the style gives the reader a strong physiological and affective stimulus which also has a potential cultural meaning. In semiotic terminology, one could say that the style is indexical; it actualizes the somatic experience of lung disease. But because signs are always dynamic and in movement toward thirdness and cognitivity, the style carries with it the potentiality of cognitions and interpretations.

1.2. Style and respiration

If we view these first sentences in the light of the theme of Bernhard's third autobiography, *Der Atem: Eine Entscheidung* (1978), in which he describes

his stay at a hospital in Salzburg, his experience of being close to death, and his sudden decision to stay alive, breathe and take control of his own spiritual and somatic recovery, we see how the stylistic stimulus performs the central drama in Bernhard's life – the threat of strangulation and the effort to breathe – and we see the importance of this somatic drama in the creative and life-giving effort of Bernhard's writing. To breathe or not to breathe, that is the question in much of Bernhard's writing.

The physician Luis Chiozza, in his book *Hidden Affects in Somatic Disorders* (1998), points out that the lungs allow for a direct transaction between gasses from the environment and the blood. Through the lungs, the body remains in direct contact with the outer world. To focus on respiration is to point to a direct, life-preserving relation which is more fundamental than the lack of identity between verbal language and the natural surroundings. This somatic necessity is elegantly *performed* in the relation established between the verbal utterance and the reader of the text. Thus the reader, during his reading, is put into direct contact with the world. Instead of aesthetic representation or the as-if of dramatic performance, the physiological style of Bernhard acts directly on the perception of the reader.

1.3. Respiration, creation and emotional performance

The meaning potential of a breathing difficulty is large. "In Greek philosophy air was considered the principle of life", according to Chiozza (1998: 30). "Air' or 'pneuma' has meant simply the essential element constituting each thing or even the 'divine breath', the representation of the Holy Spirit, the creator and regulator of the world ..." (31). Thus, from a cultural perspective, the lungs have been the seat of the spiritual since ancient Greek times, and there has always been a close relationship between respiration and inspiration; simply, to breathe means to get poetic inspiration. Thus, the somatic drama involved in having a serious lung problem has a cultural potential; it represents an acting out, a performance, an act of creation of a common environment. The *context* shaped by the style makes such an affective cultural and physiological communality possible.

The effects of the style also points to a similarity between Bernhard's autobiography and *Ecce homo*, the autobiography by Friedrich Nietzsche. In both autobiographies, the somatically diseased author is *infected* by

the climate and the general cultural and social environment of his native country. And in the same manner as in Nietzsche's philosophical autobiography, in Bernhard's autobiographical novel the values are turned upside down and the morally diseased are the seemingly healthy population of Salzburg, while the infected author is the one who is morally healthy. This Nietzschean paradox – the diseased are the healthy – is performed emotionally in Bernhard's style.

*2. Spiritualization and inspiration:
The grandfather and Schopenhauer*

The way that the young patient Bernhard assumes control of his own spiritual recovery has much to do with the influence of his beloved grandfather, who was a patient at the same hospital where Bernhard is hospitalized. The grandfather, an ardent Schopenhauer lover, dies suddenly, just a few days after a series of conversations by Bernhard's bed which are recalled in the text. The grandfather speaks to Bernhard about certain "areas of thought" – disease is such an area of thinking. We make up our diseases in our own interest, he says; existentially, we need diseases such as Bernhard's to enter areas of thought which we would not enter if we had not experienced diseases like this (Bernard 1978: 62). The diseased, Bernhard's grandfather proposes, have the possibility of a creative change in consciousness which a person without a serious disease does not, and this plays a very important role in the way an individual handles his own recovery. The text points to the connection between diseases and the possibility of a change in consciousness. This change in consciousness could be a change towards a more healthy personality in the Nietzschean sense, and my hypothesis is that this was effectuated through the style of Bernhard's writing.

One could say, with Chiozza, that the affective drama that our diseases perform does not say much about the cause of the disease, but to understand what the disease means in the existential and somatic drama of the patient can do much to further recovery (1998: Introduction). Meaning is, pragmatically, something which is constructed or inferred after the fact, in consideration of the effects. Bernhard, through his style and writing, creates a context which builds an emotional and cultural relationship with his public, and which at the same time represents the construction of a self for himself. This action has a healing effect on his somatic disease. In spite

of his breathing difficulties, Bernhard secures the creativity necessary for survival.

3. *Consciousness and intention*

I have used Sperber and Wilson's theory of communication to state that, in order to create a common mutuality through a style, there has to be an intentional act on part of the author as well as an inferential act on the part of the reader. But, as I have also said, the most an author can hope to do is to communicate a stimulus which has a perceptual effect on the reader. To assume an intention on the part of the writer seems very old-fashioned today, but I do not suggest that we should bring back the biographical author. Rather, I submit that every text is caused by a biologically based consciousness. This of course is commonsensical, but nonetheless something that we must again take into consideration. If there is an intention (to make a stimulus and to regulate a context and a possible mutuality with a reader) there has to be a consciousness, and consciousness is caused by the brain, which is part of the human organism. When I argued that Bernhard stimulated his readers in a way that assured a direct communication between them and the outer world, I also asserted that there was an intentional effort behind the style. This intentional effort is an effort of consciousness. According to Searle's *The Rediscovery of the Mind*, all consciousness is intentional, in the sense that consciousness is always a certain way of "seeing as," a certain perspective on the world (1998: 131). Consciousness is a biological phenomenon, caused by activity in the brain (Searle 1994: Introduction); we might conclude that, if consciousness is always intentional, any stylistic effort is also intentional.

3.1. A pragmatic turn

If literature is grounded in consciousness, as I have just suggested, literature is grounded in the biological body of its author. I must stress that such a postulate must be based on a theory of mind which is anti-Cartesian. It must also be based on an epistemology which does not claim any form of biological determinism or foundationalism. Colapietro in "The Pragmatic Turn" (2004) backs up the view that anti-foundationalism, anti-dualism and anti-scepticism are typical of "the pragmatic turn". To evade the dif-

faculties with dualism, foundationalism and scepticism, a pragmatic epistemology and a pragmatic ontology may be useful, especially in combination with, for example, the neurophysiology of Damasio.

3.2. The survival of a conscious self

If we follow neurologist Damasio in *The Feeling of What Happens*, consciousness has to do with the self and is involved in “constructing knowledge about two facts: that the organism (the human body) is involved in relating to some object, and that the object in the relation is causing some change in the organism” (Damasio 2000: 133). Because consciousness involves relations between the organism and objects around it, it also involves the stability and the space necessary for the survival of that organism (ibid.: 137). Thus, the self is caused by the biological need of the organism to survive. I read these facts in relation to a) the textual creation of a context and b) the internal bodily communication in Bernhard and the consequent change in his consciousness. When we consider young Bernhard dying at the hospital, his sudden decision to stay alive might be read as a biological urge to create a surviving self. In his case, the internal bodily communication continued at a low level of consciousness, between two aspects of the organism, the self and the diseased lungs. This change in consciousness could have been what the grandfather meant, and the change had to do with bodily needs. We could ask ourselves, when considering the organism’s need for stability to survive: does this mean that the creation through style of an affective and cultural mutuality between Bernhard and the outer world of his readers ensured the stability necessary for his consciousness to survive?

3.3. The text saves the author

Consciousness, according to Damasio, exists on many different levels: “At its simplest and most basic level, consciousness lets us recognize an irresistible urge to stay alive and develop a concern for the self. At its most complex and elaborated level, consciousness helps us to develop a concern for other selves and improve the art of life” (Damasio 2000: 5). According to Damasio, we have a core consciousness and an extended consciousness, of which there are many levels and grades. Core consciousness provides the

organism with a sense of self about a single moment – now – and about a single place – here. The extended consciousness provides the organism with an elaborate sense of self – an identity and a person – which places the person at a point in historical time, richly aware of the past experienced and the future anticipated, and keenly cognizant of the world beside it (ibid.: 16). Damasio also calls this extended self the *autobiographical* self (ibid.: 17).

The autobiographical self in Bernhard's *Der Atem* can be read in this light. The text performs a life-saving action on the part of the author. It is a pragmatic point of view to see literary texts as actions rather than as objects. The affective drama of the style must be seen as such a performance. Consciousness always represent an effort to stay alive, and behind any textual action, there is a will to live. However, this is usually not as pertinent as it is in the case of Bernhard's writing.

3.4. Consciousness is not one, but many

Damasio has made it a main point to falsify Descartes' dualism between body and mind. In his *Descartes' Error* (1994), he shows how what we know is based on the neurological effects of feelings and emotions. Knowledge, in other words, is based on the function of the nerves. Consciousness, according to Damasio (2000: 4), has a critical biological function that allows us to know sorrow or know joy; to know suffering or know pleasure. None of those personal states would ever be known to each of us without consciousness. In other words, we need the affective underpinnings of consciousness to be able to know something. Merrell points to the three areas of the creation of knowledge: "(1) an emotion, (2) the feeling of an emotion, and (3) awareness of the feeling of an emotion." Merrell then translates this to semiotic terminology:

In Peircean form, feeling itself is the Firstness of Firstness, the qualisign or *image*, ... The becoming of awareness of that emotion in regard to some happening "out there" or in the mind ushers in the Secondness of the *image*, while leaving everything else within Firstness.... Awareness of the feeling as feeling with respect to an *image* and its respective *object* begins happening as the *image* scales the semiotic peak to reach the first level of Thirdness.... (Merrell 2003: 129)

From this we can learn that consciousness (and the cognitive) cannot be separated from feeling and emotion, and that consciousness is not one but many different layers and functions involved in dynamical processes. Thus, to talk about a conscious intention is not to be fundamentalist in an epistemological sense, nor to be causal in an essentialist sense. There is a large difference between biological determinism and a causality based on the “bodymind”:

4. *Causality, epistemology, ontology*

To see poetic writing as something linked causally to biology seems very provocative. This, however, probably also stems from a tendency in literary studies to regard causality as essentialism or epistemological foundationalism. In the future, I believe, it will be most important that poetic writing is not grounded in biological foundationalism. Therefore we must expect that texts treating disease are based not only thematically, but also stylistically, on *ontological realism*.

If we examine medical philosophy, Wulff, Pedersen and Rosenberg state in their *Medicinsk filosofi* that medicine relies on *ontological realism*, combined with a form of empiricism which holds that experience plays a role in the way we see what is real (2003: 48, 54). Empiricism, as a theory of science, emphasizes how we experience the world and, consequently, our observations (Wulff, Pedersen and Rosenberg 2003: 30, 36). Medical thought must rely on ontological realism (that is, the assumption that the world actually exists) and the anti-sceptical thought that it is possible to build knowledge that, when set in action, can have an effect on the outer world as well as the inner somatic world. Without such a grounding, medicine could hardly act curative in any scientific manner.

We could argue that, in Bernhard’s autobiographical novels, the way in which the style ensures a direct and non-representational somatic experience points to a stylistic elaboration of ontological realism. Bernhard’s texts thereby evade scepticism without falling into foundationalism.

5. *Three intentional layers in the style*

In accordance with Damasio’s and Merrell’s understanding of the becoming of knowing, I propose that the Firstness and the Secondness of the mutual

affective and cultural context shared between Bernhard and his readers, as well as the final awareness of the feeling of an emotion, helped Bernhard survive for 40 years. Bernhard's style "infects" his readers with a direct somatic experience of the world which is neither epistemologically sceptic nor fundamentalist, and it made it possible for Bernhard to act politically within Austrian society. By performing his somatic drama in all its multiplicity, his stylistic intention is to force on his countrymen Nietzsche's view that the diseased are the morally healthy. Bernhard secures the health of his native language in the sense that he introduces into it ontological realism, anti-dualism, anti-scepticism and anti-foundationalism. Thus, by acting out his language in public, Bernhard acts politically in his beloved – and detested – home country, and in the effort to save his native tongue from a fascistic foundationalism, he helps to keep himself alive and stable for a long period of time.

6. Conclusion

The study of disease in literature cannot do without examining the style of the writer. By using Bernhard's writing as an example, I have focused on how a pragmatic and a performative use of a mutual communicative context, linked to respiration, can evade representation and anti-pragmatic epistemologies, and act directly on the perception of the reader. At the same time, the study of Bernhard's style calls for a renewed study of the author, not as biography (and the study of Bernhard as a writer has to a great extent been biographical), but as an intention (or *will*, in the terminology of Schopenhauer) linked to the neurobiological phenomenon that is consciousness. If the field of literary studies is willing to open up to contemporary neurobiological knowledge, I expect that we will see a very interesting methodological and theoretical changes in the future.

Note

1. Many thanks to Merja Bauters for making me aware of Merrell's *Sensing Corporeally* (2003). The concept *bodymind* is taken from his book, though, as Merrell himself mentions, the concept was originally introduced by Henry James.

Inference, reference, and indexicality

1. Introduction and outline

Many misunderstandings of Peirce's ideas can be avoided by adopting the view of the symbol, the index and the icon as different uses, dimensions, or functions instead of distinct classes of sign. The respective "multifunctional" concept of the sign allows a clear distinction between signs realizing either a symbolic function, or an iconic function, or both, as is the case in the typical pictogram (Section 2). But the problems with the *index* remain (Section 3.1): To subsume an almost all-inclusive concept of the *index* under *sign* makes the concept of sign empty. Further problems concerning the relations between form and similarity, on the one hand, and indexicality, on the other, arise in view of cases of "indexical similarity" such as the similarity between imprints in the sand and the toes of a bird indicating that this bird is the causer of these imprints.

Thus I suggest to eliminate indexicality from sign-specific functions (Fenk 1997) and to view indexicality as a fundamental cognitive principle pervading but also transcending the world of sign (Section 3.2). Indexical interpretations of events and utterances with respect to possible causes and consequences and to possible agents and intentions are the essential function of our cognitive system, and this inferential machinery is indispensable for the use of representational and referential systems such as language.

2. Separating functions instead of classes of sign

In his *Monist* article from 1906 Peirce argues that "three things are concerned in the functioning of a Sign; the Sign itself, its Object, and its Interpretant" (p. 497). "The Immediate Object of all knowledge and all

thought is, in the last analysis, the Percept”, and “the Immediate Interpretant of all thought proper is Conduct” (p. 507). An “analysis of the essence of a sign [...] leads to a proof that every sign is determined by its object, either first, by partaking in the characters of the object, when I call the sign an *Icon*; secondly, by being really and in its individual existence connected with the individual object, when I call the sign an *Index*; thirdly, by more or less approximate certainty that it will be interpreted as denoting the object, in consequence of a habit [which term I use as including a natural disposition], when I call the sign a *Symbol*” (p. 495).

The division of the sign into icons, indices, and symbols “is the trichotomy I have most studied”, says Peirce (1976 [1908]: 887). This trichotomy, most frequently mentioned in Peirce, got very popular, together with its misunderstanding as a separation of distinct classes of sign. In Eco (1976), for instance, this division is viewed as irrelevant for a “theory of codes” (p. 121) that tries to differentiate between “modes of producing sign functions” (p. 217), and as an “untenable trichotomy [...] by which signs are classified as *symbols* (arbitrarily linked with their object), *icons* (similar to their object) and *indices* (physically connected with their object)” (p. 178).¹ Peirce may have contributed to such misunderstandings, first of all by his substantial use of “icon, index, symbol”. Such a separation of classes would indeed be untenable, e.g., in view of pictograms being icons and conventional symbols at the same time. But, actually, most of the formulations in Peirce suggest an understanding of his trichotomy as a distinction between “isolate dimensions” (Ransdell 1986), or “different uses” (Pelc 1986), or, following Peirce’s (1906) dictum on the same “perceptible” that may “function doubly” as a sign, as “different functions” of sign (Fenk 1997). The following quotations illustrate Peirce’s idea of a multifunctional sign:

An *icon* can only be a fragment of a completer sign. The other form of degenerate sign is to be termed an *index*. [...] A weather-cock conveys information; but this it does because in facing the very quarter from which the wind blows, it resembles the wind in this respect, and thus has an icon connected with it. In this respect it is not a pure index. (Peirce 1976 [ca. 1904], IV: 242)

But a symbol, if sufficiently complete always involves an index, just as an index sufficiently complete involves an icon (*ibid.*: 256).

The same Perceptible may, however, function doubly as a Sign. That footprint that Robinson Crusoe found in the sand, and which has been stamped in the granite of fame, was an Index to him that some creature was on his island, and at the same time, as a Symbol, called up the idea of a man. Each *Icon* partakes of some more or less overt character of its object. (Peirce 1906: 496)

When separating different sign-functions instead of distinct classes of sign, at least the “naïve notion” (Eco 1976: 178) of the icon can be preserved, even in two different versions (Fenk 1997):

I. Either, in the broader version, as any product of a subject’s simulating (imitating, modeling, picturing, etc.) activity.

II. Or, more restrictively, as any sign realizing both the symbolic and the simulating function. The more restrictive version II seems to be more tractable. And it better meets Peirce’s claim that the icon “can only be fragment of a completer sign” or Ransdell’s (1986: 56) view of the icon as a “coordinate” conception of the symbol. But it also better meets the arguments (e.g., of Eco) foregrounding the all-decisive notion of a “code”, i.e., a convention concerning the use of symbolic signs.

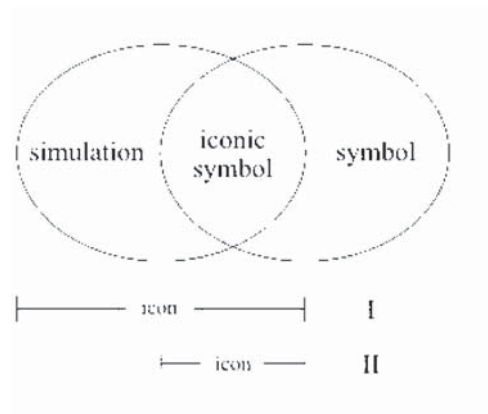

Figure 1. A rather broad (I) and a rather restrictive (II) conceptualization of the icon (adapted from Fenk 1998: 305).

In both versions, compared in Figure 1, similarity is necessary but not sufficient for *iconicity*: The similarity must come about by a subject’s simulating activities. The overlap of the two ellipses in Figure 1 contains those conventional symbols simulating the represented, such as pictograms

or onomatopoeic words. From the point of view of Pelc (1986: 14), the concepts of sign, iconic sign, symbol and the like “are typological rather than classificational, and relative rather than absolute. The corresponding properties, namely, the properties of being a sign, or of being a sign of this or that kind, are therefore a matter of degree.” The conceptualization presented in Figure 1, however, allows two different classifications in the strict sense of the word:

I. A “sign” is either a symbol, or an icon, or both, i.e. an iconic symbol.

II. A “sign” is either a symbol, or a simulation, or both, i.e. an “iconic symbol” = “icon”.

But even if the *icon*, the *index* and the *symbol* are conceptualized as different dimensions or uses or functions of sign, the problems with the index remain. Actually, the simple and clear look on the *symbol* and the *icon* illustrated above only holds if we exclude the index and indexical similarity from the *sign* and from sign-specific functions.

3. *A new look at the index*

3.1 Problems with an all-inclusive concept of sign

If the index exists in its own right as those signs in which there is “a direct dual relation of the sign to its object independent of the mind using the sign” (Peirce 1885, cited in Sebeok 1986: 49), and if “it would be difficult, if not impossible [...] to find any sign absolutely devoid of the indexical quality” (Peirce 2.306, cited in Spinks 1991: 64), then it also “would be difficult, if not impossible” to find any non-sign. If there are no non-signs left, the concept of the sign becomes “all-inclusive” and therewith empty.

In a later study, Peirce is somewhat more cautious in this respect: Although an index functions, like any other sign, only when it is interpreted, the index now remains – and this is “an infallible criterion for distinguishing between an index and an icon” – only “equally fitted to be the very sign that would be if interpreted” (Peirce 1976 [ca.1904]: 256). More generally this would mean that an interpretational act is necessary and sufficient for *sign*.

This is exactly the criterion also used in Keller (1995), but only for the explication of the “symptom”. (The extension of his “symptom” is likely to be the same as in Peirce’s “natural signs and physical symptoms”.) The

symptom and only the symptom is a sign of something only when and only as long as it is the object of someone's actual interpretation, while, say, a word or a picture in a book remains this very same symbol irrespective of whether or not it is interpreted by anybody. In some respects, this boils down to a turnabout of Peirce's system: Now only symbols and icons are signs on their own right, and only the symptoms dependent of a mind using the sign.

In the constructions of Peirce as well as Keller, the index obtains a very special role. This might result from principal problems of integrating the index, the indicator, the indication into a tractable concept of *sign*. The argument developed elsewhere (Fenk 1997): Neither indexicality, nor similarity, nor "indexical similarity" (between the toes of a bird and their imprints in the sand) is sufficient for *sign*. What remains after the respective elimination procedure are the two basic sign-functions presented in Figure 1: simulating and symbolizing.

With the elimination of the index² from the *sign* and from sign-specific functions we not only avoid an extremely broad and rather artificially constructed concept of *sign* including percepts switching between an existence as sign and non-sign. We also avoid problems regarding the relation between the index on the one hand and similarity, form and iconicity on the other: In Peirce (1976 [ca. 1904]: 242) a "pure index simply forces attention to the object with which it reacts [...] but conveys no information." Only "an index which forces something to be an icon", such as the weathercock that is "physically connected with the wind", "or which forces us to regard it as an icon" by nearness and position ("letter attached to a figure", "legend under a portrait") "does make an assertion, and forms a *proposition*." These arguments correspond to his strict definition of a "pure icon" at the end of the following quotation: "The arrangement of the words in the sentence, for instance, must serve as *Icons*, in order that the sentence may be understood. The chief need for the *Icons* is in order to show the Forms of the synthesis of the elements of thought. [...] No pure *Icons* represent anything but Forms; no pure Forms are represented by anything but *Icons*" (Peirce 1906: 513). The problems:

(1) From the point of view of information theory and of cognitive science in general one simply can not accept the existence of a perception that does not convey any information for the perceiver!

(2) And in many cases it is of course the form of what we perceive that indicates how we might interpret it. This applies to “form” in a very concrete sense, as in the “form” of the imprints in the sand indicating a certain causer (a man, a bird, or a worm) and the way it moved, as well as to, e.g., the “form” of sentences indicating a certain meaning and a certain intention of its utterer. In all of these cases it is the form that offers much of the relevant information. A separately functioning “pure index” “forcing something to be an icon” or forcing us “to regard it as an icon” is a superfluous and rather artificial construction. This construction, as well as the construction of an again “pure” icon representing nothing but a “pure” form, is probably a means to sustain a borderline between the *index* and the *icon* at least in a mathematical world behind our perceptual world.

The elimination of the index from *sign* and from sign-specific functions allows, however, to view indexicality as a cognitive principle not only pervading but also transcending the world of sign (Fenk 2004). This principle is also effective at the “interface” between inference, which is the essential function of our cognitive system, and reference, which is the essential function of language (Fenk and Fenk-Oczlon 2007).

3.2 Indexicality within and beyond semiotics

Grice (1957) and Sperber and Wilson (1986) thoroughly investigated the role of inferences in language understanding. But the intimate relationship between inferential and referential interpretation can be shown on even more general and more basic levels: Our cognitive system is an inferential machinery. Its essential function is the extraction and construction of patterns and regularities (Brunswik 1957). Anticipation plays doubly a role in the build-up of such nomological knowledge:

within a hypothesis-testing “method” (evaluation of expectations) in everyday life, and, rather systematically, in empirical science.

as the biologically essential goal of making events better foreseeable (Fenk 1986: 212). Such knowledge is a presupposition not only for the anticipation but also for the reconstruction of patterns of events, within and beyond communication (Fenk and Vanoucek 1992: 20).

Both the development and the application of such nomothetical knowledge requires “indexical” assumptions or interpretations, i.e., interpretations of something as indicating something else, such as associated

features and events, causes and consequences, agents and intentions. Such inferences are enhanced by a referential system that offers prefabricated expressions for specific phenomena such as specific “causes and consequences”, “agents and intentions”, and they are required for developing a “theory of mind” and for efficient “mind-reading”.

Pattern recognition is not only required for the identification of, e.g., icons and the detection of similarities between them and the represented, but also beyond any referential or representational system, such as in the “indexical similarity” between a bird’s toes and their imprints in the sand. The respective inferential machinery is older and more fundamental than language but is even required for the identification of words – the symbols absolute in Peirce! – within the speech record (Zacks and Hasher 2002) and for the extraction of possible rules for the use of these words (Wittgenstein 1933).

Notes

1. In this quotation, the explication of the “symbol” seems to be rather an amalgamation of the *symbol* in Peirce and Saussurean ideas of the arbitrariness of the symbol.
2. To discriminate between artificial and natural indices (as in Langer 1942) and eliminate only the latter from *sign* would not solve the problems since the remaining “artificial indices” in terms of Langer turn out to be nothing but conventional symbols (Fenk 1998, 2004).

Héctor Fernández Babillo

Understanding mysticism in music

A dialogue between Joaquín Rodrigo and Saint Francis of Assisi

Here I try to investigate the way in which mysticism is musically conveyed in several pieces by Joaquín Rodrigo. It is therefore not an attempt to elucidate the religious convictions of the composer, but simply a descriptive account of the mechanisms he employs to represent the mystic dimension of texts. I will refer to the figure of the Italian, Saint Francis of Assisi (1882–1226) and the several renditions of that figure as portrayed in Rodrigo's vocal works. More specifically, I will analyze the relation between music and text in the following pieces: *Cántico de San Francisco de Asís* (Chant of Saint Francis of Assisi), *Lo violi de Sant Francesc* (The Violin of Saint Francis) and *Sant Francesc i la cigala* (Saint Francis and the Cicada).

As a brief introduction we can provide some notes on the depiction of the different pieces. The *Cántico* is an oratorio based on a poem by the Italian saint; the second and third pieces are part of a trilogy named *Triptic de Mosén Cinto* (Father Jacinto's Triptych). The genesis of the *Cántico* is described in the following:

Father Merino came to visit us at the beginning of 1981. He was a very erudite Franciscan, very nice, and he was accompanied by Juan Ignacio Pombo, the famous aviator, already retired. They told us about the eighth hundred centenary of Saint Francis of Assisi's birth, which was going to take place in the fall of 1982. With that motive, they wanted to commission Joaquín to write an oratorio based on a poem by the Saint. Joaquín accepted almost without any insistence, since both of us felt a predilection for the "poverello" [nickname of the Saint], friend of the forest animals and the country flowers.

Joaquín was very enthusiastic about the poem part of *Floreccillas* – pointed out by Father Merino, and some months later the Oratorio was finished under the title of *Cántico de San Francisco*. (Kahmi: 300, my translation)

By contrast, the triptych was an earlier piece (1936) based on three poems by the Catalan writer – usually referred to as one of the last mystic poets – Jacinto Verdaguer (1845–1902). Nevertheless, he also recreates the life of Saint Francis of Assisi. The first of the three pieces, *The Sacred Harp*, is the most mystical of all the poems, based on biblical content. Although this piece is not specifically related to the Italian saint, it will provide us with a parallel example for the present analysis. The second piece (*The Violin of Saint Francis*) narrates a miraculous event in which the Saint is able to play two pieces of wood as if they were a violin from which great music emanates. The last piece (*Saint Francis and the Cicada*) is more contemplative and relates the dialogue of Saint Francis with a cicada, who symbolically answers with the onomatopoeic sound “zigaluzet” (Chirr... Chirr..., in Catalan).

Therefore, three different renditions of mysticism are represented in these musical characterizations of St. Francis. In parallel, they embody an emblematic leveling that shifts from a transcendental plane into a more ordinary and natural stage. The first piece deals with celestial content (the words of the saint praising the greatness of God) while the second is more down to earth, in a nativity scene (but with a miraculous moment); finally, the third piece takes place on a common day and does not involve any extraordinary element.

Does this gradation have any influence on the musical renditions of Joaquín Rodrigo? To answer this question we will consider the harmonic backdrop of the different pieces. If we analyze the harmonic foundations of the *Cántico*, we realize that the tonality is unclear from the very beginning. The overall key of the piece is D minor, but already in the opening theme, several harmonic options are available (see Example 1).

Example 1. Rodrigo, *Cántico*, opening.

Throughout the piece, we find abundant resources that promote tonal ambiguity or that attempt to evoke ancient styles of composition, in accordance with the time frame surrounding Saint Francis. Examples of these techniques can be found in the use of superimposed chords (as well as complex chords without a clear tonal function), the avoidance of thirds (and fifths) in the construction of chords (see Examples 2 and 3), or imitations in fourths and fifths (Ex. 4).

Example 2 shows two staves of music. The upper staff features a melodic line with eighth-note patterns and a piano (*p*) dynamic marking. The lower staff consists of chords, some of which are superimposed or complex, with a piano (*p*) dynamic marking.

Example 2.

Example 3 displays three staves of music. Each staff contains complex chordal structures, often with superimposed notes, and a piano (*p*) dynamic marking.

Example 3.

Example 4 presents a vocal score with four parts: Soprano (S.), Alto (C.), Tenor (T.), and Bass (B.). The lyrics are in Spanish: "Yel es be-llo y ra-dian-te con gran es-pen-dor; de ti, al-tí-si-mo, be-lloradían-te con". The score includes a forte (*f*) dynamic marking and a common time signature.

Example 4.

In a similar way, we find a parallel treatment in the piece *L'arpa sagrada*, the first in the *Tríptico de Mosén Cinto*. Though not based on the life of St. Francis, it nevertheless bears an intense mystic character, based in biblical content related to the “sacred harp” of David. In this case, modality that plays a more important role in the distortion of harmony, and the general concept of tonal ambiguity accordingly remains as a tool to convey the implications of the text.

Our second piece, *The Violin of Saint Francis*, represents a step down in the development of the image of mysticism we are developing. The general background of the piece narrates an “earthly” nativity scene. The orchestra recreates a festive atmosphere, and the harmony will become tonally centered in the key of E Major. However, the significant point of this episode arrives when the miracle of Saint Francis occurs, a moment in which the saint is able to produce great music from two pieces of wood, playing them as if they were a violin. Only at this miraculous moment does the key change purposefully and drastically, from E Major to Bb minor, responding to the logic of the overall harmonic scheme developed by Rodrigo. In this line, all the tonal instability and modulations begin to take place precisely before the miracle, preparing the harmonic Bb minor climax which will last for just fifteen bars (see Example 5).

The image displays a musical score for a piano piece. It consists of two systems of music. The first system shows a piano introduction with a treble clef staff containing complex chords and a bass clef staff with a rhythmic accompaniment. The second system features a vocal line in the treble clef staff and piano accompaniment in the bass clef staff. The key signature changes from E Major (three sharps) to Bb minor (two flats). The vocal line begins with the lyrics "Lo vi - o - lí des frei - xe, l'ar - quit d'un". Dynamic markings include *mf* (mezzo-forte) for the vocal line and *p* (piano) for the piano accompaniment.

Example 5 a.

17 *poco meno mosso* *rit.*
 brot de pi, mes en ses mans sa - gra - - des gran

(*rit.*) *assai* *pp* 18
 mú - si - ca en sor - tí. ò No n'ha d'ei - xir de mú - si -

arp. lento

Example 5 b.

The final stage in our analysis of Rodrigo's delineation of mysticism will be represented in *Saint Francis and the Cicada*, which stands as the most descriptive of all the pieces. The beginning resembles the sound of the cicada in the early morning, with its infinite tremolo in the woods. In this last piece, the tonality will be very well established, with an unambiguous C Major that the composer uses as a contemplative key for the recreation of nature. In this musical episode, the composer emulates the sound of birds (Ex. 6) and makes use of a rhythmic motive for the cicada chirping (Ex. 7). Despite some animation when the cicada sings the "song of summer", Rodrigo always keeps a meditative atmosphere that is harmonically represented by a lack of tonal modulation.

Even from this brief analysis of the different pieces, we can withdraw some initial conclusions that shed a little light on the resources used by Rodrigo in order to portray mysticism. The most interesting conclusion is the coherent use of tonality as a functional tool that represents attachment

Examples 6 and 7.

to the real world. The disengagement from a focal tonal key represents in the different pieces a voyage towards mysticism while tonal stability links the music to the more down-to-earth scenes described by the text. Consequently, the *Cántico* (as happens with *L'harpa sagrada*) is the most ambiguous in tonal terms. At an intermediate level, *Lo violi de Sant Francesc* is tonally well established, but the key is intentionally changed at the moment of the miracle. Finally, *Sant Francesc i la cigala* stands as the most descriptive and contemplative of all, bestowed with a very stable and consistent tonality. In general, we can appreciate that the text leads the articulation of the music, but the mystic dimension of the texts is intrinsically developed by means of harmony, bringing about an emblematic levelling of the pieces. Although this brief study is a rough draft, it establishes an important foundation for the “dialogue” between Joaquín Rodrigo and Saint Francis of Assisi, providing interesting insights on the coherent construction of the works by the composer and opening the ground for further, more extensive analyses.

Vladimir Feshchenko

Semiotics and the avant-garde as two ways of sign-making and sense-making

As Eero Tarasti pointed out in the opening speech to the 9th Semiotics Congress, “semiotics has kept itself as the avant-garde of sciences. It has always been looking forward, aspiring for the new, discovering new territories, asking new questions, making new explorations.” In this paper I undertake to unfold this metaphor of *semiotics as avant-garde* and, moreover, go so far as to literalize this metaphor. I will dwell upon some common features of semiotics and the avant-garde as two complementary fields of creative thinking and as two ways of operating with signs.

Whereas semiotics is mainly considered a *science* of signs, the avant-garde represents a particular form of creativity, an assembly of *artistic* practices. In a general sense, the term avant-garde is usually referred to all new and experimental views, ideas, movements, schools and works by individual artists of the twentieth century (the term Avant-Garde is capitalized hereinafter when it refers to this broader meaning). The “avant-garde condition” – a term coined by the contemporary Russian avant-garde poet Gennadiy Aygi – or “avant-gardeness” as such, could be best described by the words of Kazimir Malevich (2003: 132) from the 1/42 *Non-objectiveness* manifesto dating from the 1920s: “Man has shifted to new circumstances and must create a new form of new relationships.” This is a truly semiotic statement, indeed, which correlates with the three semiotic dimensions, the new circumstances standing for semantics, the new form – for syntactics, and the new relationships – for pragmatics. Here the avant-garde way of thinking coincides with the semiotic way of thinking. The Avant-Garde, as Mikhail Epstein has noted (1988: 399), is “the operative semiotics of arts, its decomposition into signifying elements, conceptual patterns ... The avant-garde is the constantly increasing awareness of art in what it might be, the pure

logics and semiotics of possible artistic worlds.” So, creative semiosis is understood here as inherent to an avant-garde act of thinking and creating (see Stepanov et al. 2006; Stepanov 2006; Sirotkin 2006; Feshchenko 2007; Latifić 2007). The same idea – the idea of the semiotic triad – was repeated in a slightly different wording by another avant-garde author, Vladimir Mayakovsky, in his article *Two Chekhovs* (1914). Inquiring into what shifts take place in the new poetry of the Avant-Garde, Mayakovsky (1955: 301) distinguishes three points:

What are the shifts taking place with the laws of words?

- the shift of relation of the word to the object, from the word viewed as a digit pointing precisely at the signified object, to the word as symbol, the word as object-in-itself;
- the shift of relation of the word to the word, a word to another word. The speeding-up tempo of life has laid a road from period as syntactic unit to the ragged syntax;
- the shift of relation to the word. Enlargement of the vocabulary with new words.

In this passage by the Russian futurist poet we can clearly pinpoint the basic semiotic properties of a sign as defined by Peirce and Morris. It is very doubtful that Mayakovsky was aware of semiotic studies originating from the West at practically the same time. Now, all this is not meant to show the originality of Mayakovsky, but rather to draw closer attention to some parallel intellectual trends and techniques which could bring together semiotics and the Avant-Garde. These two disciplines – the Avant-Garde could also be called a discipline in a way – being juxtaposed, at first glance look like an “encounter of a sewing machine and an umbrella on a dissection table”, using Lautréamont’s well-known metaphor. But some deeper insight into the nature of the two fields can reveal some very common frameworks, tools, and procedures. One of these is theoretical activity, the other a practical one; semiotics and the Avant-Garde share some similar or even identical ways of operating with signs.

Many avant-garde art and literary practices of early twentieth century were closely intertwined with theorizing about signs. The Avant-Garde revolution was to a considerable degree a semiotic revolution, or a “semi-quake”. The very grounds of communication and semiosis were undermined, and the categories of sign and language were reconsidered. Julia

Kristeva (1984) calls this the revolution in poetic language, considering the Avant-Garde in Marxist, Freudian and Peircean terms. But what she is doing in her book is analyzing the poetic texts of Avant-Garde from a semiotic perspective. What I would like to do here is to touch upon some semiotic ideas contained in Russian avant-garde writings, on the one hand, and to show the avant-gardeness of some scholarly semiotic writings, on the other.

The so called “linguistic turn” in the late nineteenth – early twentieth century was a crucial factor that influenced greatly the situation in European culture of the latter century. Unprecedented was the interest that many intellectuals at the turn of the century took in the category of language and other sign systems. This interest was reflected in numerous experiments, both scientific and artistic, in language construction and language creativity. This linguistic turn was finalized in Martin Heidegger’s formulation, “Language is the house of being”, enunciated in the opening page of his 1947 *Letter on Humanism*. Thus, a totally new format of thinking and creativity came into being: the format determined by language. Even theological thought could not avoid this linguistic turn. I would like to mention in this regard such Russian thinkers as Pavel Florensky, Alexei Losev, and Sergei Bulgakov. These three authors are considered the major originators of the “philosophy of the name” in Russian thought. And all three contributed much to the semiotic discussions of their time, namely regarding such categories as the term, the image, the symbol and the divine name (Stepanov 1985; Ivanov 1999; Kusse 2007; cf. Ioffe 2007).

This Russian tradition of semiotics was a bright representative of the linguistic turn in humanities and arts of the early twentieth century. And what was specific about this tradition, in comparison with the western mainstream semiotic tradition, was its greater concern for deep and spiritual knowledge rather than the positive knowledge practiced by Pierce, Saussure and others following them. I call this tradition *deep semiotics*, or semiotics of the inner self (Feshchenko 2006). By deep semiotics I mean the extension of the theory of sign systems by way of the personal-logical dimension of sign-making and sense-making. This kind of semiotic approach takes into account the truly human and personal self-determination. Since the self and the mind of the self are the source, the means, and the result of producing sense, this dimension could be called personal, or self-referential. This approach allows to shift from the two-dimensional

consideration of a sign system, to the stereometrical one, which gives that semiosis a depth perspective; hence the term “deep semiotics” (cf. Brandt 1989). This Russian tradition is very poorly known among semioticians. Everybody knows Yuri Lotman and Mikhail Bakhtin, but these two scholars are only the later successors to this line of thought. I would like to refer here to just two major representatives of this covert tradition.

The first is Gustav Shpet (1879–1937) who was a philosopher by education and profession. He was actually educated in Germany, being a disciple of Husserl (see Haardt 1993). He is mainly known for his phenomenological papers. Actually the only book by him translated into English so far is *Appearance and Sense* (Shpet 1991, published in Russian in 1914), which is a study of phenomenology. He also produced some writings on hermeneutics (in German; see Špet 1993), and this is where Shpet becomes interesting for a semiotician. Shpet’s most well-known book is called *Inner Form of the Word* (1927). This book dwells upon the particular importance of inner forms in poetic semiosis. Inner forms, in Shpet’s view, have a direct relation to the subject of semiosis, the creator, or “persona creans”, as he puts it in Latin. What we experience in the language of art, he claims, is the subjective expression. So the artistic semiosphere is primarily a sphere of subjectivity. And semiotic procedures in poetry, for example, constitute a dynamic process, a process of gradual evolution from inner forms to outer forms. This is a very important idea, indeed. It brings us closer to understanding the semiotics of poetry, and semiotics of artistic creativity in general. Shpet was the first Russian scholar to mention the term semiotics, by which he meant (2005: 476) a “general ontological study of signs”. As early as 1916 Shpet used this term in his work *History as the Subject of Logic* (published 1922). Thinking of how the historical cognition operates, he argued the following (1922: 247):

The historical cognition is never exclusively the sensual or the rational cognition, neither it is cognition of inner or outer experience, but it is always cognition presuming understanding and interpretation as the means of understanding. This kind of cognition may be called semiotic cognition.

In Shpet’s main semiotic writing, the book called *Language and Sense*, dating from the 1920s, he traces back the origins of semiotic thinking and lays the foundations for new semiotics, by which he means the science of understanding signs. It is here that Shpet speaks of the ontological study

of a sign, calling this study semiotics, or else “characterics”, and raising the issue of the *semiotic mind*. The sad thing is that many of Shpet’s writings have gone unpublished until recently; for example, the semiotic treatise I am speaking about was published in Moscow only in 2005 (Shpet 2005). So very much is still to discover in his semiotic studies, and I wish these works someday would be translated into European languages.

Another person to be noted in this context is Andrei Bely (1880–1934), a well-known Russian poet representing the symbolist movement, but a less-known semiotician, too. His main work of interest is titled *Thought and Language* (1911). In this essay Bely gives a consideration of symbolism in poetic language. Poetry, according to him, is the transformation of thought through a specific image expressed in the word, or else, it is the creation of an expanded meaning with the help of a single yet complex word symbol (Bely 2006: 206):

The connection between the sound form with the inner form constitutes the lively symbolism of language. The inner form is blossoming in the poetic symbol, it is reflected in a multitude of indirect senses present in the sound of the word, the word becomes here an autonomous symbol.

All these ideas may sound quite trivial today, considering semiotics of literature’s long and successful trek throughout the last century. Why I am dealing here with Andrei Bely’s thoughts, is because he was one of the first people that not only contemplated some semiotic ideas, but also put them into effect in his practice as a poet and prose writer. And he was indeed one of the first avant-gardists, too, being a prominent semiotic thinker at the same time.

I’d like to mention here that the Russian Avant-garde as a whole was characterized by a high degree of theorizing, through manifestos, treatises, autobiographical writings, etc. Moreover, it evidenced a high degree of semiotic consciousness in that the avant-garde writers, painters, filmmakers, theatre performers clearly realized that, while revolutionizing arts and revolutionizing the world, they must take proper care in revolutionizing the old language, and the old semiotic conventions, too (on these matters, see Stepanov et al. 2006). In this respect I can name just a few examples of how avant-garde artists reconsidered the old semiotic conventions.

It is well-known that Roman Jakobson began his scholarly career with studying the poetics of Velimir Khlebnikov (Pomorska et al. 1987; Jakob-

son 1992). But there are few of those who know about the semiotic exercises performed by Khlebnikov himself. His draft materials contain numerous attempts to invent new signs of artistic expression. His “language of the stars” combined the elements of word language, digit language and graphic language. Khlebnikov took a profound interest in artificial languages and based his inventions on semiotic theories of Leibniz and others. His semiotic way of thinking is well expressed in a quotation from *Boards of Fate*, a Khlebnikov opus magnum (2000: 49): “We should look around, look into, measure, and tag the signs of our thinking across the countries of the being, shifting the trenches of knowledge.”

Another key figure in respect of the semiotic Avant-Garde is Wassily Kandinsky, who was, *inter alia*, a prominent theoretician of arts. In his theory he came very close to Gustav Shpet’s ideas of the inner form. He called his main artistic principle the *principle of internal relevance*. A work of art, according to Kandinsky, is a combination of the external and the internal elements, the contents and the form, which are bound together inseparably and relevantly. From this basic principle Kandinsky derives a whole system of basic elements of painting, which form a specific sign system of that art (Kandinsky 2006). The semiotic way of thinking may be well illustrated by Kandinsky’s analysis of a point as a semiotic sign and artistic element. He visualizes, for instance, how a point as a full stop in a written speech sequence transforms itself into a point, as a spot in the language of painting. The point, according to Kandinsky, has the semantics of a nil, or a nought, and at the same time it bears the highest degree of brevity and reservedness, signifying the connection between speech and silence. Thus, we can clearly see how the artist’s avant-garde experiments operate on the two interconnected levels – the semiotic and the metasemiotic.

The last figure I’d like to mention here is neither a poet nor a painter. He is a director and theatrical performer. I’m speaking about Sergei Eisenstein. The recent publication of his previously unpublished materials (2002; 2003) reveal an outstanding semiotician, primarily in his quest for the definition of filmmaking method. In his writings and graphics he experiments with various types of signs; his later writings abound with different signs and his commentaries on them.

To finish, I would like to draw attention to yet one more significant aspect of semiotics and the Avant-Garde. It concerns the topic of this

Congress, that is, understanding and, more importantly, misunderstanding. Making of a sign and making sense as the key semiotic procedures are also the key instruments of creating an avant-garde work of art, as well as the key tools for understanding an Avant-Garde work of art. The two other subprocedures specific to Avant-Garde creativity are making a non-sign (a zero sign) and making non-sense (absurdity). These two latter semiotic techniques are most expressly and radically represented in the work of Alexander Vvedensky, a Russian absurdist poet from the OBERIU circle, and Anton Webern, a musical composer. The non-signs, or “semiotic silence”, as defined by Jakov Druskin (2004: 735), constitute a very interesting semiotic field, which is connected with the problem of misunderstanding as a positive notion, not a negative one. Vvedensky himself calls this kind of misunderstanding the “wide misunderstanding”, or the “wild misunderstanding”. This state of semiotic silence in absurd poetry and music presumes that it is not the meanings that are meaningful, but rather that the gaps and the boundaries between meanings are meaningful. This is what misunderstanding in this sense is about.

Summarizing, I'd like to stress again that the Avant-garde and semiotics could be viewed as different manifestations of similar practices. In avant-garde artistic practices the semiotic consciousness carries considerable importance. At the same time, semiotic theories demonstrate some features of avant-garde thinking. The concept of sign itself, as I tried to show, was approached in the Russian Avant-Garde from different angles but in similar ways, both in artistic practices and academic studies. Thus the Avant-Garde could be thought of as an operational semiotics of arts. Semiotics, in its turn, could be understood not only as a science of signs, but also as semiotic activity in a broader sense, in the sense of Roland Barthes, who thought of it as “activité structurale”, and in the sense of Julia Kristeva who claimed (2004: 55) that “semiotics is always an open research, a critique always referred to itself, in other words – self-critique”.

This research has been supported by the Russian Federal Agency for Science and Innovation, research grants HIII–8840.2006.6 and MK–3896.2007.6.

Riccardo Fusaroli

The screen and the voice

1. Introduction

The Internet and the Web are valuable tools for making services and information easily available. But if we think of disabled people – the blind, for example – this potential value seems to disappear. How can a blind person browse a website? There is software for reading the screen and translating two dimensional pages into vocal streams. But this is not enough, since the result is often a confusing list of sentences and lexical items without any intelligible order. This paper aims at untangling some of the deep misunderstandings leading to this situation, with the aim of contributing to the formation of good practices in removing barriers to disabled people trying to access web services and information.

From a semiotic point of view this is a fruitful arena for a model of the text not as already shaped, static and crystallized, but as course of semiotic action. Different perceptual, interactive and interpretative practices act in concert on the same informational items, leading to very different meaning configurations and experiences. This paper has thus the double aim of tackling a real problem in web development, by showing how important aspects of communication risk neglect without the semiotic gaze; and by highlighting the fruitfulness of the interpretative approach to semiotics as opposed to other models, in describing the actual development of meaning configurations.

After a brief introduction to issues of disability, a semiotic analysis of the accessibility for blind users of www.europa.eu is presented below. Taking categories from Peirce and theories of semantic perception, the analysis compares the structures of meaning emerging in the browsing practices of sighted and blind users. Two detailed fragments are reported together with the final results of a more comprehensive analysis.

2. *What is at stake with the issue of web accessibility?*

A UN declaration is quite helpful in defining the problem:

The term “handicap” means the loss or limitation of opportunities to take part in the life of the community on an equal level with others. It describes the encounter between the person with a disability and the environment. The purpose of this term is to emphasize the focus on the shortcomings in the environment and in many organized activities in society, for example, information, communication and education, which prevent persons with disabilities from participating on equal terms. (U.N. Standard Rules on the Equalization of Opportunities for Persons with Disabilities)

A disability is thus only a potential – not a necessary – handicap. A disability is a functional limitation within the individual caused by physical, mental or sensory impairment, whereas a handicap occurs when there is the loss or limitation of opportunities to take part in the normal life of the community on an equal level with others, because of physical and social barriers. Thus, to avoid a handicap we do not need to negate the disability; rather, we need to ensure an equal, or better, analogous participation, which acknowledges the difference created by the disability. This acknowledgement is important in the avoidance of creating a handicap. Let us take the example of jobs for disabled people in Italy. When the clear handicap of disabled people in finding jobs was acknowledged, laws were issued, forcing Public Administrations and companies over a certain size to employ a certain percentage of disabled workers. Unfortunately, this did not solve the issue. Since the differences created by disabilities were not properly acknowledged, there were (and still are) many problems. Many employed disabled people did not produce value for their employers and in many cases felt useless and unhappy with their jobs. The need arose to find duties both useful to society and adequate to the competences of the disabled.

At last, some programs are starting to deal with the education of disabled people, to ensure a more aware and daily interaction of “normal” people with disabled ones, and thus to inject diversity into the “normal” practices of life. How does this apply to web accessibility? The next paragraph will explain how an acknowledgement of the differences of disabled people is needed in practices of assessment.

3. *Assessment of accessibility*

Most European countries have created laws to ensure the right of disabled people to access public services and information in their online versions. To ensure this right a certain amount of formal requirements are listed, usually based on the Web Content Accessibility Guidelines (WCAG) produced by the Web Accessibility Initiative (WAI, <http://www.w3.org/WAI/>), part of the World Wide Web Consortium (W3C), whose duty is to produce documentation and recommendations for the development of an accessible web. The immediate effect has been the development of automatic validators: software able to check the formal requisites of accessibility of a given website and to grant the right to exhibit a certification of accessibility.

A better reading of the guidelines would have raised doubts about these certifications. Many instructions had a more discursive explanation, pointing to the qualitative aspects of accessibility. Let us take an example: “Provide a text equivalent for every non-text element”. The automatic validators will thus check to see if every image has a verbal alternative. The problem is that a given image should not simply have a verbal alternative, but given it should have a verbal alternative with an analogous communicational value. This kind of equivalence cannot be checked by any software. In fact, a second version of the Guidelines (WCAG 2.0) has been (and still is) in progress for many years, trying to overcome the limitations of the first guidelines and better consider their reception and application.

WCAG 2.0 bases its instructions on four basic principles: (1) *Perceivability* – Information and user interface components must be perceivable by users; (2) *Operability* – User interface components must be operable by users; (3) *Understandability* – Information and operation of user interface must be understandable by users; (4) *Robustness* – Content must be robust enough that it can be interpreted reliably by a wide variety of user agents, including assistive technologies.

Even if these principles try to be way more qualitative than the ones in the first version, they still carry the seeds of a deep misunderstanding. The four principles are taking for granted an engineer-like model of communication (Shannon and Weaver 1949): there are some informations meant to be codified and transmitted, there is a medium that could distort them, there is a process of decoding. While not having the space here to high-

light the inner limitations of such a model, some weaknesses of its application to this situation can be emphasised. Certainly making a web site accessible requires to make sure that every single piece of relevant information is accessible by the user. But this is by no means enough. The meaning of every single sign, token, word, even morpheme, deeply resonates with the wider meaning configuration that is unfolding in the browsing practice of the user: a local configuration of meaning emerges on a ground of expectations raised by the genre of the website and previously established inferences.

To be fair, this could be implied in the principle of understanding (Guideline 3.1): “Make text content readable and understandable”. Unfortunately, the principle is operatively translated into specifying the language of the page and occasional verbal utterances in different languages; the need is felt to explain unusual words and abbreviations, and to use short words and simple syntax. But a verbal occurrence resonates according to its position on the page, to the connotations created by graphic elements, to its possible echoes with a given image and so on. When a screen reader linearises the page and substitutes images with textual alternatives, its position and its echoes can drastically change, and thus understandability can be compromised.

We need clear criteria, but the ones available are not enough. It is time to put semiotics in action to show how a similar approach to the ongoing practice of browsing of a website can go much deeper into problems of meaning (and misunderstandings).

4. The case study: www.europa.eu

Figure 1. Splash page.

Figure 2. Home Page .

The European Union enthusiastically promotes web accessibility, both through recommendations and campaigns of sensibilisation. The EU website has a team dedicated to making it accessible. Nevertheless, several barriers for blind users browsing the website emerge – barriers that, ironically, can be found even in the alternative “text version” of the website, which is designed specifically for disabled people in general and blind ones in particular.

4.1 The semiotic perspective

Saussure claimed that the value of linguistic elements is always constituted by an internal and an external aspect. Economic value of a coin emerges from the fact that it can be exchanged with other coins (internal value) or used to buy something (external value). Similarly, linguistic (and thus semiotic) values are not simply immanent to language but are also dependent on the way they are used, the way they are embedded in a wider semiotic practice. One perspective, developed in the work of Rastier (2001) and Cadiot and Visetti (2001), does not imply an account of the idiosyncratic experience of the single user, but an account of intersubjectively sedimented practices, or in Peircean terms: concatenations of habits.

Analysing the website, we are taking into account two different semiotic phenomena. On one hand we have the visual version of the website, which is two dimensional, built with a complex mix of verbal and graphic elements and with specific perceptual saliences and kinetic affordances. On the other hand, the vocal stream generated by the screen reader, is developed in the temporal dimension, with different saliences. Moreover, both “normal” and blind users browse the web in different ways and with different expectations. Even if the verbal elements of the website are more or less the same, the meaning experienced is very different. Thus, a multi-component approach should not be an option. Semiosis is a continuous and pervasive process already structuring any emerging meaningful event. This happens through the structuring activity of habits, “general law[s] of action, such that on a certain general kind of occasion a man will be more or less apt to act in a certain general way” (C.P. 2.148).

Thus our analysis required sketching the expectations aroused by the genre of the website (information website, institutional portal); the users’ mind-sets (e.g. in the case of blind people, annoyance at the excessive use

of images); and the competences of users as related to the specificities of the text. Moreover, these established habits and framings are continuously remodulated through the unfolding of the semiotic phenomenon itself, in which local relations are established and new habits emerge to be used as premises of further interpretation processes. Thus, it is possible to describe the local configuration of meaning as a diagram, that is, as a particular configuration of more general relations, which “represents the probable course of experience” (C.P. 2.169) and which can be manipulated for further interpretative action (NEM 4). To quote Visetti and Cadiot (2001): “to perceive [meaning, in our case] is always to sketch a sense that is not developed if not in a path, in an activity of thematisation in which identities are made and unmade.”

A text is not a static entity; it is always already imbued and defined by the interpretative practice in which it unfolds. This conception makes it possible to explain how semiotic configurations continuously modulate a field of interpretative and pragmatic habits, in which semic structures and underlying isotopies are established. For reasons of space, we shall isolate only two fragments of the website, to better display these mechanisms, while remaining aware that processes of meaning emergence involve the whole website.

4.2 The path to become a European citizen

Visual version	Vocal version
 <p>DISCOVER THE EU</p> <ul style="list-style-type: none"> . The EU at a glance . Europe is fun! . Europe and Young People . Easy Reading Corner . Languages: Europe's asset <p>LIVING IN THE EU</p> <ul style="list-style-type: none"> . Your rights . Travelling . Studying . Working <p>INTERACT WITH THE EU</p> <ul style="list-style-type: none"> . Your direct line . The EU in your country . Contact the Ombudsman 	<p>Graphic Discover the EU List of six items bullet link The EU at a glance bullet link Learn Europe by playing bullet link Europe and Young People bullet link Read about Europe bullet link Languages [colon] Europe's asset bullet link Speak a new language List end</p> <p>Graphic Living in the EU List of four items bullet link Your rights bullet link Travelling bullet link Studying bullet link Working List end</p> <p>Graphic Interact with the EU List of five items bullet link Your direct line bullet link Contact your MEP bullet link Europe near you bullet link Discussion corner bullet link Contact the Ombudsman List end</p>

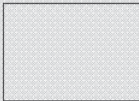

Let us start with the visual part. Each list presents itself as a significant *Gestalt* (comp. Geninasca 1997), due also to its colour-configurations. This *Gestalt* has a complex semantic articulation to be deciphered not only in its internal structure but also as resonating wider meaning configurations. Through the first list, a semantic figure of the EU is established as related to youth and being new (“discover”, “playing”, “young”, “new”), where learning about it is positively characterised as easy and funny (“discover”, “at a glance”, “playing”). These semantic configurations play a big role in the following actualizations of meaning. “Living in the EU” does not necessarily imply a positive connotation, but the opportunity is easily seen as positive, due to the semantic habits constructed in the previous sequence, a positivity further established in “rights”, “travelling” “studying”, “working”. The positivity is unfolded in different ways, certainly, but that is the nature of habit – as understood here. From the many that Peirce proposed, we choose a flexible regularity, and not a rule relying on a static type. The isotopies (redundancies of semantic units) thus inferred are not necessarily homogeneous, but can present gradients and variations.

Before analysing the third list, we can observe how the ongoing interpretative practice that defines the development of the website as a semiotic phenomenon continuously modulates between enunciative and enunciated figures, making them emerge from a texturing that keeps them together. On one hand we have: the EU as a semiotic instance of enunciation of the website, the website and the represented EU. Who is giving out the information? The website or the EU? The EU produces the website as its official delegate on the web. Discovering the information on the website is also discovering the EU, and the information disclosed on the website is part of the opportunities given by EU. On the other hand we have: the user as a semiotic instance of interaction and interpretation of the website and the subject represented in her/his potential interaction with EU. The user is seeking information by interacting with the website/EU. There is the representation of a subject getting information and interacting with the EU, and this activity is represented as funny, easy and leading to deeper involvement. Moreover, this subject is sometimes impersonal (“Living in Europe”), sometimes, when more clearly positive, directly identified with the user (“Your rights”). The third sequence pushes this blending further. The interaction is more direct and aware (“interact”, “direct”, “near”, “discussion”). Thus, the evolving characterization of the subject emerge in

a *Gestalt* that we could ironically call a *Bildungsroman*, creating a slight resistance to the completion of this path by the user. From light play and fun, we move to the aware and active embodiment of a democratic European citizenship.

When we take into account the vocal version of the fragment, a similar path can be noticed. If the continuous reference to paratextual elements (“bullets”) can be annoying, it does not make a huge difference in the local configuration of meaning. Even worse is the identification of titles as graphics. A blind user does not know that these elements are titles. S/he has to guess the potential content of the image, and must reconstruct the potential role of thematic title of the verbal equivalents, thus detaching her/his decreasingly effortless experience from the portrayed experience of the subject in interaction with the EU.

4.3 Actuality and media: Sketching the face of Europe

	<p>1000 Debates for Europe Fighting against AIDS José Manuel Durão Barroso, President designate of the European Commission</p>
<p>THE EU DAY BY DAY 17/07/2004</p> <p>Commission adopts decision to pay additional euro forty two million to the Global Fund to accelerate the fight against H I V slash AIDS, tuberculosis and malaria in developing link countries The new instruments for the reformed Cohesion Policy 2007-2013 The Commission proposes new Education, MEDIA, Culture and Youth programmes for 2007-2013</p> <p>▶ All the news...</p>	
<p>Graphic In the spotlight Graphic Indian women reading headlines on AIDS List of three items bullet link one thousand Debates for Europe bullet link Fighting against AIDS bullet link José Manuel Durão Barroso, President designate of the European Commission List end</p> <p>Graphic The EU day by day sixteen slash zero seven slash two thousand four List of three items bullet link Commission adopts decision to pay additional € 42 million to the Global Fund to accelerate the fight against H I V slash AIDS, tuberculosis and malaria in developing link countries bullet link The new instruments for the reformed Cohesion Policy two thousand seven dash two thousand thirteen bullet link The Commission proposes new Education, MEDIA, Culture and Youth programmes for two thousand seven dash two thousand thirteen List end</p>	

These sequences – apparently unrelated to the previously analysed ones – can further highlight the harmonic resonance of the habits established in

the ongoing interpretative practice with the local meaning configurations. Humanitarian issues emerge right away: women related to India related to HIV. The distance and exoticism of India for a European audience, and the importance of the problem of HIV – these clamour for more than an individual involvement, calling for a more social response. This called-for involvement is disseminated on more levels. We have (1) the portrayal of media highlighting the news and (2) Indian women reading it; (3) all this portrayed on the EU website that we are reading (calling for further involvement by the user). To this call to arms, there is also an immediate answer from the EU. First it portrays the emergence acknowledging the problem, the (portrayed) call of the media, then a (portrayed) active role in fighting it. In a way this resonates with the development of the subject in the previous paragraph: first as receiving information and acknowledging the issues, then as discussing and acting. This parallelism is strengthened by the recurrence of previous semantic relations (“debates”, culture and youth related actions) and by references to the democratic nature (and thus the relation with the citizen) of the EU portrayed in the “designate” president.

These mechanisms recur in the structure of the home page of the EU, in its daily metamorphoses. I will give as just one example a list that appeared a few months later displaying analogous structures:

- “bullet link Climate Change bullet link Lisbon Strategy bullet link Justice and Home”
- “bullet link Emission trading: Commission clears eight more plans paving the way for trade to start as planned bullet link High Representative Javier Solana on the worrisome situation in Belarus bullet link Ecofin agrees on developing measurement method for administration burden”

Here it is portrayed not only a blending between the user and the subject involved in the EU, but also a potential blending between the user and the EU.

4.4 Results of the complete analyses

4.4.1 *Visual version*

In www.europa.eu one can trace a careful balance between different strategies: divulgence, specialised information, and call to involvement and action. The latter is balanced by the other strategies – highlighting the

positive aspects of interaction with the EU – such as the complex blending of enunciating figures with enunciated ones, as well as the EU and the user. The construction of the citizen in parallel with the EU, through its constitutive diversity, goes on in the background as the information is exchanged, both as an effect and as a motivation to engage in the exchange, but never in an overly invasive way.

4.4.2 Visual text version

The alternative textual version developed to help disable people is quite pointless. For instance, it contains many images, and the text cannot be easily re-sized so as to accommodate the needs of sight-challenged users.

4.4.3 Vocal version

If the vocal version is meant to have similar communicational strategies, its overall effect is very different. The flux of information – vital in the strategic balance previously highlighted – seems to be subjected to tides. The site describes itself as aimed at communication, as a provider of information; nevertheless, at several points the communication suddenly becomes recalcitrant, the mastering of which requires specific competences (often sight or creative abduction). There is repeated use of images, sometimes without any intelligible textual alternative (the splash page and the header are “European Union”), sometimes with uncertain functions (images used as titles on the menu, individuating thematic sections). Thus, the interpretative path is configured as a series of cognitive trials requiring both patience and humility. There is a need for tricky abductions, with the possibility of achieving the premises often denied, thus robbing the use of his/her legitimacy as interpreter, of active involvement in the information flux, and of progressive constitution as European citizen. The user has to solve implicit riddles and accept the handicaps deriving from her/his disability, such as the need to see and/or use a mouse.

These difficulties are acknowledged on a text version of the site. This could in theory be coherent with the ideas developed in the first paragraphs of this paper: to acknowledge disability in order not to change it into a handicap. The problem is that the aforementioned problems do not disappear. If more information is available, many titles are still images, many of

which do not have an appropriate (vocalized) equivalent. The links are not structured in a way that gives users a map of the page. If a special version is offered, the acknowledgement of the difference should be followed by a satisfactory experience. But the long lists of links, the difficulty of getting a map of contents, the many images and riddles – all these bring out negative traits of the disability, thus transforming it into a salient handicap. The power remains in the hands of the website, creating frustration and conflict. Thus the strategies previously highlighted are made in vain, in that they do not correspond to the experiences of blind users.

5. *Conclusions*

This paper has highlighted how crucial misunderstandings can emerge in the context of web accessibility, how obstacles turning a disability into a handicap can emerge from these misunderstandings, and how it is possible to describe effectively the meanings that emerge from different experiences on websites. In the case of www.europa.eu, we have shown how the passage from the visual to the vocal version risks destroying the communicational strategies, by highlighting the very handicaps that it seeks to ameliorate. It is hoped that our analysis can lead to better means of accessing websites. Such means should take into account the semiotic perspective in order to overcome the relative ineffectiveness of alternative textual versions, by focusing on the meaning configurations that in various ways of browsing the web.

La ontología de los actos de habla y el problema de los universales

Introducción

El problema de los universales se centra en el estatuto ontológico de las entidades abstractas. Como es sabido, Platón resolvió el problema aceptando que dichas entidades son independientes de las entidades individuales, ya que las considera existentes en el mundo de las ideas. Ésta es la postura conocida como “realismo extremo”. La postura contraria se conoce como “nominalismo”, la cual acepta las entidades individuales, y el menor número posible de entidades no individuales, que además pueden ser reducidas a individuos. Hay otra postura, que trata de ser intermedia entre las anteriores: el “realismo moderado”, que establece que los universales son entidades mentales que encuentran su correspondencia en propiedades que son inherentes a los objetos (Beuchot 1997: 7–8).

El problema de la ontología de los actos de habla es, por otra parte, de más reciente planteamiento. Se puede considerar que aparece desde los inicios de la teoría, cuando el mismo John Austin lo pone sobre la mesa al exponer el proceso de constitución de los actos ilocutivos y observar que a éstos les es necesaria una convención, unas circunstancias apropiadas y un proceso que sea llevado a cabo de manera satisfactoria (1975: 14–15).

En este trabajo me centraré en tres autores del campo de la filosofía analítica del siglo XX que se dedicaron a la elucidación tanto del problema de los universales como del problema ontológico de los actos de habla: John L. Austin, John Searle y Peter F. Strawson. Mi objetivo es mostrar que estos autores plantearon en términos muy similares ambos problemas. Además quiero demostrar que las soluciones que aportan no son del todo satisfactorias. Finalmente, expondré la solución dada por Iturrioz Leza (2004) al

problema de los universales, desde el marco de la lingüística operacional y la lingüística del texto, y presentaré una propuesta de aplicación de dicha solución al problema de la ontología de los actos de habla.

1. Austin y Searle: Los actos de habla existen por convención (y los universales también)

Tanto Austin como Searle son nominalistas respecto al problema de los universales. Austin lo formula de la siguiente manera (Austin 1989: 54, énfasis en el original):

Dado que usamos el mismo único *nombre* en cada caso, debe seguramente haber alguna cosa idéntica “allí” en cada caso; algo de lo que el nombre es el nombre; algo, por tanto, que es ‘común’ a todos los *sensa* llamados por ese nombre. Llamemos a esta entidad, independientemente de lo que pueda ser, un “universal”.

Dado que se admitió que las cosas que sentimos son muchas o diferentes, se sigue que este “universal”, que es uno e idéntico, no es *sentido*.

Austin niega que los universales existan y se pronuncia contra una postura realista ingenua. Para Austin los universales no existen como tales, sino que son una elaboración mental. Sin embargo, aunque el universal no existe en sí mismo, tiene cierta “utilidad” hablar de universales.

En un cierto sentido quizás sea *a veces* inocente hablar de ‘universales’ o de ‘conceptos’; justamente como es *a veces* conveniente hablar de ‘proposiciones’, y es muy frecuentemente conveniente usar el “lenguaje de objetos materiales” ... Pero en resumidas cuentas hay notablemente poco que decir a favor de los “universales”, incluso como una admitida construcción lógica; el hombre llano no la usó hasta que adquirió el hábito de los filósofos, y los errores a los que lleva el hábito son muy comunes y numerosos. (Ibid.: 59, énfasis en el original)

Podemos considerar a Austin como nominalista en cuanto al problema de los universales: no cree que existan en realidad sino que los considera una forma cómoda de hablar. En cuanto a los actos de habla, Austin los considera resultado de un procedimiento convencional, que puede incluir cierta actitud o disposición interna de quien realiza la acción (Austin 1975). El problema de la ontología de los actos de habla lo resuelve Austin de una manera relativamente sencilla: el procedimiento es convencional, la acción

es convencional, por lo tanto, todo está respaldado por una convención, lo que encuentra un correlato con su solución al problema de los universales.

Searle, quien continúa el trabajo de Austin, considera que los universales tienen una naturaleza derivativa. Antes de “amabilidad” existe “es amable”. La predicación es anterior a la constitución del universal (Searle 1994).

No solamente trata el problema de los universales, sino que se sirve de su teoría de los actos de habla para ello. Comienza describiendo el nominalismo como un “rechazo a ‘admitir’ o ‘cuantificar’ entidades distintas de los particulares... un rechazo a contraer cualquier tipo de ‘compromisos ontológicos’ con entidades no particulares” (ibid.: 110–111). Parece buscar un punto intermedio en la disputa nominalismo-realismo, es decir, un realismo moderado.

A postular la existencia de los universales le ayuda el hecho de considerar el lenguaje (y por lo tanto el significado) como un hecho institucional, y no un hecho bruto (el estatuto ontológico de este último es más comprometedor). Tal es el compromiso ontológico que Searle asume al hablar tanto de universales como de actos de habla: Éstos existen como “reglas de juego” sin las cuales la institución no existiría, pero a su vez su existencia sólo tiene sentido frente a la institución.

El argumento de Searle es circular: los actos de habla existen como hecho institucional, en el marco de un fenómeno asimismo institucional: el lenguaje, que se caracteriza por ser un sistema de reglas. Fuera del lenguaje el acto de habla no existe, pero el lenguaje a su vez no puede existir sin los actos de habla. Por lo tanto, cada fenómeno aparece como constituyente y constituido del otro, y no se explica cuál precedente a cuál.

2. Strawson: Instancias de universales y realizaciones de actos de habla

Para tratar el problema de los universales, Strawson busca los correlatos de los elementos oracionales: el sujeto y el predicado. Para este autor, definitivamente no son los universales simplemente una cómoda e inofensiva forma de hablar, como para Austin o Searle, sino que están ontológicamente determinados, pues las cosas generales (los universales) pueden tener instancias, mientras que las cosas individuales no (Strawson 1983). A pesar de que Beuchot (1997) califica a Strawson como un nominalista,

sus concepciones sobre los universales se aproximan al realismo: primero hace una distinción entre el particular como lo que puede ser sujeto y el universal o término general como lo que puede ser predicado, para luego reconocer que “no hay nada de lo que podamos hablar que no pueda aparecer como sujeto lógico” (Strawson 1989: 239), lo que borra la distinción antes expuesta. Finalmente trata de salir adelante proponiendo “otro uso de la palabra ‘existe’”:

Es decir, podemos reconstruir toda tal proposición cuantificada como una proposición de sujeto-predicado en la que el sujeto es una propiedad o un concepto y en la que el predicado declara, o niega, su instanciación. (Esto se aplica tanto a las proposiciones cuantificadas en las que se declara o se niega que existe un único particular, como a cualesquiera otras, pues tal proposición puede interpretarse como si aseverase o negase que cierta propiedad compleja o concepto es instanciado singularizadamente. (Ibid.)

Con lo que terminan igualándose en la práctica los universales y los particulares, ya que ambos pueden ser instanciados. Así, Strawson elude el compromiso ontológico.

En cuanto a la teoría de los actos de habla, Strawson critica el énfasis que Austin pone en el aspecto convencional de los actos ilocutivos. Considera que, si bien la fuerza ilocutiva es convencional en un buen número de casos, no puede decirse que tal sea la regla.

Esto es, parece claro que hay muchos casos en los que la fuerza ilocucionaria de una emisión, aunque no esté agotada por su significado, no se debe a *convenciones* distintas de aquellas que ayudan a darle su significado. Seguramente hay muchos casos en los que decir “El hielo de ahí es muy fino” a un patinador es proferir una advertencia (es decir algo con la *fuerza* de una advertencia) sin que sea el caso de que haya ninguna convención enunciable en absoluto (distinta de aquellas que forman parte de la naturaleza del acto *locucionario*) tal que pueda decirse que el acto del hablante es un acto llevado a cabo conforme a esa convención. (Strawson 1971/1983: 176)

Para Strawson, lo decisivo no es tanto la convencionalidad de las fórmulas para ejecutar el acto ilocutivo, sino – siguiendo a Grice – el reconocimiento de intenciones.

De manera que no todos los actos de habla se basan en convenciones, sino que lo decisivo es que el oyente pueda tener acceso a la intención del hablante. El estatuto ontológico de los actos de habla, en la visión de Straw-

son, subyace no tanto en la convencionalidad, sino en el reconocimiento de la intención que el hablante tiene de realizar ese acto de habla y no otro.

Esta premisa conduce a concluir que los actos de habla de alguna manera siempre preexisten a sus enunciados, puesto que necesitan ser reconocidos como tales para su interpretación, pero Strawson les niega la existencia institucional que Austin y Searle les proveen. Por tanto, no se ve cómo es que la intención puede ser reconocida si nada avala la preexistencia del acto de habla. Strawson no aborda este problema.

El planteamiento del autor sobre el problema de los universales y de la ontología de los actos de habla son muy similares: se puede decir que tanto los universales como los actos ilocutivos “salen de la nada”: unos como sujetos y otros como intenciones del hablante, pero no se aborda el problema de su constitución.

4. Propuesta de solución al problema de los universales y al problema ontológico de los actos de habla desde la lingüística operacional y la lingüística del texto

La disputa entre el nominalismo y el realismo ha sido formulada por Iturrioz Leza (2004) en los siguientes términos:

Todavía en el siglo XX, filósofos, lógicos y lingüistas se dividían en dos frentes, el de los que creen que con la sustantivación la lengua introduce un nuevo tipo de entidades (abstractas) y el de los que ven en ella un fenómeno puramente gramatical por el que adjetivos y verbos acceden a las funciones sintácticas de los nombres. Los dos puntos de vista se complementan, pero por separado, resultan incompletos e inadecuados. El error de los realistas consiste en hipostasiar el significado de los términos generales, el de los nominalistas en negar que la sustantivación tenga algo que ver con la aprehensión de objetos, partiendo de un concepto extralingüístico de objeto que resulta tan inapropiado para los nombres abstractos como para las otras clases de nombres. (Iturrioz Leza 2004: 40)

Iturrioz Leza critica particularmente el tratamiento del problema por parte de Searle, ya que éste plantea la existencia de los universales, pero evade el compromiso ontológico mediante la separación de predicación y referencia, minimizando el problema (observación que, *mutatis mutandis*, también puede aplicarse a Strawson). Específicamente, Searle no está distinguiendo niveles lingüísticos.

El concepto es de naturaleza predicativa en un lenguaje (discurso) de primer orden, mientras que puede ser aprehendido como objeto en un lenguaje (discurso) de segundo orden. La contradicción sólo surge si ambas operaciones se colocan en el mismo nivel, es decir si se pasa por alto el carácter metalingüístico de las nominalizaciones prototípicas: la diferencia entre *rojo* y *rojura* está en que el primer término pertenece en principio al lenguaje de primer orden, mientras que el segundo se origina en el metalenguaje. (Ibid.: 41)

Frente al tratamiento poco riguroso que Searle da a los nombres abstractos, Iturrioz Leza aborda el problema desde un punto de vista funcional:

¿para qué se nominaliza? ¿para qué sirven esa variedad de estructuras en una lengua? Si no son inconexas, sino que por el contrario forman un paradigma de opciones, ¿cuáles son los criterios de elección del hablante y a qué nivel se lleva a cabo la misma? No se puede reducir el fenómeno a los aspectos puramente gramaticales, éstos se inscriben en el marco de una *operación compleja* de condensación de información, que sólo puede explicarse adecuadamente *en el nivel del texto*. Está relacionada con la organización de la información y es regulada por principios pragmáticos de la organización temática: información ya dada vs información nueva, constitución de los tópicos del discurso etc. (Ibid.: 131, énfasis en el original)

La nominalización (que es la operación lingüística que “construye” los conceptos abstractos) constituye objetos de segundo orden con la finalidad de organizar el texto (y el pensamiento), y no por afán de describir el mundo real (89). La reificación que la nominalización lleva a cabo “se da de manera gradual. Desde el punto de vista gramatical, la nominalización no se puede desligar del conjunto de las técnicas existentes en la lengua para conectar proposiciones” (89):

El que los romanos destruyeran Cartago
 Habiendo destruido Cartago los romanos
 El haber destruido Cartago los romanos
 Tras destruir Cartago los romanos
 La destrucción de Cartago por los romanos
 (Ejemplos de Iturrioz Leza: 89–90)

Aparentemente –como también observa Iturrioz Leza– “esta tesis lleva al nominalismo... Pero es precisamente esa nueva organización compleja

del discurso lo que posibilita la aparición del nuevo tipo de entidades” (89).

Ahora bien, si pasamos de los conceptos abstractos en general, a los que específicamente nombran actos de habla, podemos darnos cuenta de que están estrechamente relacionados con los verbos de los que provienen:

Promesa	prometer
Mandato	mandar
Amenaza	amenazar
Insulto	insultar
Etc.	

Los verbos y los nombres que se refieren a actos de habla también forman un nuevo tipo de entidades, ya que al especificar un acto de habla particular, aprehenden y construyen el acto de habla como tal.

Iré
Prometo que iré
Te prometo ir
Iré, es una promesa.
Te hice la promesa de ir

Respecto a esta idea, Austin habla sobre la evolución que pudo haber tenido el performativo explícito en el lenguaje:

Now, one thing that seems at least a fair guess, even from the elaboration of linguistic construction, as also from its nature in the explicit performative is this: that historically, from the point of view of the evolution of language, the explicit performative must be a later development than certain more primary utterances, many of which are already implicit performatives, which are included in most or many explicit performatives as parts of a whole. For example, “I will...” is earlier than “I promise that I will...”. (Austin 1975: 71)

Desde este punto de vista, no es descabellado pensar que, así como los universales son el resultado de una técnica lingüística de aprehensión de objetos que sirve a propósitos de organización del texto (y por ende del pensamiento), así también los performativos son constituidos en el discurso, y no preexisten al mismo. Si esto es así, entonces los performativos serían un punto en la constitución discursiva del acto de habla. La función de los verbos performativos -y de otros verbos que se refieren a actos

de habla – sería reificar y manipular enunciados. Así como los nombres abstractos constituyen objetos de segundo orden, los performativos constituyen enunciados de segundo orden, es decir, enunciados que se refieren a otros a los cuales presentan constituidos como actos específicos. Los performativos serían, como los universales, el extremo de una serie de técnicas de constitución y demarcación de los enunciados como actos de habla.

El error que cometen tanto Austin como Searle y otros respecto a los actos de habla es el mismo error que Iturrioz achaca a los nominalistas: no tomar en cuenta las operaciones metalingüísticas que reifican y aprehenden contenidos proposicionales. Por otra parte, el error de Strawson es hipostasiar los actos de habla como si fueran entidades existentes en sí mismas, independientes de los discursos que las producen.

Austin y Strawson representan dos puntos opuestos pero complementarios en la teoría de los actos de habla. Para conciliarlos, es necesario integrar a la misma los procesos de aprehensión y constitución de entidades lingüísticas

Pauline Escande Gauquié

L’affiche du film *Pulp Fiction* de Quentin Tarantino en tant que référence à un genre populaire américain: “Le pulp”

L’affiche de film a une fonction clairement définie: donner envie au spectateur d’aller voir un film. Pour ce faire, les procédés rhétoriques utilisés afin de faire émerger autour du film “un monde qui s’accorde à nos désirs”¹ sont multiples. En étudiant l’affiche de film selon le point de vue de l’*intertextualité* il est possible de montrer comment ce texte est travaillé par absorption, et transformation par d’autres textes. Comme l’écrit Roland Barthes (1991): “tout texte est un intertexte; d’autres textes sont présents en lui à des niveaux variables sous des formes plus ou moins reconnaissables. L’intertexte est le langage antérieur et contemporain qui vient du texte.” L’intertextualité s’inscrit ainsi dans une filiation plus ou moins volontaire.

Dans l’affiche du film américain *Pulp Fiction* de Quentin Tarantino (1994), la référence à l’univers du *pulp* – petit roman policier que l’on pouvait acheter pour rien aux Etats-Unis dans les kiosques à journaux entre les années 1920 et 1950 – est volontaire et maîtrisée dans le seul but de créer un imaginaire spécifique autour du film présenté. Dans le cadre de cette réflexion, le terme intermédialité est alors plus juste: il permet d’appréhender comment une culture propre à un média, le pulp, est récupérée par un autre média culturel, le cinéma.

1. *Etude comparative de l’affiche de Pulp Fiction avec trois couvertures des romans pulps des années 30 à 50: Marijuana Girl, The Last Crook, Vous pouvez tous vous l’accrochez (E.g., “Corpus visuel de l’affiche et des trois couvertures de magazines pulps”)*

Pour son film *Pulp Fiction* le réalisateur emprunte délibérément au pulp. Le pulp appartient à la littérature populaire américaine des années 50, plus précisément au roman noir. Magazine bon marché, il est imprimé sur du papier médiocre nommé “pulp” car récupéré de la pulpe de bois. Le pulp est à l’époque une industrie de masse comparable à la télévision américaine actuelle. La plupart des grands écrivains de polars de l’époque y ont publié. Dans la masse des publications se détachait *Black Mask* qui fit connaître au public des écrivains comme Earl Stanley Gardner ou Dashielle Hammett.

L’affiche du film de Tarantino montre des phénomènes d’intericonicité (image à image) et d’interdiscursivité (linguistique à linguistique) évidentes avec cette culture. L’analyse sémiologique comparative de l’affiche avec trois couvertures de pulp met en lumière ces phénomènes d’emprunts délibérés (voir figure 1).

La figure 1 présente une synthèse des éléments formels convergents (Houdebine 1994) entre l’affiche du film *Pulp Fiction* et les trois couvertures de pulp sélectionnées: *Marijuana Girl*, *The Last Crook*, *Vous pouvez tous vous l’accrochez*. La mise en évidence des procédés iconiques, scéniques et linguistiques récurrents et majoritaires entre l’affiche et les couvertures rend compte de l’*homogénéité* structurelle entre les deux corpus. Elle trouve par ailleurs son pendant dans des procédés formels dits divergents et périphériques qui montrent la culture graphique et iconique propres à chaque média. Ce travail formel statistique sert objectivement l’interprétation qui suit en l’étayant.

2. *Analyse des convergences comme phénomène d’intericonicité et d’interdiscursivité entre l’affiche du film Pulp Fiction et l’univers des romans pulps*

L’indexation systématique des éléments formels convergents exposés dans la figure 2 entre l’affiche et les trois couvertures de romans met en évidence le phénomène d’interculturalité entre les deux médias. En effet, au niveau

Figure 2. Bilan des convergences : Le code du roman « polar noir » des années 30 à 50 a été repris pour l'affiche de Pulp fiction.

de la construction d'ensemble on relève un phénomène évident d'intericonicité entre l'affiche de *Pulp fiction* et <univers des couvertures des polars noirs des années 30 à 50>.²

2.1. Intericonicité

L'interculturalité visuelle se retrouve à travers quatre processus:

2.1.1. La construction graphique de l'affiche rappelle les couvertures d'un magazine pulp via les éléments convergents suivants: L'effet /cornée/ et /abîmée/, la /construction binaire/, et la /pastille prix/. Les couvertures des pulps *The Last Crook* et *Marijuana Girl* reprennent cette pastille, les effets abîmée et cornée se retrouvent sur les trois couvertures. Par ailleurs, le /bandeau noir/ indiquant le nom de la collection visible sur l'affiche est également présent dans l'affiche *The Last Crook*.

2.1.2. Le personnage de l'affiche *Pulp Fiction* dont l'attitude générale renvoie à l'univers du <polar>. Sa tenue féminine et sexy renforce cette <attitude séductrice> propre au personnage féminin de polar noir: /bas/, /décolleté/, /talons/, maquillage appuyé(/rouge à lèvres/, /vernis à ongles/). Ces tenues provocantes sont également représentatives des personnages des trois couvertures.

La présence d'une femme uniquement, dans une /position de séduction/ avec /les jambes croisées/, /main qui tient la cigarette/, /regarde le destinataire en face/ et /ne sourit pas/. Les femmes de *Marijuana Girl* et de *Vous pouvez tous vous l'accrochez* adoptent également cette attitude très séductrice reprise dans l'affiche *Pulp Fiction*. Cette attitude impassible renvoie au polar car la femme ne s'émeut pas facilement, elle côtoie le milieu de la pègre et dans ce monde montrer ses émotions c'est se trahir. Par ailleurs, son regard franc montre qu'elle n'a pas froid aux yeux.

Le /rouge à lèvres/ que l'actrice porte est un élément d'intericonicité important à souligner. Il est l'élément de séduction par excellence qui symbolise la femme. Le rouge selon Pastoureau (2005) est la couleur de la passion et du danger, du péché et de la chair, de la transgression, des tabous.

Le /noir/ est une couleur très présente en intericonicité. Dans notre culture judéo-chrétienne, il renvoie au deuil donc à la mort et au malheur mais aussi au péché et à la transgression. Il est le symbole de la part d'ombre et de mystère des personnages qui évolue dans un monde dur et violent. Il

renvoie aussi au monde de la nuit. On est loin ici des couleurs pastelées à la “David Hamilton”.

2.1.3. Les accessoires symbolisent la <femme fatale>, personnage systématique et récurrent du pulp. La /cigarette/ est l'élément intericonicité le plus marquant de ce corpus. Elle présente sur l'affiche et sur les trois magazines. En effet, une femme qui fume dans les années quarante et cinquante est symbole d'<émancipation>. Elle revendique le vice car elle a une valeur phallique. Dans *Pulp Fiction* l'actrice exhibe sa /cigarette/ par un geste élégant (similitude du geste avec *The Last Crook*), geste très caractéristique de la femme fatale (dixit l'actrice Rita Hayworth dans le film *Gilda* de Charles Vidor). La cigarette est donc aussi symbole de <glamour> et cette connotation fumeuse est renforcée par la présence dans l'affiche d'autres accessoires comme le cendrier, le paquet de cigarettes et le briquet.

Le /pistolet/ présent dans *The Last Crook* sous forme de logotype est également une icône importante à retenir. Cependant dans *Pulp Fiction* le petit pistolet brillant est un pistolet bijou qui renforce la connotation de <femme fatale>, <femme dangereuse>.

Le /livre pulp /propre à l'affiche de cinéma *Pulp fiction* est une mise en abyme iconique de la culture pulp. Il faut relever ici que la main de l'actrice est posée sur le livre comme pour souligner la référence à cet univers. Par ailleurs, ses talons soulignent les termes *Pulp* et *Fiction* de l'affiche. L'actrice agit comme un relais entre le magazine pulp posé et le titre de l'affiche. Cette hypertrophie connotative du sens pulp peut presque paraître ironique.

2.1.4. Le décor ancre un peu plus le personnage dans cet univers de <polar> car il reprend les couleurs /noire/ et /rouge/ présentes également dans les trois magazines qui sont alternativement les couleurs du <danger> et la face cachée <violente> dans laquelle évolue ce type de personnage.

Le contraste des couleurs dans tous les éléments du corpus est intéressant à relever: dans *Pulp Fiction* les /carnations du personnage/ contrastent avec l'/aspect sombre/ des vêtements. La même remarque s'applique pour *The Last Crook*, le personnage semble se détacher du fond noir. Dans *Marijuana Girl* la peau et la robe claires contrastent avec le fond noir.

Ces contrastes s'expliquent par le fait que les années 30 sont celles de la crise, de la prohibition et de la corruption, des gangsters et de la violence au quotidien. C'est dans ce climat qu'est né le roman noir qui dépeint un univers contrasté et dur. Les parties claires de l'image sont là pour mettre

en valeur les parties sombres. L'ombre n'existe que par rapport à la lumière. Et donc par ricochet le mal par rapport au bien. Enfin le fait que l'actrice soit sur un lit dans une chambre accentue le côté <érotique> et <mystérieux> du personnage.

2.2. L'interdiscursivité

Au niveau du linguistique, la /typographie/ et le choix des termes confirment l'<univers du pulp> (ancrage du linguistique par rapport à l'image). Concernant la typographie, le choix de la /couleur jaune/ est un élément convergent de cet univers. Le choix du monème /pulp/ réfère directement à cet univers et lui rend hommage. Le terme /fiction/ montre que ce que nous raconte ce film est une histoire similaire à celles mises en scène dans ces livres.

3. *Les divergences comme point d'ancrage de l'affiche dans l'univers cinématographique*

L'analyse des divergences permet de déduire que si l'image de *Pulp Fiction* emprunte à l'atmosphère, aux personnages et aux sujets propres aux couvertures de polar des années 30, elle n'en reste pas moins une <affiche de cinéma>. Un premier élément divergent au niveau de la mise en scène du corpus permet de le déduire: le fait que ce soit une /photographie/ et non un /dessin/. Au niveau iconique, même si la mise en scène et l'attitude générale du personnage renvoie à cet univers, des éléments de <modernité> dans sa tenue permettent de déduire que nous sommes à une époque plus récente: /t-shirt/, /perruque au carré/.

Enfin, concernant le linguistique, des éléments formels absents des autres images du corpus confirment la divergence de l'image de *Pulp Fiction* et ancre l'effet de sens <photo-affiche de cinéma>: la signature de la maison de production /Miramax/ et non de la maison d'édition, la liste des comédiens jouant dans le film /John Travolta/, /Uma Thurman/, etc., et du réalisateur /Quentin Tarantino/.

4. Conclusion

Selon Quentin Tarantino les “pulps” désignent des magazines dont l'équivalent cinématographique serait le film de série B. En choisissant de travailler son affiche en intermédialité, Tarantino et son équipe marquent leur volonté d'inscrire le film dans un genre populaire et de masse. Au delà de la volonté marketing de donner envie au spectateur d'aller voir un film, ce choix d'affiche souligne le désir de Tarantino de rendre hommage au pulp genre culturel qu'il affectionne particulièrement. Ce désir se retrouve d'ailleurs tout au long du film dans l'écriture esthétique et la diégèse.

Notes

1. Célèbre phrase attribuée à André Bazin que Godard a placé en exergue de son film *Le mépris* (1962).
2. Convention de présentation: Eléments formels entre barres obliques: /.../; effets de sens et connotations liés à ces éléments formels: <...>

Film editing and ideology in South African culture

A semiotic investigation

In this paper we intend to show the link between the structuring of signs through film editing and the communication of ideological meaning through a second-order system of signification. We propose a method of analysis for decoding the connotative ideological content of a film text, then apply this method to a South African television advertisement.

First, it is necessary to look at the connection between film editing and myth, or ideology. Eisenstein described the astonishment of early film editors at the fact that, when two pieces of film were placed together, a new meaning was created by that juxtaposition. Eisenstein described this generation of meaning as a natural occurrence, stating that humans are accustomed to making “a definite and obvious deductive generalization” when two separate objects are placed together” (1943: 14). When two filmic images are put in sequential order, a third meaning, greater than the sum of its parts, is created. This third meaning is connotative, since it is not objectively representable.

This concept is similar in function to Barthes’s system of second-order signification. In this system, a sign is given further meaning by attaching connotative meaning to its existing denotative meaning. When a sign is given connotative meaning, it becomes a signifier in a second-order signification system. It now signifies something else, and so produces a new sign. Barthes uses figure 1 to illustrate this effect (1973: 115).

Film editing, which creates meaning by the juxtaposition of signs (i.e., shots), is a functioning manifestation of this process. Figure 2 shows the system of *connotative* meaning that is created by putting two shots next to each other.

1. Signifier	1. Signified	
1. Sign 2. Signifier		2. Signified
2. Sign		

- 1. = primary signification
- 2. = secondary signification

Figure 1.

1. Signifier	1. Signified	1. Signifier	1. Signified
1. Sign 2. Signifier		1. Sign 2. Signifier	
2. Sign			

- 1. = primary signification
- 2. = secondary signification

Figure 2.

In this figure, the two signs made up of the elements labeled “1” are denotative signs. They are created by the combination of the signifier and signified in the primary signification system. In film terms, one can see these two signs as separate shots. The sign labeled as “2” is the connotative sign produced by juxtaposition of the above two denotative signs. It results in second-order signification. Now the sign created by the combination of signifier and signified in the primary signification system has become a signifier in the secondary signification system. In film terms, one can see the sign in the secondary system as the meaning produced by the juxtaposition of the two shots edited together. Of course, a film is made up of a multitude of shots that may be associated one with the other. In this way, a complex connotative meaning is created in a film by the combination of

many denotative signs. An important aspect of this model is that connotative meaning is created *sequentially*. Shots are lined up, one after the other, and the order in which they are placed determines the meaning that is created by their association.

Barthes saw the second-order system of signification as a function of *myth*ideology, which produces meaning that functions at an unconscious level. In doing so, it makes that meaning appear natural, by making its productive process appear as if it is a result of “common sense” (Hebdige 1979: 13). Hebdige states that ideology imposes itself structurally, defining the forms whereby individuals understand and interpret social relations and processes (ibid.). A particular film edit provides a structuring principle for the ordering of images. The images exist, and have a meaning by themselves. The film edit structures the sequence of meaning in a specific way, and in doing so creates a further meaning.

To illustrate this process, we will look at a South African advertisement, and examine the ideological meaning created by the sequential structuring of images. It is a Coca Cola television advertisement, made in 2005 in South Africa. The advertisement’s visual content consists of a series of images of South Africans, accompanied by stirring orchestral music. A voice-over makes a number of statements, each one starting with the words “it’s the Coke of...” and then listing various groups of people.

Unfortunately, a full analysis of the advertisement’s various constituent signs and their rich ideological connotations does not fall within the scope of this paper. For now, let us conclude that there are two broad types of sign at play here. First, there are signs which carry connotations of South Africa’s post-apartheid cultural ideology. These signs are meaningful to a South African audience, and reflect the aspirations of what we call the “Rainbow Nation”. Second, there are signs that carry a consumerist ideology of commodification, or signs of global capitalist ideology. These two sign types are constantly juxtaposed in the advertisement’s sequencing. For example, we see an old black war veteran accompanied by the word “revolutionaries” (Fig. 3), an allusion to the South African Struggle against Apartheid. This is followed by an image of what could be businessmen or statesmen, suggesting the new economy where money and corporatisation form the last chapter of a revolution begun by the Struggle heroes (see Figure 4).

Figure 3. "Revolutionaries".

Figure 4. Heroes of the struggle.

There is also a multilayered sequence of "singers", "movie stars", "the common man", and the "worker" (see Figures 5 to 8). The sequencing of these images suggests a model of aspiration where the ideals of consumer stardom and the sanctity of labor are equally revered.

Figure 5. "Singers".

Figure 6. "Movie stars".

Figure 7. "The common man".

Figure 8. "The worker".

These images are combined and juxtaposed dialectically, thus conveying ideological representations that put South African cultural ideology on a level equivalent to that of an emerging consumer culture. This forms a system of interchangeable ideological signs. However, the various signs are not floating freely in an unstructured system. The advertisement has a storyline of sorts, and builds to a definite meaning at the end: Coca Cola is the drink for all South Africans. The signs are arranged according to a structuring principle. This can be linked to the ideology of the advertisement. What is the structuring principle behind this system of interchangeable signs, this equivalence between signs?

To understand that principle in this ideology of equivalence, let us examine the dominant signs, which contextualize the other signs in the sequence. Our interpretation of the advertisement is mediated through a spokesman. At the start of the advertisement, a young black man looks into the camera and addresses us directly, telling us that, when he picks up a Coke, it is the Coke of various South African groups of people (see Figure 9). This is a textbook example of Althusser's concept of ideological interpellation (1971). When the young man addresses us, we are interpellated as subjects of the ideology of the advertisement.

Figure 9. "When I pick up a Coke".

To define the structuring principle behind this ideology, we may further analyze the young man's position. Through the refrain of "When I pick up a Coke", and its crescendo, he identifies the signs in the ad with himself, through the mediation of Coca Cola. Baudrillard sees the sign-commodity as an element in the global capitalist order of simulacrum (1981). Thus, what the advertisement is selling, is not the Coca Cola product, but the Coca Cola *sign*. This sign's value is determined by its place in the coded system of sign exchange value. This raises an interesting point

about the other signs in the advertisement. If their meaning is determined by the dominant Coca Cola sign, they also fit into the coded system and become sign-commodities. The Coca Cola sign exists as a sign-commodity within the coded system of global capitalist sign exchange. If the meaning of the Coca Cola sign is determined by the structuring principle of this coded system, then so is the meaning of the other signs. Therefore, they are also sign-commodities in the coded system of global capitalist sign exchange.

It would be tempting to stop the analysis here, and claim that all the signs (and the ideologies they represent) are mere sign-commodities in the system of global capitalism.

This proposition is problematic. It might suppose that the South African cultural context is fully integrated into the global economy and the high tech visual mass media cultural machine that disseminates it. It is not. South Africa is still a third world country, where television is less than a generation old. So, perhaps all South Africans do not exist in a world of “hyperreal” sign simulations of reality. Also, South African society is unstable and highly politicized, and very much aware that ideologically loaded signs are not all equivalent and interchangeable. The average South African might even recognize the tension between the everyday use of the signs in the advertisement and the purpose for which Coca Cola uses them here.

An examination of the advertisement’s sign sequence suggests a possible resolution to this tension within the text itself. As shown in the previous examples, there is a tension between the signs themselves. On the one hand, we have the signs of homegrown South African ideology, and on the other, the signs of consumerist ideology. This tension is intensified, instead of resolved, as the advertisement progresses. Many viewers will have noticed that the ideological connotations of the signs are consciously being played with. For example, the word “queens” is accompanied by an image of an Apartheid-era beauty pageant (Fig. 10). This ironic juxtaposition reminds the viewer that the queens of the former upper class have been dethroned by not only the black majority, but also by gay queens. In another sequence, we are shown images that laud “the worker” (Fig. 8) and “all that is hard to achieve”. This is followed by “the dream” (Fig. 11), a representation of consumer aspiration straight out of an American hip hop music video. The juxtaposition of these images and the South African

“dream” they represent is so incongruous with the reality of the man on the street – probably without a car – that they can only be read as irony. This ironic playing with signs enables the juxtaposition of ideologically opposed images.

Figure 10. “Queens.”

Figure 11. “The dream.”

Yet it does not entirely dispel the tension between the signs, which comes to a head in the last list of people. The young man identifies that it’s the Coke of “Che, my father, and me” (see Figures 12–14). These seem to fit into the overall structuring principle that the advertisement has used so far. However, there is one crucial difference: this spokesperson does not contextualize these people according to Coca Cola. He contextualizes himself according to Coca Cola.

Figure 12. “Che...”

Figure 13. “My father...” *Figure 14. “...and me.”*

The sequence starts with the reference to Che Guevara. As noted earlier, Che is by now a sign-commodity in the cultural sphere of global capitalism. The statement “It’s the Coke of Che” must raise a painful heart burn in Cuba. But in this advertisement, it represents a high point in the use of iconic signs to sell Coca Cola. Similarly, the image accompanying “my

father” is a mixed historical reference to Nelson Mandela’s signature shirts, and two hats of his father’s time: one hat from the jazz icons of an apartheid ghetto like Sophiatown, and another hat typical of the ritual dress of modern Xhosa initiation clothing. A further process of interpellation is activated in this shot sequence. The young man is standing in front of a mirror, looking at himself wearing a Che-style beret. This can be seen as a moment of self-reflection on his part, or a Lacanian mirror phase, where he shows us what *his* actual image of himself is. The consequence is that the viewer, as an interpellated subject, is encouraged to identify with this image. However, as Che is a sign-commodity, the viewer identifies with a sign-commodity when she identifies with this image. The same goes for the shot of his “father”. Therefore, the viewer’s image of herself is herself as a sign-commodity.

This is the crux of the advertisement’s ideological structuring principle. The viewer is finally made to see herself as a sign-commodity. The viewer is a sign-commodity, as is everything else in the global system of sign exchange. The interpellative process is complete. Therefore, the only way to understand any object within the system is to see it as a sign-commodity. The most enjoyable way to get any pleasure or value from a commodity is to consume it as a sign-commodity, a simulation in a simulacrum.

Thus, the “message” of the ad is not only that icons of South African cultural ideology function as sign-commodities in the global capitalist system. It is not selling our ideology back to us as a sign-commodity. Rather, it is selling us the sign-commodity of ideology as a sign-commodity. The viewer is “permitted” to engage with any and all ideologies as sign-commodities, unburdened by personal attachment or ideological commitment. An obvious example is the use of Che Guevara. Today many international brands use Che’s face to evoke a romantic spirit of rebellion, like Levis. But in South Africa, Che’s still radical communist ideology has not been forgotten. During the anti-Apartheid struggle, many of our revolutionary cadres were trained by Cuban revolutionaries, who also fought in the Angolan war of liberation. There is presently a vicious ideological battle between the economic liberals and communist workers in South Africa’s ruling African National Congress. During 2007 a series of nationwide union strikes, led by the Congress of South African Trade Unions and the South African Communist Party, have seriously disrupted both the public and private sector. In South Africa, using a communist icon to sell a soft drink is no

light romantic nostalgia. However, because of his placement in the advertisement, Che Guevara is turned into a neutral image, a sign-commodity with an equivalent value to a bottle of Coca Cola.

According to the advertising company responsible, this advertisement was very popular in South Africa (Bruyns 2006). Why? There are various hypothetical reasons for this. As South Africa did not undergo a violent revolution, there was not an immediate cultural rupture. The old ideologies were not immediately replaced by new ones. We don't have an Independence Avenue, like our neighbouring states. Rather, South Africans have to juggle the remains of the Struggle ideology and the ideology of the apartheid system it overthrew. This ideological confusion is defused when all ideologies are considered as equivalent. This might explain the appeal of a text that conspicuously communicates ideology as a sign-commodity. South African ideology is something that this generation must deal with. For them, it would be easier to treat an ideology as a sign-commodity rather than as something to engage with or be committed to. It must also be acknowledged that the South African dream of economic liberation and empowerment has not been fully realized. With the high poverty and unemployment rate, racial and class tension, and a high level of senseless violence in South Africa, the dream of peaceful equality is still just a dream. As such, a certain amount of cynicism about focused, constructed cultural ideology might prevail, especially amongst the youth. This advertisement, with its principle of ideological equivalence, allows the cynical youth to buy into both an idealized vision of South Africa and the blatantly consumerist vision of the Coca Cola company.

Karl Gfesser

Verstehen – Verständigung ist nicht Verständnis

Zweifellos ist, so Charles S. Peirce, jeder Gedanke ein Zeichen, folgt ein Gedanke dem anderen im unendlichen Kontinuum der Zeichen. Zeichen bezeichnen Gegenstände, Sachverhalte, Ereignisse und sollen, soll Kommunikation gelingen, verstanden, wenigstens nicht gänzlich missverstanden werden können. Kommunikation ist Mitteilung: Nur wenn Gedanken – seien sie bestätigtes Wissen oder einleuchtende Vermutung – miteinander geteilt werden, ist Verständigung – nicht Einigung gleich – erreicht, insoweit die Kommunikanten das Strittige verhandeln, nicht bloß das je Genehme sich aneignen und das Störende verwerfen. Verständigung muss beabsichtigt worden sein, es muss gewollt sein, den anderen zu überzeugen, sein Einverständnis zu erlangen. Und weil es mindestens zweierlei Auffassungen eines Strittigen gibt, müssen Zweifel geweckt und zugelassen werden, muss in eine Argumentation eingegriffen, Störendes aufgegriffen werden, damit etwas begriffen werden kann. Einer dieser Eingriffe ist das Bemühen, sich des Gegenstandes zu vergewissern, indem man sich aufs neue an ihm stößt. Denn die Einbildungskraft greift nicht nur zu Zeichen, die dem Gegenstand gerecht werden, langt vielmehr auch nach jenen, die ihn verfehlen oder umgehen: Denkmuster, Verhaltens- und Handlungsgewohnheiten sind beharrlich und dem zeicheninternen Objekt geschuldet. Doch sind auch Verweise auf das zeichenexterne Objekt dem Zeichen verhaftet, sind eingelassen in die vorwiegend symbolische Struktur der Sprache, wengleich sie auf eine zeichenexterne Realität zielen. Wort, Sache, Begriff fallen deshalb leicht ineinander, werden nicht semiotisch als Mittel-, Objekt- und Interpretantenbezug der triadischen Zeichenrelation unterschieden. Das Dingwort wird zum Wortding mystischer Interpretation, zur selbstbezüglichen Wahnidee: Fetischismus vielerlei Art wie Rassismus, Nationalismus, Religionismus. Solchem Verfallene empfinden jeden Eingriff in ihr Selbstverständnis als Angriff auf ihre Identität, stehen

jenseits von Verstehen und Missverstehen; ihnen kann bestenfalls etwas nahegelegt werden, in der Hoffnung, dass einmal darauf zurückgegriffen werden wird. Verstehen fußt auf der Struktur rationaler Begründung, verläuft in Form schlussfolgender Argumentation vermittelt kommunikativer Kompetenz, nicht ungeachtet dessen, dass der logische Interpretant begleitet ist von einem emotionalen Interpretanten. Aufgeblähte Symbolismen und dumpfe Gefühlsaufwallungen aber verstellen den ikonischen und indexikalischen Bezug. Wohl sind unsere Wortsprachen dank ihres Bedeutungsüberschusses offen für weitere Erkenntnis, doch soll diese von Zweifel begleitet sein und retrosemiosisch übersichtlich bleiben. Am Leitfaden der Peirceschen Zeichentheorie kann versucht werden, eine Semiose durch das Dickicht unbezweifelnder Selbstverständlichkeit und unbefragter Zwiefalt zu bahnen, kann Verständnis heischender Einfalt verständig begegnet werden.

1. Vernünftiger Diskurs

Vieles, was sich von selbst versteht, ist unverständlich und bleibt es auch, wenn eine Verständigung gar nicht gesucht ist oder ausbleibt, weil eine Begründung nicht logisch konsistent, semantisch nicht präzise oder ethisch unhaltbar ist. Und Gründe müssen schon angeführt und, sollten sie bestritten werden, ausgeführt und durch weitere Gründe gestützt werden. Eine Begründung oder Argumentation obliegt dem bewussten und gewissenhaften Gebrauch der Vernunft: nach bestem Wissen und Gewissen also, – beides übrigens zusammen begriffen in dem lateinischen *conscientia*.

Darunter, selbst in Ironie und Polemik nicht, sollte man nicht gehen, geht man doch schon gerne darüber hinaus, in zwar weltlich bedingtem, gleichwohl weltabgehobenem Glauben zum Beispiel, wo weder Logik noch Empirie gelten. Sogenannte Glaubenswahrheiten oder Offenbarungen, die nicht argumentativ eingeführt sind, können auch nicht durch Argumente bestritten werden, lediglich abgewiesen werden; doch wird gerade solches hartnäckig, fanatisch vertreten, da es dem Gläubigen als absolut und ewig gilt, kein Zweifel daran rühren soll.

Der Fideist verschließt sich der Einsicht in Gründe, der Erklärung von Ursachen, der Erörterung der Umstände, will seiner beschränkten Überzeugung – ohne jeden Diskurs – uneingeschränkte Geltung erzwingen.

Anders und in reflexionsloser Affirmation doch ähnlich verhält es sich mit dem Kulturalisten. Er lehnt sowohl absolute als auch universale Wahrheiten ab, da er eine Wahrheit nur relativ zu einer Kultur sieht; er billigt kulturspezifische Einschränkungen ethischer Normen, gar Verletzungen von Menschenrechten. Aber nichts kann dadurch gerechtfertigt werden, dass es Spezifik, Charakteristik, schlicht Tradition einer Kultur oder eines Glaubens ist. Hinter Verweisen auf derartiges stecken Neigungen, Verdrängungen, Interessen, Machtstreben, wogegen vernünftige Argumentation einen schweren Stand hat.

Nur Personen, die gewillt sind, die eigene Begründung oder Beweisführung für fallibel, die der anderen für plausibel zu halten, können miteinander diskutieren, unbeschadet dessen, dass man seine Einstellungen verteidigt, – unter Wahrung logischer Stimmigkeit, in Bereitschaft zu ethischer Reflexion und in Anerkennung allgemein gültiger Menschenrechte wie das Recht auf Leben, Würde und Freiheit, nicht zuletzt auf Meinungsfreiheit und, falls erforderlich, unter Berücksichtigung von Kausalität und psychischer und soziopsychischer Bedingtheit: Woher stammen Überzeugungen denn, und ist das jeweils Meinige gemeint, wenn eine Meinung geäußert wird; werden nicht vielmehr Dogmen nachgebetet?

Partner in einem vernünftigen Diskurs sind gehalten, ihre Aussagen zu begründen und Folgerungen daraus zu erlauben, woraus sich ein inferentieller Kontext ergibt, der nicht willkürlich gestört werden soll, allenfalls ironisch, ja polemisch gestört werden kann, dient dies doch dazu, den Partner zu verstören, stutzig zu machen, damit er aus seiner Selbstverständlichkeit aufmerkt. Auch müssen die Inferenzen, da sie gewöhnlich empirisch und implizit erfolgen, expliziert werden, so es verlangt wird.

Vernunft bedarf der Offenheit, strebt nach Freiheit, gebiert Zweifel, ist auf der Suche, hält Maß, unterzieht sich Selbstkritik. Doch ist der Mensch in leib-seelisch-geistiger Einheit nichtsdestoweniger schon mit sich selbst, wieviel mehr mit dem anderen in Widerstreit. Maßlose Aggression, rücksichtsloses Rangstreben, schwächliches Verlangen nach Anerkennung überlagern Selbstkritik und Altruismus, ein Bedürfnis nach Bindung und Sicherheit dämpft Zweifel und verengt Offenheit; Neugier macht sich zwar auf die Suche, versiegt aber mit der Zeit, Liebe kommt ohnehin nur den Allernächsten zu, und dem Spieltrieb, der Suche befördert, entwächst man schnell.

Triebhafte Bedürfnisse sind uns nur zeitweilig und nie gänzlich bewusst; wie auch die Instinkte: das sind biopsychisch verfestigte Vorurteile, deren positives Wirken es ist, impulsive Reaktionen auszulösen, lebensrettend in Gefahr, wenn für bewusstes Überlegen keine Zeit ist, wenn Verhalten durch spontane Assoziationen in einem unbewussten Gedächtnis gesteuert werden muss, Assoziationen, die übrigens weniger Energie brauchen als bewusste Gehirntätigkeit, Assoziationen, die durchaus mit reflexiven Prozessen in Konflikt geraten, nicht immer angebracht und in einigem zivilisatorisch überholt sind, da sie in Situationen, wie es sie ehemals nicht gegeben hat, fehlschlagen oder versagen können.

Andere Vorurteile sind soziopsychischer Art: gegen das andere Geschlecht, gegen fremdartiges Aussehen und seltsame Gewohnheiten, andere Herkunft und Kultur, wurzeln aber doch in den Trieben der Aggression und Selbsterhaltung. Sie sind beharrlich, da Erfahrungen, die sie bestätigt haben, besser in Erinnerung bleiben als solche, die ihnen entgegengestanden haben. Sie festigen sich, wenn sie Interessen dienen, schwächen sich ab in Zusammenarbeit und Verfolgung von Gemeinsamkeiten.

Wenngleich beiderlei Vorurteile phylogenetisch geprägt sind, so sind doch die letzterer Art dank der Neuroplastizität ontogenetisch veränderlich: Nervenzellen im Gehirn verschalten sich unablässig, konsolidieren oder lösen sich, verstärken sich in ihrer Effizienz, je nachdem, was wir denken, erleben und tun; neu geschaffene zerebrale Kapazität ermöglicht reichhaltigere geistige Aktivität und differenziertere körperliche Geschicklichkeit.

Allein die Beobachtung des Verhaltens oder der Tätigkeit anderer kann ein Gehirn zu neuronaler Imitation veranlassen. Es spiegelt also die Aktivität anderer geradezu wider, weswegen die betreffenden Neuronen Spiegelneuronen genannt werden. Sie lassen uns nicht nur sinnlich wahrnehmbare Aktivitäten anderer, sondern – intuitiv – leibliche und seelische Empfindungen anderer verstehen, und zwar über das neuronale Korrelat eines basalen leib-seelischen Selbstgefühls, das in der vorderen Gürtelwindung zwischen linker und rechter Gehirnhälfte sitzt, und also auch Einfühlung, Mitgefühl auslösen kann, Empathie, die allein schon durch einen Bericht über das Befinden eines anderen angeregt werden kann, was zeigt, dass Einfühlungs- und Sprachvermögen neuronal eng verknüpft sind.

Spiegelneuronen dienen, und zwar schon gleich nach der Geburt, der Einstimmung der Menschen aufeinander, der Einübung sozialer Fähigkeiten

ten und wahrscheinlich auch der kognitiven Entwicklung: Anteilnahme drängt zu Teilnahme und Mitteilung auch verbaler Art, die bewusstes Denken voraussetzt. Spiegelneuronen, die Verhalten und Erleben nachzuahmen gestatten, befinden sich in allen Bereichen des menschlichen Gehirns.

2. *Ethische Orientierung*

Vom Selbstgefühl zum Mitgefühl – letztlich entspringen alle Gefühle einer Neigung zu Lust, einer Abneigung gegen Unlust. Gefühle begleiten rationale Überlegungen, bewirken Entscheidungen, sind selbst hervorgehoben durch Wahrnehmungen, Beobachtungen, Erlebnisse oder durch im Hippocampus bewahrte, nicht bewusste Erinnerungen. Vom limbischen System ausgehend treffen sie im präfrontalen Kortex mit Wissen und Erfahrung zusammen, gehen damit einher, liegen mit diesem auch im Widerstreit, in dem sie sich oftmals behaupten.

Gefühle verdichten sich zu Vorstellungen, und diese strukturieren sich zu Sinnwelten, vorwiegend in konträrer Orientierung, wenngleich es oft eher um – nicht durchschaute – komplementäre Verhältnisse geht. So

- beansprucht man kulturelle Einzigartigkeit oder anerkennt eine Vielfalt von Kulturen;
- zehrt man von der Vergangenheit oder schaut eher in die Zukunft;
- bezieht man Selbstwert aus einem dem Kollektiv geschuldeten Ehrgefühl oder aus individueller geistiger Anstrengung;
- ergeht man sich in Homogenität oder ist angeregt durch Heterogenität;
- geht man in Totalität auf oder schätzt Diversität;
- fühlt man sich geborgen in Abhängigkeit oder riskiert und genießt Freiheit;
- verschließt man sich in religiöser Identität oder öffnet sich zivilem Umgang;
- ergibt man sich tradiertem Moral oder bildet sich in ethischer Reflexion;
- kurz: handelt man eher mündig oder unmündig, eher vernünftig oder unvernünftig.

Wer sich einer Tendenz zur jeweils erstgenannten dieser Sinnwelten, zu deren Überschneidungen und Überlagerungen überlässt, begibt sich

einer zivilgesellschaftlichen Verpflichtung auf Werte wie individuelle Menschenrechte, Demokratie, Säkularität. Zwar kann sich niemand einer kulturspezifischen Überformung seiner Vorstellungen, Einstellungen, ja sogar seiner Wahrnehmung entziehen, doch findet der vernünftige Denkende Gründe für einen ethischen Universalismus, der gestützt ist auf die allgemeine psychophysische generische Konstitution des Menschen, und er wird Kritik erwägend hinnehmen; der Gläubige hingegen empfindet Kritik als Zumutung oder Beleidigung, verweigert sich erprobender Übernahme der Argumente anderer.

Zwar scheut sich auch der Aufklärer Immanuel Kant nicht, von Glauben zu sprechen, aber er spricht von einem Glauben, „welcher sich auf keine andere Data gründet als die, so in der *reinen* Vernunft enthalten sind“ (1912: 141). Er erläutert: „Ein reiner Vernunftglaube ist also der Wegweiser oder Compaß, wodurch der speculative Denker sich auf seinen Vernunftstreifereien im Felde übersinnlicher Gegenstände orientiren, der Mensch von gemeiner, doch (moralisch) gesunder Vernunft aber seinen Weg sowohl in theoretischer als praktischer Absicht dem ganzen Zwecke seiner Bestimmung völlig angemessen vorzeichnen kann ...“ (1912: 142).

Das ist, so Kant, nichts anderes als die „Unterwerfung der Vernunft unter keine andere Gesetze als: *die sie sich selbst gibt* ...“, und dennoch oder gerade deshalb die „Freiheit im Denken“, welches Denken nichtsdestoweniger methodisch nachzuvollziehen und schlüssig zu verstehen sein muss. Doch „... wenn die Vernunft dem Gesetze nicht unterworfen sein will, das sie sich selbst giebt“, hat das zur Folge, dass „... sie sich unter das Joch der Gesetze beugen muß, die ihr ein anderer giebt ...“ (1912: 145). „Und so zerstört Freiheit im Denken [...] endlich sich selbst“ (1912: 146).

Was nun ist Vernunft? Was ist theoretische und praktische Rationalität? Jedenfalls, um ein negatives Urteil zu gebrauchen, die Vermeidung von Illusion. Vernunft dringt auf Wahrheit, bescheidener: Richtigkeit. Irrt sie auch, ist sie doch methodisch und logisch kontrollierbar, sodass begreiflich ist, warum die Ergebnisse ihrer Anstrengungen sich als falsch, als Irrtum erweisen. Aber: „Eine Illusion ist nicht dasselbe wie ein Irrtum. [...] Für die Illusion bleibt charakteristisch die Ableitung aus menschlichen Wünschen. [...] Wir heißen also einen Glauben eine Illusion, wenn sich in seiner Motivierung die Wunscherfüllung vordrängt, und sehen dabei von seinem Verhältnis zur Wirklichkeit ab, ebenso wie die Illusion selbst auf ihre Beglaubigungen verzichtet“ (Freud 1926: 434, 440).

Kants Vernunftglaube ist insofern nicht illusionär, als er der Glaube an etwas ist, was sich logisch und praktisch bestätigt hat, zumindest der Bestätigung fähig ist. Vernunft ist sowohl geistiges Streben: *noema*, als auch praktisches Werkzeug: *organon*, welches letztere sich erst in seinem Gebrauch als solches erweist. Vernunft ist, was Menschen vernünftig denken und tun, und darüber muss immer wieder befunden werden. Vernunft ist nach Stimmigkeit strebendes Denken und dessen praktische Bewährung, ist individuelle und kollektive Leistung. Alles andere ist sie nicht, wobei dies unendliche negative Urteil nur dazu dienen soll, falsche kategoriale Bestimmungen zu vermeiden.

Vernunft zeigt sich im menschlichen Werk, in Äußerungen des menschlichen Verstandes, im vernünftig geführten Diskurs. Da Illusion und Glaube nur durch schiere sich selbst bestätigende Wiederholung überdauern können, ist Vernunft, die sich denkend und handelnd reflektiert und weiterführt, kategorial anders zu bestimmen als Glaube und Illusion. Deshalb bestimmt man sie auch besser nicht substantial, sondern prozessual als vernünftiges Denken. Dieses ist logisch jeweils die materiale Negation unvernünftigen Denkens und ist gegenüber und unterschiedlich zu diesem unter Beweis zu stellen.

Das geschieht, wenn es sich um empirische Folgen vernünftigen Denkens handelt, "in einem gemeinsam kontrollierten, offenen Prozess der allgemeinen Wissensentwicklung, die als solche immer zugleich auch Begriffsentwicklung ist" (Kambartel und Stekeler-Weithofer 2005: 254). Nicht nur innerhalb einer Forschungsgemeinschaft, sondern im gesamten öffentlichen Bereich ergibt sich so interindividuell die Chance, sinnlose von sinnvollen Aussagen oder – in kategorialer Ausgrenzung, die aussagt, dass ein Prädikat nicht zum Gegenstandsbereich gehört – relevante von irrelevanten Aussagen zu unterscheiden, und unsinnige Aussagen, die gar nicht wahrheitsfähig sind, dahingestellt sein zu lassen.

Solches Verfahren gilt auch für intelligible "*generische Sätze*" (ibid.: 254) die Gattungen betreffen, aber nicht allquantifiziert empirischer Art sind; sie unterliegen nicht strikter Verifikation, sind aber intersubjektiv konsensuell und insofern auch objektiv, als sie sich auf eine Außenwelt beziehen, deren objektive Erkenntnis uns zwar nur durch Zeichen vermittelt ist, die wir aber leiblich-seelisch subjektiv wahrnehmend erleben – unsere Lebenswelt, unsere Wirklichkeit, weil sie Wirkungen auf uns zei-

tigt. Wirklich spürt man die Welt, und wenn davon die Rede ist, stimmt man schnell überein, wenngleich man subjektiv, ganz bei sich ist.

Jedoch: “Die für eine sinnkritische Analyse des Redebereichs der objektiven Erfahrung bei weitem wichtigste modale Kategorie ist die Möglichkeit. Was, so lautet die relevante Frage, muss erfüllt sein, dass ein Urteil eine *objektive Möglichkeit* zum Ausdruck bringt und nicht bloß eine *rein formale Möglichkeit* artikuliert” (ibid.: 257–258). Formal möglich sind fiktive Wesen und die Zuschreibung ihrer Eigenschaften. Formal möglich, aber auch faktisch funktional ist die logische Konsistenz der Arithmetik; objektiv möglich, weil empirisch bestätigt, sind die Dynamik und Kinetik der physikalischen Mechanik.

Nach Immanuel Kant ist – im empirischen Denken –

1. was mit den formalen Bedingungen der Erfahrung, also der Anschauung gemäß den reinen Verstandesbegriffen übereinkommt, *möglich*;
2. was mit den materialen Bedingungen der Erfahrung oder der Empfindung zusammenhängt, *wirklich*;
3. dessen Zusammenhang mit dem Wirklichen nach allgemeinen Bedingungen der Erfahrung bestimmt ist, *notwendig*, das heißt existent. (1911: 185–186/B 266)

So weiß man, wovon objektiv die Rede ist. Gleichwohl steht auch das subjektiv Mögliche oder Wirkliche nicht außer Rede, doch kann diese nur anderer Art sein als jene, in der es um Objektivität geht. Subjektiv kann durch Glaubwürdigkeit geltend gemacht werden, was dem einen eine Erklärung ist, dem anderen spekulativ zu sein scheint, dunkel, nicht einsichtig ist. Ist aber eine logisch-empirisch sinnvolle Hypothese dazu gefunden, kann abduktiv eine Folgerung gewonnen werden, ein Schluss also von einem vorliegenden Ergebnis auf einen besonderen Fall unter einer angenommenen Regel oder einem Befund, wodurch der Fall vorläufig erklärt ist, – welche Abduktion oder Hinleitung sich dann induktiv bestätigen und deduktiv nutzen lässt.

Nach Charles S. Peirce ist möglich, “was sein könnte; wovon nicht bekannt ist, dass es unwahr wäre: wovon nach einem hypothetischen Stand der Information nicht bekannt ist, dass es unwahr wäre.” Es sei ein elliptischer Ausdruck insoweit als “wir nicht wissen”, ob ein Ding existiere oder ein Ereignis oder eine Tat nicht vorkommen werde; “möglich ist, was sein könnte [may], nicht, was sein kann [can]” (1991: 462). *Wirklich* unterscheidet Peirce von *real*, “weil das, was nur keimhaft *in posse* ist, insofern es

das Vermögen hat, sich zu einer bestimmten Wirklichkeit zu entfalten, real ist und unabhängig davon, was wir darüber denken mögen. Reale Objekte sind entweder außerhalb unseres Geistes, wenn sie nämlich überhaupt von unserem Denken unabhängig sind, oder sie sind innerhalb des Geistes, wenn sie vom Denken, wiewohl nicht vom Denken über sie abhängen” (1991: 468), das heißt, intelligible Realität sind.

Letztere wären nichts anderes als die generischen objektiv reinen Gegenstände, die in Kants Terminologie in den “reinen sinnlichen Begriffen” erfasst werden, “denen nicht Bilder der Gegenstände, sondern Schemata zum Grunde” liegen (1911: 136/B 181), Gegenstände, über die jeweils zu befinden ist. Über subjektiv geglaubte Realitäten, ist nicht einmal intersubjektiv, geschweige denn objektiv zu befinden; bei entsprechender Neigung kann man sich nur in jemandes Befindlichkeit, jemandes Glaube etwa, einfinden. Es ist aber über Glaube mit dem Gläubigen nicht zu rechten, weil dessen Geltung, subjektiv wie objektiv, für ihn von vornherein ausgemacht ist; es gilt ihm nur, seinem Glauben zu folgen, diesen auch zu verbreiten.

Was in Semiose und Retrosemiose, in Herkunft und Fortgang nachzuvollziehen oder zu verfolgen wäre, verschmilzt in Befindlichkeit, Aufwallung, Mystik. Die Kantschen Kategorien und Peirce’ semiotische Differenzierungen greifen hier nicht. In Vermeidung “kognitiver Dissonanz” (Festinger 1989: 31) wird nicht kategorial bestimmt, fallen externes – so es existiert – und internes Objekt ineinander, ebenso wie rhematischer, dicentischer, argumentischer, logischer, emotiver, dynamischer Interpretant.

Es geht nicht um logisch und empirisch zu klärenden Sinn, sondern um überschießende, haltlose Bedeutung, um rituellen Vollzug, nicht um Verständigung, sondern Selbstverständnis, um verschwommene Symbolik, wabernde Metaphorik; das Dingwort wird zum – unbedingten – “Wortding” (Gfesser 1996: 23), dem bedingungslos entsprochen wird, gelegentlich und gern erbarmungslos, obschon allemal ein barmherziger Gott beschworen wird. Wohl hält ihr referentieller und inferentieller Überschuss die Wortsprache offen und geschmeidig für neues; er kann aber auch informationale Geschlossenheit befestigen: Wer nur noch selbiges beschwört, dem fehlt es an Aufmerksamkeit für anderes und andere, der will selbst nur Aufmerksamkeit erregen.

Aufmerksamkeit aber ist eine "geistige Operation, welche eine einzelne Idee von allen anderen Ideen absondert ..." (Robin 1967: 6/MS IIII). Man muss aufmerken, um etwas bemerken, etwas beachten, um etwas achten zu können, muss sich stören, ja verstören lassen, sich auf etwas einlassen, statt sich über etwas auszulassen, aufeinander zukommen und mit Unverständnis auskommen, überlegend innehalten und Widerspruch aushalten können.

Grundlegend dabei bleibt, dass Verstehen nur aus Strukturen rationaler Begründung erwächst, aus abduktivem Vermögen, in inferentieller Argumentation, und kraft kommunikativer Kompetenz, derart, dass man sich angemessener Mittel bedient, um etwas festzustellen, zu erläutern, zu begründen, zu unterscheiden, zu bewerten, dass man über geeignete Prädikate verfügt: für Qualitäten, Quantitäten, Eigenschaften, Gattungen, Zustände, Handlungen, Ereignisse, Beziehungen, Verhältnisse, Zusammenhänge, dass man klarstellt, ob es um eine Handlung geht oder ein Widerfahrnis, einen Wunschtraum oder ein Erlebnis, einen Vorgang oder eine Tätigkeit, ob jemand Handelnder oder Betroffener ist, Urheber oder Nutznießer, Beteiligter oder Unbeteiligter.

3. Differenzierende Performative

Verben wie feststellen, unterscheiden, erläutern, begründen nennt man performative Verben, (Austin 1972: 87–95) weil sie die Intention des Sprechers hinsichtlich der performativen Geltung seiner Äußerung, aber auch die perlokutive Absicht des Sprechers in einer Kommunikation, eben die beabsichtigte Performatio explizit benennen. Sie tauchen meistens erst in einer Redewiedergabe auf, und zwar in der dritten Person, seltener, etwa im Falle einer Bekräftigung, eines Versprechens, einer Entschuldigung, eines Ratschlags, eines Widerspruchs, eines Vorwurfs, oder einer Bitte in der ersten und zweiten Person, sind aber dem Sprechakt implizit. Der Sprecher äußert seine Intention explizit nur, wenn er sie hervorheben will oder meint, missverstanden worden zu sein, oder befürchtet, missverstanden werden zu können. Ansonsten vertraut er darauf, richtig verstanden zu werden, zumal er sich bemüht, dem zur Rede stehenden Sachverhalt und dem Verlauf des Diskurses sprachlich gerecht zu werden.

Man überlege nur, wie viele Performative eine Sprache doch bereithält, um zu ersehen, wie differenziert Argumente vorgebracht werden

können und ebenso darauf eingegangen werden kann. Man kann etwas beurteilen, einräumen, gegenüberstellen, einschränken, mitteilen, benennen, beschreiben, bekennen, unterstellen, fragen, bitten, prüfen, fordern, empfehlen, versprechen, bezwecken, verknüpfen, vergleichen, auseinanderhalten, dafür oder dagegen halten, vereinzeln, verallgemeinern, verstärken, abschwächen, vermuten, erwarten, vorziehen, abwehren, gutheißen, annehmen, ablehnen, einüben, anvertrauen, herausstellen, gewichten, berichtigen, verneinen, bejahen, bestätigen, einbeziehen, ausschließen, kann zustimmen, widersprechen, beharren, drohen.

Weiters kann man etwas ausnehmen, ausschließen, beziehen, berichten, beachten, andeuten, ausführen, bemerken, berücksichtigen, bestimmen, bestreiten, beteuern, bekunden, bezweifeln, darstellen, deuten, einklagen, einwenden, erkunden, erwidern, entgegnen, erwähnen, erwägen, entwerfen, erforschen, entnehmen, kann belasten, bezichtigen, beschuldigen, sich beschweren, bedrängen, abweichen, ausweichen.

Man kann etwas finden, erfinden, folgen, folgern, fühlen, gestehen, gewährleisten, glauben, hervorheben, hinzufügen, hoffen, leugnen, loben, tadeln, meinen, schließen, unterstreichen, verdeutlichen, verlangen, versichern, verwerfen, voraussetzen, vorschlagen, verbinden, wiederholen, aufzeigen, zugeben, hinweisen, verweisen, unterrichten, vorhalten, warnen, täuschen, irren und zweifeln.

Derart unterschiedlich also können die Intentionen der Sprecher sein, die in der Sprechhandlung verborgen vorgebracht, aber selten ausdrücklich zur Sprache gebracht werden. Hinzu kommen Mimik und Gestik, leiblich-seelische Befindlichkeit, geistige Fähigkeit, Wissen, Erfahrung, Kenntnis, Erkenntnis, Motivation und Strategie. Auch Alter, Geschlecht, Status und Rolle, Norm und Regel, Sozialisation und Enkulturation, sowie die grammatische, semantische, kommunikative Kompetenz, auch die Anzahl der Gesprächsteilnehmer, Zeit und Ort, Anlass, Umstand und Situation des Gesprächs bestimmen Sprecher und Sprechakte.

Es trifft zu, was Peirce (1960: 169/5.283) gesagt hat: "When we think, then, we ourselves, as we are at that moment, appear as a sign." Gemäß aktuellen neurologischen Forschungen schließt das reflexive Denken auch zerebrale Aktivitäten ein, die unbewusst bleiben, aber eben unser Denken, unsere Handlungen und unser Verhalten beeinflussen. Die Faktoren und Agenten einer Kommunikation sind also sehr komplex und es leuchtet ein, dass jedes Verstehen von Missverstehen begleitet ist, dass es schwierig ist,

sich verständlich zu machen, dass man etwas eben nur zu verstehen geben kann, in der Hoffnung, dass es aufgenommen wird, dass schwerlich zu verstehen ist, wofür man kein Verständnis hat, dass man für vieles kein Verständnis erwarten kann, und dass dennoch nichts bleibt als der Versuch, sich zu verständigen, um Verständnis erlangen zu können.

Dazu muss man seinem Verstand aufhelfen, wozu es des Verstandes selbst bedarf. Verstehen ist Entwicklung und nicht Stillstand. Und weil es mittels Zeichen vonstatten geht, ist es ein Zeichenprozess in Zeichensystemen, deren umfassendstes unsere Wortsprache ist. Ein Zeichenprozess, eine Semiose, ist immer ein triadischer Prozess, durch den ein Erstes ein Drittes dahingehend determiniert, sich auf ein Zweites zu beziehen, auf das es sich selbst bezieht. Man nennt diese triadische Relation seit Peirce den Mittel- Objekt- und Interpretantenbezug des Zeichens. Nur wenn diese semiotische Logik gewährleistet ist, die Zeichenbezüge nicht verfehlt werden, ist Verständigung möglich.

Vielfältig und vielschichtig verlaufen und gestalten sich die Semiosen in einer Kommunikation. Die dreieitliche Beziehung zwischen einem Bestand an Mitteln, einem Bereich von Objekten und einem Feld der Interpretanten ist dynamisch, also im Gebrauch der Zeichen veränderlich, kann doch jeder der drei Bezüge erweitert, eingeschränkt, abgewandelt werden. Mittel ist prinzipiell jede geeignete Materie, ist sie nur in eine triadische Relation gebracht; Objekt ist prinzipiell alles, was bezeichnet, dargestellt werden kann; Interpretant ist weitestgehend sämtliches Wissen der Welt.

Die moderne Semiotik hat die drei Zeichenbezüge differenziert und praktikabel gemacht, wenn es gilt, ein Mittel zu wählen, um ein reales oder fiktives, physisches oder mentales, konkretives oder abstraktives, individuelles oder kollektives Objekt bezüglich eines intendierten Interpretanten angemessen treffend und präzise, auch prägnant zu bezeichnen. Der Mittelbezug des Zeichens wird an Wahrnehmbarkeit, Aufmerksamkeit, Wirksamkeit gemessen; der Objektbezug daran, welcher Art er bezeichnet: iconisch-abbildend, indexikalisch-verweisend, symbolisch-benennend, eher anschaulich oder unanschaulich; der Interpretantenbezug schließlich wird in seinem logischen, offenen, geschlossenen, vollständigen, emotiven, dynamischen Konnex ermessen.

Social studies of science? Semiotic studies of medicine!

A case of positron emission tomography

1. Social studies of scien...tists?

The almost total exclusion of materials from medicine and technology reflects the fact that history, sociology, and anthropology of medicine and technology are large and actively practiced fields whose literature is as sizeable as that of science studies itself.
(Mario Biagioli 1999)

This editor of *The Science Studies Reader* might have made such a decision neither for the sake of size nor for convenience. Intentionally or not, Biagioli's reiterated juxtaposition of "medicine and technology" reflects another fact: Western medicine has been *technology* rather than science ever since the time of, for instance, hepatoscopy, from 3000 to 2000 BC, which was the deciphering of a sheep's liver, into whose *in vivo* nose the sufferer has breathed, and inscribing whatever diagnosis on a hepato-shaped stone in cuneiform. After the Hippocratic aphorism, "Life is short, art (*techne*) long," Aristotle – among other Hellenic rationalists – called medicine a sort of art (*ιατρικη τεχνη*; e.g. *Metaphysics*: 12. 1070a) or productive science (*ποιητικων επιστημων*) whose goal is health; unlike theoretical ones, such as geometry, the aim of which is "to contemplate nature" (*Eudemian Ethics*: 1. 1216b).

I realize that medical science has existed since continental researchers, like Claude Bernard (*Introduction à l'étude de la médecine expérimentale*) and Rudolf Ludwig Karl Virchow, in the mid-19th century, started observing test-animals in laboratories. For me, however, this scarcely equals *sickbed* performances. Scientific studies – fractal physics as well as biology – often deal with isolated, *laboratory* erudition. For example, *Les microbes*

by Bruno Latour pertains to Louis Pasteur, who was hardly a diagnostician; Evelyn Fox Keller's *Making Sense of Life* features no signs of illness; the recent work of Nikolas Rose (2003) has explored the ethical implications of pharmaco-genetic psychiatry (hence following more in the Foucauldian line of *Folie et déraison* than of *Naissance de la clinique*.)

2. *It takes the Dutch*

Half the number of contributors to a *Body and Society* issue (v. 10, nos. 2–3) were Dutch. In fact, the second wave of scientific studies of corporeality is being led by promising Dutch authors. For example, José van Dijck has gathered papers highlighting where the gaze of media interests converges with that of surgical purposes. Since differences between those lenses are still clearly admitted (van Dijck 2005: 11), nothing approaching metaphorical similarity¹ could satisfy readers.¹ Neither is her monograph concerning such a synchronicity as compact discs triggering off the respective progress of music industry and cardiovascular scanning; to say that CAT needs computers would also be a mere tautology. Instead, she discusses how both technological sectors have frequently met: for example, x-ray photographs were made popular to help the promotion for respiratory health, while documented separations of Siamese twins or the Visible Human Project became a spectacle in Guy Debord's sense. Endoscopy hence parallels not so much any communication gadgetry *per se* as it does science fiction.

A chapter where van Dijck compares roentgenography with a Nobel Prize winner by Thomas Mann is unique at certain points. Firstly, her choice of *The Magic Mountain* leads to questioning how broadly she defines media. Then, we realize the contents – rather than materiality – of Mann's novel matter. Third, when van Dijck (2005: 88 & 161 n) wrote, "Part of the X ray's power rested in its ability to 'speak for itself,' [...] Röntgen's device resembles a contemporary technological invention: the gramophone," she cited *Grammophon, Film, Typewriter* [1986] by Friedrich A. Kittler whose inscription theory looks preferred to Bruno Latour's; is van Dijck's exposition shifting from science studies to media archaeology? That seems unlikely, because she invites no such Foucauldian word-before-thing media as Siegfried Zielinski (2006) does some 18th-century remote typewriter which did not exist. *Fantastic Voyage* epitomizes discursive inventions of diagnostic apparatus popularized using media. Another case for Zielin-

ski is Jan Evangelista Purkyně's doctoral thesis apropos subjective vision featuring optical tools like kaleidoscopy, a technology from the same century. If van Dijck found new ideas which ironically appeared to somehow transcend historical contexts as recommended by Erkki Huhtamo (1996), van Dijck would seek any literary attraction before 1895 to non-invasive anatomy or place *Fantastic Voyage*, *Innerspace* and *Osmosis Jones* recurring every second decade vis-à-vis treatment with miniaturized agents that we have never witnessed.

3. *Which semiotics of medicine?*

Whatever acts or shifts actions, action itself being defined by a list of performances through trials; from these performances are deduced a set of competences with which the actant is endowed; the fusion point of a metal is a trial through which the strength of an alloy is defined; the bankruptcy of a company is a trial through which the faithfulness of an ally may be defined; an actor is an actant endowed with a character (usually anthropomorphic). –Madeleine Akrich and Bruno Latour, 1992

Despite those aforementioned rarities, *science studies-ts* (my designation) appear to be sociologists rather than students of science let alone medical technology; hence the label sounds problematic, which is more so because I have never heard of *medicine* – not *medical* – *studies*. Clinical practices may be of no concern unless they appeal to science *and technology* studies. Likewise, social thinkers or anthropologists of the body (e.g. Polhemus 1978; Martin 1992; Featherstone et al. 1993; Shilling 1994) have cared little about diagnostic imaging. When determined to chase laboriously how inequalities are strategically depicted as steady by the power machine, Gordon Fyfe and John Law (1988: 1) continued participating in leftist politics: “To understand a visualisation is thus to inquire into its provenance and into the social work that it does. It is to note its principles of exclusion and inclusion, to detect the roles that it makes available, to understand the way in which they are distributed, and to decode the hierarchies and differences that it naturalises. And it is also to analyse the ways in which authorship is constructed or concealed and the sense of audience is realised.”

Semiotic influences come to mind next, although they are seldom recognized: Bernike Pasveer (1989) exceptionally reveals possible equivocality

of radiography: i.e. people interpret stuff diversely at their discretion. Sociologists of scientific knowledge or actor-network theorists have favoured the Greimassian notion of *actant* that was borrowed from Lucien Tesnière (1976: 102) as referring to any noun (*substantif*) which engages in the predicated event (*procès*) and becomes a human or equivalent actor. This linguist investigated how expressive grammar signifies real-life contents; to *École-de-Paris* semioticians, it matters that Vladimir Propp's (1984) several *dramatis personae* were replaced with fewer categories.

Figure 1. Actantial model (Courtés 1976: 62–68).

Algirdas Julien Greimas proceeded to exclude the bottom row in “La Soupe au pistou ou la construction d’un objet de valeur” [1979] and projected a protagonist on such modal verbs as – since “Les Actants, les acteurs et les figures” was published 6 years earlier – *vouloir* (wanting) *pouvoir* (being able) *savoir* (knowing) and, in “Pour une Théorie des modalités” [’76], *devoir* (having to). Though animals or things such as diamonds are often sought after (Prince 2003: 2), they may not so much assume those heroic positions. Greimassian actants have turned out more of the subject i.e. social agent (in French, *actant*) which science studiests have adopted for longer than it appears to be internationally confirmed (see Lenoir 1994). Latour and Paolo Fabbri in 1977 co-wrote “La Rhétorique de la science: Pouvoir et devoir dans un article de science exacte” that was appreciated by Jean-Claude Coquet (1984), a Parisian scholar. This clan gave birth to sociology of scientific knowledge or *actor-network theory*, if not François Rastier et al’s (2002: 255–260) information semiotics! However, with its three words and the hyphen all intimidating, ANT may be a misnomer of the agency-structure debate², according to which actants themselves achieve society rather than having been within or constructed by it *a priori* (Strum & Latour 1987).

4. *It takes Dutch, and others*

Anne Beaulieu has contrasted three players in positron emission tomography: first, psychological researchers understand that it statistically measures the cerebral functions. Secondly, a lay audience would consume the scan like beautiful paintings or photos so misleadingly realistic some have created ungrounded expectations for clairvoyance while its personality-wise data are enormously difficult to evaluate (Hüsing et al. 2006). Third – and this particularity explains why science (or scientists whom Beaulieu has described as reliant upon numbers and texts rather) studies does not suffice – a clinician requires such rendering of data to communicate with his or her patient (Beaulieu 2002). Here we have Algirdas Julien Greimas' subject, receiver, sender (Figure 1); tomographs are no actantial machinery serving people modestly (cf. Johnson 1995³), but objectified for visual analysis to which – and Hippocrates' symptomatological legacy – I find Charles Sanders Peirce faithful (Ghimn 2003). Let us paraphrase Beaulieu's accounts: PET, comprised of pixels, calculates where and how many isotopes are concentrated *diagrammatically*. Göran Sonesson (1999) considers this cartography (the darker yellow – which corresponds to nothing of that colour – in a map, the hillier) more fulfilling than *image* or *metaphor*⁴, two other kinds of *iconicity* that does not mimic things so much as exhibits how the structure is proportionally arranged (Peirce 1931–35: Volume IV, paragraph 544).

Bruno Latour (1999: 29 & 66) sounds less Greimassian when saying not only “they can point with their fingers to phenomena taken in by the eye [...] the ‘index’ par excellence” but also “Is the diagram [...] more abstract or more concrete than our previous stages? More abstract, since here an infinitesimal fraction of the original situation is preserved; more concrete, since we can grasp in our hands, and see with our eyes, the essence of the forest-savanna transition, summarized in a few lines. Is the diagram a construction, a discovery, an invention, or a convention? All four, as always.” Regarding rhetorically generated credibility, the concepts of “selective” perception – i.e. filtering, uniforming, upgrading, defining – by Michael Lynch (1988) and “homologues” demonstration by Peter Galison (1997), which retains internal relations of what has been represented, seem compatible with Peirce's *diagram* too.

Figure 2. An electron collides with its anti-particle carrying a + charge (i.e. positron) to be annihilated. Two γ rays thereof aim in the opposite directions (Sochurek 1987; reprinted with permission from Dr. Joel Karp, the source).

I have proposed a thesis on diagnostic images to prove the *diagrammaticality* in PET, where science studies is disappointing: it rarely does medical technology justice. Greimas' actant scheme that underlies Latourian sociology of scientific knowledge once comprised in *Sémantique structurale* [1966] personified objects but has soon focused on asking what a subject can, must, wants and knows (how) to do. Henceforth *semiotics of passions* later: this inconclusive project has succeeded to Louis Hjelmslev's mission in *Prolegomena to a Theory of Language* – how to fragment a continuum (Hénault 1992: 116–119). Tomographers act i.e. upon our sensate body (Greimas & Fontanille 1993: xxii) without a scalpel (*τομευς*), PET instrumentation helps wherein patients experience the procedure (Figure 2); yet, tomographs are rather acted or practiced on by those expert agents (Figure 3). Latour would not call such PET inscriptions *actors* either, but *diagrams*.

Figure 3. Actantial model applied to visual diagnosis.

Notes

1. “Indeed, just as medical progress, the possibility of radiography, scanners, and grafts, transforms our body and our relationship to our body, media space, whether we are spectators or actors, in one way or another, implies a profound transformation of the body and of our relationship to our own body,” says Jacques Derrida to Bernard Stiegler (2002: 96).
2. Latour involves “actants” to be humanized while Greimas and Joseph Courtés (1982: 302) expel such automatons without *savoir* from communication.
3. Latour’s anglophone pseudonym; in Parisian semiotics – the door can be open (situation), was not yet so then it has been opened (event) or the door flies open (process), but somebody must still make that happen (action) by opening it (Genot 1979: 20).
4. Why subdivide (*hypo*)*icon* there into those *diagram* and *metaphor* concepts? Firstly, it is a myth that *images* or pure *icons* would amount to the perfect double of whatever they denote. Peircianism has already fought non-semiotic, though ordinary, examples of computer-graphic “icon” which look *symbolic*. Next, just like *indices* are the core sign, *diagrams* characterize a condition termed *iconicity* that some, even decreasing, extent of resemblance could satisfy: the famous triplet went in 1885 without designating *symbol*: “The first is the diagrammatic sign or *icon*, which exhibits a similarity or analogy to the subject of discourse; the second is the *index*, which like a pronoun demonstrative or relative, forces the attention to the particular object intended without describing it; the third is the general name or description which signifies its object by means of an association if ideas or habitual connection between the name and the character signified” (Peirce 1931–35: Volume I, paragraph 369).

Tiziana Giudice

Metaphors and imagination

1. Introduction

Metaphor, according to Aristotle, is a device for the acquisition of knowledge that relates something known to an abstract, less clear portion of reality or experience. Through metaphor you can imagine what you do not yet know, on the basis of what you already know. This is an “expressive device present in verbal language that connects it to non-verbal language, activating interpretative routes in signification that relate sections that are even very distant from each other in the sign network” (Ponzio 2004: 67–68). It has been demonstrated that metaphor is present in the most different communicative situations. Metaphor has been defined as being endowed with cognitive value: it organizes language, thinking and symbolic expression in general.

The relation between metaphor and imagination has not been an object of systematic investigation, even if it seems fundamental to understanding the function of metaphor. In fact, the production and understanding of metaphor not only presuppose the processes implicated in linguistic elaboration, but also the semiotic and cognitive capacity to create links among even the most disparate elements: this capacity calls on the imaginative dimension.

In this paper I focus on Cognitive Linguistics because it defines metaphor as a “device” used by the mind to (cognitively) re-direct human mental systems and organize thinking (see Lakoff and Johnson 1980). I will analyse Johnson’s perspective of 1987, in which he affirms that metaphor is based on cognitive elements that are not logical-propositional, but imaginative. Starting from the limits and merits of this approach, I will propose some topics concerning the metaphor-imagination relation with reference to both Giacomo Leopardi and Giambattista Vico.

It would be methodologically risky to argue that these authors, who had different languages and knowledge from our own, were forerunners with respect to the issue of metaphor and imagination, or that they even solved it in any way. Instead, by focusing on the history of this issue, my aim is to build and describe the setting from which came the terms of the relation of metaphor and imagination.

*2. Principles of Cognitive Linguistics:
The cognitive role of image schemata*

Cognitive Linguistics affirms that mind is not detached from body; rather, it is *embodied*, in the sense that cognition depends on the body, on its specific characteristics of perception and of motion, as well as on its interaction with the external world. In this perspective metaphor is a cognitive mechanism able to transform what is difficult to represent cognitively into something concrete and simple by individuating the physical-perceptive elements of cognition of what is abstract and lacking in information. More precisely, metaphor is meant as a projection of different material configurations – perceptive, motoric, spatial, etc. – into the linguistic and conceptual level.

This means that projection is not accidental but caused by the materiality of thought and of language: human beings have a body, are able to move, to manipulate objects and, generally speaking, to interact physically and perceptively with the world. These conditions create a series of pre-conceptual *schemata* that constitute the basis of the conceptual system. Johnson (1987: 2) defines these pre-conceptual structures as “image schemata”, which are “dynamic patterns that function somewhat like the abstract structure of an image, and thereby connect up a vast range of different experiences that manifest the same recurring structure.”

Schemata are recurrent models of corporeal experiences, organizing centres of knowledge that structure, in a non-propositional form, a group of salient information which emerges from sensory-motoric activities, such as manipulating objects, orienting in space and focusing perceptive attention on different ends. Examples of these schemata are “up-down”, “front-back – both linked to spatial orientation – and “container”; all of these arise from the fact that we experience our body as the latter. These schemata, metaphorically projected and propositionally elaborated, constitute

our web of meanings; moreover, they motivate a great part of semantics in any language. For instance the “up-and-down” schema is metaphorically projected onto positive abstract domains such as happiness, sadness, health and illness, so that what is correlated to psychical, physical and social well-being is understood as though it had a direction upwards. Negative psychical, physical and social conditions have the opposite direction. For example, *I’m low/ down in spirits* are metaphorical expressions connected to the physical sense of vertical orientation. Both of these derive from the “up-and-down” schema; for example, *to reach the top* that means *to have success*.

Turning to the concept of “imagination”, it appears to be considered intuitively as a creative activity, as synonymous with fantasy. In the cognitivist context, this dimension in relation to metaphor has been neglected with respect to the consideration of image schemata as products of the imagination. In this perspective, the imagination drives the entire cognitive experience; and it activates and coordinates, through metaphorical projection, the schemata from which linguistic activity comes.

3. *Limits and merits of the cognitivist theory of metaphor*

One of the limits of this theory¹ resides in the fact that it is not able to go beyond merely noting that the basis of symbolic expression is given by metaphorical interconnections characterizing human thought (see Ponzio 2001). In fact, this perspective lacks a psychological theory, since Johnson (1987) did not construct a functioning model of mind: without analysing the procedural nature of image schemata, it is not clear if and how these structures are represented in the human mind. This approach, however, has recently received confirmation from that experimental field of cognitive neuroscience which propose neural models that accord with the thesis of embodied mind. Some studies demonstrate the neurobiological plausibility of image schemata: both literal and metaphoric language, related to the body and bodily actions, activate some areas within the sensorimotor cortex, according to image schemata hypothesis (see, e.g., Hauk et al. 2004; Rohrer 2005).

On the one hand, I believe that a notion of imagination as deriving from body-world interaction, and intended as the ability to produce and organize knowledge, is an important *trait d’union* between body-experi-

ence and the gnoseological dimension of metaphor; but on the other hand, such a notion is also reductive. Our linguistic productions are not only covered by body metaphors but also by those more complex metaphors connected to the culture of reference. With the term “experience” we do not just mean the corporeal and motor-perceptive dimensions. The content of language, namely the experience, as Aristotle says, is not made up of only what it is perceived. Experience is, in doing, a specific use of physical entities. Experience brings into what is sensibly perceived, a “utility” and an “end”, which have a cultural matrix. So we could not intend the notion of imagination as just the ability to elaborate sensible data, but also as the ability to connect our experiences – intended in a wider sense – and our background by organizing and structuring them in coherent and meaningful units and also by making them pertinent to our ends. These actions are possible because of the metaphoric mechanism: the human mind moves through a web of interpretative routes made up of associative and metaphorical links (see Ponzio 2001), and it is based on the ability of discovering new cognitive combinations (see Danesi 2001). Moreover, imagination lets words resound, oscillate, evoke, allude and open to the entire range of possible signification exactly because metaphor is not a mere “representative” modality but is a “reconfiguration” of reality that is capable of symbolically structured, abstract and creative processes.

Within this theoretical approach some of Vico and Leopardi’s issues assume a decisive role. These issues demonstrate that the Enlightenment was not simply characterized by the cult of rationality, but that it also gave voice to emotional, imaginative and corporeal elements of life and of knowledge (see Gensini 2002). Both philosophers, though starting from different perspectives, consider imagination as a dynamic, productive and fundamental element of knowledge. The creative dimension of language corresponds to imagination; this creative dimension is made explicit in the metaphoric ability and in its constantly ambiguous and opened way of being. Leopardi’s philosophic reflections in the *Zibaldone* as well as Vico’s in *La scienza nuova* can contribute to placing Cognitive Linguistics in a theoretical frame that can better explain metaphorical processes, and can be an important starting point for explaining, both empirically and theoretically, either the presence or the functioning of associative-metaphorical thought in the formation of new concepts (see Ponzio 2001).

4. *Imagination and metaphor according to Vico*

Giambattista Vico (1668–1744), in *La scienza nuova*, not only highlights the relation between metaphor and body, a strong point of the cognitivists, but he also connects, systematically and indissolubly, the metaphoric ability with that of imagination. When Vico criticizes the mere rational basis of knowledge, he clarifies that language develops when you transfer sensible and corporeal data onto data which are not yet known. In this process metaphor plays a fundamental role. It is by no means a mere embellishment of discourse; it is not “an ingenious invention of poets”. It is an act with heuristic value, an interpretative and gnoseological mechanism that can make something visible, through unpredictable matchings and likenesses difficult to understand and to verbalize. According to Vico, metaphor is able to unify and to join what would seem logically heterogeneous. It is the spontaneous, natural form through which creatures, since the beginning of their intelligence, were able to express a pre-logical and pre-rational vision of the world. In this primitive phase, the human being was directed to what was concrete; he was immersed in the senses and in the corporeality of images, and his relation to what surrounded him was experienced on the imaginative level, which is the level of the fantastic and the affective. This was in opposition to the logical-rational activity which will characterize the next stage.

In *La scienza nuova*, Vico tries to reconstruct the origin of mankind by identifying the original moment when the first human beings started to think as “humans”. His work is based on the reconstruction of the original cognitive state within which language came to life. What initially characterized those “big beasts” – who had strong senses and a lively fantasy – was irrationality; that is to say, the lack of reflection. Instinct, violence, ferocity, the poverty of language, all these clashed with “the need to explain themselves and to make themselves understood”. Through tropes, primitive peoples gave forces of nature the names of gods; frightened by lightning and thunder, they idealised them – through metaphors – as the voice of a god who ordered them to behave well. Primitive mankind needed senses and body in order to become acquainted with anything: not only natural phenomena but objects were named, too, sometimes by reference to parts of the body (“eyes of the grapevine”, “saw’s teeth”, “comb’s teeth”, “first-hand”, “heart of the matter”, “come to a head”, “bowels of the earth”, and so

on). Metaphysics, philosophy and all other forms of knowledge were first born as metaphorical: the transport operation, coming from likeness, is a growing in knowledge; it is an operation that acquires new contents and that implicates imagination. It is imagination, not rational deduction, that opens the path to the comprehension of reality. The human mind, in order to know, first uses the faculties that the body possesses: it is a mind that thinks by feeling. Senses and imagination, then, not only constitute the first moments of human history but they also represent the constitutive moments of human mind (*La scienza nuova*, Libro I, II, LXIII).

Vico not only evidences the notion of imagination connected to corporeality, but specifically affirms that the generating nucleus of language – what Vico calls “the universal principle of etymology” – is metaphor, the construction of which requires a particular, fundamental level of imagination, namely, the *ingenium*. The latter consists in getting close to, and in creating connections among, objects which until then were thought to be unrelated. It is the ability to discern and to realize likenesses, to see what is similar in what is different, to connect what is separated. *Ingenium* is not a passive recorder of the world order; it is the ability that enables one to construct this order, which is inferred by the organizing of apparently disparate elements that experience presents us. In this sense, the *ingenium* is the most refined and creative of human abilities, and it is the most useful to creating metaphors. The *ingenium* consists in the ability to link what is different through the perception of similar elements, and this ability is manifest in metaphor. Metaphor is the *organon* par excellence of *ingenium* (see Gensini 2002); it is an index of the functioning of the *ingenium*, which is the practical use of imagination.

Vico puts metaphor at the heart of “poetic [and imaginative] logic”; it is that level of knowledge of verbal expression that has a relevant function in the ontogenesis and phylogenesis of language. Poetic logic is none other than Peirce and Sebeok’s “play of musement”, namely, the ability to construct different possible worlds. Imagination, *ingenium*, metaphor – all three derive from this innate poetic logic that is dominant in cognition when the latter is creative; it is the condition that makes human symbolical behaviour possible.

Cognitive Linguistics, by focusing on the relation among experience, concepts and language, declares the existence of gnoseological links between metaphor, concepts and language, which converge in Vico’s

notion of “poetic logic”. This notion can, according to Danesi (2001), give a theoretical perspective to the interpretation of linguistic research on metaphor, and of cognitive processes based on metaphorical works. Vico’s poetic logic constitutes an appropriate basis upon which to build adequate Cognitive Linguistics theories, because it constitutes the primal basis of all symbolical and cognitive behaviour.

5. *Imagination and metaphor according to Leopardi*

Leopardi (1798–1837), in his *Zibaldone*, offers important reflections on the relation between metaphor and imagination. Similarly to Vico, Leopardi underlines that the role of corporeality is fundamental in human conceptualization. He affirms that everything in the mind is material and that mental faculties cannot operate without reducing everything to something material (see *Zibaldone*: 1657–1658). It is thanks to the imagination, which has its own productive force, that sensible data are revised. Leopardi attributes to the imagination a melting function within the cognitive process, giving the latter the ability to connect the most heterogeneous things, to discover new points of view on the world, to gaze upon new proportions and relations. Leopardi clearly connects the imagination with metaphor by affirming that words give place to associations that are always variable, depending on the exercise of the imagination. The associative mechanism of ideas is made explicit in metaphor, which allows us to discover relations among unrelated phenomena. In this process the exercise of the imagination is fundamental (*ibid.*: 3717): the imagination has to recover relations and likenesses among things. Leopardi, indeed, considers metaphor as the ability responsible for establishing new and unpredictable relations among heterogeneous data. Crucial to the inventive process, metaphor represents the “linguistic space of imagination” (see Gensini 1989).

The imagination, then, is able to transcend the denotative dimension of reality, and the metaphoric ability also coincides with the faculty of “grasping” (comprehending) relations. In this ability is expressed the power of imagination.

6. Conclusion

Just as something is a sign only if put in relation with something else, namely the interpretant, metaphor consists in the ability of drawing together and relating different interpretants – even the farthest ones – within the web of signs, in order to comprehend one dimension of knowing in terms of another. I'll say more: each sign brings with it a metaphoric element; metaphor belongs to the sign structure; it is an index of the vagueness, the ambiguity, the incompleteness of the sign. Metaphor is the space of never-ending possibilities of creativity, and it is connected to the imagination as an ability to give life to a new reality, of seeing in it something never seen before, of sending relations and analogies, of creating creative associations. These aspects are an indication of the semiotic characteristics of the metaphorical procedure, which does not record what things are, but shows that for human beings each aspect of reality is constructed in an interpretative process. This process is not a given truth, but a process always open to new possibilities.

Note

1. For a discussion of the limits of the cognitivist theory of metaphor and of the image schemata thesis, the reader is referred to Casadei (1999), Glucksberg & Keysar (1993), and Ortony (1993).

Pets, fantastic beasts and magical creatures

**The animal world in the *Harry Potter* series
by J. K. Rowling**

This article aims to show the role and meaning of animals and magical creatures in the *Harry Potter* series with the help of representative examples. Some of these creatures are animals from the realm of reality, whereas others are mythical creatures, existing only in the world of fantasy and art. Only some central figures have been chosen for this overview, to show the importance and variety of magical creatures. Fortunately Sabine Wienker-Piepho (2004: 99–102) has already defended this subject, and I thankfully continue it by looking at the animal part of the “*Potter*-world pandemonium”, as she calls it (ibid.: 99).

It is very important to notice the concept of two worlds in *Harry Potter*. They are not separated from each other; rather, one exists inside the other. Care is taken that these two worlds do not interfere too much in the other’s realm. One world is the magical one of witches and wizards; the other is the non-magical world of the Muggles (Rowling 1997: 43), i.e., those who cannot do magic. This circumstance makes the animals all the more interesting and offers an additional point of view for the relationship between humans and non-humans, as well as mixed forms of human and animal. As one example of this point, consider the fact that there are no zoos in the magical world – a world in which “Care for magical creatures” is a subject studied at school. Marion Copeland (2003: 287) notes correctly that non-human animals play roles in *Harry Potter*, but that the story is not about them. Adding to this, I would only remark that the animals and mythological creatures in the books are more than just added spice for this fantasy fiction. They carry history, values and symbolism.

The first animal mentioned in the first book of the series is a tawny owl, which is the most significant natural animal in the series. On the same page a tabby cat appears (Rowling 1997: 8), the second very important animal of the wizarding world. This particular cat in *Harry Potter* is actually a human, as is revealed some pages later (an issue to be explored in another article). Other cats in the first book are the pets of the neighbour Mrs. Figg and the school's caretaker. The value of pets is exemplified when Harry receives the invitation letter from Hogwarts School, in which we learn that pupils may bring an owl, cat, or toad with them to school. Traditional schools normally do not allow animals on their premises; but for wizards, pets are essential. They help the pupils to feel more at home at Hogwarts, and are used for doing homework assignments. Young witches and wizards should learn how to transform objects, and one's own pet can come in handy for practising. Harry's best friend Ron has a rat, Scabbers, and their roommate, Neville, a toad. Magical people have regular pets, but also tarantulas, Nifflers, and other more unusual creatures. There are many regular pets at the school. The caretaker of Hogwarts, Mr. Filch, keeps a cat called Mrs. Norris, who is perhaps too stealthy and nosy but otherwise a perfectly normal cat; the gamekeeper, Hagrid, has a huge dog called Fang, who is gentle like its owner, if not as brave. It seems that just as in the world known to the reader, in *Harry Potter* people freely choose their own pets, according to their own likes and dislikes. There is no need to turn to psychology here; the descriptions in the text of humans and their pets are sufficient to support this point. Pets in *Harry Potter* serve as companions and fulfil small duties for their owners. Additionally, they seem to anticipate the needs of their owners and perform services without having to be asked.

Other animals the reader encounters early in the story are Harry's roommates in the cupboard under the stairs. Small spiders are nothing unusual and Harry does not mind them much. They are at this point merely a decorative item underlining Harry's miserable living conditions at his Muggle home. Spiders are not common as pets in the world of wizards, but Aragog (a giant spider) is an exception, it being Hagrid's pet for a while. At some places in the story spiders have a significant meaning, and Aragog's fate is another example of the attitude of humans towards animals.

Hogwarts's headmaster, Albus Dumbledore, keeps a Phoenix named Fawkes in his office. This mythical bird – a symbol for reincarnation and

hope – does not only help Harry during his fight with a Basilisk but also heals his deadly wound. A powerful moment occurs in the sixth book, when the lamenting Phoenix leaves Hogwarts forever. With him hope leaves, and the whole wizard community becomes gloomy instantly. It is no surprise that it lives with the most powerful wizard, Dumbledore, until his death. Dumbledore's body is then burned to ashes, out of which the mythical Phoenix arose.

Of the many animals the Hogwarts students encounter during their "Care for magical creatures" classes, the most interesting is the Hippogriff. This animal may not quite fit into the category of pets, but nevertheless numbers among the domesticated beasts in the magical world. A mixture of eagle, lion and horse, the Hippogriff most closely resembles the Griffin that one finds on many European coats-of-arms (Rose 2001: 153–154, 174). The Hippogriff can fly and is one of the fastest known. It may be compared to Pegasus in its abilities and companionship to heroes. In *Harry Potter* the Hippogriff Buckbeak is sentenced to death for attacking a pupil. It is interesting that in this magical world, its creatures may be charged and sentenced even though they and their habits are studied and usually well known. The incident brings to mind the witch trials of the Middle Ages, when many innocent people were convicted of sorceries. Buckbeak is saved from his punishment, but shares the fate of exile with Sirius Black, whom he helps to escape. He also saves Harry from a Werewolf, therewith showing his quality as a pet-like animal.

The animals and magical creatures in the series inherit the reputation and function of their ancestors, but are put into a new and exciting story. They get names and personalities, and are woven into the protagonists' fate. An animal quite important to magical people is the owl, because the whole mailing system is based on this creature. Owls do not only transport the mail in the magical world, but they always find the receiver no matter where he is. On top of that, they demand a fee for their services and make sure the payment is made. Owls hunt for themselves and do not need much special attention by their owners. In ancient myths owls are messenger birds, among them the Greek goddess, Athena of Greek. Their high symbolic continues to be valued even today; e.g., an owl decorates the one-Euro coin of Greece, continuing a long tradition as monetary decoration. Owls are mysterious: they move in the night, they make no noise, and their eyes seem to see everything. Their voices are low and eerie,

which has led to the belief that they can foresee terrible happenings. Owls were also believed to predict the future. The eyes of owls are positioned on the front of the face and not on the side, which makes them different from any other bird species. The look of owls and their nocturnal activities make them “*unheimlich*”, a creature from a different “home” (*Heim*) than our own. They represent the life that happens parallel to ours but is unknown and uncanny. The *Harry Potter* books do not reveal much of the life of the owls outside their postal duties. In European folktales, the owl may appear as the companion of witches. Some owl species carry the Latin expression *Strix*, from which derives the Italian word *strega* meaning “witch”. That owls belong to the sinister sphere of witches does not clash with their other attributes; for example, wisdom. Witches are also called wise women, who have gained their wisdom during the night, which makes them different from regular scholars. Rowling, the author, is rather specific about the species of owl we are dealing with. The very first owl mentioned, as noted above, is a tawny owl (*Strix aluco*), a species known to accompany witches. Harry’s owl, Hedwig, is a snowy owl (*Nyctea scandiaca*), a species unknown to the British environment. Harry received her as a birthday gift from Hagrid, after realizing he is a wizard and will attend Hogwarts School for Witchcraft and Wizardry. This gift brings him closer to being a member of the magical society and teaches him the responsibility of caring for an animal. He has a cage for her, but it is only needed when Hedwig is transported in a Muggle environment. Harry’s boarding school, Hogwarts, provides an owlery, with all services needed for the night sentinels. An owl is not a cuddly pet, but Hedwig is able to show affection and also to indicate when she is displeased with Harry’s behaviour or lack of attention. In situations where Harry realises he has failed to care properly for his pet, he gets the chance for self-reflection and improvement. Because of her white colour and majestic look, Hedwig is less likely to have ties to evil. Moreover, she bears the name of a saint and therefore cannot symbolize anything bad. Hedwig ties Harry to both worlds, the magical as well as the Muggle one. She is the only means by which he can exchange messages with his friends, during the times he is not allowed to meet them or to use his family’s phone. Harry talks to Hedwig, and even though she cannot answer, she seems to understand him. She flies all the way to France to pick up a birthday gift for Harry from his friend Hermione, who could not have

otherwise sent it to him in England. Hedwig dies during a pursuit of Harry by his enemies; this leaves him feeling responsible and miserable.

Not all wild beasts or magical creatures are meant to be pets. Nobody would want to keep a Troll or Dragon, but Hagrid, the school's gamekeeper, who is particularly fond of fierce and monstrous creatures, tries to raise a Dragon baby. Harry and his friends convince him that little Norbert, the Norwegian Ridgeback, is better off in the wild and the reader is assured that Dragons do not make good pets. The reader encounters more Dragons in the fourth volume, when Harry and three other contestants have to fight Dragons in a competition. The aim is not to kill the beast, but to steal an egg from its nest. The breeding mother-Dragons in this situation adds a new nuance to the old Dragon-fight scene we know from fairy tales, legends and tales of saints. Dragons in *Harry Potter* cannot talk, but nevertheless seem rather smart. They apparently know about their invincible strength and can outwit their opponents in battle. During the competition, the young challengers are hurt, but Harry lands a small blow and ends up being the best competitor, having used his own special skill – flying at high speed on a broomstick – to win. He was also prepared to meet a Dragon, whereas the others did not know what awaited them. Rowling invented different races of Dragons for her books (2001: 10–15), adding more detail and depth to them in the series, hence making them more like animals than mythical creatures. They are extremely strong and breathe fire, but those are the only points on which they differ from regular animals. The importance of Dragons in *Harry Potter* is made up of two ingredients. One is the long tradition of these creatures in legends, myths and folk tales, harking back to the beginning of time. The other is our attitude towards them, and to their close relative, the snake. Both are chthonic creatures living close to the ground, if not under it. Some dragons can fly, but this is not to be set in opposition to the chthonic feature; rather, it helps to complete the picture of them as being among the oldest creatures with elemental powers. There is hardly any myth without a dragon or snake. They have positive as well as negative aspects, but they usually thrive on chaos and lawlessness, and thus are usually dangerous to both humans and deities. On the other hand, they may be revered and admired as a force beyond human understanding. It is likely that the Christian faith has gone furthest in giving dragons and snakes a fully negative character, associating them with the realm of Satan. This is the point where snakes differ very much from dragons in *Harry*

Potter. Harry's first encounter with a snake happens at the zoo, where he finds himself communicating with a boa constrictor. First Harry talks and the boa uses sign language, but eventually the snake speaks one sentence to Harry. This small but remarkable event is not referred to any more at all in the first book, but later on the reader will find out that Harry's ability to talk to snakes is a very unique and dangerous talent. Only special, enchanted animals are able to talk; for example, Aragog. In the Bible there is only one serpent capable of speaking, and that one is the very embodiment of evil. On the other hand, snakes have a much longer tradition than their Christian interpretation. They are animals combining the underworld with the earth's surface, where humans dwell, and sometimes even with the sky. Harry meets various snakes throughout the series, but the most interesting of them is Lord Voldemort's Nagini. Her name indicates her ancestry from Indian Nagas, a race of ancient serpents representing elemental forces and often fighting against the gods. Nagini is the only pet snake we encounter; all the others are wild animals or mythical beasts like the Basilisk. Snakes in *Harry Potter* have the ability to speak and have their own language, Parseltongue. Speaking that language is a rare gift and commonly believed to belong to the dark side of magic powers. Harry is most uncomfortable with this ability, which he for an unknown reason calls his own, because nobody in his family was a Parseltongue speaker, nor did he learn this language anywhere. In fact, it cannot be learned; one is born with it. The Basilisk, king of snakes, is similar to dragons: it is a wild beast that cannot easily be controlled by any power human or magical. The use of Parseltongue may lure it into action though. Lord Voldemort's snake, Nagini, is the property of her master and does his bidding. One might consider her evil, but there are no signs that this particular snake is such by nature. This snake is merely a container of her master's spirit. It is noteworthy that Nagini is referred to as "she" and hence may represent an older conception of snake than that which exists in Christian tradition, mentioned above. Sabine Wienker-Piepho (2004) makes an interesting point, that to name a creature is to tame it. In *Harry Potter* the animals and creatures with names are mostly pets, but there are also exceptions. Norbert the dragon would be one. Even though he is christened, he refuses to be tamed, and tears apart a teddy bear he got from Hagrid as evidence of his wildness. Neither is Nagini tamed; rather, she is possessed and deprived of her own will.

Important magical creatures are the Centaurs, in animal form with human features. These have roots in Greek and Roman mythology and even a place in the night sky. The Centaurs may have originated in the east, coming to Greece via tales and artefacts. The most popular representative of the Centaurs is Chiron, teacher of Achilles and other heroes (Rose 2001: 77–78). Centaurs are wild, independent, and occasionally cruel, but also wise, helpful, and devoted to reading the signs of the gods in the stars. They are semi-divine, Chiron even becoming immortal before he sacrificed himself. Like Dragons, the Centaurs represent chaos, specifically the human part of it. They have the ability to be almost divine, or at least civilized and wise, but their tendency to violence and misuse of alcohol drive them to unruliness and occasionally mayhem. In *Harry Potter* the Centaurs live in the Forbidden Forest close to the school. They are fierce, independent and particularly fond of stargazing. They give hints to witches and wizards, but do not reveal clearly what they read in the stars. The Centaurs prefer to keep to themselves, hide from non-magical people, and only rarely meet with magical people. One of those living in the Forbidden Forest is less mystical and friendlier to humans. He is called Firenze and is younger than the other Centaurs that Harry meets. He saves Harry from an attack by Lord Voldemort in the first book and later joins the teaching staff at Hogwarts. According to Greek tales Centaurs are very attracted to women, but in *Harry Potter* it is the schoolgirls who are extremely fond of the young and beautiful Firenze. He is described as having “white-blond hair and a palomino body” as well as “astonishingly blue eyes, like pale sapphires”. He ideally combines girls’ craze for horses and their awakening interest in the other sex. Rowling sticks to tradition, and there are no female Centaurs. Firenze makes a sacrifice, like Chiron, when he becomes a teacher for humans. His herd expels him for doing so. Firenze fights alongside humans against the evil power of Lord Voldemort, and stands as a symbol of understanding and trust between different kinds of beings.

(The linguistic concept of) voice in music

Examples from western art music

The grammatical concept of voice in a linguistic context is distinct from recent metaphors of a “voice” that is projected through the music, or inferred from its energies, as explored by Abbate (1991) and Burnham (1995). As the previous papers have noted, different languages offer quite contrasting grammatical means of marking agency, from the not-so-simple distinction between active and passive voice in English, to the even more subtle category of “middle voice” in languages such as Greek, where the focus is on neither agent nor patient, but the action itself (and, as Rick notes, on whose behalf it is being done – hence its importance in earlier languages such as Greek, where the authority and agency of divine forces are constantly being invoked). As Pearson and Littlefield have stated, the unmarked condition of music is to focus on the action itself, which I would interpret as the ongoing flow of intertwined musical events – melodic and motivic, rhythmic and metric, harmonic and contrapuntal, timbral and textural – as these are synthesized to create ever-changing gestural shapes with expressive character.

But subjectivity may play a role in music, as well (see Hatten 2004). The historical shift from the subject-less and seamless continuities of a late 1500s Palestrina Mass, where the focus is on the act of reverent devotion, to the reductive yet highly rhetorical monodies of the Camerata in the early 1600s, with their highly-charged solo declamation, must have had a shocking effect upon listeners (at least, as soon as the monodic experiments of these scholarly neoclassicists began to spread into the newly emerging and more accessible genre of opera). Of course, various kinds of subjectivity have been intertwined with music from the time humans first began to

sing and to devise instruments. Improvisatory performance is inevitably marked with the authenticity of human expressiveness, and can even involve calculated representations of emotional states (these were theorized as early as the Greeks, with their concept of *ethos*). Nevertheless, with the rise of opera, and the concurrent emergence of independently expressive instrumental music in the early Baroque, we find an impressive grounding for claims of subjectivity, and even multiple agencies. Hence, there is the possibility that we may be able to reconstruct the variable focus among agent, patient, and action that a linguistic concept of voice addresses.

Before exploring how such shifts in focus might be cued compositionally, I would like to address the emphasis that Pearson and Littlefield have placed on the intentions of the performers (including conductors). As Pearson notes, voice is triggered at the moment of conversion from type to token, and certainly the performance of a musical work – its manifestation in sound – is a prototypical example of type-token conversion, parallel to that of speech. In each case, the utterer can decide how to “spin” the focus of an event: whether to project the agency of one’s own utterance (what I call Type 4, or performative agency), or whether to perform neutrally within the constraints of the score.

But there is a type-token conversion in the act of composition, as well, in that the composer creates a token of a musical type (such as a form or genre), and the token is manifested through the “once-removed-from-sound” coding of musical notation, which represents – transparently for the composer and perhaps less so for the interpreter – a relatively specific shaping of sound. It is here that the range of options expands, in that the composer can suggest at least three types of agency. I have called these internal (Type 1), external (Type 2), and narrative (Type 3).

The easiest way to distinguish internal from external agency leads to the kind of focus we find in the linguistic concept of voice. When Mahler, in the finale to his Sixth Symphony, inserts three hammer blows, we know from his program that the third “fells the hero”. But even without the program, which Mahler withdrew, we would never assume that the internal agent – that subjectivity with which Mahler identifies, and which is engaged in a tragic-heroic struggle – would be the agent of his own demise. Rather, we would automatically assume that such impressive hammer blows are delivered by an external agent, which we might generically label as Fate, although its identity could be variously construed.

In order to effect a change of focus from internal to external agency, Mahler, in the passage mentioned above, required a startling change in musical parameters – one sufficient to suggest the break from an ongoing identification with the hero to a recognition of an external force. In some performances, the hammer blow is given an “otherworldly” timbral presence by using a heavy mallet on a less-resonant body (for example, a wooden conductor’s podium, which creates a tremendous and sickening thud). Thus, a highly marked opposition or rhetorical gesture is required to cue the shift from internal to external agency, because in this case the music does not possess a grammatical means of effecting the shift of focus, and must instead rely on a contrast that sounds extra-grammatical, hence externally powerful.

Likewise, in order to effect a shift to narrative, or Type 3, agency, a composer must find a way to shift level of discourse (Hatten 1994, 2004), and again, a radical change (of register, style, texture), often unconnected to the previous discourse (by introducing unrelated motivic material), is typically required to support the interpretation of an agency that, as it were, steps out of the discourse to comment upon it.

Many musical contexts exhibit a degree of indeterminacy when it comes to interpreting agency. For example, the opening of Brahms’ First Symphony is monolithic (the throbbing pedal point) and fateful, hence expressive of external agency, but there is also an element of striving in the oblique lines straining against the implacable pedal C. Their linear dissonance, and the intense wedge created by ascending strings against descending winds helps cue an internal agency. This agency is not only tragically heroic, but perhaps the wedge suggests an agency divided in itself, torn by internal conflicts.

When the internal (split) agency of the heroic and the external agency of fate are present simultaneously, should we consider this an example of tensional counterpoint between agential strands in a single musical cable, or should we recognize a *trope* emerging from their counterpoint? Whichever interpretation we choose, a conductor who tried to inflect the focus toward one agency at the expense of the other, perhaps through dynamic foregrounding of the former, would be considered suspect, since both agencies must be heard for the remarkable tension to achieve its full effect. Thus, Brahms has loaded the appropriate focus into his conversion of symphonic-allegro *type* to specific “first movement of Brahms’ First-

Symphony” *token*. It is as though he wanted to convey an equal focus on both subject and patient in this fateful encounter, or grim struggle. And thus, we might speak of a *troping of voices*.

Composers’ very struggles to achieve these types of effects, even without sufficient syntactic or grammatical cues built into their styles, demonstrates the need for a concept of voice in describing music. In the remainder of my paper, I will explore how one composer found an ingenious way to cue such shifts through rhetorical play, even without the grammatical means that language has to accommodate such shifts of focus.

The composer is Chopin, and the work is the Nocturne in B Major, Op. 32 No. 1, in which there is a striking shift in level of discourse right at the point where one would expect a final cadence. Many have noted the sudden rhetorical effect of this “external” coda. Recently, my student John Reef wrote a paper in which he pointed out the gestural continuity of the recitative figure, which maintains a discursive link to the thematic language of the Nocturne proper. But starting in measure 60, the extreme shift in dynamics, the sudden negation of harmonic closure, and the topical shift to dramatic recitative all signal a shift in level of discourse. The problem is whether or not this shift is analogous to a shift in voice. As Rick has suggested in our discussion of the work, the subject (what I call the internal agency) is still active, perhaps more dramatically so than before, and even the treatment of the E# has been prepared in the previous discourse. What strikes me as novel is the sudden intrusion of a very external agency – again, quite fateful – that overpowers the internal agent (despite his heroic-tragic struggle). The ultimate cadence, with its added plagal finality (and perhaps a shift outside the realm of the internal agent altogether), suggests the inexorably tragic ending to this otherwise rather serene Nocturne.

There are two questions to ask. First, is there an *actor-patient relationship*, and if so, who is the actor and who is the patient? If fate is the actor and the internal agency is now the patient, reacting to the sudden intrusion of fate, then the drama of the coda could then be expressed in the active voice: “fate is overcoming the agent”, a familiar enough reversal of agency, but still in the active voice, of: “the hero is overcoming fate”. Second, and equally importantly, is it possible to hear the *focus* being shifted from actor to patient, a passive transformation that would indicate the option of voice is present: “the hero is overcome by fate”. Without evidence for an optional

shift between active and passive voices, the claim for voice in music would be somewhat incomplete.

Consider the following interpretation of the coda (mm. 60-end) as a play of agencies and, from a compositional standpoint, a play of voices:

1. the coda disruptively shifts to an extreme external agency, undercutting the internal agency's closure. Active voice, with fate as actor.
2. there is a sudden rhetorical shift to the internal agency, in dialogical defiance. Active voice, with hero as actor.
3. sudden chords cut off the hero's defiance. Active voice, with fate again the actor.
4. ultimate liquidation of the hero's motive. Passive voice, with focus on the hero as patient.
5. finality of fate in Adagio, with its monophonic voice-leading 7–1, enhanced by a plagal extension (iv-I) and Picardy third. Could we consider the framing finality of this Adagio as evidence of a shift to *middle voice*, with the focus on the act that has just been accomplished? If so, it achieves a certain grandeur and objective sense of remove, fully appropriate to the tragic expressive genre (which has displaced the serenity of the Nocturne, as lyric is wrenched unexpectedly into dramatic mode).

Of course, this is only one of many possible interpretation of the dialogical action in this coda, but the variable options of voice certainly provide for a more nuanced interpretation than one based solely on the conflict between internal and external agency alone. And that alone is a good reason to continue investigating voice in music.

Sémiotique du spectacle vivant: Le corps du déni

La sémiotique du spectacle vivant occupe, par son questionnement sur la marque (la désignation de soi) plutôt sur que la *communication* spectaculaire, un espace décentré par rapport au thème inaugural du congrès *Communication: Understanding/Misunderstanding*.

La *présence* du corps en scène comme lieu paradoxal de mise à distance de la communication spectaculaire à travers la *dénégation* justifie le titre de notre contribution. Il s'agit de cerner cette présence-absentifiante, cette oscillation, entre la matérialité signifiante et la sémiose, que Peter Brook (1977) évoque dans *L'espace vide*. Trois questions permettent de thématiser la problématique. Elles portent sur:

(1) La légitimité du malentendu produit-reçu lors de la représentation et de sa définition à travers les voltesfaces de la théorie: la *Wirkungsethik* ou effet produit par le théâtre sur la société et le public empirique, la *réaction collective*, confortée notamment par Labeyrie (*perception spectaculaire*), qui touche à la validation de la *communauté d'usages* chère aux sociologues (et notamment du non-public), la *réception* par le spectateur *déchiffreur* chez Barthes, le statut du *spectateur modèle* et les stratégies cognitives *coopératives* d'Eco/De Marinis, voire le *collectif d'énonciation* tel que nous l'avons-nous-même défini (Helbo 2007: 67).

(2) La pertinence de la *communication* dans le champ des arts du spectacle (son extension à toutes les pratiques spectaculaires).

(3) Le cas du théâtre et les modalités d'un réexamen des acquis à la lumière des progrès accomplis pour proposer d'autres opérateurs méthodologiques.

1. *Légitimité de la problématique liée à sa pertinence
dans le champ des arts du spectacle*

La question du malentendu est aussi ancienne que la sémiotique: Buysens (1943) et Mounin (1971: 87) disqualifient la communication théâtrale, sauf dans le dialogue intra-scénique des personnages; les dimensions phatique et conative seraient seules valides au niveau de l'extra-scénique. On sait aujourd'hui, depuis le développement des théories sperberiennes entre autres, que le modèle de communication visé est trop étriqué et que l'approche de Mounin implique un présupposé d'existence de l'avant-spectacle largement remis en cause, notamment par le concept de *postdramatique* chez Lehmann (2002: 45).

1.1 Le film

Certes, la thématique de la communication stricto sensu a été sollicitée en d'autres termes à propos de l'image filmique d'abord chez Casetti (1990: 83) à travers les rôles déictiques permettant de repérer les figures stratégiques liant spectateur, cinéaste et personnage (les "vues"). Metz, on s'en souvient, critique ce modèle à travers le concept d'énonciation *impersonnelle* (Metz 1991: 79) qui privilégie la rencontre entre l'image (sa métadiscursivité) et le spectateur. Fontanille, pour sa part, à travers le non-langage (Fontanille 1995: 24) remonte de l'expression au contenu et remet en cause l'idée d'une deixis préétablie.

On notera cependant une prise de distance par rapport à l'approche bühlienne de la communication. Tant chez Casetti que chez Metz s'opèrent de premiers déplacements à l'intérieur du cadre de la communication:

- de la communication vers l'énonciation: l'accent est mis sur le parcours et le trajet;
- vers la mise en évidence du *spectateur*, concept versatile et tuilé, stratifié et contesté (la même dénomination est utilisée pour le théâtre depuis Mukarovsky); au point qu'on se demandera si le leurre est terminologique ou si l'opérateur recouvre des compétences, des contraintes universelles.

1.2. Les différentes pratiques du spectacle vivant

Les réflexions sur le spectacle vivant nous incitent à écarter la notion de communication au sens entendu supra, et ce pour deux raisons: (1) le caractère colonialiste de la notation/communication, perçue par les acteurs de la performance: il est impossible de reconstituer des processus, des vectorisations, des copies verbales sans passer par le rendu de sa propre perception (vidéo, livret, copie verbale sont indissociables du vécu de l'événement). Jakobson (1963: 78–86) parle de *traduction intersémiotique*: transformation d'un système de signes en un autre système de signes (par l'interprétation du spectateur, du metteur en scène ou du comédien). (2) À cette situation épistémologique s'ajoutent divers facteurs reliant le spectacle vivant au non-communicable: l'absence de reproductibilité technique (MRP vs MRI); la mise en cause d'un avant-spectacle (autre que le texte dans le théâtre français); la notion de présence et de corporéité qui soude production et réception du sens dans la contemporanéité: la surmodalisation du "comme si" (Helbo 2007: 102) conjointe pour scène et salle (le spectateur invente le sens, l'émotion en même temps que l'acteur et sans médiation).

2. Le cas du théâtre: Limites de la traduction intersémiotique

L'événement théâtral comme espace de la traduction intersémiotique offre cependant un lieu de tangence aux théories sur la communication de Jakobson, de Peirce et d'Eco. Chez Jakobson, le *passage* à la scène maintient l'émergence du système de signes, de la production, de la performance qui interprète (au sens de réactualise) un autre système de signes: Jakobson (1963: 78–86) oppose intrasémiotique (traduction) et intersémiotique (adaptation).

L'approche d'Eco est tout entière balisée du côté plus peircien de l'interprétation et des univers de référence de la réception: Umberto Eco (2001) distingue ainsi la déclinaison d'un système *endosémiotique* (intra-système: on reste dans le système, la mise en scène relève du théâtre et est inscrite dans le système expressif qu'elle actualise, il en va de même pour le concert et la musique centrés sur l'interprétation) et le passage à un autre système: *intersémiotique* (en fonction d'une lecture, transformation

de la substance de l'expression, abandon du prototexte, mise en évidence du non-dit: dans sa mise en scène du *Soulier de satin*, Vitez invente un personnage d'annoncier qui représente les didascalies chez Claudel mais qui n'existe pas dans le texte dramatique).

Ces théories font la part belle à l'interprétant si on accepte de maintenir ce concept dans le champ de la promenade inférentielle (relation entre sujet et objet en termes d'hypothèse): chez Peirce, le parcours porte sur l'expérience esthétique. Le cœur du débat porte sur cette limitation, sur le contenu et la nature du processus:

- La traduction intersémiotique peut-elle se limiter au parcours inférentiel: faut-il l'entendre, au contraire, comme reconstruction de la passion, comme reconstitution des affects (la représentation comme *intervalle pulsionnel* cher à Ropars)?

- Qu'en est-il du statut de la corporéité? Barthes définit un nouvel ordre sensoriel, sémio-phénoménologique: les incidents pulsionnels (le grain de la voix, l'écriture à haute voix), annoncent les logiques sensibles de Deleuze (Barthes 1973: 104–105). Au théâtre, nous avons souligné la parataxe linéaire-tabulaire qui participe à la production du sens et à la mise en discours: la proprioception y jouerait un rôle (Helbo 2007: 81). Fontanille (1995) parle de médiation proprioceptive de la sensibilisation du corps percevant.

- Une voie d'articulation se dessine entre sémiotique et phénoménologie, certes très éloignée de Merleau-Ponty mais plus proche de Michel Serres (1986: 181–182): le corps y apparaît comme catégorie cognitive (*tactilité* dont l'opérateur est la peau touchante/touchée, en rapport au monde et suiréférentielle).

- C'est à ce prix que se dessine le rapprochement peircien:
 - avec l'abduction (bio-abduction sensorielle, socio-abduction sur le monde communicable, érotico-abduction: le désir et le rêve de l'autre) (Peirce 1958: 7–8);
 - avec l'interprétant (émotif/affect, énergétique/action, logique): qui ne porte pas sur la transformation du sujet mais sur les modalités de l'expérience émotionnelle.

3. *Les modalités d'un réexamen méthodologique:*
La théorie des seuils

Sur le modèle de l'expression "mise en scène", nous avons proposé le concept de *mise en seuil* (Helbo 2006: 89) pour désigner l'ensemble des processus par lesquels les énonciateurs se mettent d'accord sur l'invention des conditions de mise en discours du corps, s'entendent sur les conditions du déni.

Quel est le contrat ou la promesse (Jost 2002) permettant de produire le *signal spectaculaire* qui va mobiliser un type d'expérience, de cadre, d'observation, de vécu?

C'est un travail dont les repères traversent l'histoire de la dramaturgie. On relèvera:

- la théorie de l'acteur: tantôt simulateur (Stanislavski: traduire l'émotion par des actions auxquelles le spectateur adhère) tantôt stimulateur (Meyerhold: la matérialité antérieure au sens; l'émotion étant déjà traduite dans le corps, l'acteur agit, le spectateur rejoue la biomécanique);

- la théorie de la marque: l'acteur joue à être un autre ou effectue un "travail sur soi": Artaud évoque *l'athlète affectif*, Copeau cerne *l'expressivité du corps*; le travail sur les codes et la sémiotique des seuils: l'articulation avec l'ethnoscénologie peut se révéler pertinente en l'occurrence. Arlequin ou la danseuse de kathakali communiquent d'abord un consensus sur le corps du déni: sur la manière dont regarder autrement le corps, et sur le fait que le comédien change de corps. Arlequin adopte des positions qui éliminent le casuel (cf. la série Frossart); la danseuse de kathakali désarticule son corps et le reconstruit en équivalence/résonance avec les signes de la partie chantée: elle invente et mobilise un véritable alphabet mimique, comprenant code facial, routes musculaires (*navarasa*: neuf saveurs); de même, le costume devient ce qu'il camoufle: l'image vestimentaire est tantôt iconique (renvoie au brahmane) tantôt symbolique. Au théâtre, le problème n'est donc pas de lever le malentendu: l'essentiel consiste à s'entendre sur les conditions du malentendu.

The accentuated signified

Between musical and linguistic signification

A question of my present musicological study concerns how musical and linguistic expressions are correlated with each other, asked so as to gain more insight into how autistics live and communicate with people. The question posed is: Can music (and the other arts) tell us anything about human language and speech? Is there a kind of knowledge that would lead one closer to autistic people and their experiences in dealing with the world?

One sign that might help us in answering such questions is the *prosodic feature* that can be interpreted as an *accentuated signified* within music and language. It has been found in music-therapeutic interactions, where it has worked like an expressive link or or cultural mediator between and within musical and linguistic messages. In researching music or speech, one investigates sounds, words, codes and constructions, contents and forms of human communication. Music and language can be approached as if they were tools of culture. That is actually one part of our common interactive reality. These implements are indeed means of cultural existence. Music and language can be analysed and classified into different categories by type. In the theoretical field one can sometimes overlook their external functions as implements of human individuals. As culturally given things, they have become everyday utterances to non-autistic people. It seems to be an automatic habit to use them around and within our *Dasein*.

“Automatic” generally signifies something non-special. And non-special has reference to non-significant, which seems to express a paradox concerning language and speech. Non-significant here does not refer to the meaning of words or to a grammatical state of signified content, but instead correlates with “unimportant” or “of no notice.” Within the negation of language there has occurred an unconscious decrease of human expressiveness and cultural values. One speaks, but does the language still

contain internal sounds of humanity? Does spoken language have its mirrored sign in the linguistic (bodily) expressions on peoples' faces?

Music (as well as the other arts) and language are signified mainstreams of life situated both outside and inside one's body and mind. Externally they present us with a common, everyday language, being means of linguistic and meta-linguistic communication. If one approaches them from a semiotic viewpoint and signifies them through concepts of inner meaning and symbolic signs, they will change their understood appearance and start to take on an existence as experienced, received and interpreted manifestations. Music and language signified as cultural signs of speech share in an unbroken semiosis, where they have the possibility to create connected signification through their commonly-held signs referring to prosodic features.

The idea of *replacement* includes the *accentuated signified* within an expressive semiosis. It is a question of prosodic features in movement from the *musical* to the *linguistic* semiosphere. In advance of the *replacement* of this movement, prosodic features are thought to have their origin in one's individual corporeality. A prosodic gesture or motion, accentuated by that which is bodily, has reference to a natural core of vital energy that is supposed to guide the developing human consciousness and interactive socialization of man. The energetic core of human life is obviously found in signification when the *natural* moves and unites with the *cultural*. A chain of *replacement* signifies prosodic features as the smallest units of meaning in *bodily*, *musical* and *linguistic* manifestations, and it makes contact with unbroken *becoming*. Sometimes the common *replacement* deviates from cultured signification processes. For example, people with autism express an inner compulsion to choose mostly *natural* instead of cultured ways of development.

Jan Kaaplinski, in his plenary lecture, quoted us in another connection when he posed this question: "Who has power over the meaning of words?" People with autism are perhaps ready to ask, "Why must I come out of my silence?" And autistics might reply: "My communicative intentions continually try to reach the content of prosodic features of your spoken language. So far, however, I have only a developing ability to catch prosody through music. Its non-verbal signification brings me emotional warmth and human light. And I assume you will keep them waiting for me in your prosodic features, to help conquer my inborn silence and speechless

night?” Autistics’ outer speech is generally non-prosodic, but in their inner speech the prosodic qualities probably exist. In inner speech the prosodic features are supposedly *moving* entities in autism’s a-rhythmic chaos.

The prosodic features of existential life and expression are in most cases signified through their non-appearance. They represent an existential sign more often in their absence, situated in the negation of transcendence. Their natural existence within spoken language does not normally refer to the existential sign of their expressive significance. From a meta-linguistic point of view, prosodic features can be seen as the signified in both music and language. The *accentuated signified* in music can create a channel between the overflow of sensibilities between the *linguistic* and *corporeal* realms. Prosodic signs of music become broader in their movement towards the *corporeal* and the *linguistic*.

Human existence can be seen as a communicative chain wherein the developing prenatal, corporeal, musical and linguistic phases follow each other step by step or, when overlapping, adapt to each other. This kind of *expressive semiosis* is constructed in time-oriented movements. These developmental movements have their boundaries (stops and new starts) in representation of *replacements*, such that the accentuated prosodic signs open a new space of signification as early as in the embryo’s prenatal life (Guerra Lisi & Stefani 2006). The same steps will be taken later as well, both within and through one’s sensible body and mind. The prenatal phase, as theorized by Stefania Guerra Lisi and Gino Stefani in their theory of Prenatal Styles, is bound tightly to the *corporeal* as a scene of the senses.

The *corporeal* joins the *musical* in the becoming-conscious of time and space; it develops discrimination, sense perfection, and spatial constructions and codes. The *musical* phase, which occurs before the grasping of a linguistic way of consciousness, is the growing ability to sense a natural development that reflects the transcendental world and signifies experiences in the artistic sense. The musical phase can have elements that signify “being for myself” as described by Eero Tarasti in his theory of existential semiotics. In the latter, “being for myself” has reference to the Greimassian dynamic modality of *pouvoir* (can) and as such refers so to the signified actor of an emotionally progressing, functional life.

Personally felt and translated into words, the psycho-physiological experience of “I can” is one of our deepest feelings. It may be translated forward, for example, into the words “I’m living”. Every non-autistic person

has experiences such as those and can recognize in him/herself this transcendently signified touch of the deep desire for life. It can be signified in existential semiotics by another of Tarasti's existential concepts, "being-in-myself", which is combined in the principal Greimassian modality, the endotactic "will" (*vouloir*). On the level of feeling, the bodily experienced knowledge of "will" makes us feel a joy of life that has a powerful appearance in practice and is signified by the words "pleasure of doing", which refer directly to the sign of functional content in the theory of Prenatal Styles. According to Tarasti (2005: 244), "Being-in-myself represents our bodily ego, which appears as kinetic energy, 'khora,' desire, gestures, intonations, all emerging from the sea of Peirce's First. Our ego is not yet in any way conscious of itself but rests in the naïve *Firstness* of its being." To bring out the existing *linguistic* relationship between the humanly-lived worlds of the non-autistic and the autistic, one will presumably need the signified touched on by the arts with Peirce's *First*, Kristeva's *khora* or Tarasti's "being-in-myself". In this, people with autism are most experienced, and they have a deep ability, through their synaesthetic sensory images, to understand a negation of Greimassian "will" and "can". Lacking the experience of non-autistic *being*, the latter thus represents for them them an alien existential world. Does it have a transcendental contact with our own world?

Debussy y la plástica

De la predilección por la pintura a su imaginario creativo visual

De todos aquellos músicos finiseculares que se aproximaron de una manera u otra a las artes, Claude Debussy destaca por el establecimiento de una teoría musical propia y por la rotundidad del planteamiento en relación con su aproximación a otras disciplinas artísticas, especialmente pintura y literatura. La relación de Debussy con la pintura se inicia de joven. Su biógrafo Vallas afirma que de niño tuvo su propia paleta de pintor que guardó hasta su divorcio de Lilly Téchier y con la que llegó a pintar “petits toiles” (Vallas 1958: 12). De esta pasión por la pintura fue cómplice el que fue su tío político, padrino y que acabaría ejerciendo de tutor, Achille Arrosa, amante del arte y coleccionista de cuadros de pintores contemporáneos.

Según el propio Vallas, a Debussy “incluso le hubiera gustado ser pintor” (ibid.: 10–12), hasta el punto de que “regretta toujours de ne pas avoir travaillé la peinture au lieu de la musique”, en palabras de Mme Gérard de Romilly, una de sus alumnas (Nectoux 2005: 14).

Son numerosos los testimonios coetáneos a Debussy que evidencian su interés por la pintura. Una de las reflexiones de Margerite Vasnier expresa este gusto de Debussy por las artes plásticas: “il avait un goût inné pour juger ce qui touchait à l’art, même pour les tableaux et gravures qui, en ce temps-là tout au moins, ne l’intéressaient guère. Quand mon père, grand amateur, le faisait causer, il trouvait dans ses paroles une grande sûreté de jugement et des appréciations tout à fait personnelles et remarquables” (Lesure 1992: 208). Esta atracción de Debussy por la pintura aparece reflejada a través de las numerosas alusiones que le dedica en sus escritos y el entusiasmo que muestra hacia la misma, que puede resumirse en la frase que escribe a Edgard Varèse: “... car j’aime presque autant les images que la musique” (Debussy 2005: 1389).

Ya durante su estancia en Roma en la Villa Medici da muestras de un destacado interés por el arte italiano. Así, cuando Ernest Guiraud le pregunta: “Qu’est-ce qui vous a le plus frappé à Rome?” Debussy responde:

Les Loggie de Raphaël (pas les Stanze!) et la Madone du Rosaire de Sassoferrato à Sainte-Sabine. – Saint-Pierre est une halle pour géants raisonnables et sans goût. J’aime mieux Saint-Séverin. J’adore la Villa Pia qui ne sert à rien du tout. Mais des portiques, des balustrades, des frontons. Mais ça s’encadre dans les verdure du Paradis. À Orvieto, la Résurrection de Signorelli (pas à cause des trompettes! (Lockspeiser 1980: 754).

Así expresa la admiración que le produce la obra de Miguel Ángel: “Certes je me courbe avec humilité devant ces chefs-d’oeuvre, seulement je crois que nous ne pouvons en tirer que des impressions d’œil et non des impressions d’âme, pour tout dire: vivre avec eux” (Debussy 2005: 57). De vuelta a París visita asiduamente museos. Según Mme. Romilly: “il aimait visiter les musées, les expositions de tableaux et avait une prédilection pour les paysages du peintre scandinave Frits Thaulow et pour Claude Monet” (Lesure 1992: 209).

Debussy también estuvo próximo a los círculos prerrafaelitas, al igual que las personas más cercanas a él: Pierre Louÿs, Albert Samain, Raymond Bonheur, Paul Bourget, Jules Laforgue, Gabriel Mourey, Robert Godet o incluso Paul Valéry. Según Nectoux, Debussy mostró un especial interés por el pintor y poeta Rossetti, y gracias a las abundantes traducciones contemporáneas de sus poemas Debussy acabará imbuido por la atmósfera onírica que caracteriza su obra, al modo del teatro de Maeterlinck, introductor del prerrafaelismo en Francia (Nectoux 2005: 100–104).

Otro pintor al que se aproximó Debussy fue Whistler, amigo de Mallarmé desde los años 1887–88 y quien se integró en los martes de Mallarmé a partir del otoño de 1891. El propio Nectoux expone cómo la presencia de Whistler en los “martes” fue más regular entre los años 1892–1894, cuando realizó el retrato litográfico del poeta, en un momento en que Debussy trabajaba en *L’Après-midi d’un faune* (Nectoux 2005: 107). Théodore Duret, primer biógrafo francés de Whistler, le da a conocer los *Nocturnos* de Debussy y le escribe: “Avez-vous entendu parler de Debussy et de ses nocturnes? Après qu’on vous a tant de reproché d’avoir emprunté à la langue musicale pour l’appliquer à la peinture, voilà maintenant la

musique qui vient s'inspirer de votre peinture. Quel retour des choses d'ici-bas!" (Nectoux 2005: 111).

Duret también evoca el entusiasmo de los simbolistas, y particularmente de Debussy, ante la obra de Whistler (Nectoux 2005: 111):

Le côté de fluidité, de rêve, de nuances indéterminées que possédait la peinture de Whistler. ... La musique seule était restée en dehors de l'innovation raffinée, mais elle devait aussi la connaître. L'homme qui lui en donnait la formule, Debussy, admirait tout particulièrement l'art de Whistler. De même que Mallarmé était son poète, Whistler était son peintre. Et sans vouloir pousser plus loin qu'il ne convient l'influence du peintre sur le musicien, on doit croire que les *Nocturnes* de Whistler ont agi, par suggestion, sur Debussy pour l'amener à produire les siens.

Nectoux plantea asimismo la atracción de Debussy por el universo onírico de Redon, quien le mostró una litografía realizada tras asistir a la primera audición de *La Damoiselle élue* en la primavera de 1893 (Nectoux 2005: 180–181). Otros artistas plásticos a los que Debussy se sintió próximo fueron Turner, Gustave Moureau, Arthur Rackham o el pintor y escultor belga Henry de Groux.

Debussy coleccionista

La práctica del coleccionismo supone un nuevo elemento indicador del interés por la pintura, catalizado a través de la concepción del coleccionismo como un acto de creación en sí mismo y simultáneamente expresión de gusto. En este sentido tenemos que señalar la importancia del coleccionismo como un elemento fundamental dentro de la trayectoria creativa debussysta.

La crítica sobre su figura señala cómo ya desde niño mostraba interés por el coleccionismo. Según Vallas "il aimait avec passion les brillantes couleurs des papillons qu'il collectionnait, la beauté menue des bibelots ou des images dont il ornait sa chambre" (Vallas 1958: 12). Desde su etapa de Conservatorio, que se inicia a la edad de 10 años, mostraba una particular atracción por el coleccionismo de estampas y antigüedades (Nectoux 2005: 15).

A partir de 1892, instalado en un apartamento, llenó sus paredes de objetos raros que juntaba por su belleza extraña y cuyos creadores se encon-

traban, en muchos casos, entre sus amigos, lo cual encaja con el interés por objetos raros y extraños que caracteriza a la tradición simbolista. Étienne Destranges se refiere al apartamento que Debussy ocupó a partir del verano de 1893 en el nº 10 de la calle Gustave-Doré dando muestras de su gusto artístico: “C’est tout là-bas, presque aux fortifications, au cinquième étage d’une grande maison neuve, que M. Debussy demeure dans un petit appartement tranquille orné de reproductions de tableaux préraphaélites anglais pour lesquels il semble avoir une prédilection toute particulière” (Destranges 1906: 164–165). La colección de Debussy llegó a incluir *gouaches* en blanco y negro, piezas Art Decó así como pinturas chinas y orientales (Sánchez 1999: 99).

El imaginario creativo debussysta

Junto a su vinculación con corrientes estéticas contemporáneas y su interés por la pintura, el pensamiento sinestésico debussysta aparece fundamentalmente determinado a través de su propia actividad musical.

Al menos en ciertas etapas compositivas la concepción musical de Debussy parte de referentes extramusicales, como él mismo declara en una carta a Paul Dukas, donde expone: “je ne pense plus, ou presque plus, musicalement” (Debussy 2005: 586). También aprecia la actitud de Robert Godet de “voir plus loin que la musique” (Debussy 2005: 1471) y aconseja a su alumno Raoul Bardac “oubliez même toute la musique, de temps en temps” (ibid.: 942).

Estas frases insisten en la valoración de un fundamento más allá del lenguaje musical como referente último de la música a la vez que redundan en la idea de Christian Accaoui según la cual “la plupart des procédés techniques de Debussy ont une origine extra-musicale” (Accaoui 2004: 47). En este sentido resultan clarificadoras las palabras que Debussy dedica a su editor referidas a sus *Images pour orchestre*, cuyo título es en sí mismo revelador al respecto: “Les *Images* ne seront pas terminées à votre retour, mais j’espère vous en jouer une grande partie... J’essaie de faire ‘autre chose’ et de créer, – en quelque sorte – des *réalités* – ce que les imbéciles appellent ‘impressionnisme’” (Debussy 2005: 1080–1081). En el sentido que venimos exponiendo resulta revelador el interés por la búsqueda de “realidades” en Debussy, entendidas como un referente más allá del lenguaje musical al que aspira en su creación.

Este punto de partida extramusical para sus composiciones supone una concepción consciente de valoración de elementos ajenos al lenguaje de la música como referente último de su lenguaje compositivo. Si bien Accaoui relaciona específicamente estos referentes extramusicales con el empleo del símbolo y del mito (Accaoui 2004: 47), en nuestro estudio hemos procedido a vincularlos con un imaginario creativo de tipo visual, donde lo pictórico juega un papel importante; nos alineamos así con Célestin Deliège asociando la expresividad en Debussy a la traducción de la sensación más que a la del símbolo (Deliège 2004: 129).

En sus escritos, el imaginario visual adquiere una importancia considerable, llegando a teñir incluso sus emociones: “les armes et les casques illuminés par les flambeaux”, “la Seine ... comme un miroir terni”, “rythme dansant de l’atmosphère avec des éclats de lumière brusque” (Plantard 2004: 160). De hecho, en la producción teórica de Debussy la concepción imaginaria de Debussy específicamente vinculada a lo pictórico aparece reflejada en la siguiente frase, referida a su entorno simbolista: “Ceux-là seuls peuvent me comprendre à qui la peinture donne des idées de musique” (Lesure 1992: 210). En este sentido su imaginario visual pictórico aparece magníficamente expresado por Satie en una conferencia pronunciada sobre Debussy, donde declara que éste había sido su iniciador a la hora de traducir musicalmente ciertos procedimientos pictóricos: “Pourquoi ne pas nous servir des moyens représentatifs que nous exposaient Claude Monet, Cézanne, Toulouse-Lautrec, etc? Pourquoi ne pas transposer musicalement ces moyens?” El propio Debussy confirma a Jean Cocteau que la estética de *Pelléas* fue inspirada por una frase de Satie: “Il faudrait créer un climat musical où les personnages bougent et causent. Pas de couplets, pas de leitmotiv –se servir d’une certaine atmosphère Puvis de Chavannes” (Delage 1963: 18).

También el pianista Ricardo Viñes en su diario íntimo dejó constancia de la inspiración pictórica debussysta: “Je suis allé [*sic*] chez Debussy qui m’a de nouveau fait entendre ses derniers morceaux, *Pour le piano* dont il m’enverra une copie à la fin du mois; quel hasard, je lui ai dit que ces pièces me faisaient penser à des tableaux de Turner et il m’a répondu que, précisément, avant de les composer, il avait passé un long moment dans la salle des Turner, à Londres!” (Viñes 1903: 226). Aquí se pone de manifiesto no sólo la propia concepción visual de Debussy sino su recepción en este sentido.

En su producción musical uno de los ejemplos más destacados de asimilación a cualidades específicamente pictóricas son sus *Nocturnos*. Su primera versión de la obra *Scènes au crépuscule* (Debussy 2005: 110). Dos años después rebautiza la obra con su título actual, *Nocturnes pour violon et orchestre*, y le otorga la forma tripartita final (Plantard 2004: 159). En 1894 comenta la obra a Eugène Ysaÿe en una carta, expresando sus paralelismos con una obra pictórica (Debussy 2005: 222):

Je travaille à trois *Nocturnes* pour Violon principal et orchestre qui te sont destinés; l'orchestre du premier est représenté par des cordes!; le second par 3 Flûtes, 4 cors 3 Trompettes et 2 Harpes; le troisième réunit ces deux combinaisons. C'est en somme une recherche dans les divers arrangements que peut donner une seule couleur comme par exemple ce que serait en peinture, une étude dans le Gris.

Aquí Debussy establece una referencia colorística clara – “un estudio en gris” –, lo que ha conducido a vincular esta obra con los cuadros de Whistler (Lesure 1993: 133). En este mismo sentido Pierre de Breville a propósito de la interpretación de los *Nocturnes* en los Concerts Chevillard en 1901 expone: “La plupart ont eu recours à des analogies disant: ‘c'est du Whistler musical’ – ce qui se peut tourner, et permettre d'affirmer que Whistler est du Debussy en peinture” (Breville 1901: 214). Refiriéndose a este hecho, Debussy, en una entrevista en la que se le dice: “You are an impressionist, M. Debussy”, declara: “I have been called the ‘Whistler’ of Music” (S / A 1909: 4).

Posteriormente a la carta a Ysaÿe, a propósito de sus tres *Nocturnes pour orchestre*, reorienta la intención del público con el siguiente texto (Plantard 2004: 160; Nectoux 2005: 14):

Le titre de *Nocturnes* veut prendre ici un sens plus général et surtout plus décoratif. Il ne s'agit donc pas de la forme habituelle de Nocturne, mais de tout ce que ce mot contient d'impressions et de lumières spéciales. “Nuages”: c'est l'aspect immuable du ciel avec la marche lente et mélancolique des nuages finissant dans une agonie grise, doucement teintée de blanc. “Fêtes”: c'est le mouvement, le rythme dansant de l'atmosphère avec des éclats de lumière brusque, c'est aussi l'épisode d'un cortège (vision éblouissante et chimérique) passant à travers la fête, se confondant en elle, mais le fond reste, s'obstine, et c'est toujours la fête et son mélange de musique, de poussière lumineuse participant au rythme total.

En cuanto al método de trabajo, Debussy compara su propia forma de trabajar con la de ciertos pintores, buscando las variaciones cromáticas de un mismo elemento. En este sentido expone: “Parce que la Musique a cela de supérieur à la peinture, qu’elle peut centraliser les variations de couleur et de lumière d’un même aspect ...” (Debussy 2005: 942). Probablemente pensaba en experimentos del tipo del último Monet, donde planteaba un mismo elemento visto desde diferentes estados atmosféricos; mientras que la pintura impide un planteamiento continuo, éste sí es permitido por la música (Lockspeiser 1962: 16–17).

Debussy también dedica especial atención en sus escritos al establecimiento de vínculos entre cualidades plásticas y musicales. En este sentido expresa lo siguiente en relación con el Señor Corchea, Paul Valéry (Debussy 1993: 46):

[El Señor Corchea] Enseguida excitó mi curiosidad por su particular visión de la música. Hablaba de una partitura de orquesta como de un cuadro, sin emplear casi nunca palabras técnicas, sino palabras inhabituales, con una elegancia mate y un poco gastada, que parecía sonar como una moneda antigua. Me acuerdo del paralelismo que hizo entre la orquesta de Beethoven, que representaba mediante una fórmula en blanco y negro – que da como consecuencia una gama exquisita de grises –, y la de Wagner: especie de amasijo multicolor casi uniformemente extendido y en el que me confesaba no poder ya distinguir el sonido de un violín del de un trombón.

En su actividad como crítico también plantea paralelismos entre la música de Rameau y Couperin y la de Wateau, así como entre la pintura de Böcklin y la música de R. Strauss: “Il y a de curieux rapports entre l’art de Böcklin et l’art de Richard Strauss ... Même souci d’un dessin préconçu, même goût pour chercher la forme directement dans la couleur, et tirer de cette même couleur des effets de pittoresque dramatique” (Nectoux 2005: 14). En este sentido expresa: “Las *Impresiones* de Italia de G. Charpentier son una orgía de colores y de ritmos plenos de lujuria. G. Charpentier no sueña de la misma manera que R. Strauss que también trajo unas *Impresiones de Italia*. Pero en lo tocante a recrear la impresión de las calles de Nápoles, Charpentier es sencillamente incomparable” (Debussy 1993: 131).

A través de la aproximación de Debussy a la pintura nos hemos acercado a una nueva lectura de su pensamiento y obra fuertemente vinculada a un lenguaje creativo de tipo plástico. En relación con su interés hacia la

pintura, éste aparece reflejado en sus vacilaciones acerca de su dedicación profesional a la misma, su gusto por las artes plásticas evidente en las frecuentes visitas a museos y centros de relieve artístico, y el interés que muestra hacia la pintura en sus escritos, dando testimonio de su familiarización con las técnicas pictóricas y de su sensibilidad plástica que le condujo a la práctica del coleccionismo. Respecto al propio acto compositivo, Debussy declara la búsqueda consciente de un referente extramusical ajeno al lenguaje musical, que hemos visto vinculado al imaginario visual presente en su proceso creador y en el que específicamente lo pictórico adquiere especial relevancia. La lectura que tanto Debussy como la crítica desde finales del s. XIX hasta nuestros días hacen de su música da muestras del fuerte contenido visual presente en la misma, tanto en la evocación de elementos naturales como en la expresión de características de luz y color.

Drina Hočevar

An existential approach to the analysis of Sophocles' *Oedipus rex*¹

Introduction

The tale of Oedipus Rex, as told in the tragedy by Sophocles, appears from a mythical background. The tragedy starts when Oedipus is already king of the Greek Thebes, and married to Jocasta (queen of Thebes and former wife of King Laius) for having freed the city from the Sphinx. In ancient Greece, myths were part of the common lore, which allows us to suppose that the stories were well known, so that the uniqueness of the play is the expression of Sophocles as an individual artist.

The tragedy itself follows the Aristotelian principles of unity of time, space, and action in its main narrative thread through the voices that are individualized as the main actors of the plot, the tragic hero and principal character being Oedipus. The voices that appear from the Chorus accompany those individualized voices in a musical dialogic interaction, sometimes among themselves as strophe and anti-strophe, or in a dialogue between the coryphaeus, collective actant, and the main actors. It is in the chorus where we find divergence from the Aristotelian principles, since various mythical threads are there woven together.

At the beginning of the tragedy we see Oedipus happily re-united with Jocasta, not knowing that his wife is his own mother. It is the same mother that gave him as a newborn to be killed for fear that the oracles would come true. It was prophesied, as we all know, that Oedipus would kill his father then marry his own mother. It is only when Oedipus unveils the truth, when he understands this circle or endogamy, that the incestuous relation will appear as taboo and, paradoxically, the hero will deprive himself of sight by piercing his eyes at the end of the tragedy.

1. “Understanding” more, “knowing” less

The play starts when the harmony is broken between the citizens of Thebes and their *Umwelt* causing them deep suffering due to infertility and death. The Priest, who represents the religious tradition, and the old men come to Oedipus as supplicants, for they consider him the wisest of all for having solved the riddle of the Sphinx, thus proving his competence in the modality of “knowing”. They also believe him to be the best of mortals, being closer to the gods. Oedipus, in his desire to be “Good” and again to help the community of which he is an integral part, seeks help from the gods through the oracles and promises to act accordingly. Guiding him are two *metamodalities*, that is to say, two moral and epistemic principles: (1) a *meta-will* to act according to the idea of the “Good”;² and (2) to act according to Apollo’s will – to do what is morally correct, in accordance with the divine Apollonian conception of the world – which is interrelated closely with the hero’s *meta-will* to know the truth.

The obstinate search for truth leads the subject on an inward journey from affirmation to negation: subject \cap plenitude (complete happiness in unity with Jocasta) to negation, when Oedipus, unveiling the truth, blinds himself in utter despair. It is interesting that Oedipus, unlike Jocasta, does not take his own life but prefers to prolong his agony as an exile, cast away from his own society where he was living in endogamous relations. We may state that his journey as a subject does not want to stop in the negation, but intends to go further, towards the possibility of affirmation. Oedipus realizes that when he had eyes he “could not see”, when he thought he knew he did not “know”. That is to say, as a “self” (*Soi*), Oedipus was competent in knowledge, so we may infer that as *Moi*³ he puts out his eyes in order to “see” more deeply, perhaps seeking to emulate Teiresias, the blind clairvoyant who foresaw Oedipus’s real situation.

This dramatic text involves readers in its deep *existentiality*. The understanding by which Oedipus uncovers his deeper self (*Moi*) progresses in a dialectic going from “outer” to “inner”. As in a detective story, Oedipus wants to find the criminal, while unaware of the tragic irony that all the evidence will point to him as the perpetrator. The understanding / misunderstanding dialectics, acting as a mirror, allows Oedipus to see his true or “inner” self, which takes him further and further away from his conjunc-

tion with the modality of “knowing”. That is to say, he comes to realize that the more he “understands”, the less he “knows”.

2. *The moral principle in art: The universal sense of Guilt*

It is in his deeper self, or “Moi”, where Oedipus uncovers his Guilt, thus leading readers or spectators into a dimension of *universality* of which the tragedy is only an extreme expression, as the radicalisation of an inner drama that every human being may see, consciously or unconsciously, represented within his / her own deeper self. This much is pointed out to Oedipus by Jocasta, when she tells him not to fear marrying his mother, since many mortals have done so before in their dreams – a fact that drew the attention of Sigmund Freud, as we all know.

By violating the prohibition against incest, Oedipus transgresses *not* against nature but against culture. His existence, his situation or *Dasein*, is determined by fate, wherein resides the resistance to the subject’s activity: Oedipus wants to escape the Oracle’s prophecy, and for that reason travels to Thebes, only to encounter there his tragic destiny. His individual freedom is exercised in fighting against Fate, to which he eventually falls victim.

It seems that Oedipus’s individual choice is in the end the acceptance of his fate: he does not choose to end his life, but to continue living, searching for inner knowledge and for expiation of his unconscious guilt by means of suffering. Since he was intended to die but did not die as a child, he seems to be telling destiny to continue its course; his individual choice is *not to see*, the taboo being what one does not want to see.

The play opens up the existential dimension of guilt as it relates to destiny in opposition to individual freedom. So we may ask, What things depend on fate, and for what things is Oedipus responsible as subject? At the beginning of the play Oedipus does not believe himself responsible, or guilty, but after listening to Teiresias he begins to doubt himself; and this is the existential force that makes his outward search be projected inwards. The doubt first appears in the Chorus, in its dialogue with Jocasta, representing both the “outer” voices of the people and reflecting the inner voices within Oedipus’s own being, Heidegger’s *das Man*; it is the *polis* of which he is an integral part.

3. *The understanding / misunderstanding dialectic*

In the understanding/misunderstanding dialectic, two underlying and opposing energies are in play, we may call them Apollonian and Dionysian forces. The former is the positive, constructive movement that affirms individuality; the latter, a destructive, negative force that tends to dissolve individuality.

The inductive/deductive, detective-like unfolding of the play is Apollonian, but through this movement the individual consciousness paradoxically and progressively fades away, giving rise to the opposing movement, which strives toward a Dionysian dissolution of consciousness; the latter occurs the theatrical ritual as an unveiling of masks, which are superimposed one upon the other. But because this is theatrical representation, individuality is maintained insofar as the characters remain the same. So what we see is a fusion of the two opposing fields of action, a blending of light and darkness, a chiaroscuro scenario wherein conscience appears, revealing guilt (see Diagram 1).

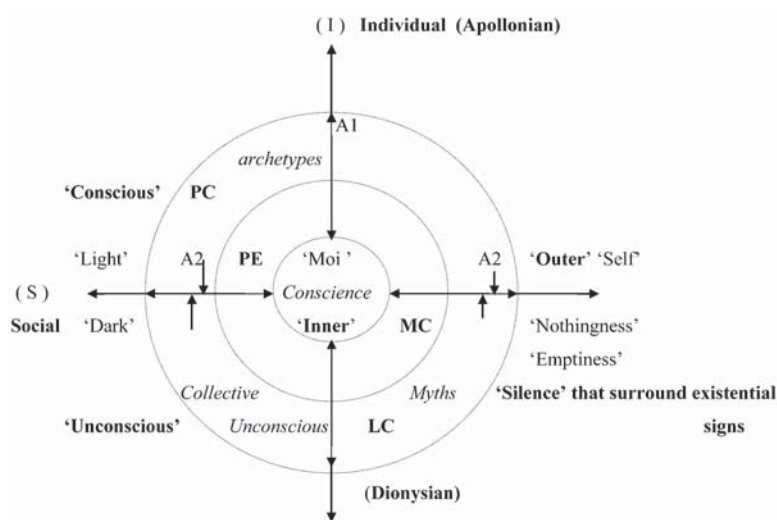

Diagram 1.

The opposing energetic fields blend into each other in a chiaroscuro scenario where guilt is unveiled by conscience. It is a tension between the opposite Apollonian and Dionysian forces.

LC: Latent Content of Dreams.

(I): Individual

(S): Social

We may summarize as follows the “outward” movement of the subject (guided by the Self) seeking for truth in a series of progressive stages:

1.a. Oedipus affirms that he does not know where to find the trace or sign of an ancient guilt; the tragic irony is such that the spectator or reader knows more than the actor, whether him / her is inside or outside the written text. The subject, then, is in disjunction from the “truth”: $S \cup O$.

2.a. The first clue is brought forth, but it is false, and hence the cause of the first misunderstanding. Creon, Oedipus’s brother-in-law, affirms that Laius, previously king of Thebes, died in the hands of several thieves – *not in the hands of one*, but in the hands of many.

3.a. The people then advise Oedipus to consult the wise Teiresias, since advice from the gods cannot be sought directly. Oedipus does not believe Teiresias when he tells him the truth: that he, Oedipus, is the criminal is searching for. His first reaction, which leads to further misunderstanding, is to think that Teiresias is lying in order to discredit him. In proceeding thus, Oedipus pushes further away from his understanding of the sought-for truth.

4.a. Teiresias tells him the truth a second time, but Oedipus does not accept it because he does not understand it. His misunderstanding leads him to suspect Creon of conspiring against him in a plot to seize political power. The Chorus, representing the voice of the people, voice their doubts, torn between their religious belief in the Oracle and their estimation of Oedipus as a trustworthy person. Oedipus in his rage accuses Creon, thus affirming his belief that he, Oedipus, is not guilty, and hence will not be found guilty.

5.a. The Chorus takes part in the confrontation between Oedipus and Creon, advising Oedipus not to make accusations based merely on rumours.

6.a. In Oedipus's search for the truth he encounters three main opponents: Teiresias, the Chorus, and Jocasta try to dissuade him from his search, and to some extent so do the messengers and Laius's former servant.

7.a. A dialogue with Jocasta follows. Here we see Oedipus's negative reaction and rage against Creon, and further misunderstandings which might have been the consequence of the doubt that starts growing in him after he hears the truth as told by Teiresias.

At this point in the narrative the outward search of the subject for his object starts to be projected inwards (guided by the "Moi"), with a cathartic force that can be seen in the rhythmic acceleration of the narrative movement. The importance of the Chorus in this cathartic movement cannot be neglected. Here Sophocles demonstrates his *ars poetica* in his rhythmic skill in composing antistrophes, since each one must imitate the *spontaneous meter* of the preceding strophe.

1.b. New evidence, brought forth by Jocasta, acts as a mirror, making Oedipus seriously doubt his own innocence and be overcome by fear: the mention of the intersection of three roads where Laius was said to have been killed by thieves. Jocasta also explains how the child was tied by the ankles (hence the name *Oedipus*, which means "swollen feet"), thrown down a hill, and left for dead.

2.b. Creon observes the change in Oedipus and inquires about its cause, which makes Oedipus "retrace his steps". This can be thought of as *anamnesis* that refers to the temporal process of recollecting or remembering the past. In Heideggerian terms, the existential past has the function of bringing the being (*Sein*) to its "there" (*da*), thus opening up an existential situation (see Hočevar: 2003). Despite his fear and anguish, Oedipus continues his search for further evidence.

3.b. Jocasta informs Oedipus that only one of Laius's servants survived. Oedipus then wants the witness to be brought to him. She agrees, but observing the visible change in Oedipus, she inquires about the cause of his anxiety. He replies that it stems from the fact that, when he was living with his parents, a drunkard told him that he actually not their child. His parents denied this, but still the drunkard's words affected him deeply,

and he had been tormented by them ever since. That is when he decides to travel to Delphi to learn the truth from the Oracle. Apollo only manifested to him the terrible calamities that he would suffer: he would kill his father and marry his own mother, which union would bring disgraceful offspring into the world. Upon hearing the Oracle, Oedipus turns his back on his home, so as not to encounter his parents and risk his foretold fate. In so doing, the tragic irony appears by which Oedipus will find the very thing he is trying to avoid. He then tells Jocasta what happened: how he encountered a party at the intersection of three roads, in a horse-driven carriage; how, in reaction to aggression, he killed an old man along with the rest of the company.

4.b. In trying to verify a connection between the man that he killed and Laius, Oedipus continues his investigation, not yet that Laius was his father. So he still has some hope, which is echoed by the Chorus, as he awaits the arrival of the witness: the peasant who untied his ankles and saved him from imminent death. Jocasta, believing her son to be long dead, has reason to hope for the best.

5.b. A messenger arrives; it is the same peasant that rescued him, who confirms the fact that Oedipus was not really Polybus's son. He then tells how he found Oedipus, rescued him, and gave him to the childless Polybus, king of Corinth. As the truth begins to be unveiled, Oedipus's understanding grows.

6.b. The messenger can tell no more, so the next witness is sought. It is Laius's own servant, who had received the order to kill him when he was born. Oedipus's last hope remains: to be the son of a slave in the palace. But Jocasta, now totally convinced of the truth, enters the palace and kills herself.

7.b. The last witness appears, and the truth that was hidden is totally unveiled, and with it, *Guilt*. The subject is united with the object of his search. Oedipus, in extreme mental anguish, stabs out his eyes with Jocasta's brooch.

4. *Transcendental dimension of the analysis*

We may understand the transcendental sphere of ideas in connection with temporal processes brought about by the existential movements of the subjects. Transcendental ideas of "the Good" and "the True" function in the

tragedy as pre-signs, in as much as they determine Oedipus's actions or choices, as well as ideals against which he mirrors his being; the same also function as post-signs or post-interpretants (cf. Tarasti 2000: 3). We may further relate these existential semiotic ideas with Heidegger's temporal "ecstasies". The temporal movement of negation in this tragedy is related with the "past", with unveiling the past in the act of anamnesis, as mentioned before. All this is deeply connected with existential *Befindlichkeit* ("state-of-mind" or "attunement") and with "moods" (in this tragedy, those of anxiety and fear), which open up the existential situation, bringing the being to its "there". We may say, in reference to dramatic ritual, that it is the "nothingness" that is found when the last mask is removed and the persona dissolved.

In the play the Chorus develops the theme of the tragic vision of life: the emptiness or vacuity of human existence that is found also in Shakespeare (e.g., in *Macbeth*). The movement of the subject may continue toward "affirmation" through understanding related with existential future. Through existential understanding the temporal, deterministic process may be existentially reversed, thus bringing the being to its "there" in anticipation (see Hočevar 2003: 72–73). This further movement may be guessed in Oedipus's tragedy, as explained earlier in this essay.

Concluding remarks

Oedipus, in his determination to act in a "good" way, as a king should to his people, is guided at first by a religious tradition that determines his course of action. He "must find" the truth; and this modality is also a *metamodality* determined by the Apollonian divinity, as shown by the Oracle. The epistemic principle acts in aid of the moral one, which is to help the citizens of Thebes and to help himself the process. Then when doubt appears within him, his deeper self or "Moi" guides his course of action. The *Self* determines, so to say, Oedipus's outward journey in search of the object, and his *Moi* determines his inward, reflexive journey for the same reason. Oedipus's self-determination, guided by the *Moi*, leads him into a dimension of guilt when he unveils the taboo that he had previously chosen not to see. But it must be emphasized that the taboo of incest is something "learned – it is not a biological constraint. It is clear that Oedipus transgresses against culture, but it seems that he transgresses also against nature,

in connection with the religious dimension: his land and people are punished with infertility, and the Oracle reveals there is a *guilt* that must be expiated.

To what extent, then, is the behaviour of the *Moi* really Oedipus's "own" categorical imperative? When doubts arise and the evidence confirm his suspicions, Oedipus is dissuaded several times from his search for the truth. He is urged to leave things as they are, abandon his quest for the facts, and in doing so could have continued living happily in concealment. Oedipus thus finds that, in helping others, he cannot help himself. It might seem furthermore that life in society – human relations within a culture – is marked by a desire to keep the "dark side" covered or repressed, so that we may remain united as society. Is this "cover-up" or concealment the necessary condition for our social life?

Notes

1. I would like to thank CDCHT University of Los Andes (Mérida-Venezuela) for support in this project, codified as: H-851-05-06-B, which made the present research possible.
2. See Tarasti (2000: 26, 33) regarding the transcendental ideas of the True, the Good, the Beautiful, which function as pre-interpretants or "pre-signs" in his theory.
3. "Soi" and "Moi" are (French) existential semiotic distinctions, explicated at length in Tarasti 2000.

The musical understanding of literature¹

1. Introduction

The musically signifying dimension of poetry that manifests in sonority and rhythm and in rhetorical figures should be acknowledged as “a new linguistic axis,” according to Lubio Cardozo, a Venezuelan poet and literary critic (2003: 80). In his view, our first approach to a poem is determined by the musicality of its composition (ibid.: 13). The sonorous effects responsible for euphony do not constitute merely a superficial or artificial effect in isolation; rather, they constitute a musical dimension that is meaningful in itself.

Lubio Cardozo’s distinction of two musical dimensions – sonority and rhythm – may be compared with the Russian Formalists’ distinction between *orchestration* (sonorous effects of vowels and consonants) and rhythm. According to Yuri Tynianov (1981), the sound effect of vowels and consonants produce a spatial movement within the text that is predominantly regressive. This movement is explained as the rhyme effect, which “carries backwards”. In contrast, the movement of meter is essentially progressive (ibid.); it is an expectant movement that pushes “forwards”. Both movements as a whole constitute the musical flow of the poem (see Tynianov 1981: 53–54).

The “new linguistic axis” implies, then, a *musical signifying dimension in language*, where sense and conceptual truth of the imagination, manifested in figures of speech, appear in a new space of creative expression. Octavio Paz had already stated (1956) that rhythm, image and sense confirm a signifying whole. What is interesting in Lubio Cardozo is that, according to this author, “musicality” is made conscious; it is not reduced to an unconscious dimension, to the *semiotic* in the Kristevan sense. The oneiric unconscious dimension is known when the dreams are made conscious (Cardozo 2003:

47). How then is the musical signifying dimension communicated to the reader? How is it “understood”?

The reader of poetry should be able to grasp its musical sense; he or she should be a “listener” attentive to the double genesis of the poem: both written and oral. The poem is heard, written and pronounced. It appears on paper through writing and in the air through the voice; it is originally sung: “... upon the trace of beauty as a hidden human impulse, in part intuited, in part rational, mysterious and luminous, unconscious and conscious, under this double energy does the work appear” (ibid.: 11–12).

In our aim to give account of the musical signifying dimension of poetry and of how it is understood, we cannot ignore the double genesis of the poem, as determined by Cardozo. In so doing it is necessary to investigate in depth the signifying relationship between music and language, taking into account the temporal dimension of the sign (see Hočevár : 2003a). That is why we base our model on Martin Heidegger’s (1962) *existential analytic* and in Eero Tarasti’s (2000) *existential semiotics*.

2. Understanding the musical signifying dimension of a literary text

The musical signification of a text is usually pointed out when there is an explicit reference to music. For example, the title of a novel or story may refer to a generic type of musical composition, such as sonata, fugue, rhapsody, and others, that is to say, when one “sees” the literary text as an intertext, in intertextual relationships with “real” musical texts. In these cases some similarities are perceived between text and music: The written text is said to imitate its musical counterpart. Other types of musical references may point to a composer, a musical instrument, a musical quotation or direction. All these references challenge the reader’s musical knowledge and response, and may play a leading role in the understanding and interpretation of a text, as observed by Frédérique Arroyas (2001: 82). References to music may also be obtained from “paratextual indices” or knowledge obtained outside the text; for example when an author in his writings acknowledges being influenced by music, as was the case of the English romantic writer Thomas De Quincey.

Arroyas, in his cognitive approach to the investigation of musical metaphors and analogies in literature, finds that the referential cues to music in

a written text open up a metaphorical space, where two “inputs”, such as the concept of a musical fugue and the idea of a novel, fuse into each other, thus creating a blended or intermediary space that, while encompassing similarities, also has its own emerging structure (ibid.: 98). Thus, signification is sought for in the reader’s mind: ... “it is also in the reader’s mind that we must look for an ontology of music, not only in the text. It is then that we can say that the text’s virtual musicality becomes reality” (ibid.). The problem with this approach is that it does not take into account the fact that musicality is not just an intellectual phenomenon. It is not just something that we understand with the “intellect”. It is not only a “mental space”; it is also “felt” in the “body”, so to say. We shall elaborate on this assertion below.

Arroyas states that “explicit references to music in a text, however, are not a necessary condition for a reader’s investigation of the musical domain and its relevance to the text” (ibid.: 83). He points out two instances where this is so: (1) the case of language’s intrinsic aural and rhythmic qualities, “where sound takes precedence as a mode of expression and often sensitizes readers to a text’s ‘musicality’” (ibid.); as an example, James Joyce’s *Ulysses* comes to mind). (2) There is also the case of narrative structures following or trying to imitate musical forms, as happens in De Quincey’s “Dream-Fugue” (analyzed below).

And yet, when we read a poem, the musical sense is not only “heard”; it is also “felt”. The musicality of language is a reality that may be experienced by the reader/listener. So musical understanding also implies a shift from the modality of “knowing” to that of “feeling” (see Tarasti 2000: 65). Musicality may be felt as the enunciation is projected upon the enunciate, as in the gradual acceleration of the rhythm, allowing us to “to weigh its enunciation” (ibid.: 58). The shift from theoretical knowledge to feeling opens up the existential space of signification and communication that makes itself present in art.

2.1. Existential space of the musical signifying dimension

From the point of view of Heidegger’s existential analytic, “knowing” and “feeling” derive from a deeper ontological level. “Knowledge” is rooted in existential understanding (*Verstehen*), whereas “feeling” is rooted in existential “attunement” or “state-of-mind” (*Befindlichkeit*), where we find

that the existence is opened up mood-wise to the existing subject. Interpretation is considered “visible” understanding, which is an intellectual process, based upon “non-visible” or primary existential understanding as *Being-in-the-World*, where the self is not detached from its “world”, nor from others (see Hočevár 2003b: 167).

Signs produced by the poetic self reflect the transcendental journey of the existing subject via the *enunciant*.² Creative act-signs may be thus interpreted, after Tarasti:

Signified	⇒	<table style="border-collapse: collapse; margin: 0 auto;"> <tr> <td style="border-bottom: 1px solid black; padding: 2px 10px;">Transcendence (reflecting both negation and affirmation)</td> </tr> <tr> <td style="padding: 2px 10px;">Dasein</td> </tr> </table>	Transcendence (reflecting both negation and affirmation)	Dasein
Transcendence (reflecting both negation and affirmation)				
Dasein				
Signifier				

The dividing/uniting line between signifier and signified can be seen to represent the mediation of the body (nature, *physis*). The transcendental dimension that we are seeking to approach is thus not to be identified with Descartes’s or Husserl’s transcendental Ego (as a mind/body dichotomy). The transcendental dimension is given in existence and mediated by the body.

The existential signifying dimension of the sign is opened up when the subject *understands*, and existential understanding is given always with an existential *state-of-mind*. Instead of being considered a “mental” phenomenon, a cognitive process, as something “within” the mind, understanding may be considered rather an *existential* phenomenon; so that when a subject understands, he or she is already “outside” (see Heidegger 1962).

In the open space of the existential dimension of the sign we may find the appearance of the existential phenomenon of *Guilt*, which as an *existential*, is a universal phenomenon. Applying Tarasti’s existential semiotic distinctions between *Self* and *Moi* we find that it is when the self approaches his /her “inner” being (“le moi profond”) that the dimension of guilt may be disclosed in its individualizing self-arousal. The existential movement that discloses, in its root, the ethical dimension that may be present in art, is interrelated with the basic temporal movement of existence (see Hočevár 2003b).

2.1.1 Existential temporality of the musical signifying dimension

The “voice of conscience” that “may be heard” is related to *existential* discourse that discourses in the uncanny mode of *keeping silent*. The call says nothing, but it gives-to-understand. It does not put on trial the Self to which the appeal is made. Rather, it calls *Dasein* forth (and forward) into its possibilities, as a summons to its “ownmost *potentiality-for-Being-its-Self*” (Heidegger 1962: 273).

When the voice of conscience is understood, the basic existentials may be “reorganized”: the call of “conscience” that carries on discourse in the mode of *keeping silent* (“coming at the same time *from me* and yet *from beyond me*”) discloses the Self that is “individualized” through the accompanying state-of-mind (“attunement”) of *anxiety*. The call brings *Dasein* to the “there” of its disclosedness, by means of “understanding”, which comes from the “future”, and by means of “attunement”, arriving from the “past”, both of which push the “them” (*das Man*) into *insignificance* and disclose the Self in the face of “nothingness” (the “leap” into Sartre’s *le néant*). This process is visualized in Diagram 1.

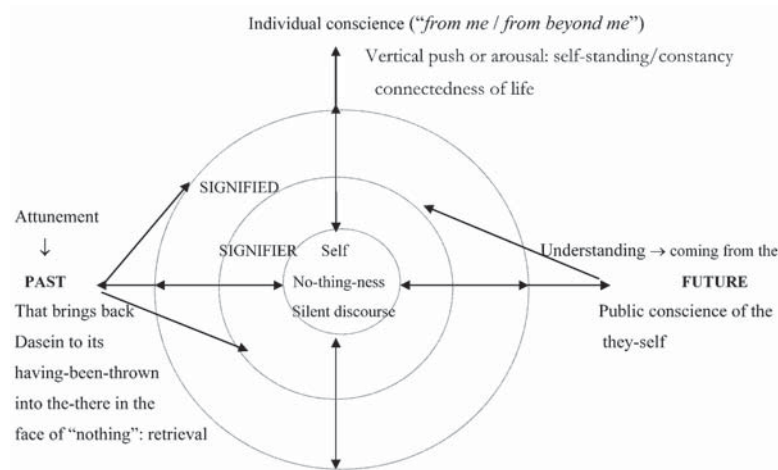

Diagram 1. Temporal movement of the basic existentials.

Understanding the musical signifying dimension of a literary text may be exemplified in Thomas De Quincey’s “Dream-Fugue”.

3. *Understanding through intertextuality and structural analogies*

The reference to music in Thomas De Quincey's "Dream-Fugue" is quite evident already in its title. The "Dream-Fugue" is the third section and climax of *The English Mail-Coach*, wherein De Quincey explores the dream territory of art in the mode of impassioned prose, consciously reconstructing the dream and its remembered causes: "The worst of its symptoms was an uncontrollable stream of fearful dreams, which tyrannized over him not only in sleep but also in the whole of his waking life. And it is in the description of these dreams that De Quincey rises decisively above the prosaic, into his own unique kind of 'impassioned prose'. The style reflects his long and careful study of prose as an artistic medium, above all his sense of its analogies with music" (*British Writers* 1981: 152). De Quincey was not concerned with dream writing for its own sake; rather, it was "the special material on which he founded his study of the growth of the human spirit" (*ibid.*: 153).

Understanding the "Dream-Fugue" as an intertext is not a difficult task. Apart from its suggestive title, further musical reference is found in the musical direction *Tumultuosissimamente* that marks the beginning of the literary fugue's "prelude". Other musical references include instruments like the organ and trumpet, and the voices of the antiphonal singing of holy hymns that refer to religious liturgy. It is perhaps less evident to the literary reader how close the narrative structure follows the structure of the musical form.

Calvin Brown (1938) has shown in his essay, "The Musical Structure of De Quincey's Dream-Fugue", how closely the literary fugue imitates its musical counterpart, notwithstanding the limitations imposed by the use of two different artistic media. Brown finds that the subject of the fugue is not a group of words but rather a group of ideas: speed, urgency, and a girl in danger of sudden death. The variation in settings would perform the function of a shifting, contrapuntal accompaniment. While the subject is identified by its content, the countersubject is identified by its form: a series of participles, constant in form, but varying in words: "There she stood, with hair disheveled, one hand clutched amongst the tackling – *rising, sinking, fluttering, trembling, praying*; there for leagues I saw her as she stood...". According to Brown, this series of participles is one of the

principal structural elements of the piece. In his analysis of the analogies between the two structures Brown shows how the main parts of the musical fugue may be perceived in the literary structure. Three sections are clearly distinguished: Exposition, Middle section and Final section, where subject, countersubject and subject-answer are identified. Also shifts of tonality, the *stretto* and even pedal-point are seen to exist in the tale. In this sense, the De Quincey's "Dream-Fugue" is perhaps the most successful example of literary fugue, at least in the English language.

4. *Understanding: A shift from Knowing to Feeling*

As pointed out elsewhere (Hočevar 2003: 234), the central motif – the endangered woman, identified as the subject of the fugue – is closely related to the basic mood of fear. The corresponding rhythmic gestures, expressed in the series of participles and identified with the countersubject of the musical fugue (Brown 1938), unites and gives directionality to the piece. It is possible to trace back this basic motif to the store of intonations present in the collective memory of the *langue*. We may also identify iconicity in its rhythmic gesture; as an underlying beat that imitates the organic rhythm of the heartbeat. We may also perceive and interpret these rhythmic sounds from the "inside", as the organic *Ich-ton* (essential self, *Moi*) whose presence is felt throughout the piece.

The mood of fear leads through the *Ich-ton* of the inner organic dimension into the "outer" Dasein as being-in-the-world-with-others, where a sound discloses the "there", where Da-Sein "finds" itself, not by "external" perceiving, but rather through "inner" moods. In this literary work we find the existential situation described by Heidegger as fearing-for-others, where the Other need not fear. The first-person narrator fears for the endangered lady, the subject of the dream and the literary fugue. Conscience or sense of guilt is awakened when De Quincey as enunciator reveals the foreseen danger, but also how he is incapable of action: he is unable "to act" to prevent the collision and the terrible accident in which the lady dies.

5. *Understanding is to uncover what is “hidden” or veiled in darkness*

Underlying the conscious/unconscious categories of human existence, we find an existential-temporal dimension of awareness or state of being “awakened”, where the existential Self is able to hear its self as he or she approaches “inner discourse”. The dimension that is “hidden” may be revealed whether one is awake or sleeping (as happens in dreams). The movement of rhythm in poetic creation courses through the non-visible (Dark) and visible (Light) dimensions of the sign, as it relates to the non-visible and visible existential understanding, in its movement toward manifestation in derivative discourse (music, language, etc.).

6. *Temporality of understanding and state-of-mind*

It is possible to trace back the textual rhythmic movements identified by Tynianov, already mentioned in the introduction, to the existential *a priori* movements of *understanding* and *state-of-mind*. Understanding opens up the existential future. This ontological dimension appears in this text as traces of the enunciation felt in the constantly moving flux of rhythm that pushes forward the images in a state of constant transformation and expectation. The existential past that is disclosed mood-wise (as fear for the other, in the case of the “Dream-Fugue”) manifests in the *backward pull* or temporal movement of the sound elements, where *self* and *world* are disclosed.

The rhythmic function of the countersubject, manifested by the series of participles already referred to, is not restricted to bringing-back from the past (memory) into the present, of projecting the paradigm into the syntagm, based on the ordinary understanding of time. The function of recollection or retrieval is realized in connection with the basic mood of fear that discloses the “there” in the mode of “fleeing”, which displays the structure of fugue as the basic existential structure of “falling” into the world. We find that in De Quincey’s literary fugue, the motive, as a *non-hierarchical* musical element, associated with the *existential past* in its “regressive movement”, brings us readers/listeners back – mood-wise – into the “there” of the *existential present*.

Seeing connections

An enquiry into a metaphor of understanding

Introduction

Could the metaphor of “seeing connections” offer glimpses into the process of understanding? The notion of metaphor itself embodies that of a connection – as we are transported (by a metaphorical expression) from one semantic field to another, thereby gaining a new insight. This paper provides a philosophical framework that does justice to this metaphor of understanding.

1. Philosophical framework

Metaphors have the power to redescribe reality. Our concern is to explore an image of the process of understanding that synthesizes two apparently incompatible theoretical perspectives: hermeneutics and semiotics. The metaphor of *seeing connections* already embodies this alliance, this pact between a realist or positivist ontology, appropriate to the natural sciences and hence a semiotic or structuralist approach to texts in the broadest sense, on the one hand, and a (phenomenologically orientated) hermeneutics of the experience of reading or interpreting, on the other. “Seeing” represents the latter, while “connections” represents the former. The seeing of connections as an interpretative model, therefore, jointly engages these two theoretical orientations.

In what follows, attention will be given, both to the concept of the “event of seeing” and to that of metaphor as such. Before we consider seeing as a metaphor of understanding, we will investigate two philosophical orientations towards this key epistemological process of seeing in the literal sense: one inaugurated and developed by Rene Descartes, in terms

of which an isolated, disembodied concept of seeing forms the (mechanistic) foundation of an abstract knowledge; the other as developed in response to the former by way of an embodied seeing as inseparable from the totality of lived experience.

We will then explore two sets of epistemological metaphors as analyzed by Paul Thagard and Craig Beam: *foundation* metaphors (again as typically deployed by Descartes) and *coherence* metaphors, notably, for our context, as utilized by Charles Peirce, for whom reasoning should be depicted as a cable (of intertwined strands of meaning) rather than in terms of a chain of inferences back to a foundation of all knowledge. In terms of the cable image, understanding is more a case of “making connections”, or a coherence of beliefs, than of founding knowledge on some indubitable foundation of certainty.

2. *Two concepts of seeing*

In this section we first trace the domination of vision in our knowledge of the world, or the vision-centred rationality, developed by Descartes, in which the latter’s “idea of a disembodied and rational eye as an instrument of order and control”, to quote Olga Belova (2006: 93), is the focus of our attention. Thereafter, we will consider a radical alternative to this Cartesian paradigm of seeing, that of French phenomenologist, Merleau-Ponty, who developed an embodied, as opposed to a dis-embodied view.

For Descartes (1985: 33), knowledge is sought by “fixing the eyes on a single point, (to) acquire through practice the ability to make perfect distinctions between things, however minute and delicate.” Descartes is careful, however, to qualify this statement by emphasizing that the judgement we think we make with our eyes is actually a *mental* judgement. As Jay (1993: 81) notes, Descartes’s philosophical quest is one of “a spectator rather than an actor”, a distinction being drawn between a passive bodily dimension and an active mental one. Cartesian epistemology cannot be viewed in isolation from this dualism of body and mind. The event of seeing is conceived of as neutral, mechanistic, rationalistic, *detached* from the lived body, which is at best a mere instrument of the active mind.

Against this conception, Merleau-Ponty offers that of seeing as an event of *embodied* being. To quote Belova (ibid: 96): “This perspective allows us to distinguish between ‘the thought of seeing’ or purified vision,

severed from its body and senses, and ‘active vision’, that which happens in the midst of things, ‘squeezed into a body – its own body’, and of which we can have no idea except in the exercise of it” (see Merleau-Ponty 1993: 136). For Merleau-Ponty, visual engagement takes place on the border between seer and seen, in terms of an interconnection he (1968) depicts as *flesh*. According to Waldenfels (1998: 228–229), flesh here is to be understood not as existing between the body and the world, but “functionally, as *texture, articulation, framework, joints*, as an *element* in which we live and move ... An *intertwining* forms between things, others and myself, a *chiasmus*, or a *chiasma*... (where) (w)hat is one’s own and what is not constantly more or less overlap but never entirely coincide with each other.” In Merleau-Ponty’s (1968: 135) words: “The thickness of flesh between the seer and the thing is constitutive for the thing of its visibility as for the seer of his corporeality; it is not an obstacle between them, it is their means of communication.”

Far from being in a relationship of opposition, as in Descartes, Merleau-Ponty brings them into a bond: seer and seen are indivisible. “He who sees is of it (flesh) and is in it” (Merleau-Ponty 1968: 100). We are no longer “in” our bodies, any more than our bodies are “in” the world, for the world itself is flesh! In Merleau-Ponty’s revised epistemology of visual engagement, neither the look nor the thing commands.

3. *Two metaphors of knowledge: Foundation versus coherence*

Thagard and Beam (2004) have traced two master metaphors of knowledge through the history of philosophy – from Plato’s cave to Quine’s web of belief. Essentially, the two images that stand out are those of *foundation* (for all certainty) and *coherence* (of our beliefs).

According to Thagard and Beam (2004: 505): “Many philosophers have sought a ground or base on which knowledge could be erected. To say that knowledge has or needs a foundation is to use a metaphor based on a systematic analogy between the development of knowledge and the construction of a building.” Once again we encounter Descartes (1985, 2: 366), who is found to be an arch proponent of this metaphor and is quoted by Thagard and Beam (*ibid*) as follows: “... I began by taking everything that was doubtful and throwing it out, like sand; and then, when I had noticed

that it is impossible to doubt that a doubting or thinking substance exists, I took this as the bedrock on which I could lay the foundations of my philosophy.”

Two further images used by Descartes (*ibid.*, 2: 324 and *ibid.*, 1: 120) are outlined to defend his method of doubt (that of emptying out a basket of apples, some of which are rotten and then returning only those that are not) and of a chain (of inferences akin to the geometer’s) to defend his epistemology. Other philosophers who have subscribed to the foundation metaphor of knowledge include Spinoza, Leibniz, Locke, Aristotle and Kant, as well as Frege and Husserl. These thinkers, according to Thagard and Beam (2004: 507), “wanted philosophical knowledge to be an unchallengeable edifice built on an unassailable foundation.”

As for the other metaphor of knowledge – that of coherence – we may first consider Charles Peirce, who in 1860 rejected Descartes’s method of universal doubt. Replacing the latter’s chain image with that of a *cable*, Peirce (1958: 40–41) claimed that:

Philosophy ought to imitate the successful sciences in its methods, so far as to proceed only from tangible premises which can be subjected to careful scrutiny, and to trust rather to the multitude and variety of its arguments than to the conclusiveness of any one. Its reasoning should not form a chain which is no stronger than its weakest link, but a cable whose fibres may be ever so slender, provided they are sufficiently numerous and intimately connected.

Here it is *connections* that count, more than the strength of individual propositions. According to Thagard and Beam (2004: 508), the most influential twentieth century coherentist metaphor was Otto Neurath’s *ship*, used against (empiricist) foundationalism based on protocol sentences. According to Neurath (1959: 201):

There is no way of taking conclusively established pure protocol sentences as the starting point of the sciences. No *tabula rasa* exists. We are like sailors who must rebuild their ship on the open sea, never able to dismantle it in dry-dock and to reconstruct it there out of the best materials. Only the metaphysical elements can be allowed to vanish without trace. Vague linguistic conglomerations always remain in one way or another as components of the ship.

While Peirce was challenging rationalism, Neurath challenged empiricism. W. V. O. Quine (1960: 3–4) extended the boat metaphor: “... if we are to rebuild it (the science boat), we must rebuild plank by plank while staying afloat in it. The philosopher and the scientist are in the same boat...”. The very title of Quine and Ullian’s book, *The Web of Belief*, is a clear case of the coherence metaphor of knowledge. Other prominent philosophers who used this metaphor include Karl Popper, John Rawls and Nelson Goodman, for whom “logical principles are justified not a priori but rather on how well they fit with inferential practice” (Thagard and Beam 2004: 509).

4. *The concept of metaphor*

Recent years have witnessed a revival of interest in metaphor. One study warrants special attention: “The Limits of Literal Meaning: New Models for Understanding Metaphor” by E. Oesch (1996), who distinguishes between a “literal” and a “non-literal” approach. Oesch (1996: 2) notes that “... careful investigation is still needed to show how metaphors actually function in meaning creation processes...”. One approach is in Aristotle’s *Rhetoric*, where we find his most concentrated treatment of metaphor, in terms of “the ability to make phenomena visible” (Oesch *ibid.*). In Aristotle’s (1982: 1411b2) own words:

We have said that smart sayings are derived from proportional metaphor and expressions which set things before the eyes. We must now explain the meaning of ‘before the eyes’, and what must be done to produce this. I mean that things are set before the eyes by words that signify actuality.

The notion of actuality (*energeia*) here speaks of vividness of representation and is closely related to *dynamis*, which conveys the idea of virtual, as opposed to, actual existence. Oesch (1996: 3) observes that “reflecting these two terms together, it seems that for Aristotle certain properly chosen words have the power to make visible phenomena included in entities as potentiality.” As to the specification of what these entities are, Oesch (*ibid.*) relates Aristotle’s *Rhetoric* to his *Categories*, which, from a logical point of view, deal with the way we think about things and make predictions. She notes that:

In the *Rhetoric* the starting point is explicitly linguistic, which puts these two works in an interesting dialogue with each other, for paying attention to different equivocal expressions, metaphors and other figures of speech, the *Rhetoric* simultaneously endeavours to uncover the potentiality of language to question our settled classifications and to put forward new and unexpected features in reality (Oesch 1996: 3).

Hence, for both Aristotle and Oesch words “have the capacity to reform reality incessantly.” This leads us to Oesch’s (ibid) own definition of metaphor: “Metaphors are expressions which simultaneously both deconstruct old meanings and reconstruct new ones, transforming ceaselessly the boundaries between semantic fields.”

5. *Building (cable) bridges*

In a seminal article, Paul Ricoeur (1982: 197–221) develops a “hermeneutical arc” to incorporate both understanding and explanation within a general process of interpretation in the human sciences. Prior to Ricoeur, Dilthey had rigidly separated the human from the natural sciences, pursuing understanding and explanation respectively. What distinguished the human sciences was their *historical* nature. History remains important, though not within the narrow confines Dilthey envisaged. Ricoeur wants to bridge the dichotomy engineered by Dilthey more explicitly, and starts by analyzing the features of discourse and inquiring into what happens to it when speech is replaced by writing. Four characteristics distinguish the latter; written discourse is: fixated beyond the fleeting moment of speech, set free from a speaker (i.e., externalized), opens up a world beyond that of the author, and is universalized by being made available to anyone who can read.

From here Ricoeur reconceptualizing meaningful action as a kind of text, thereby bringing it within the latter’s methodological paradigm.

Next, he develops a new model of interpretation, consisting of a two-way process: first moving from understanding to explanation, and then (back) from explanation to understanding. The first phase of the process takes the form of *Guessing followed by validation*. We must start somewhere and, subjective as it may sound, this takes the form of a guess. Yet, as soon as this has occurred, it must be validated. This process was already depicted by E. D. Hirsch (1967: 25), who conceded that while there are no rules for

making good guesses, there are rules to validate them. Explanation follows on from understanding.

The second phase – explanation to understanding – utilizes the techniques developed by *structuralism*, as a more natural scientific orientation within the human sciences, conceiving of language as a closed, abstract system of inter-relating signs, worldless and without human interlocutors. These very categories and structures, however, necessarily imply the possibility of (human) *meaning*, according to Ricoeur. The myths analyzed by Levi-Strauss only make sense as (eventually) opening up new meaning, novel insights into the human situation. In this sense, even the scientific rigours of structuralist (and semiotic) analysis, as *explanation*, must in the end move on to the promised land of meaning, thereby facilitating a new *understanding*.

6. *Media aesthetics: Making the visual understandable*

The media aesthetics of H. Zettl illustrates the philosophical principles developed in this paper. Accordingly, aesthetics – aimed at clarifying the *visual* – is for him contextualized. In his ground-breaking *Sight Sound Motion*, he notes the following:

Aesthetics, then, means for us a study of certain sense perceptions and how these perceptions can be most effectively clarified, intensified, and interpreted through a medium, such as television or film, for a specific recipient. Since all media elements interconnect and are ultimately shaped by our perceptual sensitivities, we call the operational field within which we conduct our examination *contextualistic aesthetics* or simply *contextualism*. (Zettl 1973: 2)

A key influence on Zettl was the inductive approach of Kandinsky, whose *Punkt Linie und Fläche* was to help inspire *Sight Sound Motion*.

7. *Conclusion*

In conclusion, two insights of Zettl may be highlighted. The first is his rejection of the absolute. Having dispensed with foundation metaphors of understanding, we can appreciate our own limitations, this being but a consequence of the radical *historicity* of existence. Second, there is his

quest to enrich the wonder of being human. If we can join hands, we can build bridges, which carry us into a fuller understanding of ourselves, each other and our world. And that surely remains the ultimate goal of the human sciences.

Tomohai Hori

Pentatonicism in the vocal music of Schubert's "Romantic period"

The meanings of *Mi-sol-la*

Introduction

The appearance of the pentatonic scale in a work of classical music may be represented as a singular event. In this regard, Day-O'Connell (2007) has demonstrated the discursive implementation of this scale in the west and cited some 400 musical examples demonstrating how it has been used in association with themes of "nature", "folkishness", or "religiosity" or the "primitive" – from Peircian semiotic points of view (ibid., 6f.). While by definition the pentatonic scale consists of "do-re-mi-sol-la" (in a major scale), Day-O'Connell paid primary attention to the ascending "sol-la-do" progression (ibid., 13–43; 130–142).

In the vocal works of Franz Schubert, we find many examples of pentatonicism appearing suddenly so as to form a *crux*. For example, in the lied "Die junge Nonne" D 828 (1825), a young nun continues to pray, fraught with madness amid the stormy roar. In the course of praying she is led "all-powerfully to eternal heights" (*allmächtig zu ewigen Höhen*) at a moment towards the end of the song. At this moment (m. 78), we encounter an important procedure extensively applied in Schubert's vocal works: the vocal part suddenly doubles the bass (See Ex. 1a). As Leo Black (2001: 100) has observed, such passages of "voice doubling bass" frequently appear in the lieder Schubert composed after 1818, in places where the protagonist loses her- / himself and surrenders to "Übergeordnetes" (superior sublime beings or ideas) or to "innere Stimmen." Corresponding to this crucial event, the downward progression of D (which is repeated just before Ex. 1a) – a kind of "Classical progression of the sixth degree tone" (Day-

O’Connell 2002: 30ff) – abruptly rises three degrees to form a “sol-la-do” (C-D-F) pentatonic pattern. The latter then changes into a “mi-sol-la” (A-C-D) series in the final “Alleluia” section (see Ex. 1b).

Example 1a. Schubert, “Die junge Nonne” (D 828), mm. 77–80.

Example 1b. “Die junge Nonne”, mm. 85–87.

Recent Schubert studies – though in very different ways – have put special emphasis on figures or phrases which make brusque appearances to form a crystallizing moment in a particular work. Marie-Agnes Dittrich (1991: 14; 51, 52), focusing on the “uniqueness of a certain harmony” in Schubert’s lieder, avoids the “functional” frame of reference, in which each harmony is functionalized within the frame of the whole structure. Instead, her analysis shows how meaningfully Schubert assigned unique sounds (e.g., mediant chords) to a single, focusing word. Similarly, Richard Kramer (1994: 86; 90ff.; 112f.) examined moments, such as certain tonal sections in Schubert’s lieder which are often “the most eccentric” or “closed off” from the whole, as forming the “cruxes” of the works. Lawrence Kramer (1998: 1–8) sees such a “crucial point” as a means of “the ‘deviant’ subject’s self-affirmation”. For him, the subjects in Schubert’s songs that are “normal enough to begin with”, sooner or later “venture into ... dangerous, marginal,

or prohibited areas of experience", so as to deconstruct the normative structure and to "explore alternative subjectivities" (ibid.). Furthermore, Robert Hatten (1994: 34 & passim) has applied the linguistic theory of "markedness" to music analysis, by which establishes a foundation for observing the structurally "marked" zones in Schubert's instrumental music (Hatten 2004: 53–67), which serve "to achieve an appropriately balanced (structural and expressive) manifestation of foreground *and* background, melody *and* harmony, yearning *and* fulfillment" (ibid.: 10). Although these studies are varied in their purposes and in some ways incompatible with each other, their points of view have unquestionably led to new ways of revealing the meanings of unusual idioms in Schubert's music.

My study looks at the musical phenomenon of pentatonicism that suddenly appears and foregrounds a particular moment or main theme of Schubert's vocal works. Examining his body of work – 577 German lieder, 6 Masses, other religious works, and surviving operas – I found the usage of pentatonicism to be an important means of creating such a focus, especially in its descending "*mi-sol-la*" form (in "la-sol-mi," "sol-la-sol-mi," etc.). This figure is used extensively to create a pastoral mood; as in the "Fischerlied" D 351 or "Die gefangenen Sanger" D 712; a religious invocation, as in the *Kyrie* of two Masses (D 105, D950) and the *Dona nobis* of another Mass (D 678), or to call attention to something uniquely precious to a given work (as on the words "suer Friede" in the "Wanderers Nachtlied" D 224). In this paper I focus on works from Schubert's "Romantic period"; because it is in this period that a salient *mi-sol-la* figure is used in the most refined manner, and becomes clearly related to three thematic motifs that were highly cherished by the composer: 1) reliance on God; 2) mankind's misfortune at having lost God; and 3) the desire to unite or become one with Nature. To demonstrate the interrelation between the *mi-sol-la* figure and these motifs, I examine the religious drama *Lazarus*, the song cycle *Die schone Mullerin* (briefly) and various of Schubert's lieder.

1. "*Delights of Friendship*": Peaceful death within a reliance on God

The unfinished religious drama *Lazarus* (D 689, 1820) deals with the death of Lazarus, his burial, and his resurrection, as described in the *Gospel of John*. As intended by the librettist Niemeyer, a dual motif runs through-

out the drama: the relationship between two kinds of feeling – “fear” and “solace – experienced by characters as a reaction to the death of Lazarus. As pointed out by Blanken (2002: 199) and Brown (1966), this characteristic libretto led Schubert to adopt a special composing technique: he assigned a few musical motives to the contrary feelings of “fear” and “solace,” and used them in the work to communicate such feelings, in a kind of leit-motif process. In line with this observation, I describe three phases in the first part of this work, which deals with the story up to the death of Lazarus. First, various pentatonic patterns appear in the orchestral part during the songs of Mary (one of Lazarus’ sisters), exclusively when she speaks of “solace” (*der Trost*) and “reliance on God.”² Second, such pentatonic patterns change into the *mi-sol-la* figure in the impressive arioso sung by Lazarus just before his death, this time in the *vocal* part.³ Third, this figure once again appears in Jemina’s aria near the end, thereby crystallizing the suggested theme of this work: “the delights of friendship.”

The work begins with a scene in which Lazarus, sick and preparing to die, bids farewell to his sisters, Martha and Mary. Although Martha is shocked to hear this, Mary remains calm and comforts Martha. Afterwards Mary sings an aria, encouraging Lazarus. In this aria we encounter the first impressive appearance of pentatonicism. In the middle section, Schubert describes the “last struggle” of the dying Lazarus in the parallel minor. But at the last few measures of the interlude – just before the F *major* section (A section) returns, the “mi-sol-la-sol-mi-do” in the clarinet part heralds the return of Maria’s comforting voice (Ex. 2a).

Example 2a. Lazarus (D 689), Mary’s aria, beginning of reprise, mm. 171–181.

Mary always remains calm in this way, a feeling often emphasized by various pentatonic patterns. For example, pentatonicism appears in the cello part, where "das Reich des Lichts" is predicted by Mary's own solace, "der Trost" (Ex. 2b), and returns at the end of her another aria, thus constituting the climax of part one of the entire work. At this point, pentatonicism appears in a reduced "do-mi-sol-la" series, highlighting the theme of this aria: "Gottes Liebe, du bist seine Zuversicht" (Ex. 2c).

Example 2b shows the beginning of Mary's aria. The score includes parts for Clarinet (in B), Violin, Viola, Maria (soprano), and Cello. The key signature is one flat (B-flat major/D minor). The cello part features a pentatonic pattern circled in red. The lyrics are: "Der Trost beglei - te dich hin - u - ber in das Reich des Lichts,"

Example 2b. Lazarus, Mary's aria, beginning, mm. 442-448.

Example 2c shows the ending of Mary's aria. The score includes parts for Clarinet (in C), Bassoon, Cor (in G), Violin, Viola, Maria (soprano), and Bass. The key signature is one flat (B-flat major/D minor). The Clarinet and Bassoon parts feature pentatonic patterns circled in red. The lyrics are: "- ver - sicht, du, nur du bist seine Zu - ver - sicht!"

Example 2c. Lazarus, Mary's aria, ending, mm. 570-581.

The solace felt by Mary finally comes to the dying Lazarus. In his arioso, which gives thanks to the friends who have gathered, the pentatonicism arises in a *mi-sol-la* series in the *vocal* part. This figure vividly foregrounds the words “der Freundschaft Wonne” (the delights of friendship) in F sharp major, which always has an extraordinary meaning in Schubert songs (Cf. Youens 2002: 358) – emphasizing his expectation of a peaceful death, based on his reliance on God and friendship (Ex. 2d).

Example 2d. Lazarus, beginning of Lazarus's arioso.

During the last phase of this work, a young woman named Jemina comes to Lazarus, just before his arioso. In his arioso, Lazarus has asked her to sing “a song of death and resurrection”. In response, she sings of how peacefully she died, having already experienced her own death and resurrection, as described in Table 1. (She is identified as “the daughter of Jairus” described in the *Gospel of Mark*.) During the A section she sings of the death of an innocent woman (“die Unschuld”). In turn, in the B section she sings of her own experience (“So schlummert *ich*”). The *mi-sol-la* figure occurs at the end of the first section, where she calls out “weckt sie nicht”. Although the “innocent woman” must be identified as no one but Jemina herself in this context, the libretto clearly distinguishes two persons, and Schubert also separates them strictly in two respective sections.

Uniquely, in the latter half of the reprise, the text of the middle section is recalled (line 5 of A is immediately followed by line 1 of B); hence the whole aria ends with the text of the B-Section. Christine Blanken (2002: 212) has drawn attention to the radical change of declamation in the reprise, but not tried to explain the composer’s reason for the change.

[A:]	So schlummert auf Rosen, Die Unschuld ein, Wo sanfte Lüftchen säuselnd Mit Blüthen sie bestreu'n. <u>Wie süß sie schläft.</u> Mit Engelsfrieden Im blühenden Gesicht, Weht leiser, Lüftchen, Weckt sie nicht!	Resting on a bed of roses, So sleeps an innocent woman, Where tender quivering breezes Strew her with flowers. <u>How tenderly she sleeps.</u> With that angelic peace On her enraptured face. Rustle softly, Zephyrs, Do not wake her!
[B:]	<u>So schlummert ich, und die Gespielen</u> Streuten die Rosen Sarons über mich!	<u>So I sleep [too]. And companions</u> Would scatter roses of Sharon over me!

Table 1. Text of Jemina's aria (translation by Bob Fogg, slightly modified, italics mine).

Why did Schubert change the text? The answer is clear, if we consider the meaning of the *mi-sol-la* figure: in the reprise, the words "she sleeps..." are immediately followed by the words "so I slept [too]," which suggests a continuity between the death of the third person ("sie") and of Jemina in the first person ("ich"). This procedure enabled Schubert to end the aria with a description of Jemina's own death, and accordingly to assign the *mi-sol-la* figure – previously heard at the death of "the innocent woman" – but this time at the death of Jemina.

To summarize: in this work Schubert assigned to each character various pentatonic patterns, finally refining these last as the *mi-sol-la* figure so as to imbue them with the calm of a "peaceful death within a reliance on God", and to emphasize a primary theme of this work: "the delights of friendship".

2.1. "Now All the Sweet Bonds Are Torn Asunder"

Having observed how the *mi-sol-la* figure works as a *leitmotif* of peace and acceptance, we next look at how it used in the opposite meaning. The lied "Der Unglückliche" D 713 (1821) underwent a long compositional process. Exceptionally for Schubert, there was a sketch phase; moreover, a first version has survived, as well as the final one. These versions demonstrate how the figure has been highlighted gradually throughout the compositional process, as well as how it closely relates to the main theme of this lied-text.

The text, originally taken from a novel written by Calorine Pichler, consists of four stanzas, each of which has eight lines. First the text describes a scene in the brooding night, and goes on to describe an “unhappy man” who has “wounds” in his heart (in the second stanza this man exclaims to himself, “Awaken your sorrows, with cruelly sweet delight”). The last two stanzas relate how “the Golden age” is forever lost, and finally “all the sweet bonds [with the heavenly world] are torn asunder”: the recognition of which is the very reason for his “unhappiness”.

Schubert subdivided this poem and contrasted the brilliant past with the unhappy present more radically. What most draws our attention is his deletion of the last six lines of the original poem. Deleted was the text expressing renewed hope for a bond with the heavenly world, including the line “Im Götterglanz erscheint die heilige Pflicht” (holy duty shines in the brightness of the Gods). In the original, this lied is sung by a princess in front of a gathering of people; however, the protagonist Olivier leaves the room, unable to listen to her song through to the end. This deletion strongly suggests that Schubert intended to finish the song with a cry of despair, thus sympathizing with Olivier as presented in the novel (see Dürr 1991).

The beginnings of the three different versions exhibit a gradual foreshadowing of this mood of hopelessness. In the “Entwurf” (sketch phase), the bass part moves actively (Ex. 3a), and in the “ursprüngliche Fassung” there prevails the dactylic rhythm, well known as Schubert’s “wandering motif” (Ex. 3a, lower right). But this motif completely disappears from the later versions. As Walther Dürr (1991: 228) has pointed out, this motif may be derived from the keywords of the first stanza: “night”, “gentle sleep”, “death’s brother”, and “daily grave”. These words, implying “Hinüber” (the other side), at first prompted Schubert to thematize “wandering to the other side” by his choice of the “wandering motif”. Therefore, the gloomy and newly added introductory chords, which substitute for the “wandering motif”, are a representative factor that is intimately bound up with the final conception of the whole work. In other words, Schubert, realizing the impossibility of wandering to the other side, employs this gloomy introduction to express his main theme: “a return to oneself” (“Zurückwerfen auf sich selbst”, in the words of Dürr).

Here we must realize the importance of the “la-sol-sol-mi” figure migrating, such that it appears only in the last version of the song (m. 12).

Entwurf

Die Nacht bricht an... mit lei-sen Lüf-ten sin-ke-t sie

urspr. Fassung

korr. Fassung

Example 3a. "Der Unglückliche" (D 713): Beginnings of the three versions, respectively: "Entwurf", "first version", "final version", and the primary form of the "Entwurf" (Wienbibliothek im Rathaus, MH187).

In the first version this figure was still in the “la-sol-sol-sol” form; Schubert obviously found no possibility of using the *mi-sol-la* figure \boxtimes in the “Entwurf, given the active bass line. In the final version, this figure appears only two more times: first, at the exclamation in response to the exile from Paradise (Ex. 3b) – in the first version, the text was composed over a mere sequential progression; second, at the lamentation pursuant to the exile (Ex. 3c).

Example 3b shows two versions of the musical score. The first version (mm. 39-40) features a vocal line with lyrics "wor-aus in dei-ner Ju-gend gold-nen Zai-ten die" and piano accompaniment with dynamics "fz p" and "cresc.". The second version (mm. 77-81) features a vocal line with lyrics "wor-aus in dai-ner Ju-gend gold-nen Zai-ten die" and piano accompaniment with dynamics "scen" and "do".

Example 3b. “Der Unglückliche”, the moment of the pronouncement of “exile from paradise”: First version mm. 39–40 and final version, mm. 77–81.

Example 3c shows the final version of the musical score. The tempo is marked "Langsam". The vocal line has lyrics "und dein stil-les Glück, dein all-zu-schö-nes Traum-bildkehr-te wie-der zur bes-tern Welt,". The piano accompaniment is marked "pp".

Example 3c: “Der Unglückliche”, final version: Point of “Lamentation”, mm. 118–125.

We can now draw conclusions about the meaning of the *mi-sol-la* figure in this lied. Corresponding to the deletion of the “wandering motif” and the addition of the introduction, this figure expresses the main theme of the song: “a return to the self, when happiness is forever lost and all sweet bonds with the heavenly world are torn asunder”.

2.2. "Then You Abandon Him to His Agony"

The *mi-sol-la* figure appears along the same line in the lied "Gesang des Harfners" D 480 (1822), a composition based on Goethe's *Wilhelm Meisters Lehrjahre* (see Ex. 4). This poem consists of two stanzas, the first conveying the agony of mankind and the second accusing the heavenly powers. By such dualism Goethe described the fall of mankind in challenging the power of God, as Lorraine Byrne (2003: 305–307) has pointed out. To embody this thematic, Schubert set forth a dual tonal opposition: the first stanza is consistently in the key of A (major or minor); the second is mainly in B flat major or minor – a semitone higher.

Example 4. "Gesang des Harfners" (D 480), second stanza, mm. 34–51.

With vigorous and defiant plucking the old *Harfner* begins the second stanza in B flat (m. 35), which signifies “heaven” in this lied. The turning tone F sharp (m. 41), assigned to the word “Schuld (guilt)”, deviates crucially from the B flat context, and returns the tonality to A major. Via the radical usage of an augmented triad⁴ in measure 44, the second stanza is repeated, but now in B flat *minor*. However, where the words “then you abandon him to his agony” are repeated (m. 49), the tonality suddenly shifts to A flat major – an apparently irrelevant key in this context. Whether we interpret this seemingly unaccountable section as “an awful spot to accuse God without pathos” (Einstein 1952: 189), or a phrase which signifies “the distance of the gods and their indifference to man’s fate” (Byrne 2003: 311), Schubert undoubtedly wanted to give special emphasis to these two measures, which are preceded by a unique pause in the bass line of this work. What does this moment mean? The answer lies in the *mi-so-la* figure, which appears only once during the lied. At this particular, out-of-context moment (both harmonically and melodically), Schubert must have again intended to foreshadow the fall of mankind, by seeking to express poignantly the misfortune of losing one’s God.

3. “*Brook, Beloved Brook ...*”:
The desire to unify with Nature

Lastly we shall examine some examples in which this figure appears when a desire to unify with Nature is evoked. The lied “*Nachtviolen*” D 752 (1822), with text by Mayrhofer, begins by addressing the woman’s violet, with a “*si-do-mi*” tetrachord in C major. Later, at the beginning of the second stanza, it reappears as *mi-sol-la* in G major (Ex. 5). As Charles Rosen (1997: 95) points out, this kind of transfiguration technique in a narrow register is characteristic of Schubert to give some songs “a certain intensity”.

An analysis of the composer’s modification to the original poem will help clarify the association between the *mi-sol-la* figure and the theme of unification with nature. The modification may be summarized in three respects. First, Schubert deleted the first line of the third stanza, including the third person noun “*der Dichter*” (the poet). Second, in the last line of the same stanza he substituted the personal pronoun “*my*” for the original “*his*” (the poet’s). Third, he deleted the last two lines, ending the song at the moment the “*heilige Verbindung*” (sacred union) with the flower is

Langsam

Nacht - vi - o - len, Nacht - vi - o - len!

pp

legato

Grü - ne Blätter stre - ben freudig, euch zu hel - len, e

Example 5. "Nachtviolen" (D 752): Beginnings of first and second stanzas.

achieved. All of these changes suggest that Schubert is expressing his own experience of unifying with the violet, not the contemplative "poet's" experience (cf. Muxfeldt 1997: 135–137). The processes of gradually approaching the violet and making the lied culminate at the "sacred union" are reinforced by the above-mentioned transfiguration of the *mi-sol-la* figure: in short, through this procedure Schubert expressed his gradual exaltation in unifying with the violet.⁵

In *Die schöne Müllerin* this figure is used with great economy. Throughout the song cycle the *mi-sol-la* figure makes an appearance only four times, if we count two or three appearances within a strophic song as one⁶: First, where the young miller communicates to the brook his delight at having found the miller maid, in "Halt!"; second, in the introduction to the following lied, "Dankgesang an den Bach"; third, at the moment he throws himself into the brook saying "Brook, Beloved Brook..." in the last two measures of "Der Müller und der Bach"; fourth, in the last lullaby of the brook in "Des Baches Wiegenlied". In those moments, the miller's desire to be one with the brook is strongly expressed and achieved.

4. Conclusion

I have tried to demonstrate how Schubert assigned the *mi-sol-la* figure to the crucial moment in each of the works examined here. The three meanings of this figure in his Romantic period may be summarized as *a poignant calling out to the precious thing that is forever lost to mankind*. In this paper I have contextualized the *mi-sol-la* figure as consistent with pentatonicism; for, as is shown in *Lazarus*, the appearance of this figure clearly seems derived from pentatonic patterns – a generally marked sound in Schubert’s day. Yet, it must also be asked whether it is possible to specify with complete certainty the stylistic derivation of such an original fingerprint of Schubert. The *mi-sol-la* figure seems to provoke – and answer – such questions about the unique expressive means of the composer.

Notes

1. During the years 1819–23, Schubert took an intense interest in poems written by the “Jener Romantiker”, whose themes of night, longing, and a pantheistic view of nature attracted him more and more. For a theoretical view of the literature of this period, see Dürr (1997: 47); for a brief survey of its influence on compositional procedures, see Hilmer (1997: 32); for a review of relevant “Romantic” lieder, see Dürhammer (1996: 66).
2. A pentatonic pattern also appears when Nathanael (Lazarus’s friend) talks about his “death in peace” (mm. 360; 366); for reasons of space, I go no further in explaining it here.
3. The *mi-sol-la* figure also appears in the preceding *arioso* of Mary (see mm. 506f.; 519f.).
4. This kind of augmented triad is a great invention of Schubert in his “Romantic period”. For a review of its usage, see R. Kramer (1994: 210–213). Other typical examples, which Kramer does not cite, are in the Mass in A flat (D 678): the beginning of the *Sanctus*, and in the “Quoniam” section (mm. 297–299) of the *Gloria*.
5. The same usage of this figure is pursued typically in the lied “Der Knabe”, one of the Friedrich Schlegel lieder-group *Abendröte*; in this song, Schlegel’s pantheistic idea is vividly set to the music. The *mi-sol-la* figure is assigned to the phrase where a boy expresses his desire to fly freely like a bird: “Ach, wie wollt’ ich lustig fliegen!”
6. On the meaning of one particular appearance of a certain figure among parallel ones within a strophic song, see R. Kramer (1994: 33).

Anne-Marie Houdebine et Ekaterina Nossenko

Texte-image: Relais, ancrage ou complémentarité?

Jalons d'un parcours interprétatif

“Comment le sens vient à l'image? Où se finit-il? Et s'il finit, qu'y a-t-il au-delà?” Ce sont les questions que soulève Roland Barthes en introduction de l'article “Rhétorique de l'image” (1964: 40-51), le texte inaugurant la sémiologie interprétative. Dans ce texte l'auteur s'interroge sur les messages transmis par une image publicitaire, et il en dégage trois: message linguistique, message iconique littéral et message iconique symbolique. Cette décomposition permet de poser deux concepts méthodologiques, issus de la linguistique, *dénotation* et *connotation*. Pour les illustrer, l'auteur choisit d'étudier l'affiche publicitaire Panzani en la soumettant à une analyse sémiologique structurale.

Rappelons qu'à l'époque, en 1964, ce texte produit un effet révolutionnaire: pour la première fois, un universitaire se propose d'étudier un objet trivial en le traitant d'un point de vue scientifique. Le langage iconique se révèle alors aussi structuré que le langage articulé. L'image n'est pas toujours naïve et naturelle, mais construite et culturelle, elle évoque d'autres messages que ceux accessibles au premier abord, elle est accompagnée, en filigrane, des messages idéologiques. Il est donc au sémiologue de les révéler et dénoncer en s'attaquant non seulement à "la bonne conscience petite-bourgeoise" mais au "système symbolique et sémantique de notre civilisation, dans son entier ..." (Barthes 1985: 14).

Avant de s'interroger sur la place et l'opérationnalité de la démarche barthésienne dans le cadre de la sémiologie d'aujourd'hui, revenons rapidement au texte d'origine.

Par la description des deux niveaux, linguistique et iconique, l'auteur démontre la coexistence des signes, dénotés et connotés, au sein de l'affiche étudiée. Le premier message ainsi livré est celui du langage articulé (écrit); ses supports sont la légende et les étiquettes, les éléments prélevés dans le code de la langue française, pour les décoder il suffit d'avoir la connaissance de l'écriture et du français. Barthes montre que le message linguistique ne se réduit pas seulement aux noms des produits et de la firme, mais aussi, au nom même des pâtes, Panzani, qui par son assonance, livre un signifié supplémentaire (celui de connotation), "l'italianité":

Au niveau de l'image pure, sans texte, une autre série de signifiés est dégagée. L'auteur souligne que l'ordre est ici sans importance car, contrairement au signe linguistique, le signe iconique est non linéaire; il est global, discontinu. Ces signes sont puisés dans un code culturel. Barthes en dégage quatre: 1) /filet entrouvert qui laisse s'épandre les provisions/ = <retour du marché, anticipation possible d'un repas>; 2) /tomate+poivron+teinte tricolore de l'affiche/ = <drapeau italien, l'Italie>; 3) /rassemblement de produits frais et conservés/ = <service culinaire total nécessaire pour un plat composé>; 4) /la composition, la mise en présentation des produit sur un fond uni/ = <nature morte>.

En dégageant ces quatre signes de connotation, Barthes insiste sur l'originalité de l'approche structurale en rappelant que le nombre de lectures d'une même lexie (d'une même image) est variable selon les individus. Ou comme le dit l'auteur: "Une même lexie mobilise des lexiques différents" (Barthes 1985: 48). Une même image mobilise alors des imaginaires

différents. L'analyse de l'image de Barthes a fourni des signifiés culturels investis par les savoirs expérimentiels: il s'agit donc des savoirs pratique, national, culturel, esthétique. Ou encore du tourisme, du ménage, de la connaissance de l'art. Mais il en y a certainement d'autres. Comme le langage articulé est composé d'idiolectes (système linguistique individuel) de ceux qui le parlent, l'image prend sens au travers des idiolectes de ceux qui la regardent. Barthes déplace la notion linguistique d'idiolecte en idiolecte culturel. Comme la langue, l'image devient "l'ensemble des paroles émises et des paroles reçues".

Nous reviendrons à cette question des émetteurs et récepteurs dans la deuxième partie de notre exposé et développerons comment certaines étapes de la démarche barthésienne se révèlent problématiques et quelles en sont les défaillances méthodologiques. En les reformulant nous montrerons comment on peut hiérarchiser différents messages linguistiques et iconiques dans un cadre théorique et méthodologique de la sémiologie actuelle, pour nous, *la sémiologie des indices*.

Arrêtons-nous à présent à deux types de rapport qu'établit Barthes entre le message linguistique et le message iconique. En cherchant à définir la structure signifiante de l'image, l'auteur s'interroge sur le rôle du texte qui l'accompagne. Etant donné qu'au niveau des communications de masse le message linguistique est omniprésent, l'auteur tente de définir sa fonction par rapport au message iconique. Il en voit deux: 1) les cas où l'image double certaines informations du texte, par un phénomène de redondance, ou *le relais*; 2) les cas où le texte ajoute une information inédite à l'image, ou *l'ancrage*.

Le cas de relais (équivalent de redondance) ne semble pas poser problème au moment de la réception, car il n'y a pas de confusion au niveau du sens: le texte ne fait que répéter l'image. Dans le cas de Panzani, les couleurs rappelant le drapeau de l'Italie ainsi que le nom de la marque vont dans le même sens: les deux messages permettent de construire le signe dénoté, <cuisine italienne>, <l'Italie>, et le signe connoté, "l'italianité", ce qui est d'après Barthes, "l'essence condensée de tout ce qui peut être italien, des spaghetti à la peinture" (Barthes 1964: 49).

Il est moins évident quand l'image produit une pluralité de sens et que le récepteur peut en lire certains et en ignorer d'autres. Cette polysémie provoque des doutes sur le sens et peut créer un dysfonctionnement. Le texte joue alors le rôle de régulateur; il permet d'ancrer le sens souhaité

par l'émetteur dans "la chaîne flottante de signifiés" (ibid.: 44); il élucide l'image en répondant à la question *qu'est-ce que c'est?* Cette technique, porteur de l'idéologie sociétale, guide l'interprétation du lecteur en empêchant que le sens connoté ne prolifère vers les régions trop individuelles. "Le texte dirige le lecteur entre les signifiés de l'image, lui en fait éviter certains et en recevoir d'autres; ... Dans l'image publicitaire, le linguistique est alors aussi, voire, plus important que l'iconique, car à son niveau s'investissent la morale et l'idéologie d'une société" (ibid.).

Trente ans après ce texte, Anne-Marie Houdebine constate que l'ancrage peut se produire dans un sens ou dans l'autre: du linguistique vers l'iconique comme le pensait Barthes ou inversement: "L'équivoque linguistique peut à son tour être ancrée par l'évidence analogique de l'iconique" (Houdebine 1994: 19–38). L'exemple présent est mobilisé pour illustrer la technicité du rapport texte–image et non sa spécificité discursive (comme le rôle de l'ironie). L'iconique analogique élucide alors les équivoques linguistiques. Autrement dit, chacun (iconique ou linguistique) pouvant servir d'interprétant interne à l'autre.

Bien que les deux techniques, *relais* et *ancrage*, semblent convenablement définies, nous nous retenons de leur réserver une place de droit dans le cadre théorique de la sémiologie des indices. Définis par Barthes en 1964, ces deux outils connaissent aujourd'hui une expansion importante dans le domaine du marketing. Mais, comme nous le savons, la pertinence de la sémiologie de la signification a pour objectif la *praxis critique* et pas le sens informationnel.

Dans le souci de la rigueur méthodologique et de la pertinence sémiologique, Anne-Marie Houdebine inverse la démarche barthésienne et propose de commencer par l'inventaire de l'iconique sans prêter attention, aussi longtemps que possible, au message verbal. Cette approche développée dans le cadre de *la sémiologie des indices*, laisse plus de possibilités associatives si l'on souhaite s'intéresser aux autres sens qu'au seul message publicitaire (Houdebine 1994: 26, 275–282). Pour cette auteure, la sémiologie des indices ou sémiotique indicielle participe d'une sémiologie générale (des indices, des codes ou structurations), se donnant comme objet la culture. Elle a comme enjeu d'en décrire les éléments, leur mode de fonctionnement (phase systémique, descriptive et explicative) et de tenter d'en dégager les effets de sens et les valeurs symboliques, les modes de signifiante (phase interprétative). Elle se définit donc non seulement

comme “science générale de la vie des signes de la vie sociale”, ainsi que l’anticipait Saussure mais aussi “praxis critique” selon la sommation de Barthes ou mise au jour des insus culturels. Il s’agit, en premier temps de mettre au jour les significations qui se dégagent sur le plan iconique. Cela avec rigueur, pour limiter “le trop plein associatif” (Houdebine 1994: 26), cette phase est régie par un cadrage méthodologique, ayant pour principe celui de l’immanence, d’abord restreinte à l’interne. Les formes iconiques sont ainsi décrites selon différentes strates (le dispositif scénique, strate iconique, coloristique, etc.) en s’efforçant de ne pas utiliser le contenu du message verbal, qui, à son tour, sera analysé formellement, syntaxiquement, rhétoriquement, lexicalement, énonciativement.

Cette phase descriptive sera suivie de celle explicative où seront repérés les modes de connexion entre strates et l’impact du message linguistique sur la polysémie significative venue de l’iconique. Au cours de cette modélisation, Houdebine propose de différencier entre *relais* et *complémentarité*, pour réserver cette dernière notion pour la position méthodologique évoluée qui signifie la recherche de la pluralité du sens en acte. Il ne s’agit donc pas de se restreindre au seul message idéologique intentionnel de l’émetteur mais de tenter de dégager les divers messages que peut susciter l’image analysée, ceci en recourant aux savoirs *internes* et *externes* mobilisés par les associations de l’analyste les construisant en *interprétants*. La complémentarité du message sera ainsi construite dans le parcours interprétatif ayant pour objectif la mise au jour des “systèmes sémantiques et symboliques” de notre culture ou de nos stéréotypes, nos figements idéologiques voire nos insus culturels. Pour ce faire le parcours d’interprétance a recours aux *interprétants internes*; tout d’abord de façon immanente, recours aux éléments dégagés dans l’analyse systémique et à leurs entours ou opposition (plans syntagmatique et paradigmatique dans le corpus) puis aux *interprétants externes* dégagés par associations (cf. champs associatifs saussurien ou freudien, recours à la notion d’imaginaire culturel, de carte forcée culturelle, utilisation de relations intertextuelles, intericoniques, intermédiatiques); celles-ci devant être étayées à l’aide de corpus connexes en absence eu égard au corpus initial (Houdebine 2007), autrement dit dans le visuel et hors du visuel.

Houdebine pose ainsi un nouveau cadre théorique qui, issu de la démarche analytique barthésienne, abandonne les concepts de *dénotation* et *connotation* ainsi que ceux de *relais* et *ancrage*, banalisés aujourd’hui

dans les recherches littéraires mais apparaissant moins opérationnels pour des objets sémiotiques actuels. A la place, Houdebine propose de nouveaux concepts qui se révèlent méthodologiquement plus opérationnels et donc adaptés aux objets évolués avec le temps. Ces outils méthodologiques sont *signifiant indiciel* et (repris à Greimas) *effet de sens*.

Rappelons à ce propos que, Barthes, lui-même, évoque la difficulté attachée à la connotation et, en particulier, celle des signifiés de connotation auxquels ne correspond aucun métalangage qui devrait les prendre en charge. Mis de côté le problème de métalangage, Barthes semble préoccupé par un autre souci méthodologique lié à la typologie de différentes lectures: “la variation des lectures n’est pas anarchique, elle dépend des différents savoirs investis dans l’image ... et ces savoirs peuvent se classer, rejoindre une typologie; tout se passe comme si l’image se donnait à lire à plusieurs hommes et ces hommes peuvent très bien coexister en un seul individu ...” (Barthes 1964: 48). Ainsi, l’auteur met en lumière le problème de différents types de récepteurs et/ou d’interprétation; cela sans y répondre.

En s’appuyant sur le cadrage théorique et méthodologique de la sémiologie des indices nous montrerons maintenant comment un circuit externe destinataire/destinataire peut émerger dans la phase interprétative de l’analyse sémiologique afin de construire différents types de récepteurs. L’émetteur de l’affiche (entreprise Panzani) s’en sert pour un message typique (promotion des pâtes). Or le circuit communicationnel permet de construire plusieurs types de récepteur: “un riche”, “un pauvre”, “un gourmand”, “un esthète”, “un touriste”, “une ménagère”, “l’Autre et sa culture” et plusieurs types de compréhension; ce qu’Anne-Marie Houdebine appelle “mise au jour du procès de signifiante”; ce dernier terme venant de Julia Kristeva.

Passons à une démonstration rapide. Le /fond rouge/ de l’affiche peut être considéré effectivement comme <le fond d’une nature morte>, suggéré par Barthes, mais il peut renvoyer également à <la draperie théâtrale> ou au “rideau rouge du théâtre de maintenant”; cela sans oublier qu’à l’interne ce fond renforce non seulement la couleur des tomates, des légumes ou de la sauce mais aussi celle du drapeau italien. Dans tous les cas, cette forme coloristique, /le rouge/ peut être remis en position de *signifiant indiciel* (notion qui selon Houdebine conjoint les notions d’*indice* et de *signifiant* (inspiré de la psychanalyse lacanienne et marquant la filiation saussurienne) parce qu’il devient une forme renvoyant à un <sens> non imposé par un code); ainsi /la couleur rouge/ peut produire plusieurs sens

“l’Art de la peinture”, “le théâtre”, ou bien “le luxe des pâtes” ici présentées (cf. à *l’italienne de luxe*, à *l’italiana di lusso*). Ces effets de sens impliquent une certaine esthétisation du quotidien. La culture ou encore un plaisir esthétique devient la propriété de ce que Barthes a appelé “l’italianité”. Notons au passage que ce terme est né de ses hésitations à propos du métalangage des signifiés connotés. Obligé à exploiter des vocables du langage courant, Barthes finit par créer ainsi l’axe sémique des nationalités du type *l’italianité*, la *francité*. Mais, ce faisant il ne voit pas, ou bien, ne le montre pas explicitement, que Panzani oppose deux cultures: en mettant en valeur “l’italianité”, il refoule “la francité” qui est pourtant présente dans /Parthenay France/. Mécompréhension? Refoulement? Dénî? La France est ignorée en faveur de l’Italie, évoquée par l’assonance de la marque et le syntagme /à l’italienne de luxe/. Le nom de l’entreprise (Panzani) efface celui du lieu où elle se trouve (Parthenay). Ces pâtes, rêvées italiennes dans le discours publicitaire, sont d’origine parthenaisienne; elles viennent d’une petite ville française. D’ailleurs, en toponymie, *-ay*, de Parthenay, est anciennement *-ac*, ou “lieu” (Houdebine 1994: 26). Ainsi “un lieu d’origine” réel et imaginaire est mis en avant dans cette publicité. Mais il en y a un apparemment plus intéressant que l’autre. Ce lieu est d’origine étrangère, l’Italie, la terre de l’art, du luxe, de la culture culinaire de l’Autre. L’axe de nationalité compare alors deux cultures: la culture française s’empare de la culture italienne.

“Origine”, “lieu de l’Autre”, “nationalité”, le parcours interprétatif peut s’arrêter là, mais il peut aussi continuer si d’autres signifiants indiciels s’y prêtent. Et si on s’arrête un peu sur /ce filet ménager tendu/, comme s’il y avait <une main généreuse qui la tient encore>. A qui appartiendrait-elle? Peut-être à celui ou celle qui revient du marché et ferait maintenant la cuisine? Suivons /les contours/ de la rondeur lourde du filet, que découvre cette /forme/? Certains y verront une mammographie, un sein, d’autres une *mamma* prototype de toute mère (Houdebine 1994: 31). La mère qui fait la cuisine mais aussi qui donne l’origine. Nous voilà, de nouveau aux origines. La carte forcée culturelle, en filigrane, nous fait sortir du texte et nous renvoie à l’actualité, au discours sur le communautarisme, l’Europe, l’identité, ou encore au musée du quai Branly pour lequel l’engouement des Parisiens comme celui des touristes croît de jour en jour. Cette attirance pour la culture de l’Autre que cache-t-elle? La curiosité, la culpabilité, la

repentance? “Le retour à l’origine”, explique un journaliste de France-Inter le 9 juin 2007.

En 1964, Panzani donne naissance à “l’italianité”. Aujourd’hui ce texte de Barthes est relu à chaque cours inaugurant l’enseignement de sémiologie. Placer l’axe des nationalités dans le contexte social actuel nous amène, au travers du parcours interprétatif, à la question de l’origine. Pour y arriver certains ont besoin de passer par Parthenay, d’autres de rencontrer une image latente de mère. Laissons-nous donc séduire par “le frisson du sens” qui parcourt cette image, à l’origine de la sémiologie interprétative, ou (comme le disait Barthes) “les surprises” du sens.

Note

1. Conventions de notation utilisées: /.../ = forme du signe, signifiant, soit /Sa/; <...> = sens du signe, signifié ou encore <signifiant indiciel> support pour “...” = effet de sens.

Preparing the unknown

Semiotic fundamentals of cybercartographical communication

1. Formulation of the problem

By inspecting the cartography textbooks edited at the end of the twentieth century (e.g., Hake et al., 2002; Robinson et al. 1995) it is possible to summarize the subject as follows. Functionally, cartography enables and communicates knowledge of spatial aspects of reality by focusing on the map – generally understood as a plane model (Hake et al 2002: 25) – as its most important form of expression schema. In contrast to this, the rapid development of technology has created numerous alternatives with which to communicate reality (e.g., virtual reality environments, hyperglobes). Nevertheless, cartography remains encapsulated in the map; hence it is facing the necessity of justifying itself. Concretely, these recent alternatives raise the question, Which one of them is most suitable for cartographic matters? Which technology provides an optimal or even ideal framework for expressing cartographic schemata? Despite the potential embodied in these innovative technologies, cartographic textbook theories are not yet able to meet the demands of current digital practice. These deficiencies are caused by cartography's focus on the map during the last decades as well, which has resulted in a situation that Koch concisely describes in the following way: "Undoubtedly technology is currently far ahead of theory" (Koch 2004: 5, my translation).

2. Cybercartographic communication

A current attempt to overcome these theoretical inadequacies has been elaborated under the designation *cybercartography*, to be described as "the organization, presentation, analysis and communication of spatially refer-

enced information on a wide variety of topics of interest and use to society in an interactive, dynamic, multimedia, multisensory and multidisciplinary format” (Taylor 2003: 406). The first part of this definition is largely in accordance with the above-mentioned self-conception of cartography. Likewise the application of interactive (cf. Peterson 1995), dynamic (cf. Dransch 1997) and multimedia (cf. Cartwright et al. 2006) formats is not new to cartography, whereas an extensive commitment to multisensory representation in an interdisciplinary framework marks a specific characteristic of the cybercartographic agenda. Such an extensive integration of multiple senses not only creates new possibilities but also new questions: How are these possibilities to be utilized suitably for communicating spatially referenced information? This suitability can be proved empirically, as cybercartography defines itself through the user and her multisensory interaction.

A precondition for this empirical testing, however, is a common theoretical basis, which ensures that all cybercartographic expression schemata to be tested acquire theoretical and methodological equivalence. Current atlas cartography (Asche 2007) may be cited as an example to illustrate this call for a shared theoretical basis. Principles of visualization that have been elaborated during decades have mostly remained unconsidered for digital atlases. Therefore the comparison of digital with analogue, paper atlases has often resulted in relatively low evaluation ratings of the digital atlases. However, such results are not adequate to estimate the better suitability of analogue atlases, since the objects to be compared are not based on equivalent principles of visualization, i.e., on a common theoretical basis.

3. Semiotic fundamentals

Accordingly, cybercartography too needs a common theoretical basis, so as to make its products comparable and assessable both within and beyond itself, i.e., in relation to analogue products. Special problems arise from cybercartography’s explicit reference to technologies that are currently still in an early stage of development (e.g., an electronic nose; Taylor 2003: 408) or as yet unknown. Therefore a theoretical fundament with a panchronic value needs to be elaborated, that allows a purposive integration of currently known and still unknown techniques. Provided that, first, each cybercartographic product is a system of signs and, second, semiotics deals

with all kinds of sign systems, semiotics can be a comprehensive theory as claimed above (cf. Dressler 1989: 7).

3.1 Applying Peirce to cybercartographic matters

Out of all the numerous semiotic models (Nöth 2000: 59–130), only the theory of Peirce shall be considered here, as it seems to be of particular appropriateness to cybercartographic matters, for the following reasons. First, the triadic structure of the Peircean sign provides an accurate model of the (cyber-)cartographic self-conceptions cited above. In Peircean terms, the cybercartographic *representamen* is a concrete product or part of it. This representamen stands for a single entity or a group of entities, which form the cybercartographic object. Furthermore, the representamen creates an effect upon a user, which effect can be called the cybercartographic *interpretant*. Second, it is substantially the representamen that is open to cybercartographic design. Unlike other triadic models, the Peircean model considers the representamen to mediate between object and interpretant (Nöth 2000: 141). Third, a triadic model, as it seems highly appropriate for cybercartography, and a typology of signs have been elaborated most comprehensively by Peirce (Nöth 2000: 139; Eco 1977: 75). Fourth, Peircean semiotics is not restricted to any particular sign's medium (Morris 1981: 291); thus, it meets the demands of a multimedia and multisensory cybercartography. Fifth, the Peircean theory also considers communicative and cognitive functions of signs (Dressler 1989: 9), which offers various linkages with other theories and disciplines. Hence the Peircean model works well for the interdisciplinary approach of cybercartography. Sixth, Peirce himself integrates his semiotics into a comprehensive division of sciences (cf. Peirce 1998a), facilitating not only interdisciplinary connections, but also providing rich opportunities from the perspective of the philosophy of science, which allows a sophisticated reflection of the self-conception of cybercartography, too.

According to our translation of the Peircean model into cybercartography, the representamen is the central sign-correlate regarding cybercartographic matters. Because the cybercartographic representamen is typically multimedia- and multisensory-based, the key question of cybercartography is, How should a cybercartographic representamen be designed so as to offer optimal usage of these multiple media and senses in terms of a gen-

eral theoretical basis? Answering this question presupposes determination of how a cybercartographic representamen – from a semiotic perspective – actually *can* be designed. Within the framework of the Peircean triadic model, three relations between the representamen and the object can be differentiated, which form the most fundamental division of signs (Peirce 1998b: 273). These three possible modes are iconicity (relation based on similarity), indexicality (relation based on causality), and symbolicity (relation based on convention) (cf. Nöth, 2000: 178–198).

3.2 Towards a semiotic imperative

Accordingly, every cybercartographic representamen can be either the correlate of an iconic, indexical or symbolic sign. Different semiotic qualities are inherent to each of these three types of signs. With regard to the key issue, how a cybercartographic representamen *should* be designed, the qualities of an iconic sign seem to be of particular importance. Peirce defines icon as “... a sign which refers to the object that it denotes merely by virtue of characters of its own and which it possesses, ...” (Peirce 1998c: 291), and describes its qualities as follows: “It will be observed that the icon is very perfect in respect to signification, bringing its interpreter face to face with the very character signified” (Peirce 1998d: 307). Bringing the user face to face with spatially referenced information is exactly what cybercartography intends to do.

The postulated importance of iconic signs is supported by empirical findings of cognitive science. These experiments show that pictures of objects are both better memorized and reproduced than the accordant (rather symbolic) object’s names, such that increasing iconicity improves the results of the tests (Schwarz 1996: 98). Cartographic research corroborates these conclusions. Häberling, for example, presents data in which certain features (e.g., a church or a tree) are to be represented in an iconic way (Häberling 2004: 130). Empirical studies cited by MacEachren found that iconic representamens can be better identified than symbolic ones (MacEachren 2004: 130). This confirms Volli’s statement that icons in general are more easily understood (Volli 2002: 41). Finally, Dressler assesses the icon as the most important type of Peircean sign (Dressler 1989: 13) underlining this assessment with reference to a broad area of different sciences (cf. Bouissac et al. 1986).

The attention given iconicity by different sciences is of particular interest, since cybercartography defines itself as an interdisciplinary approach, and thus calls for fruitful interfaces between the participating disciplines. Returning to our key question, we can conclude the following from the aforementioned arguments: the cybercartographic representamen shall be designated as the correlate of an iconic sign, so that it refers to the object that it denotes by virtue of similarity.

This demand for iconic representamens does not imply that indexical and symbolic signs are irrelevant to cybercartography. On the one hand, indices and symbols surpass icons in important aspects, since they can be found more easily and faster than icons (cf. MacEachren 2004: 130). On the other hand, important cybercartographic criteria, such as scale and perceptibility, set boundaries on iconic representations. However, the demand for iconicity does imply the exhaustion of every representamen's iconic potential, i.e., to design the representamen as iconically as possible. This means, in cybercartographic terms, that every representamen shall look, smell, taste, sound and feel as similar as possible to the object. Not until the iconic potential has been thoroughly exploited can optimal energy between iconic, indexical and symbolic sign-aspects be created.

4. *Prototype theory*

The iconic imperative of cybercartography that has been formulated above faces a crucial difficulty. This difficulty is caused by the subjectivity inherent to a similarity-based understanding of iconicity, since not every user may assess similarity in equal measures. Furthermore, spatially referenced information can be made accessible only in a structured way by means of categories, which are affected by subjectivity as well. Consequently cybercartography needs to know, how the objects to be represented are categorized by the users, so that similarity-based relations between cybercartographic representamen and objects can be established. Due to its empirical approach, prototype theory seems particularly promising concerning this matter. For example, by such a theory one is enabled to understand categories based on a prototype, "which captures the conceptual 'center' of a category, but which might not be associated with any specific instance, or subcategory" (Taylor 2003: 64). Such prototype, as an abstract construct of (proto)typical attributes, serves as a referential point for cat-

egorization of entities. In the sorting process, all entities are more or less ambiguously incorporated into a certain category according to the number of attributes shared with the category's prototype (Kleiber 1998: 38).

4.1 Cue validity

One criterion for determining the prototypical attributes of a category is *cue validity* (Rosch 1978: 5). This probabilistic concept allows us to define how far an attribute may predict a certain entity: "The cue validity of a given attribute M as a predicator of a given category D_i increases as the (subjective) probability $\text{prob}(M/D_i)$ – a numerical value to estimate the frequency with which attribute M is associated with category D_i – increases and decreases as the probability $\text{prob}(M/D_j)$ of an accordant contrast category D_j decreases ..." (Blutner 1985: 99, my translation). The cited consideration of contrast-categories matters to cybercartography insofar as all representaments of a cybercartographic product need to be semantically and sensuously discriminable to an adequate extent. This determinability can be formalized through the concept of cue validity. Concretely, the *cue validity* (*cv*) of a given attribute M for a given category D_i (contrasting category D_j) can be calculated as follows: $cv(M, D_i) = \text{prob}(M/D_i) / ((\text{prob}(M/D_i) + \text{prob}(M/D_j)))$

A disadvantage of the cited formula is that its results lose explanatory power if the attribute is to be found in just one category. Consideration of this shortcoming can be found in Reed's application of weighted probability to a *Cue Validity Model* (Reed 1972: 405). Reed starts from a prior probability of 0.5 for each attribute, since both categories are equally likely regarding any attribute *a priori*. Subsequently, the prior probability gets combined with the concrete sample probability: "The prior probability will be weighted by p and the sample probability by 1 – p, where $p = 1/(1+F)$ " (Reed 1972: 405); F stands for the attribute's frequency. Embedding the above-mentioned formula of CV in Reed's approach, a *cue validity* (*CV*) that depends on attribute frequency and proportion can be calculated in the following way: $CV = p(0.5) + (1-p)*cv$

CV can not only be calculated for a single attribute but also, by summing up individual values, for a whole category (Kleiber 1998: 63). This overall degree of prototypicality is of importance, insofar as the prototype of a category serves as a cognitive reference point, with which other

members of this category are compared. Also, similarity is evaluated using this point of reference: “A prototype is a typical instance of a category, and other elements are assimilated to the category on the basis of their perceived resemblance to the prototype; there are degrees of membership based on degrees of similarity” (Langacker 1987: 371).

4.2 A semiotic imperative based on prototypical attributes

As the prototype of a category (in terms of an intersection of prototypical attributes) is linked to this very category’s members by virtue of similarity, we can now insert this similarity-based relation into the Peircean sign model. In doing so, an iconic relation between representamen and object can be established on the basis of prototypical attributes and formalized via CV as well. In turn, these prototypical attributes have to be translated into a cybercartographic representamen. As a result the cybercartographic representamen would be similar both to the individual object that it represents (e.g., the apple tree in your garden) and to the accordant categorization (e.g., “tree”); in other words, it would be the representamen of an iconic sign.

As a result of this excursus to prototype theory we can now complete the semiotic imperative of cybercartography that has been outlined above with a measure of similarity: A cybercartographic representamen shall be designed as the correlate of an iconic sign, so that it refers to the object that it denotes by virtue of similarity. The maximum possible similarity between representamen and object is specified through the prototype of the object’s category, whose attributes are to be translated into a concrete representamen according to their CV. The author has already tried to demonstrate how such translation of prototypical attributes into a concrete (cyber)cartographic representamen can be done, in the exemplary case of two contrast categories: tree and shrub (Hruby 2006: 21–24).

5. Summary

We have tried to demonstrate that the Peircean theory of signs offers semiotic fundamentals, which conform to the claims on a general theoretical basis as formulated at the beginning of this essay. This basis can serve to guide multimedia and multisensory design of cybercartographic represen-

tamens, and situates those processes within an interdisciplinary context as well. Moreover, a semiotic imperative of cybercartography provides an opportunity to evaluate cybercartographic, as well as traditional-cartographic (e.g., paper map signs) representamens – both within and beyond itself. These semiotic fundamentals are, on the one hand, applicable to all existing (cyber)cartographic representamens *a posteriori*. On the other hand, semiotics is conceptualized independently of any technology, hence allowing one to hypothesize and carry out both known and unknown technologies of cybercartographic design. In concluding we can reformulate the aforementioned statement of Koch into a reversed relationship of technology and theory, which should be more useful to current and future cybercartography: Undoubtedly semiotic theory is ahead of cybercartographic practice *a priori*.

***Homo somatikos* and *Homo ludens* in Russian Modernist life-creation**

Sign-systems and the transgressive “plastic gesture”

The conceptual axis of “life-creation” may be uniquely relevant to Modernist culture in its totality (Schmid 1998; Paperno and Grossman 1994). An interesting creative attitude of a very peculiar character becomes evident during the early developmental stages of historical Russian Modernism. This propensity finds expression in different ways of dealing with one’s personal (life) behaviour in the context of a) Symbolism as the movement of *Decadence*, and b) the Avant-Garde, including Futurists, Konstruktivists, Supremacists and others.

The Russian Symbolist Decadents and their successors in the Avant-Garde were taking further the Western (mostly French and English) existing aesthetical paradigms, landing on the remote shores of what I’d like to term as the “new somatics”, focused on building up the “Homo somatikos” of their own culture.¹ As explicated in the ideas brought about by the nascent Russian Revolution, propagating the notions of “life-building” (*zhisnestroitel'stvo*) that were used in order to facilitate the emergence of a New (Soviet) Man (Paperno and Grossman 1994).

The discussion focused on the Russian decadent “life-creation” may be realized through the available memoirs and accounts composed by various immediate contemporaries of the “decadent milieu” (Ioffe 2007). To my mind, the grotesque eccentricity of these personae conveys a sign-bearing organization in its foundation. This point is demonstrated in the variety of Modernist life-creating and self-fashioning practices. Such behavioural patterns may be described vis-à-vis the semiotic idea of universal “play” as

a fundamental cultural concept (e.g., Johan Huizinga) along with some additional components of Modernist creative activity. We enter here into the realms of the total *theatricality* of performative and theatrical “masks”, the turbulent aesthetics of “private theatre” (as developed by Nikolai Evreinov), and more. Special attention has to be paid to the concept of “aesthetics of life” as understood through the prism of a world taken as a universal playground (Ingold 1981: 36–62).

Symbolism as a historical cultural movement differs in some aspects from the Avant-Garde. Symbolist artists and writers were, in principle, more dependent on the previous cultural milieu, namely Romanticism. One of the major primary figures of Symbolism, Charles Baudelaire, may instantly demonstrate some clear post-Romanticist facets in his personal creative outlook. I'd like to take a step further and propose grasping the entire axis of literary history of Modernity – from the classic English Romanticism of Byron (with some interest in German idealist subjects) and the pre-Romanticism of Goethe till the end of the Avant-Garde – as one mega-unit of cultural habitués (or “habitus”) centered around certain common elements such as “explosion”, “experiment” or “dissatisfaction with the surrounding reality”.

The first genuine and successful endeavours, which *en masse* indicated reforming and modifying human life according to the new intellectual and spiritual assumptions, also originate in the age of Romanticism. In agreement with all major Romantic opinion, the primary concern of the Avant-Garde was to radically extend the boundaries of what was then universally accepted as the norm, which accorded with certain conventional definitions of life, art, and culture. This attitude can be seen as relevant to the many-faced activities of the various groups of intellectuals and artists who were articulating all sorts of radical experiments in their creative activities.

The ideas of Russian “Lebenskunst”, however popular, were not in the same way relevant to just everyone. The complex problem of the aesthetical organisation of life-activity enters the operational spheres of a turbulent “cultural hero” (or “ikon”) and comes to its unique realisation with the milieu of the Russian Silver Age culture. I wish to employ the term “cultural hero” in the sense of referring to any particularly “noticeable” or culturally active personality, who operated within the studied historical milieu. This was the time of a common attention to the “idea of the Self”, and the “individuation: process was irreversible and far-reaching (Siegel

2004). In this epoch – the last decade of the 19th and first two decades of the 20th century, Russia's so-called “Silver Age” – there was an unprecedented interpenetration of social and cultural reality, on the one hand, and the personal biographies and identities of writers and artists on the other (Lavrov 1994: 83–121). In a deliberately conscious way, writers and poets of the period were trying to adapt their lives to already existing models or creating new and original biographies, highly aesthetic “artists’ lives”, both in their own works and in real life. Many of them considered their own lives as actual works of art, dressing in a particular way and changing the place they lived into a kind of “theatrical” stage (Schahadat 2004).

I'd like to approach the semiotic nature of symbolist and avant-garde life-creation in accordance with its most characteristic way of constructing literary texts. This “orderly unification” can be represented by the concept of the “plastic suggestive gesture”,² imbued with abundant innuendo and the productive potential of an impulse used to create novel and unique modernist poetics. Evidently the notion of “plasticheskij zhest” has something in common with the theory of “semantic gesture” as developed in the Prague Linguistic Circle in the thirties. I'm referring here to the basic notion of life or “event of life” understood as “text” and imbued with the relevant sign-operation (Ricoeur 1973: 91–117).

In the context of the notion of the “plastic gesture”, two protagonists of Russian modernism in general and of symbolism in particular, deserve special attention – Alexander Blok and Andrei Bely. The former carries on the romantic tradition (much in the way Charles Baudelaire was a romanticist while at the same time being an important part of a modernist canon). The latter – Andrei Bely – already anticipates (and, in many ways, transcends) the tell-tale achievements of the historical avant-garde; his prose is often almost more radical than that of the majority of the proclaimed avant-garde writers – consider, for instance, his works *Glossolalia*, *The Christened Chinaman*, *Kotik Letaev*, and *Masks*, to name but a few (Lavrov 1994: 83–85). It cannot be denied, however, that both belong wholly to the Russian symbolist literary canon, and specifically to its so-called “younger generation”. Especially characteristic of the works of these two authors is the semiotically rich, “plastic gesture” that transcends traditional textual boundaries.

In his scholarly essay “A Semiotic Radical of Blok's Semantics”, the American Slavist, Savely Senderovich, writes:

A sign is viewed as a gesture, resulting in three corollaries with major semantic significance. First, it is produced by a persona, and not necessarily a human one: it can be an esoteric, mystical entity perceived as a person or personified as an element... This means that a sign is seen as the means of a living, active communicational strategy. Second, the sign has a dynamic character – it appears and vanishes, one needs to wait for it patiently and grasp it; its existence is closely associated with time, often as brief as a moment. Third, it exists in the visual modality – all the characteristics of its appearance are visual. In this sense, a sign is the opposite of a spoken word and is akin to a *pregnant silence*.... (Senderovich 1984: 307)

Senderovich aptly points out that Blok often rhymes *znak* – “sign” – with *zлак* – “grain”. This Slavic scholar from Cornell University notices that:

As we can see, *maki* (poppies) and *zlaki* (grains) are not at all interchangeable – for one thing, they belong in different contexts: poppies are being set aflame (beginning to bloom), while grains wilt (die down). This pair of motifs reveals one of the inner dualities of Blok’s “sign”: its ability to both provide a subtle reference to some ancient secret and to aggressively impose dreadful apocalyptic revelations. Nevertheless, even in the latter function the sign retains its mysterious esoteric character: “*Not everyone was reading / The signs at dawn*”. In general, no two signs are alike: while sharing many other common features, signs can play two roles, as though oscillating between the two. Changing the motifs (*maki* – *zlaki*) within a single semantic paradigm means a partial change in the semantic functions: different situations call for different elements of the paradigm. (Ibid.: 308)

It is important to stress here the crucial role of “sign” in Blok’s texts as a *sui generis*, self-sufficient, and independently acting “character”. Especially important is its plasticity, its transcendent capacity to belong in “two worlds”, and its overall existential ambivalence. The inner dichotomy of a symbolic literary gesture as “sign” is vividly represented in Blok’s verbal texts (Minc 2004: 97–98).

The Moscow-Tartu school of semiotics was particularly interested in the sign-systems of the cultural “text of behaviour” (Lotman 1992–1993: 300–319; Lotman 1992–1993a: 369–378). This topic of Russian cultural history may include studies of creative personal behaviour and its possible semiotic ambiance. The analysis of cultural sign-systems explicates the creative patterns of personal, “bodily” conduct belonging to the different cultural

icons of the entire epoch.³ The Tartu-based scientific school, which originated under the guidance of Yuri M. Lotman, gave to this initial impulse the most adequate scholarly understanding of the relevant sign-structures and hidden meanings dwelling within the pragmatics of authorial behaviour. Lotman suggests dealing with a person's "cultural biography" as if it were a common sign-system, a text *sui generis* (1992–1993-a: 369–378). By coming to terms with this historical phenomenon, only certain specific considerations can be formulated with regard to unique cultural types, such as codes of conduct, reputation, and the writer's biography. All these characteristics are bound by their direct relation to the way the creative construction of the author's personal image is being achieved (self-built). These various creative "literary masks" were very popular among these layers of Russian writers and artists (Schahadat 2005; Rippl 1999).

In her short but important pioneering work "The Idea of Text and Symbolist Aesthetics", Zara Mintz writes:

1. Ideas on the nature of the literary text occupy a special place in the views and work of the Russian symbolists ... Reality itself is given the properties of a literary text. 2. The universal Text is realized in the "texts of life" and the "artistic texts." The Unity of the Text is juxtaposed with the infinite number of its particular manifestations. This has much to do with the deeper particularities of the symbolist worldview as a whole. The Symbolist "picture of the world" is always constructed from two divergent tendencies. One consists of the establishment of a system of antitheses, organizing the world in terms of space, value, and so on, while the other is directed at reconciling opposites and establishing a universal isomorphism among all of the phenomena of life ("the world is full of correlations" – A. Blok)... Finally, it is this very conception of the world as an "art-like" text that explains the origin of the symbolist idea of "life-building". The "idea of life-building" combines naïve utopianism with the pathos of the harmonious persona, historicism, and the "preservation of culture".... (Mintz 2004: 98–99)

The philosophy of life-creation, understood in the broader historical sense as "the art of living" (lifestyle), has been discussed in a series of works by the Berlin philosopher Wilhelm Schmidt (1998). The semiotics of some peculiar forms of "masked-behaviour" will frame my discussion of Modernist authorial *Lebenskunst*. One theoretical text by Lotman and Piatigorsky, devoted to the problem of sign-mechanisms in culture (1971:

144–165), has described the primary semiotic rules responsible for management of paradigmatical cultural fashions and corresponding behavioural multi-functions. The degree of operational semiosis may vary considerably among the self-conscious individuals, being engaged in the aesthetic creation of their specific life-texts:

When we speak of the semiotics of behaviour we should have in mind, on the one hand, some creation of a “behavioural text”, which functions as a meaningful sign in relation to any other text, or, on the other hand, gives thoughtful recognition of certain empirical phenomena (of our environment) as sign-constructions. This particularly pertains to some conventional sign-system or to any separate reality that in its turn determines the concrete meaning of these phenomena. In each case, we are entitled to speak, respectively, about the two models of semiotic behaviour: pro-creational and analytical. In both types the semiotics of behaviour might vary considerably among the different living personalities. (Ibid.)

The semiotic nature of one’s behaviour depends, therefore, on the culturally-suggestive way this type of text is perceived by much of the potential audience related to the cultural hero. In the real time of this concretely-happening behaviour, the reception and perception turn out to be possibly as meaningful as is the “embodied action” itself. The way the mask was perceived by its audience is equally important as the author’s original personal intention. The principal point, accordingly, is whether the mask and its creator could in fact be perceived adequately and correctly. And here arises the problem of myth and mask types of consciousness with respect to semiotics.

Lotman and Piatigorsky would go so far as to argue that the self-appearance of each concrete authorial/masked deed (event or action) will be dependent upon the way this individual perceives his I-image and how he is engaged in the self-modeling process of mask-creation. Lotman and Piatigorsky give a good deal of thought to the importance of “mask-conscience” for any process of self-communication of the author and his environments. This particular point might be visualised with the scholars’ own terms, making the idea of “outer-perception” crucially important, elucidating the point of reaching the correct attitude of his/her contemporaries toward the masked-personality:

Evidently, the major characteristics of different types of behaviour are controlled by a distinctive dependence on a concrete individual. It is also evident that the self-understanding, i.e. the comprehending of one's very "I", is determining the general sphere where all the areas of analytical behaviour and, moreover, the generation of this behaviour are cross-meeting and complementing one another. ... The degree of self-awareness may vary considerably from the point of view of a third observer and that of the second or the first. The semiotical nature of this process of the virtual construction of the 'I'-image gives its foremost explication in the problem of personal mask. (Lotman & Piatigorsky 1971: 147–150).

The heterogeneous nature of mask-issue could be crucial to a proper understanding of the inner essence of Russian life-creation subjects. The *duality* of the mask and its complex archaic structure should be named in connection with the mystificational interests of some of the Russian cultural heroes of the Silver Age.

The importance of an indigenous mask rests on how the person's solid self-image can thereby be created: "Evidently, the 'mask' is needed to an individual, first of all, in order to create the sufficient image of its own 'I' in the communication with the Others. The 'mask' is, therefore, depicted as some sort of stabilized static appearance hiding all the ever-lasting changes of the core-'I'. This process resembles the stability of archaic ritual that received its form in all the magnitude of its performing history. Such a ritual and its masks can be seen as a stabilizing element in human society that is regulating all the outer forms of the behaviour of a person inside the community" (ibid.).

This suggestive notion of personal (archaic) mask could be relevant for dealing with Lotman's seminal article, "The Russian Poet-Decembrist in His Everyday Life (1992–1993: 300–319)". This scholarly text presents central considerations with regard to the complex relations postulated between the life-text of the deed (*postupok*) and that of "the implied author". Lotman's analysis provides a basic research framework to analyze many meaningful elements in one's personal behaviour and the way they constitute the case-study for any *Lebenskunst* scholarly effort. Lotman focuses on one of the great Russian poets, Alexander Pushkin, his personal myth and the "private-biography", myth-creating agendas. In the actual behaviour of human beings, the so-called texts of conduct may remain eternally unfinished. He illustrates this further:

The hierarchy of many meaningful elements of behaviour is creating some sort of a *sequence*: the artistic gesture → the action → the text of behaviour. The latter should be understood as a complete chain of the “conscious actions” that is made evident by means of the intention and the palpable result. In the real behaviour of people, the complex and artificially controlled universe of empirical being, these ‘texts of behaviour’ may remain eternally unfinished, transcend their boundaries to merge with some adjacent texts, intersperse with the parallel entities. ... they always, necessarily comprise a sensible and understandable narratives (*sjuzhety*) ready to human perception. ... Every text of behaviour corresponds to a specific “behavioural program” on the level of intentions. (1992–1993: 301–303)

With this theorizing by Lotman comes the important idea of a certain mental gesture (a concept that deserves special attention). Tartu scholars utilize it in cultural sciences to understand the initial state for any cultural event and, in turn, the behavioural text. Possible uses of these ideas (“cultural event” and “artistic gesture”) will be shown in the coming chapters. For the appropriate *sjuzhet* (story or plot) of a person’s self-fashioning is behaviour. Its ideal horizon exists on the background; its farthest *finalizing*, as Lotman takes this point, comes to be crucial for the human behaviour concept and understanding. By “finalizing” I refer to particular notions developed by Lotman’s elder contemporary Mikhail M. Bakhtin – the Russian cultural theorist who had spoken at length on the “non-finishableness” of great works of fiction.

Crucial to any adequate research description used for cultural texts is the virtual opposition between the genre-modules of myth and narrative, a problem not neglected by the structuralists of the Moscow-Tartu school. Yuri Lotman and Boris Uspensky (1972: 282–284) devoted much attention to this topic when they defined this opposition as “descriptive vs mythological”. By “descriptive” they mean the so-called meta-language (such as Modernist experimental literature-about-literature), whereas the “mythological” (in addition to its meta-textual function) was intended to designate some other *text* dealing with the same object by certain auxiliary means: “In the first case [the descriptive account] we have a reference to the meta-language, to its specific category or a concrete element of its structure. In the second case [the mythological account] we have a reference to a meta-text, i.e. a text which operates according to meta-linguistic function. ... Therefore, a mythological description has a mono-linguistic nature, in

principle; the objects and subjects of this system are described via the same system, which is built according to the same rules” (1972: 283).

Reflecting on these notions, the founders of the Moscow Tartu School postulated the mono-linguistic character of a primary, mythological narrative, which laid the foundation for many further scientific elaborations of aesthetic or “creational” philosophies of culture or art. The Moscow-Tartu semiologists insisted on a peculiar “poly-linguistic” character of the non-mythological variants of any narrative description and its direct relation to the idea of a mere technical translation, whereby the transformation process of that sort may be further utilized as a variety of semiotic unfolding for the different, subsequent debates that would deal with the literary, “mythopoetical” descriptions of creative and playful texts of behaviour, which were realized by the physical bodies of their authors.

Relevance and misunderstanding

1. Introduction

Relevance theory was originally developed by Sperber and Wilson in 1986 and then revised in 1995 and refined in further work by its originators (cf., among others, Sperber and Wilson 1987, 1997, 2002; Wilson 1999, 2004; Wilson and Sperber 2002, 2004) and by other researchers of similar orientation (e.g., Carston 2002, 2004a, 2004b, 2005; Wharton 2003; Žegarac 2006). The main goal of the present paper is to show how relevance theory can be used to account for misinterpretation of the speaker's meaning, in other words, for misunderstanding.

2. Relevance theory: A cognitively-rooted model of ostensive communication

Relevance theory, which models human overt and intentional (ostensive) communication, is rooted in observations about how human beings function, how they interact with the environment and how, from the stimuli that constantly bombard the organism, they select those that are potentially worthy of attention (Sperber and Wilson 1986: 46–48). The originators of the theory assume that the long-term goal of the human cognitive system is to understand the outside world. Since the human senses are capable of monitoring significantly more stimuli than the central cognitive processes can deal with, it is only to be expected that some sort of cognitive efficiency mechanism must be at play. It is believed that cognitive resources “have to be allocated to the processing of information which is likely to bring about the greatest contribution to the mind's general cognitive goals” (ibid.: 48). Sperber and Wilson convincingly argue that, “As a result of constant selection pressures toward increasing efficiency, the

human cognitive system has developed in such a way that our perceptual mechanisms tend automatically to pick out potentially relevant stimuli, our memory retrieval mechanisms tend automatically to activate potentially relevant assumptions, and our inferential mechanisms tend spontaneously to process them in the most productive way” (Wilson and Sperber 2004: 610).

Based on this assumption, researchers postulate the existence of an in-built mechanism of cognitive efficiency, which they define as the Cognitive Principle of Relevance. The latter states that “human cognition tends to be geared to the maximisation of relevance” (*ibid.*).

Human cognition tends to be relevance-oriented, since in ostensive communication the communicator claims the addressee’s attention and creates certain expectations concerning relevance in the receiver of the message. This is formalised within the relevance-theoretic approach as the Communicative Principle of Relevance: “every utterance conveys a presumption of its own optimal relevance” (Wilson and Sperber 2002: 604). As Wilson (2005: 40) contends, while explaining the mechanisms underlying oral communicative exchanges, “the speaker, by the very act of addressing someone, communicates that her utterance is the most relevant one compatible with her abilities and preferences, and [that it] is at least relevant enough to be worth [the hearer’s] processing effort.” This is precisely how the presumption of optimal relevance is defined (see, also, Wilson and Sperber 2004: 612).

On this model, communication is viewed as an interaction involving two information-processing devices, one of which modifies the cognitive environment of the other, which results in the addressee constructing mental representations similar to those of the communicator (Sperber and Wilson 1986: 1). Every ostensive stimulus, that is to say, a stimulus produced in overt intentional communication, is postulated to provide evidence for the meaning that the communicator is trying to convey. This suggests that the communicator’s meaning cannot just be decoded but must be inferred from what has been said through a highly context-dependent, inferential process of comprehension. Restricting the scope of the present analysis to verbal communication only, it should be noted that, according to relevance-theoretic theory, an utterance that the speaker has produced is assumed to initiate the interpretation process. The latter is postulated by Sperber and Wilson (2005) to be constrained, on the one

hand, by the search for relevance and, on the other, by the communicative intention that the hearer attributes to the speaker in a given communicative context (see, also, Ariel 2002; Hamblin and Gibbs 2003; Sperber 1994; Wilson 1999).

The Communicative Principle of Relevance and the presumption of optimal relevance provide the heuristic backbone of utterance comprehension. It instructs the interpreter to “(a) follow a path of least effort in constructing an interpretation of the utterance (and in particular in resolving ambiguities and referential indeterminacies, in going beyond linguistic meaning, in supplying contextual assumptions, computing implicatures, etc.); [and] (b) stop when [the interpreter’s] expectations of relevance are satisfied”, or, we might add, abandoned (Sperber and Wilson 2005: 360). In simple terms, this heuristic mandate directs the comprehender to choose the least costly route in recovering the interpretation which he finds sufficiently relevant and which accords with his assumption that the utterance is to be recognised as optimally relevant. Of, the speaker may, for various reasons, fail to be optimally relevant; the point is that the interpreter is *to treat* the utterance as tagged with a guarantee of optimal relevance (*ibid.*). This means that hearers, constrained by considerations of relevance in their search for the speaker-intended meaning, are justified in applying the least-effort principle in interpreting the linguistic input, and in testing interpretive hypotheses in the order of accessibility. The first interpretive hypothesis that is found optimally relevant in a given communicative exchange is assumed to be the one intended by the communicator, to the exclusion of other potential interpretations of the processed utterance (cf. Žegarac 2006: 1703).

3. Predicting and explaining misunderstanding along relevance-theoretic lines

An utterance, as produced by the speaker, severely underdetermines what is actually being communicated (cf. Ariel 2002; Bach 2004; Carston 2002, 2004a; Jucker et al. 2003; Nerlich and Clarke 2001; Sperber and Wilson 1986, 1997, 2002, 2005, 2006; Wilson 2006; Vicente and Martinez-Manrique 2005; Žegarac 2006). Thus, the hearer’s task necessarily has to do with “fleshing out” the semantic skeleton that is recovered as a result of linguistic decoding. This means that recovering the meaning as intended

by the speaker, which starts with decoding the linguistically encoded meaning (cf. Carston 2006), usually involves a number of inferential, relevance-constrained subtasks that the hearer needs to perform. These, as the originators of relevance theory point out, can be broken down into: (a) constructing an adequate hypothesis about the explicit meaning via decoding, disambiguation, reference resolution, pragmatic force assignment and other pragmatic enrichment processes; (b) formulating an appropriate hypothesis about the intended contextual assumptions; and (c) forming an appropriate hypothesis about the intended contextual implications (Wilson and Sperber 2004: 615). These are all pragmatically-motivated inferential processes, which are believed to be happening in parallel as the on-line comprehension process is being performed, and which are postulated to be automatic and unconscious (Sperber and Wilson 2005: 366).

This kind of approach to comprehension makes it possible to predict and explain what happens when communication is not successful, or in other words, when there is “a mismatch between the speaker’s intended meaning and the hearer’s understanding of this meaning in the particular context of interaction” (Tzanne 2000: 34). At each level of interpretation, whether that of recovering the explicit meaning, that of formulating contextual assumptions, or that of formulating implications, the first interpretation found relevant by the interpreter may depart from the meaning intended by the communicator. To illustrate how relevance theory explains the mechanisms underlying misunderstanding, let us analyse an example. Here is an allegedly true exchange between a journalist and a famous American basketball player, Shaquille O’Neil, in which the misunderstanding is quite easy to trace:

1. (a) Reporter: “Did you get to visit the Parthenon while in Greece?”
- (b) Shaquille O’Neil: “I’m not sure about that one ... we went to lots of nightclubs.”

The locus of misunderstanding in the reporter’s question is *the Parthenon*, which in the context of visiting Greece seems unambiguously to refer to the ruins of the famous temple in Athens. That is the kind of interpretation one might expect to be the most highly accessible in the context. To be more exact, relevance theory predicts that the words, as decoded by the hearer processing this (as well as any other) utterance, afford access to background knowledge stored under particular conceptual addresses in

the individual's mind, making it possible for the interpreter to create a context of background assumptions in which a given utterance can be processed. In the context of the most accessible contextual assumptions that the co-text makes highly predictable, the hearer is trusted to identify *the Parthenon* as Athena's Temple on the Acropolis. A relevance-guided interpretation process of (1a) has been schematically represented in Table 1.

The reporter has asked, "Did you get to visit the Parthenon while in Greece?"	The encoded (incomplete) logical form of the speaker's utterance gets embedded into a description of his overt intentional behaviour.
The reporter's question is optimally relevant to Shaquille O'Neil.	The presumption of relevance conveyed by any stimulus produced in overt intentional communication (here: the reporter's verbal behaviour) results in the creation of this expectation.
(c) The reporter's question achieves relevance as a request for information about whether Shaquille O'Neil visited the Parthenon while in Greece.	Expectation raised by (1a), which is most relevant in the context of the interview.
(d) If the question is about visiting the Parthenon, it is about visiting a particular nightclub while in Greece.	First assumption accessible to Shaquille O'Neil; it, together with other adequate premises (e.g., background knowledge about questions reporters ask), satisfies expectation (c), an implicit contextual assumption that Shaquille O'Neil forms.
(e) THE REPORTER HAS ASKED WHETHER SHAQUILLE O'NEIL VISITED THE PARTHENON, NIGHTCLUB WHILE IN GREECE.	First pragmatic enrichment of the logical form of (1a) to have been made by Shaquille O'Neil, which together with premise (d) will lead to the satisfaction of (c). Treated as explication of the reporter's utterance.

Table 1. Schematic relevance-theoretic utterance interpretation process of (1a).

In this example, the culprit was the meaning of the noun phrase *the Parthenon* wrongly understood in the context of the most accessible contextual assumptions brought to bear in the interpretation process by the addressee of the question. The speaker expected the hearer to have accessed

the “Athena’s Temple” reading of the phrase as the most accessible one, and Shaquille O’Neil’s unexpected interpretation gave rise to a humorous outcome.

Another case of misunderstanding, this one from an episode in President Roosevelt’s life, can be explained in a similar way along relevance-theoretic lines.

2. When a fire erupted in the hotel at which Vice President Teddy Roosevelt was staying one day, he was ordered to head down to the lobby along with the other guests. After some time, still unable to return to his room, he protested to a hotel official. “But I’m the vice president!” he exclaimed. “Oh, that’s different”, the man replied, allowing Roosevelt to pass. As he headed up the stairs, however, the other man started after him. “Wait a minute”, he called. “What are you vice president of?” “Why, of the United States, of course”, Roosevelt replied. “Then get the hell back down there”, the official cried. “I thought you were vice president of the hotel!”

In the context of the background assumptions most accessible to the hotel official, *Vice President* is interpreted to mean “the hotel’s vice president.”

Here is another example of misunderstanding borrowed, from Tzanne’s (2000: 63) book. Anderson and McKendrick are academics talking about how McKendrick’s paper was received at the conference at which papers were simultaneously translated for the audience:

3. (a) Anderson: “Was your paper well received?”
- (b) McKendrick: “No, they didn’t get it. I could guess from the questions that there’d been some kind of communications failure.”
- (c) Anderson: “Translation phones?”
- (d) McKendrick: “No, no. They simply did not understand the line of argument.”

Let us focus on the part of McKendrick’s discourse that creates the problems. Analysing the pivot of misunderstanding with the tools that relevance theory provides, we get the following schematic interpretation:

McKendrick has said, “there had been some kind of communications failure.”	The encoded (incomplete) logical form of McKendrick’s utterance gets embedded into a description of McKendrick’s overt intentional behaviour.
--	---

(b) McKendrick's utterance is optimally relevant to Anderson.	<i>The presumption of relevance conveyed by any stimulus produced in overt intentional communication (here: McKendrick's verbal behaviour) results in this expectation.</i>
(c) McKendrick's utterance will achieve relevance by answering Anderson's question about how Anderson's paper was received by the audience at the conference that Anderson and McKendrick are attending..	Expectation raised by (b) and the fact that such an answer would be most relevant to Anderson in this exchange.
(d) If McKendrick claims there were some communications problems that the audience had with understanding McKendrick's paper, then as the papers are being simultaneously translated, the reception through the headphones must have been poor.	First assumption to be accessible to Anderson, which, together with other adequate premises, might satisfy expectation (c). Treated as an implicit premise of McKendrick's utterance.
(e) MCKENDRICK CLAIMS THERE WERE COMMUNICATIONS PROBLEMS THAT THE AUDIENCE AT THE CONFERENCE HAD WITH UNDERSTANDING MCKENDRICK'S PAPER.	First pragmatic enrichment of the logical form of (3b) to have been made by Anderson, which together with premise (d) will lead to the satisfaction of (c). Treated as explication of McKendrick's utterance.
(f) The reception through the headphones must have been poor.	<i>Inferred from (d) and (e), meeting expectation (c); accepted as an implicit conclusion of McKendrick's utterance (3b).</i>

Table 2. Schematic model of interpretation of the pivot of misunderstanding in (3b).

In this way, the analytic tools that relevance theory provides seem to offer a credible explanation of how the misunderstanding has arisen.

It should be emphasised, however, that relevance theory can not only explain in an *ex post facto* manner how misunderstandings originate; it can predict where they are likely to arise. Since interpretation is postulated to involve a non-demonstrative inferential process of bridging the gap between what is said and what is actually communicated (cf. Sperber and Wilson 1996: 65–71, 81–83), a mismatch can easily occur, between the

contextual assumptions that the interpreter uses in the process of following the least-effort path in recovering the speaker's meaning and those that the speaker intends the hearer to access (cf. Mason 2006). Sometimes this mismatch may not even be traced by the participants in the exchange, and the speaker and hearer may not be aware of the misunderstanding that has taken place. On other occasions, the discourse that follows or the situational clues (e.g., the behaviour of the interlocutor) may lead to discovery of the communication problem. This brings us to another, not yet attested example.

4. (a) A: "Did you enjoy the talk?"
 (b) B: "The talk was about relevance theory."

If question (4a) is answered as in (4b), then (4b) can potentially mean: "Yes, B enjoyed the talk" or "No, B did not enjoy the talk", depending on the background assumptions by which the interpreter of (4b) can be assumed to process the utterance.

4. *Conclusion*

Relevance theory provides a viable framework to account for how interpreters recover the communicator's meaning in overt intentional communication and what happens when communication is unsuccessful. In this frame, utterance interpretation is a highly context-dependent inferential process in which the hearer treats the utterance as evidence of the speaker's meaning, and the relevance-guided search for this meaning forms interpretive hypotheses in the order of accessibility. The first one found to conform to the hearer's expectations of relevance is treated as the intended interpretation.

Most of the time communicators accurately predict the interpretation first accessed in accordance with relevance-guided heuristics and found relevant enough by the interpreter. But there are cases when there is a mismatch between what the speaker thought would be the optimally relevant reading and what the hearer actually accesses as the relevant interpretation. This gives rise to misunderstandings, which can be neatly explained with the help of the analytic tools that relevance theory provides (for instance, Yus 1998). A number of authors have applied the relevance-theoretic apparatus to study different kinds of misunderstanding (cf. online bibliogra-

phy, <http://www.ua.es/personal/francisco.yus/rt.html>), focusing mainly on reasons for pragma-linguistic failure. The present contribution provides an analysis of misunderstanding from the on-line utterance interpretation perspective. As I have tried to emphasise, the framework under discussion has substantial explanatory power, since it can predict under what circumstances misinterpretation of the intended meaning is likely to occur. Relevance theory may thus be worth the while of not only pragma-linguists but also semioticians studying various aspects of human communication.

It needs to be pointed out that the mechanisms postulated for the relevance-theoretic approach have been confirmed by empirical tests (e.g., van der Henst et al. 2002; van der Henst and Sperber 2004). Moreover, relevance theory provides a homogeneous framework, based on a set of psychologically plausible reasoning principles (cf. Wedgwood [forthcoming]). These have already been used, in my estimation successfully, to investigate and elucidate a diverse and multifaceted range of phenomena, such as literal, loose, figurative, poetic, ironic, humorous, and phatic uses of language.

Enhancing signal strength in later life through technology

1. Background

This paper uses semiotic theory as a framework for exploring how older adults can enhance their social impact and life space by using technology in communication (Eco 1976; Sebeok 1991). We explore access to technology among 490 elder persons living in urban, community-dwelling settings. We consider the extent and types of technology use by those aged persons with access to cell phones, computers, and the Internet. We examine attitudes held by members of our elderly sample toward technology, and particularly toward computer use. Finally, we consider demographic and attitudinal predictors of communication technology use in our sample. Our research is anchored in a theoretical framework of proactive adaptation as antecedent to successful aging (Kahana & Kahana 2003; Kahana, Kahana & Kercher 2003). In this paradigm, technology usage is discussed as an emergent option for proactive adaptation. Taking initiatives to address normative stressors of aging older adults can help ameliorate the adverse effects of stressors on their social and psychological quality of life.

Semiotics is the study of signs and signaling. Anchored in philosophy and communication science, including linguistics, it helps elucidate how individuals may emit different “signal-strengths” based on their internalized perception of the way they are viewed by others (Mead 1976; Eco 1976). As the reach of semiotics has expanded, graphic signs, verbal signs, and computer technology based signs have been increasingly studied in a semiotic framework. However, attention has only recently been directed to the impact of technology in general, and computers in particular, on

the lives of real human beings (Andersen 1990). Humanistic research in information technology is particularly salient to social groups who may be at a disadvantage in “signal strength” based on personal disabilities, social position, or lack of attention by others to the signals they communicate (Eco 1976).

As more individuals live to a very old age, diminished abilities to communicate can pose a problem, especially in cultures that value youth and vitality (Charness & Holley 2004). Age related sensory, cognitive, and motor declines have been established (Salhouse 2000). Changes in physical appearance, loss of memory, and visual/hearing decrements can place older adults at a disadvantage in signaling others, both practically and symbolically. Negative attitudes toward the aged have been based on cultural stereotypes (Palmore 1990). Ageism has been a powerful social force that has served to rob older adults of meaningful social roles, and to minimize contributions of senior citizens to society at large (Butler 1975). There have been few attempts thus far to integrate insights of semiotic inquiry with understanding of challenges faced by aged members of our society (Combe & Schmader 1999). Semiotics affords a new prism for considering weaker signals emitted by the aged on the one hand, and on the other, opportunities to compensate for real or socially constructed diminution of late life “signal strength”.

Semiotics is generally associated with deriving meaning through narratives (Tarasti 2000). Although in this paper we consider technology use in late life from a quantitative perspective, the narrative story of an encounter with one aged respondent in our study illustrates the complex processes whereby technology can serve to transform not only the signal strength but also the presentation of self by the aged and their image in the eyes of others.

After a public lecture given by the lead researcher of this study, a frail elderly lady approached the speaker. She noted, in a halting voice, that she had been a respondent in the study of adaptation to frailty conducted by the researcher’s team. She stated that she had recently been interviewed by a very personable interviewer and noted apologetically, “At my age, I can’t remember her name.” The researcher tried to reassure the aged woman that remembering names is not very important and indicated that she appreciated the elderly woman taking the trouble to attend the lecture. The woman retorted, “Oh my, but it’s important that I tell you about this

fine interviewer.” She reached into her purse, pulled out her Palm Pilot and triumphantly announced the name of the interviewer, along with the date and time of the interview. The image of the old woman was instantly transformed in the eyes of the surprised researcher from that of a frail octogenarian to a vibrant and feisty informant about the competence of the research staff. We can thus view technology as a ticket to independence, personal control, positive self-image, and enhanced quality of life, when it reflects proactive initiatives by older adults (Kahana & Kahana 2003).

Our study explores the use of technologies (e.g., computers and cell phones) that have the potential to open avenues to information for older adults, and enhance their communication and semiotic impact on others. We hypothesize that older adults who hold more positive attitudes toward new technologies, those who are more educated, and who have greater social resources to support access and use of technology, will be more likely to use technology in managing their daily lives (Cotton 2001). Educational background has been shown, in prior studies, to be the single most important factor facilitating the embracing of proactive technology use by older adults (White et al. 1999). Fear of new technologies and negative attitudes about technology have been considered as major impediments to adopting new technologies in later life (Czaja & Sharit 1998).

2. *Methods*

2.1. Sample

Data for this research were collected in 2005 as part of the fourth wave of the Cleveland Health Maintenance Study (CHMS), an ongoing panel study which focuses on late-life adaptation of urban community dwelling elderly persons residing in Cleveland, Ohio (Kahana & Kahana 2003; McDonald & Wykle 2003). Baseline data collection occurred in 1998, and respondents have been interviewed via face-to-face interviews every two years since then. Concerns relating to missing data are minimized owing to the strong commitment of study respondents to remain actively involved in the study. As such, rates of missing data range between 1–3 percent. For the current cross-sectional study, a sample of 490 respondents, age 65 or older was utilized.

Table 1 summarizes sample characteristics. The mean age of the sample is 77 years (SD=7.3). Respondents were predominately female (57.5%),

married (74.6%), Caucasian (81.6%) and relatively well educated, with 62.8% having completed one to two years of college or more.

		Category	N (%)
Demographic Characteristics			
Age in years			Mean 77.1 (7.3)SD
Gender	Male		208 (42.5)
	Female		282 (57.5)
Ethnicity	White		395 (81.6)
	African American		80 (16.5)
	Other		9 (1.9)
Education	High school graduate or less		181 (37.2)
	Some college/technical training		115 (23.6)
	College graduate/Postgraduate		191 (39.2)
Marital Status	Married/Remarried		365 (74.6)
	Widowed		89 (18.2)
	Not married		35 (7.2)
Access to Technology			
Owns a computer			295 (65.7)
Access to a computer			328 (70.2)
Subscribes to Internet service*			220 (84.3)
Access to Internet			247 (67.7)
Owns a cell phone			260 (53.2)
Frequency of Technology Use			
Computer*	Less than once per week		24 (9.1)
	Once per week or more		188 (71.5)
Internet*	Less than once per week		20 (8.2)
	Once per week or more		163 (66.5)
E-mail*	Less than once per week		18 (8.5)
	Once per week or more		154 (72.6)
Cell phone*	Less than once per week		88 (35.9)
	Once per week or more		143 (58.4)

^a: Percentages do not include missing responses

Table 1. Sample description (N=490).^a

2.2 Measures

2.2.1. Access to Technology and Technology Use. Access to technology was measured as a binary response (yes=1, no=0) to the following questions: “Do you own a cell phone?”, “Do you own a computer?”, “Do you have access to a computer?”, and “Do you have access to the Internet?”. Technology use was measured with a 5-point scale in response to the following questions: “How often do you use a computer?”, “How often do you use the Internet”, and “How often do you use email”. Response categories ranged from never (0) to daily (4).

2.2.2. Demographic and Attitudinal Predictors of Access to Technology and Use. Demographic characteristics such as respondent's age, gender, race, education, and marital status were included in the analyses as potential predictors of ownership and access to technology and frequency using technology.

Attitudes toward technology were measured as a 5-point scale response to the following questions: "Computers do not scare me", "Feel at ease in computer class", "Feel comfortable working with a computer", and "Computers make me feel uneasy and confused". Response categories ranging from strongly disagree (5) to strongly agree (1). A scale summing these four items was created and had a reliability of .85.

2.3. Analysis

To address our research questions, bivariate analyses were conducted using t-tests for continuous variables and chi-square tests for categorical variables. The analysis was then extended to multivariate regression to determine the relative influence of demographic characteristics and attitudes towards technology on two key outcome variables: access to technology and frequency of technology use. The former, a series of binary variables, was estimated with a logistic regression and the latter, an ordinal variable, was estimated with ordered logistic regression.

Each domain of technology was estimated separately with a binary variable indicating whether or not the older adult had access to a given type of technology (1 = yes; 0 = no). We then estimated the frequency of technology use across four selected domains with ordered logistic regression. Each of these four domains was classified into three categories (0 = never, 1 = less than once per week, 2 = once per week or more). All analyses were conducted using SAS software Version 9.1.

3. Results

3.1. Descriptive results

A majority of respondents owned a cell phone (53.2%) or a computer (65.7%) and 70.2% reported having access to a computer. Just over two-thirds (67.7%) said they had access to the Internet. Frequent use of cell phones and computers was a relatively common activity for respondents in

the sample. For example, 58.4% used their cell phones and 71.9% used their computers on a weekly or daily basis.

Table 2 summarizes the types of Internet use in the study sample. Exchanging emails and using the Internet were at least weekly occurrences for a majority of computer users. For Internet users, the most common information-seeking activity reported was to keep abreast of current events, sports, and weather conditions (41.0%), followed by searching for health-related information (35.6%), and checking product or financial information (31.4% and 27.2%, respectively). Frequent practical uses of the computer included playing computer games (37.2%) and making travel reservations (33.1%).

Type of Use	Frequency	Percent
Information Seeking		
News, Sports, or Weather Information	98	41.0
Health/Medicine Information	85	35.6
Product Information	75	31.4
Financial Information	65	27.2
Community Services Information	50	20.9
Government/Other Organization Information	48	20.1
Legal Information	21	8.8
Email (at least weekly)		
With Adult Children	119	56.7
With Friends	110	52.1
With Business Associates	44	27.8
With Grandchildren	49	26.6
Practical Applications		
Gaming	89	37.2
Travel Reservations	79	33.1
Library Searches	52	21.8
Bill Payment/Online Banking	32	13.4
Discussion Groups	11	4.6
Grocery Delivery	6	2.5
Support Groups	2	0.8

*Subsample of people who had access to the Internet

Table 2. Types of Internet use (N=247).*

Of those older adults who had access to the Internet, email communication was prevalent. The majority reported email correspondence with adult children (56.7%) and friends (52.1%), followed by business associates (27.8%) and grandchildren (26.6%).

Descriptive data regarding attitudes toward computers and learning to use technology revealed that most respondents do not fear technology, and would feel comfortable learning more about computers. Accordingly, 41.5% strongly agreed that computers do not scare them, and 47.5% strongly agreed that they would feel comfortable in a computer class. The mean score on the attitude toward technology scale was 7.3 with a range of 0 to 19, where lower scores reflected more positive attitudes.

3.2. Multivariate results

Demographic characteristics and attitudes towards technology were found to be statistically significant predictors ($p < 0.05$) for all the five binary indicators of access to technology (yes or no), and for all four indicators of frequency of technology use. In summary, greater access to technology and more frequent use of technology was associated with younger age (among these respondents aged 65 or older), those who were single, those who were white, those with more education, and those who had positive attitudes towards technology.

As to the multivariate logistic regression predicting access to each domain of technology separately: higher education, younger age, and more positive attitude towards technology was statistically significant ($p < 0.05$) for all five items that measured access to technology. Being single, other than widowed, was found to be a significant predictor ($p < 0.05$) for three of the five indicators of access to technology (owns a computer, owns a cell phone, has access to Internet).

Finally, we estimated ordered logistic regression models predicting frequency of use for each of four different types of technology. We found that positive attitude towards technology was a statistically significant predictor ($p < 0.05$) for three of the four indicators of frequent technology use (computer use, Internet use, and email use). Findings show that respondents with positive attitudes towards technology were more likely to use technology frequently (more than once per week). Younger age was statistically significant ($p < 0.05$) for computer use and cell phone use, while less strongly associated with Internet and email use. Whites were more likely to use the technology frequently.

4. Discussion

Findings of this study offer encouraging evidence that the majority of older adults have joined the “age of technology” (Czaja & Lee 2003: 113). Furthermore, most of those with access to technology appear to be frequent users of technology, reporting at least weekly, and typically daily, use. The potential of technology to transform signaling ability in late life appears to have become a reality for new cohorts of older adults (Volti 2006). The reported uses of the Internet offer a broad array of links to the social world for older adults. Our data run counter to stereotypes about fears or negative attitudes attributed to older adults regarding technology use (Charness 2003).

Nevertheless, age was a consistent significant predictor for each of the technology access and use outcomes. Younger respondents were significantly more likely to own or have access to technology, and to have higher rates of usage. These findings are likely to reflect the evolution of technology use among different cohorts of elders.

Results suggest that for older adults, technology serves as an important vehicle in maintaining social ties to others (Thomas 1993). The prevalence of computers and cell phone usage demonstrated by this sample also speaks to the proactive adaptive efforts that elders undertake as they face normative losses associated with late life (Kahana & Kahana 2003). In this sense, elders may rely on technology to enhance their semiotic life space. For example, cell phones, while they are primarily for conversation, can also serve as a monitoring system or safety measure for the older person. As a monitoring tool, family and friends can easily check up on the older person and, since cell phones are usually held near or on the person, contact with others is immediate and not dependent upon an older person to walk across a room to answer the phone. As a safety measure, a cell phone could be used to alert someone or to call 911 if an emergency arises. Both of these examples illustrate how even elders with diminished capabilities can maintain and enhance their semiotic life space (Schieber 2003). Electronic mail is used to interact with children, grandchildren, and friends. This reflects both same-generation and cross-generational links forged on the Internet.

Enhanced communication with family and friends can play useful preventive roles in developing availability of support for times of need. Use of

technology can also facilitate obtaining support correctively, thereby helping to deal with caregiver burden and deal with other stressors (Lawhon & Ennis 1995). Communication with family members on the Internet can also serve to integrate the elderly family member who may appear to be “excess baggage” in a culture of parsimony and time consciousness (Dunning 2005). As a result of technology, the aged person becomes an “equal player” in a society geared to quick and goal-directed communication. The older adult can thus create a bridge from the discursive and deliberate communication of their cohort. Seniors using the Internet are signaling that they belong on the playing field of contemporary technology, alongside the young.

In addition to the increasingly common use of cell phones, the use of Internet and email communication has brought about a paradigm shift in older adults’ ability to communicate instantly and effectively, both in maintaining social networks and in conducting commercial transactions. Our findings regarding the prevalence of Internet use by the aged to accomplish business transactions is likely to offer another important way to enhance their self image. The self-presentation of the older adult on the Internet removes the often stigmatizing visual or auditory signs of being aged, and can render age irrelevant in their communications and negotiations.

There are alternative semiotic meanings of different forms of Internet communication in late life (Deely 1990). In the case of business transactions and commercial communication, Internet use can contribute to age irrelevance (Dannefer 2000). The seller of merchandise or bank clerk is no longer aware of the client’s during an Internet based transaction. Thus the Internet becomes a semiotic equalizer. A third distinctive area of Internet use involves leisure communication, including use of the Internet to play games such as chess or scrabble. Use of the Internet for leisure communication with other seniors in a recreational context may help affirm group membership in an age homogeneous circle. Such communication can be age and group affirming (Malcolm et al. 2001). Older adults may also benefit from enhanced status in the eyes of others, since they become an information resources for others. In this sense, the older computer user becomes empowered and can serve as a central source of information for others.

Our discussion has thus far emphasized the prevalence of access to technology and technology use in late life. Nevertheless, we must also acknowledge that significant proportions of elderly in our sample still lacked

access to cell phones and computers. Findings of our study confirmed our hypothesis that lack of sociodemographic resources, as reflected in lower education, limit access to technology. Furthermore, even among those with access, lack of sociodemographic resources such as minority racial/ethnic background limit frequency of technology use. It is also notable that more negative attitudes toward technology also limit participation in the digital world.

The cross-sectional nature of our research doesn't permit conclusions about the directionality of the causal linkages we observed between attitudes and technology use. Thus, it is possible that those with negative attitudes do not invest in cell phones, computers, or Internet services. Conversely, it is also likely that in the absence of access to such technology, there is little opportunity to alter negative attitudes. Notably, for those with access, attitudes are still linked to frequency of usage. An alternative explanation regarding the negative attitudes findings is that those who do not have access or are afraid of the technology may preserve the self by "signaling" a negative attitude. They may actually desire to use such technology, but barriers to access may be embarrassing to one's self image. Thus, those who cannot participate may be the strongest opponents to it.

Technology use is growing exponentially among the aged, and it is an area where dramatic shifts are likely to occur as baby boomers, who are already veteran users of technology, join the ranks of the elderly (Charness 2003). Use of information technology can provide important sources of empowerment for older adults (Thursz et al. 1995).

Use of Internet technology can improve the social and emotional well-being of senior citizens. The opportunity to make friends and bond with online friends through message boards and email exchanges can contribute to psychosocial well-being in old age, especially for those who are home bound and physically limited (Volti 2006). Terminology, such as "cyber-senior", is being increasingly used to describe Internet connected seniors (Post 1996). The Internet has been found to offer new opportunities for communication that can reduce social isolation among community residents as well as residents of sheltered care facilities (White et al. 2002).

In our previous research, we advocated for technology use as a potentially useful proactive adaptation (Kahana, Kahana, & Kercher 2003). In this paper we argue that technology use can serve as a vehicle to increase

semiotic life space. Accordingly, access to cell phones and the Internet can increase the ability to receive and emit signals to others.

The semiotic potential and relevance of technology in the social world of the aged is thus evident. Yet, the concepts of semiotics have not yet become visible in the field of social gerontology. The terminology or even the label of semiotics is almost completely absent in the social gerontological literature. This paper represents an initial effort to link semiotics with our understanding of proactive adaptations used by older adults to insure maintenance of meaningful activities and contributions (Kahana & Kahana 2003). Such enhanced opportunities for increased signal strength through technology comprise an unexplored aspect of quality of late life, particularly for the frail elderly (Lawton 1991).

Acknowledgements

The authors would like to thank Rebecca Siders, Rachel Hammel, Jessica York, and Jason Speck for their assistance in the preparation of this manuscript. This research was made possible by National Institute on Aging grant No. AG10738, sponsored by the National Institutes of Health.

Katriina Kajannes

Possibilities of (mis)understanding

**Eero Tarasti's *Le secret du professeur
Amfortas* as a semiotic novel**

Eero Tarasti's (b. 1948) first work of fiction is *The Secret of Professor Amfortas* (*Professori Amfortasin salaisuus*). Here I focus on that work as a *semiotic novel*, and specifically on questions of understanding, misunderstanding and communication as raised in this book. First, I present a brief introduction to Eero Tarasti and to the term "semiotic novel". Second, I analyze acts of misunderstanding described in the novel. Third, I deal with the possibility of deepening one's understanding of human existence in the light of Tarasti's novel.

1. Introduction

1.1 Eero Tarasti and his work

Eero Tarasti is one of the most interesting writers in contemporary Finnish literature. As a novelist he belongs to Finnish postmodernism, together with Henri Broms and Harry Forsblom. Besides their writing careers, they are also scholars, and each one has published studies on postmodernism. The style of their fictional work is synthetic, eclectic and pluralistic, with a narration that unites traits from different periods and different literary genres. They use irony, perspectivism and hybridization. The interplay between quotations from different discourses such as myths and light reading is common in their texts, as well as complex structures, rich intertextual dialogue and many-sided analogies with literary romanticism. They use fragmentation and cliché, parody and plagiarism. They deconstruct grand narratives, and they rewrite tradition and history imaginatively.¹

As a novelist Tarasti belongs, together with Umberto Eco and Italo Calvino, to the cultivated, playful and aesthetically orientated branch of literary postmodernism. *Le secret du professeur Amfortas* contains cultural criticism, but represented with a light touch. Moreover, Eco and Tarasti are among the leading semioticians of the world, and they carry on a dialogue with other semioticians in their prose.

Professor of musicology at the University of Helsinki, Eero Tarasti has developed musical semiotics as an independent discipline. He has renewed the theory of semiotics and also found new ways to use it for analyzing art and literature. In his theory, music is not an object but “a situation comprised of many various elements” (Tarasti 2002: 70). In recent years he has been involved in constructing a theory of *existential semiotics*. This new epistemological model may also be seen to stimulate new methods for studying music.²

As with Eco, for Tarasti *understanding* is an important term. He introduces the reader to the matter in his article “Understanding, Misunderstanding, and Self-Understanding” (2003), in which he investigates the conditions, processes and particular aspects of understanding. Tarasti writes: “One may go on to ask, What, then, is *self*-understanding? To this one may answer: it is precisely existential understanding. I understand myself via objectified signs; that is to say, my aspirations are crystallized into something objective” (Tarasti 2003: 7). In his existential theory Tarasti stresses the role of the subject: existence is opened by a subject who is able to change and re-articulate his being. He “rejects a violent analysis that damages the phenomenon (an ethical-moral principle); the universality of phenomena consists of their being seen as something, and in some light; what is said or expressed may be less important than in what sense or mode it is said; as for temporality: its meaning grows denser over time, and is completed in the moment we know we have to give it up” (ibid.: 197).

1.2 The “semiotic novel”

It is useful to read Tarasti’s novel against the background of his studies, since *The Secret of Professor Amfortas* is metasemiotic in nature, in that it describes scholars and their work, and it discusses various semiotic paradigms (e.g., existential semiotics), including the one given by Tarasti himself.

Tarasti has written and edited many books about art and literature. When creating a new theory and new scientific terms he often analyzes some works of art as an illustration. In Tarasti's essay about the semiotic novel (1996: 215–228), the starting point is a book by Henri Broms. Tarasti describes this work as a fine example of the semiotic novel, comparing it to novels by Goethe, Hermann Hesse, Marcel Proust and Umberto Eco. According to Tarasti, the theme of a semiotic novel is an existential one, giving birth to a semiotic consciousness which poses certain (existential) questions and answers them in a critical way. Tarasti shows that the novels by Eco, Julia Kristeva, and Henri Broms are semiotic in nature. Yet jokingly he maintains that no one has the right to classify a person as a semiotician and another a non-semiotician.

Especially in postmodernism, the characteristics of a semiotic novel include parody, the abandoning of illusions about reality, playing with narrative conventions, frequent allusions to other texts, and often also a polyphonic structure. Tarasti emphasizes that this kind of prose is deeply rooted in European humanities and scholarship. In his book *Esimerkkejä* (*Examples*) Tarasti writes that *Parsifal* by Richard Wagner is semiotic in a particular way, because it is based on meditating about and reproduction of previous things (1996: 255).

Corresponding to Tarasti's article, Henri Broms uses the term "systems novel" (1993a: 33–36). He underlines that this kind of prose work is a metanovel and often an encyclopedic and labyrinthine work about many things at the same time. A systems novel consists of many levels, one of which is the semiotic, and the events are signs pointing to something else (Chesterman 1995: 23). In writing about *Professor Amfortas* as a semiotic novel, Broms (1993b) defines the term as does Eero Tarasti in his article. In addition, Broms maintains that a semiotic novel asserts certain utopian characteristics.

2. *To understand or not to understand*

The Secret of Professor Amfortas discusses and parodies the author's own program for existential semiotics as it was in the year the novel first was published in Finnish: "We have to be able to study the life of signs from within, as well as to study in what kind of factual universe of meanings we live our whole life during its process in time" (Tarasti 1995: 45). The novel

tells indeed about the birth and change of signs and meanings, as well as the processes of semiosis. It also discusses the starting points of semiotics, its representatives and orientations.

The ethical tone of the novel is found behind the parody and laughter. The existential semiotics created by Tarasti is concerned with, among other things, ethical questions and values. In his book *Existential Semiotics* Tarasti considers the basic problems of the human condition – in a nutshell: how to live in the world. The novel shows that to understand is to see the structure of culture and of human existence. It is to see the system of connections between things that are usually believed to be separate. The novel shows these things in a negative way. The reader will see how misunderstanding arises from lack of probity and from the inability to see nuances of meaning. In the fictional world of this novel the situation actually is that of misunderstanding, and the consciousness of the characters is not an existential one in its fullness. On the contrary, we could say it is a false consciousness, *falsches Bewusstsein*, an issue addressed in one of his essays (Tarasti 2004).

In the Professor's fictional world there is a total cultural, spiritual and social crisis, and misunderstanding, caused by excessive materialism and too much faith in science. *The Secret* actually is a story about conditions of understanding – and misunderstanding – in the postmodern world. The existential issue of the novel is this: Where can we find the power to set us free as individuals and as a culture? Where can we find salvation?

Tarasti himself points out that the redemption of the man is the main subject in Wagner's *Parsifal*. He writes (1978: 110): "Wagner's development ultimately encompassed a shift from hero-mythical and nature-mythical categories to the Christian sacred sphere in the musical mystery play, *Parsifal*". Redemption, together with the themes of quest and of human growth, forms one of the general topics in western myths, arts, literature and philosophy from the classical period to the postmodern world. In Tarasti's novel questions of understanding and misunderstanding are involved in these themes.

Professor Amfortas uses and exaggerates themes of utopia and dystopia. The origin of the word comes from the Greek *topos*, and means a "place". The negative prefix changes the meaning; so it is literally "the place that does not exist", or "nowhere". This concept was articulated by the renaissance humanist Thomas More. His work *Utopia* (1516) is one of the best

known in the genre, together with *Città del Sole* (written in 1602) by Tommaso Campanella, George Orwell's *Nineteen Eighty-Four* (1949), and Aldous Huxley's *Brave New World* (1932). The intertextual dialogue *Le secret du professeur Amfortas* enters into with other utopias gives material for the critique so central in the novel. The most important of these are *The Republic (Politeia)* by Plato and *The Glass Bead Game (Das Glasperlenspiel)* by Hermann Hesse.

The novel is set in future North American Americana. Most of the events take place in a university town to which a few top scientists have moved from Europe, destroyed by a catastrophe, and in which two schools of semiotics are active. The leading position of the scientific community of Professor Amfortas, from Finland, is threatened, and the future of the university is uncertain. Especially two of the students, Sebastian, a relative of the professor, and his friend Felix see him as a saviour of the world of science. To remove the obstacles hindering his work and to solve the riddle connected with him, they collect information about his life and study his writings. In the novel, the most important places are Americana – led by women –, the town of Irokesh, the university, and Europe.

In the utopian literary genre it is possible to represent the clash of two different ideologies or sets of values. Because it is often set in a faraway place, and the time of it is in a past or future which is better than the present, it serves as a means of comparison and for cultural or social critique. This kind of fiction is in many cases also parodistic. The central topic often is an ideal form of society, which does not actually exist. The starting point offers a place for comic misunderstanding, and its dystopias show forth tragic and sometimes frightening elements. It is often the case that most characters of the novel are unable to understand deeply anything important. In fact, understanding itself is the main utopia in Tarasti's novel.

Tarasti offers us critical insight into the present state of European life and thought, while at the same time creating something totally new in his intense dialogue with European writers and scholars. What kinds of (mis) understanding and communication does one encounter in Americana, in terms of rational and irrational forms of consciousness? The starting point of this analysis is the fact that, in the novel, science and art – thinking and imagination – represent different forms of knowing, which illuminate each other. Next, I focus first on the rational and second on the irrational aspect of knowing. For this it is important to understand the educational

system in Americana, because it opens the door to the utopia of understanding in this novel.

3. *The university and the misunderstanding*

The Secret of Professor Amfortas is a university novel, shadowing forth an educational utopia, where the main focus is on education: on its means and goals, as well as the values behind it. The University of Americana is a sign pointing to misunderstanding as a problem of individual human beings and of a community. The sharp critique of the university found in this novel is common in postmodernism. In this novel, the keywords of the university are *competition, obedience, prohibition* and *censorship*. How do these things exist in this fictional Americana?

First, competition: everyone learns that the meaning of life is to be better than the others – not a better human being, but better at all kinds of contests. Also, at school, even at the university level, obedience to the establishment is important. Such extreme obedience is demanded, that the status of the pupils, students and their teachers, too, resembles that of a slave in Plato's republic. As an institution and as a building, the University of Americana is functionally similar to a church. Science has stolen the place that once belonged to religion – intellect has replaced spirituality. In Americana people believe in science, and they search for holiness in it. Science is a form of materialist religion, and as in religious sects, everybody's attitudes are controlled. Many things are forbidden, or at least discouraged, such as the reading of novels, romantic music, wandering in nature, and most of all, criticism of the establishment.

Everyone must work very hard at their studies, but this does not lead to deep understanding. Approved information has been saved in a central computer, and the students are passive receivers. No one notices that somebody has modified and chosen the information for them. It is almost impossible to get any new and valuable knowledge in the university. Because knowledge is disseminated in piecemeal fashion, one cannot comprehend larger entities. Education unifies thought in Americana, where there is strict censorship. At the same time, decision making is said to be transparent. All information is said to be available for everyone. But in reality, information is strictly controlled. In Americana education serves the totalitarian society, as it does in Plato's *Republic*. Furthermore, Ameri-

cana and the university incorporate a model of consensus society. That is why the citizens of Americana are satisfied with the university the novel describes: they do not know about alternative educational systems. So they claim they have the most efficient educational system in the history of the world! To this rejoins a critical voice, through some young students and through Amfortas, who was born in Finland. Amfortas and some students know Americana has reached a dead-end, and that in a way it is an inferno. The university is compared to a pyramid, housing many dead and mummified things, such the languages and literatures of Germany and Finland.

The predominant set of values is a completely and consistent opposition to anything that is normally appreciated in western cultures. In Americana, education is quite different from that in Europe. Americana lives in the here and now, without a past, in a kind of collective amnesia. The vital connection between present and tradition is in fact interrupted in the fictional world of the novel. In addition, obedience to the establishment is what matters, not the following of one's own conscience. The Socratic maxim "Know yourself" is no longer valid here.

For Americanians, Europe is taboo; they know very little about it, and they have been taught to underrate its culture. The history and humanism of Europe are interpreted in a distorted way. Misunderstood signs and concepts point to other misunderstood signs and concepts, and together they give rise to false interpretations. The rich, multi-dimensional culture of Europe can no longer be comprehended. Instead of platonic dialogue, the usual mode of communication is battle. Even semioticians are masters in fighting. Such persons as Grimaldas, Alcan, and Pierce are mentioned, as equivalents of Greimas, Lacan and Peirce. Barthes and Lévi-Strauss appear under their own names. But their doctrines are misunderstood, and their opponents silenced. In fact, the rulers have imposed their language and discourse on the whole country. At the same time, the digital culture strengthens the battle against human culture.

Now it is necessary to remember Tarasti's semiotics, since it gives us new perspectives on questions of cultural memory and the role of post-colonialism in this context. Tarasti writes about "post-colonial semiosis", pointing out that post-colonial theory is intimately related to existential semiotics (2000: 139). Tarasti writes: "One colonizing technique is that of silencing. Pre-colonial practices are suppressed simply by the fact that one no longer talks about them. The colonized subject keeps silent... The colo-

nizing discursive practice has taken the voice into its possession” (2000: 138).

4. *The irrational and the understanding*

Tarasti proves, both in his essays and in his fictional work, that the dilemma of rationalism and irrationalism is most topical in European culture. In order to solve it, men need a kind of inside knowledge and a new way of understanding.

How can ethical and cultural problems be resolved in Americana and elsewhere, or can they be? Some characters in the novel realize that salvation might be found in myth, in the arts, and in the literature of Romanticism. People do not remember the myths about their origin, and the door to real art is shut. Nevertheless, a bridge might exist, from the rational to irrational and even from aesthetics to ethics. Some young students try in vain to find it. The knowledge about both the rational and the irrational aspects of life and of human existence proves to be essential for full understanding.

I would like to point out that the rise of humanism and human rights is only a utopia, if no strong and free persons are making it happen. As Tarasti (2000: 88) writes: “The discovery of ethics seems to be related first to the problem of the subject – and, paradoxically, simultaneously to both the foregrounding of the subject and its disappearance. Without the concept of subject there is no ethical choice. Norms, external *devoirs* can be programmed into a computer or robot, whereas inner ethical ‘will’, i.e., deliberate choice with complicated factors and criteria with their hierarchies, cannot be inserted.”

There are still some areas in which to look for a new humanity. The most important of them is the written and spoken word – literature, narratives, and language. In fact language is the way to understand things. As Hans-Georg Gadamer (1986: 478) writes: “Sein, das verstanden werden kann, ist Sprache” [Being that can be understood is language]. Because of the dead condition of language, one cannot see the world in its richness. Latin, German and Finnish are dead languages, and only the superficial English remains. Note that the novel is critical of excessive admiration of America and of the Anglo-saxonisms invading our culture and our educational systems.

There is one concrete direction where professor Amfortas and some of his students try to find the solution: they travel to Europe, and to an imaginary Finland, the county of myths and poems. The country that used to be Finland is now an area destroyed by a big catastrophe. The search for Finnish identity proves vain, because they do not find the culture of Finland any more. Professor Amfortas could be a saviour in the situation. He is a personification of those humanistic values that are missing from the superficial and competitive Americana. Those values are justice, equality, respect for individuality, a positive outlook on life, and at the same time, skepticism.

Salvation could be found in the values of European humanism and in a living connection to cultural heritage, especially a respect for one's own language. It is important to be conscious of one's own roots. The stream of personal and collective memories has energy enough to renew mankind, and these will be the bases of a new understanding.

Notes

1. A good guide to postmodernism is Harry Forsblom's (2001) *Concepts of Postmodernism*.
2. Paulo Chagas (2003) has written about Eero Tarasti's recent musical semiotics.

Ágnes Kapitány and Gábor Kapitány

The interiorization of social events and facts by means of symbols

As cultural anthropologists we have dealt for decades with the analysis of symbols. We analyse symbolic events of various thematic territories, such as objects (2005), human motivation (1993), value systems (1995), adaptive behaviours and so on. We try to summarise those experiences to find a common denominator from this work, from the view-point of *socio-semiotics*. To do so, we must start with the evidence. What is the role of symbols in the society? What kinds of symbolization processes are typical? How do those symbols become important bricks in the construction of society?

Claude Lévi-Strauss (1973), one of the great representatives of cultural anthropology, built on Roman Jakobson's (1972) notion of "binary opposition" and its importance in the development of a symbolic universe of society. We need, however, to return to the beginning of this process. The first stage is the emergence of first notions, first ideas. In the social sciences, the concept "symbol" is generally considered a derived category, supposing the primary status of notional-conceptual thinking. Social scientists argue that ideas are the primary elements of human thinking, and that symbols are born through the linking of two or more different ideas. We, however, agree with those who begin from the other side, arguing that the primary state is one of holistic observation of the world. Those ideas or notions with one or more definable meanings are secondary to symbols, which retain the spirit of holism. Humans need to use ideas and concepts, the basis of which is the so-called law of non-contradiction – "A equals A". It is also the basis of our instrumental behaviour and the point of departure for analytic thinking. In Nature, however, the truth of "A equals A" is inseparable from the truth of the opposing thesis: "A does not equal A".¹ Symbols, and the symbolic thought behind them, retain the simultaneous

truth of both theses. With the help of symbols, people can correct the one-sidedness of notional, conceptual thinking.²

Therefore, the first step is the appearance of notions, emerging from the chaos of the world, as observed by a human being. These first notions are still very confused; like the “symbols”, which come later, they contain a lot of associations. A rock means a hard thing, a being, such as man himself, a concrete place in the landscape, a place where lightning struck, the source of a spring (hence with some characteristics of a mother) and so on. Today we say that this rock can be a symbol for these different things, but the original state is precisely the sum (a holistic unit) of these different meanings. The tightening of the circle of associations, the disambiguation of meaning, is a *result of the development* of notional thinking from this multitude of meanings to well-defined and precise notions, these last abstracted from experiences connected with very real, yet different, rocks. If one of our ancestors used a tiger’s tooth as a knife, that knife meant the power of a tiger, the power of the man’s arm that wielded it, the sharpness of blade, the person who used it, and so on. Later, different knives – those made of bone, stone, or wood or iron, etc. as well as those belonging to different people – all united in the notion “knife”, and this abstract notion lost the associative circle of special, individualized knives. The rock and the knife – things that earlier were inseparable from their surroundings and from the activities carried out with them – became abstract words, that is to say, they became “ideas” of rocks and knives. And from this point we can speak about distinct words, ideas, notions and, on the other side, of symbols. A word, idea, or notion means the abstract essence of a thing, being, or object; “A equals A” means the thing, in and of itself. We build up a world of words, ideas, and concepts, in which everything has a distinct meaning.

We have another world, too: the world of symbols. In the world of symbols, “A equals A” and, at the same time, “A not only equals A, but it equals something else and/or anything else”. Hence symbols have a double character. On one hand the symbolic meanings of words keep their earlier broad association-circle of things; on the other hand, we make newer and newer symbols by connecting different things, events, or phenomena; by connecting different words, ideas, or notions; and by spiritualising the distinct borders between them. In this way, we permanently correct the one-sidedness of our notional thinking.

Up to this point we have noted trivialities. Nevertheless, to do so has been necessary, since, in our view, the distinction between notional and symbolical thinking constitutes the basis of the socio-semiotical functioning of symbols. In what follows, we first examine how society appears in the world of notional/ideational thinking; second, we explain the role of symbols.

In the process of ideation we give names to everything; something is called “tree”, something is called “war”, something is called “power”, something is called “idea”. One of them is more concrete, another is abstract, but all of them are distinct elements of our thinking. But these names, words, and ideas lead their own life in society. We have relations with them. For example, we cut down a tree. This seems to be a very concrete thing to do, but it also presumes a moment of abstraction: we must know that a sequence of movements and the relation between the properties of our axe and the material of the tree will result in the felling of the tree. The notion “cut down a tree” is a result of a serious mental operation, namely, of ideation. But the essence is, that we have a *relation* – in fact, multiple relations – with the tree. We have similar relations to more abstract things, too. We hate (or sometimes we like) “war”, although war is not a tangible thing or person. Ancient man needed to personalise war as Ares or Mars, but today, as a result of a long process of abstract thinking, we can imagine “war” as a complex thing without the need of personalizing it. We can think about and discuss “ideas”, although the idea of “idea” is a very abstract thing. Our relation to different things and to their ideas are very similar: we operate with them as with distinct things.

The next step is very important from the point of view of symbolisation. While notions and ideas become elements of relations (as with real things, and as representatives of these real things in the mind), a lot of associations are connected to them. These associations are based on sign similarities and contrarities to other things, on connections with the surroundings, and on the emotions they produce; they include the past of the respective thing, its functions, its possibilities, and so on. In other words, our mind distinguishes things in separation from their environs; we consider them as distinct things. After this indispensable step, the next one restores the original holistic unit of the perceived world with the help of a wide and always open circle of associations. This very wide circle of associations is condensed in symbols, in the symbolic meanings of the given things.

During the last step, the symbols, in turn, become *elements* for thinking, as did notions. But differing from these last, symbols retain their circle of association and openness of meanings. We now examine this process with the help of three examples.

1. *The rise of “individualism”*

A very important change in European history occurred when the dominant value system of the Middle Ages found itself face to face with that of modern bourgeois society. The main values of the former are centered in tradition and custom, the domination of community – or as Tönnies (1972) calls it, “*Gemeinschaft*” – over individual; the mandate to “be like others”; and so on. The main values of the bourgeois system were antagonistic to those of the former; here one feels the pressure to “be different, be individual, make your own way”, with a high priority put on liberty and personal freedom. Although the welfare of the community remains an important value, the individual holds pride of place in such an individualistic value system. In the more traditional value system, the community is primary and the person is derived from his or her community. In the individualistic value system the community – which Tönnies calls a “*Gesellschaft*” – is considered primarily as a collection of individuals. The battle between these two value systems continued seven to eight centuries of European history, with individualism emerging victorious, having won “souls” to its mood and way of life. The victory occurred first in the economy, then in art; first in private life, then in public – the signs of the new value system appeared as social customs and rules of conduct (cf. Elias 1982), and later in ethics and religion (cf. Weber 1972).

These changes in different aspects of life had a common denominator: the central role of individuality. The different experiences of these changes are condensed in the modern notion of the “individual”. Members of modern society became “individuals”, in their relations to each other, to institutions, to the economy, etc. These relations, with their many associations to the notion of “individual”, crystallize in the symbol “individualism”³ as *the* symbol of modern man.⁴ Like any symbol, this one in turn became another *element* in our world-view. When we analyse modern society, individualism is scrutinized and weighed. We consider the modern man a *complex* of his or her individualism, altruism, rationalism, irrationalism,

and so on. When we analyse someone, his or her individualism is assessed as a *part* of his or her personality. No person can be an “individualist” and nothing else; individualism is only one element of the compound, whether one is speaking of a society or a person. (Take housing as an example: the increasing number of bathrooms in today’s flats is one index of the rise of the individualistic value system.)

To sum up: (1) Symbolisation begins with the appearance of new and separate phenomena; in such areas as value-systems, it is the appearance of new behaviours in different fields of life. (2) Then comes the process of “ideation”, when people recognise a common denominator among the new phenomena (in our case, the notion of “individualism”). (3) The next step is the “fertilisation” of the new notion by a crowd of associations, as when the “individualism” enters the *Lebenswelt* and assumes different forms. (4) During the process of symbolisation these associations condense into a symbol; in our example: when we start to call modern man “individualistic”, it is a *result* of a condensation process. (5) Finally, the symbols become elements of different structures; in our case, individualism becomes an element of society, of personality, of housing, and so on in this manner.

2. *Adaptive behaviours*

Let us take another example. Adaptability is a very important part of being human, enabling us to meet a multitude of different challenges: the dangers of nature, the tyranny of power, family conflicts in our family, etc. First, we learn how to protect ourselves against the storm, against a powerful landlord, or against the machinations of our relatives. Second, we recognize the common denominator of these very different behaviours to be *adaptation*. We create the notion and the abstract idea of adaptation. Third, we fill this category with a lot of concrete experiences: successful escapes, sly tricks, successful violence or polite behaviour, carefully weighing alternatives, and so on. These experiences are very concrete – escape from a storm, tricking a tyrant, settling a family dispute. But fourth, we link these different experiences in the sole notion of “adaptation”, and transform the latter into a symbol, which includes all of these concrete experiences as associations. (There are many distinct experiences in our memory, but we link them together with metaphors, metonymies, synecdoches, personalisations and so on; as we said earlier, precisely this is the difference between the distinct

categories of notional thinking and the open nature of symbolic thought. If notional thinking is a telescope, which enhances the useful essence of a thing, the symbol is a sphere, a ball, an orb, which offers innumerable routes from its skin to the centre). As we link our different experiences of adaptation, we can combine them. This means that the experience acquired in public life will be usable within the family; the adaptation which was successful at home, can be used for defense against the dangers of nature, and so on.) Lastly, in this way the different modes, techniques and sources of adaptation become elements of social life, of personality, and so on.⁵ As we combine them, these special experiences become applicable to the most varied territories of life. This is the role of symbolisation in the process of adaptation: to make the notions open, polysemic and combinable. Here is the basis of the exceptional flexibility of the human being.

3. The power of advertising symbols: The case of Coca Cola

Our third example may be more *tangible* than the previous two. Value systems and adaptation mechanisms are rather abstract, theoretical categories, to which the functioning of simpler symbols is very similar. Our third example is the well-known bottle of Coca Cola.

The first two steps involve the enhancement of Coca Cola. It has a special form, different from the shape of other bottles, and we learn to link this form to a special brand, and to the special taste of a special drink. We taste some cola, we see the unique bottle of Coca Cola at different places in the world, then we create the “idea” of Coca Cola; after the process of ideation we know what it means. Third, Coca Cola “conquers” the world. The advertising suggests a special life-style, gives it a special sense (or a bunch of different senses). We learn where we can or cannot find Coca Cola. Fourthly, Coca Cola becomes a symbol. A symbol of what? It depends on the character and circumstances of the community that creates and/or uses the symbol. For residents of formerly communist countries, for example, Coca Cola was a symbol of the West, the “free world”, or the United States; a symbol of a world not behind the Iron Curtain. For critics of modern capitalism it can symbolize “consumer society”; for a fundamentalist, it may symbolize the world of Evil; for a young person, who drank a lot of cola during childhood, it can symbolize happy years; for a dentist, it is one

of the well-known dangers to teeth. Lastly, the symbol becomes an element of our visual language. If we watch a performance of a young Hungarian or Russian musical group from the fifties or early sixties, and somebody holds up a bottle of Coca Cola, it might mean, “This man is a fan of the west”. Now that the Iron Curtain has been destroyed and the “multi-nationals” and western European and American firms have overrun eastern Europe, Coca Cola has become an element in the stock of symbols of power (the power of money, the power of capital). Hence we find Coca Cola’s emblem everywhere, not just in restaurants or stores, but in school corridors (sometimes taking the place of Lenin portraits), on the notice boards of some churches, and even at an office of the Socialist Party (formerly the Communist Party), the whole show-window of which was covered with Coca Cola advertisements. Coca Cola has become a visual “word”, a part of our visual statements, a simple (symbolic) element of our “visual speech”.

4. Conclusions

Now we will try to summarise the main functions of symbolisation in society. Semiotically speaking, one of its main functions is to correct the one-sidedness of other sign-systems, the system of distinct notions and ideas. The social functions of symbols are endless. Through symbols we can direct, guide and govern others. Symbols are very open in meaning and have many connections to other elements of the world; thus, a directed symbol can create a whole circle of associations, and the whole world of things connected with this symbol will move in that direction. The first theoreticians of the workers’ movement symbolised the relationship of capitalist society as a battle (of classes), and millions of workers and intellectuals followed this symbolic model for one and a half centuries. Newton and Leibniz worked out a world-view of monadic, individualistic units, and both the natural sciences and the social sciences have built on this symbolic doctrine for centuries. Symbols determine the direction of politics, the economy, science, and the entire lives of people; they dominate our everyday thinking. The symbolic doctrine of freedom preserves capitalist society (the free market, free enterprise, free movement of labour, etc.). Symbols are the instruments of different ruling groups and different ruling interests, and lengthy books have been written about how symbolic power

is felt in medicine, the judiciary, the penal system, and more (see, inter al., Foucault 1955, 1972, 1975; Bourdieu 1972; Bourdieu and Passeron 1970).

But symbols can also play an opposite role: they can also be instruments of revolution and innovation. The symbol “freedom” is not a weapon only for representing the interests of the bourgeoisie. The anti-capitalist workers use this symbol, arguing that the freedom of a worker is not the same as the freedom of a capitalist; the freedom to sleep under a bridge is not the same for a homeless person as it is for a bored millionaire. To create a new symbol includes the possibility of changing existing relations, to revolutionise the world. We see how impressionism (as a new way of painting) revolutionised visual culture, how the music of The Beatles revolutionised the culture of generations, how computerisation has revolutionised our whole life. You might reply: but these changes are merely technological. Indeed, these changes do mean technical innovation, but they also have symbolic meaning, which endows them with extra importance and influence. Symbols do not have just a revolutionary function. Sometimes they can be integrative, as instruments of peace. When Sir Walter Scott wrote novels about lovers who were representative of clashing social groups, he was urging society to give up religious and national rancour (Scottish and English); in this way, he built up the symbolic base of a united nationhood of the United Kingdom. Stanley Kramer, director of the *The Defiant Ones* (a famous film of the fifties), inspired a new way of thinking about the relationship between races in the United States, through the symbol of handcuffs, which fastened a white man and a black man together.⁶

We could go on listing the functions of symbols in society, but we think that the most one is the final result of the symbolisation process outlined above. As we have mentioned, symbols eventually turn into elements of the everyday development and structure of society, and elements of the development and structure of individual personalities. Because symbols condense and include a crowd of associations, we can obtain very different experiences through them, and it is precisely by means of symbols that history – and experiences of history – can survive into the present.

Notes

1. Every moving thing equals itself, but it doesn't equal its existence-form in the previous or next minute. This has been a well-known experience

and theoretical problem, from Xeno's *aporia* up to present-day quantum theory.

2. Every metaphor corrects the thesis that A equals A. If a lover says, "You are to my thoughts as food is to life", he says the following: (1) The soul and the body are different things. The soul is not body, the body is not soul. The soul is soul, the body is body. A equals A. Amorous desire and hunger are different entities, and so are the instinct for self-preservation and the instinct for race preservation. A equals A, and A doesn't equal B. (2) But there is also a common denominator to them. There is an equality between A and B. I am not a cannibal, but somehow you are also food to me. And if A (*A'*) equals B (although we said earlier that A doesn't equal B), it means A (*A'*) does not (totally) equal A.
3. We find this "individualism" (and the contradiction of two value systems) at every moment of life. For example, at the table. If the lady of the house follows the rules of the traditional value system and serves you soup, it would be offensive if you were to add more salt to it. It is an offense because, in the traditional value system, all women want to be "like the others", to conform to the norms of a community. To say that her soup has too much or too little salt is to say that her cooking was not adequate, not "normal". In the individualistic value system the basis is not the "norm", but the individual. In the latter system, it is okay to eat the soup as you like it, according to your personal taste.
4. The "binary oppositions" of Lévi-Strauss become important *at this moment*, at the birth of a symbolic meaning. Most symbols are born in tandem with their opposite. Individualism became a symbol of modern man, as compared to a former sense of community. When we use the word "individualism" in a pejorative sense, it takes on an antipathy to "altruism". Still, the word "individualism" has many other possibilities for comparison besides its opposite.
5. We don't have enough space here to enter into details. We have, however, written a monograph in which we consider different types, modes and sources of adaptation as elements of human adaptive behaviour.
6. In our monograph on human motivation (Kapitány and Kapitány 1993), we present how the experiences of an age of human history are built into the personality, serving as an element of an individual's motivational system.

Ágnes Kapitány and Gábor Kapitány

Visual symbols of political system-change in Hungary

A longitudinal study

In this presentation we would like to show the results of our longitudinal research. The first step of our research was taken in 1985 (published in 1989). The research was about visual messages (mainly symbolic ones) of cultural institutions. We used the term “cultural institution” in a broad sense, which means that we analysed not only schools, nurseries, houses of culture, cinemas, libraries (cultural institutions in the traditional, narrow sense); but also institutions of power (party headquarters, local government buildings, council offices); as well as institutions of religion (churches, parishes), and institutions of consumption (restaurants, cafés, pubs, clubs, etc.). Thirty thousand photos were taken in 1985, and we analysed the symbolic visual messages conveyed by three thousand institutions. The main aspects of the analysis were the following:

- symbolic signs of *hierarchy*
- “Potemkin-syndrome” (the difference between the front side and back side of the same institutions)
- *aspects* concerning the degree of civilisation in the institutions (the hygiene, condition of lavatories, etc.)
- the *gardens*, natural surroundings of the institutions
- *design*, visual culture of the institutions
- *proxemic* analysis of the institutions
- symbolic signs of *identities*
- key *values*, transmitted by the institutions
- signs of dominant *ideologies*
- *cultural patterns* transmitted by the institutions
- *social patterns* transmitted by the institutions
- *centre--periphery* distinction
- signs of *creativity* in the institutions
- signs of *intimacy*

In 2005 we repeated the research (see Kapitány and Kapitány 2006), at which time approximately five hundred institutions were analysed and twenty thousand photos taken. By comparing the two states, we can register similarities and differences. Between the two phases of the research there was a change of political system in Hungary, which caused a lot of essential changes even of the general visual impression of the institutions. For reasons of space, we next present only some results of the analysis.

1. Changes in symbolic (visual) signs of hierarchy

Hierarchy of different types of institutions. In 1985 we were able to rate the institutions based on differences in their condition. These differences generally reflected the formal and informal status of the institutions. The ones in the best condition were council houses in bigger cities and county towns; churches, restaurants and nurseries; the ones in the worst condition were village halls, rural primary schools, and cinemas. Council offices are symbolic institutions of political power; restaurants can be symbolic places of financial prestige; the good condition of churches was a manifestation of the compromise between the communist state and the churches in “late socialism”. The good condition of nurseries was a result of the reigning attitude in the eighties, as the expression “investment in the future” shows. The very bad condition of village halls, small schools and cinemas expressed the submissive role of culture and education.

In 2005 the hierarchy of different kinds of institutions was less definite; the differences were expressed more among different items of the same type of institution. While earlier the centralised power determined the possibilities of the institutions, after the system changes several factors of differentiation appeared, and the variability of the condition of institutions has increased.

2. Internal hierarchy of institutions

Another form of hierarchy is internal to institutions. We can recognise the symbolic signs of this hierarchy, if we register the dissimilarity between the level of comfort and the visual state of rooms used by managers, directors, bosses on the one hand, and on the other the rooms provided for white-collar and other workers at the same institutions.

(a) A very important element of the symbolism of power is the wall behind the boss's chair. The symbolic suggestion of this part of the space: *who* or *what* is behind, at the back of the manager (who or what is his/her supporter). In 1985 this symbolism was determined by the one-party system, by communist ideology. There were portraits of the "Fathers", the Marxist "Holy Trinity": Marx, Engels and Lenin, or Lenin alone. Lenin as the embodiment of Soviet supremacy was indispensable. His portraits were rather varied. We could draw up a Lenin-iconography: the more bureaucratic bosses were drawn towards the stern official portraits of Lenin, the more liberal bosses used pictures of Lenin in a less "official" mode (for example, crouching on a staircase). These portraits and the national coat of arms behind the boss suggested that his supporter was the political power, the dominant ideology itself. But there were also other signs of power behind the boss, with many symbolic signs of victory; the signs of successes of the institution (medals, cups, honorary diplomas). These "meant": the power of this boss was also based on his successes; i.e., the authorities recognised his achievements. The bosses used some other symbols on this wall: mostly military symbols and symbols of cultural authority.

After the system changed, so did these signs of power. In 2005 we saw no relics of communist ideology. Instead there are pictures that symbolise cultural-historical traditions. No more symbols of only one ideology: the monolithic party-power was followed by a multi-party system; the one-sided political power was followed by a society governed by different (economic, financial and political) interests. The power of a chief is not based on his or her unilateral loyalty. A significant expression of these changes is that there is "nobody" behind the bosses' back. Sometimes we can see symbols of state authority, such as the Hungarian coat of arms, and Hungarian and EU-flags. (Sometimes the arrangement of these flags copies that of the presidential office in the USA.) But the most typical place for the boss's chair is in front of a window. What is behind the manager? The life of the street. It is a symbol of democratic legitimisation, and of a close connection to reality. Since the window has become the "main wall", the curtain has become one of the most important symbols of prestige.

(b) Some signs of power remained. The objects and pictures, which suggest the atmosphere of history, the measure or the (antique) style of tables and wardrobes, and their ornaments refer to power at any time.

(c) In 1985 almost every boss's room had three parts, three spaces: the writing table, the desk and its surroundings (like the conning tower of a ship); a long conference table with hierarchical seating, and a coffee table with comfortable armchairs for “informal”, “unofficial” communication. In 2005 there was an interesting change: the conference table was generally connected to the desk – this change can express the increasing importance of communication and team-work.

(d) After the system changed, signs of local authority became more important. This is another symbolic sign of decentralisation. In 1985 it was very rare, but in 2005 flags, coats of arms, and local maps were designed for even the smallest villages, and used in different rooms of local council offices; these local signs are imprinted on different objects.

(e) The monopolistic position of managers (and its signs in the manager's rooms) was a further typical symbols of the internal hierarchy. The bosses *monopolised* the objects of *comfort* (refrigerator, comfortable armchairs, divans). The objects of *communication* (newspapers, TV, videos, telephones, computers) and some objects of their rooms suggest *secrecy* (safe, padded door).

There were some remarkable changes in 2005. Namely, objects of comfort also appear in the rooms of subordinates, and bosses have new symbols of prestige. These last (laptop, mobile phone, DVD-player, etc.) express a new, more mobile style, a more independent form of managerial work. The symbolic function of telephones also changed. In 1985 the number of telephones was a symbol of prestige. (Some of the leaders had 4, 5 or 6 telephones on their desks, expressing their importance. It was the main function of this phenomenon, because nobody can use more than two telephones at the same time.) In 2005 traditional phones were changed to mobiles, and now the type, quality, brand, high-tech functions of the mobiles (private mobiles, official mobiles, etc.) have become new symbols of status.

(f) In 1985, in the time of centralised power, the objects representing achievements of the institutions (cups, diplomas, etc.) were also exhibited in the bosses' rooms. In 2005 we observed signs of decentralisation in this respect: the majority of relics of successes can be found in common areas. This suggests that the successes of the leader are not connected only with the leader, but are the results of teamwork; they are achievements of the whole institution.

(g) Lastly, we could observe changes in the proportion of the three types of power (economic, political and intellectual-academic). In the fifties an unambiguous dominance of the political power was significant. In 1985 there was a balance of the three types of power. In 2005 we observed the dominance of economic, financial power. (In the institutions it was expressed, for example, by the multiplication of advertisements, the emphasis on the role of money, the increased importance of sponsors, the thematisation of competitions, and financial results.)

3. *The “Potemkin syndrome”*

The well-known story: Prince Potemkin invited Catherine the Great to show her the development of the county, and a new village was built for the visit. But only the front side, the front walls of the houses were made; behind these walls there was nothing. The essence of this story lies in the contrast between the visible and invisible, the illusion and the reality – such is the symbolic sign of a highly hierarchical world, where the opinion of the authority is the most important factor. This phenomenon is characteristic of different societies and different cultures, and in varying degrees. There is a very lucid analysis by Janos Kleinesel (1981), who compares the Scandinavian type of Protestant tradition with the Catholic culture of the Habsburg empire, and points out the dominance of the “Potemkin syndrome” in the latter. In the first model the exterior of buildings is simple, but the inner parts have an intimate and cosy character; the main values came from Puritanism; in the second model, the exterior has a bigger importance. The main aim is representation; the decoration and the symbolic signs of power are very important; there is a great distance between up and down. The buildings of the second model show everything upward and outward.

The majority of our institutions wear signs of the “Potemkin syndrome”. The changes in the last twenty years were not significant in this area. The “Potemkin syndrome” appears in three relations, three types of contrast: First, there is a sharp contrast between the front of the institution facing the street, and the back of the institution. (The front is in a relatively good condition; renovated, decorated, etc. The back of the building is in a worse condition, the walls crumbling, rubbish accumulating around them.) Second, there is a similar contrast between front gardens and back

gardens. The front gardens are well-kept, with a lot of flowers, while the back gardens grow wild, and are often the place where rubbish and building refuse is dumped. The third contrast is between the visible and invisible parts of the institutions. (Invisible parts are for example cellars, lower parts and landings on staircases, places under counters, and so on.) The contrast appears in most of cases as the difference between order and disorder or as the difference between new or renewed parts and neglected parts. These different signs of the “Potemkin syndrome” were very frequent not only in 1985, but nowadays also, and symptomatic signs can be seen in every kind of institutions (even in churches).

4. Changes of civilized conditions (condition of lavatories, toilets)

As Norbert Elias wrote, one of the main indicators of the development of civilization are the methods of alimentation and excretion. Some years ago the distance between living standards and civilizational development of Western and Eastern Europe was very perceptible in the better and worse condition of toilets.

In 1985 the toilets of Hungarian institutions were generally in very bad condition; many were without running water, and there was a very great difference between cities and villages. Moreover, there was also a rather great difference between the Eastern and the Western parts of Hungary.¹

In 2005 we found much better conditions: running water, drainage, cleanliness, repaired rooms, nice tiles. At schools and nurseries there were separate toilets for boys and girls – as a sign of individualisation. This was not typical twenty years ago. The general effect is very good. But we do not want to hide the fact that in 2005 we were unable to visit as many small villages as we did in 1985, so our sample is not fully representative. Neither do we want to conceal the fact that, while the majority of analysed toilets were in good condition, the conditions of others have declined in a short time because of careless usage.

5. Individualisation – Changes of values

The history of modern societies is marked by the increase of individualism and individualisation. This process became widespread in the 17–18th

centuries in the most developed countries (cf. Habermas 1962). However, in Eastern Europe it happened more slowly; for example, in Hungary individualisation started in the 19th century and became widespread in the 1960s.

In the sixties, individualisation conquered private life. It was very impressive in housing: the building of separate bedrooms, bathrooms, children's rooms are a symbolic sign of individualisation, because the main function of these rooms is in connection with the possibility of having privacy and intimacy. These rooms appear everywhere, when the importance of individuality become one of the main values. In Hungary these kinds of rooms appeared and spread even in small villages in the sixties.

In the eighties, individualisation also contributed to public life. The elements of the individualistic value system became central values in society. Competition (among individuals) became a key value. Individual efforts and results were emphasised versus efforts and results of communities. Private, individual responsibility was emphasised over state responsibility. Neo-liberal ideology reached a dominant position in the economy (and after the system change it penetrated healthcare, education, culture, research funding); the market became the bases for every choice. At the time of the system change, the welfare model of capitalism seemed to have won over communism; but in recent decades the neo-liberal model of capitalism has begun to displace the welfare model.

The individualisation process has positive and negative aspects. Its positive aspects are, for example, the possibilities of having privacy, intimacy, independence. Some of the negative aspects of individualisation are the absence of solidarity, alienation, loneliness of individuals, the generation gap, ruthless competition, frustration, and anxiety.

We can see a lot of symbolic signs of individualisation in our surroundings. For one, we find more and more private spaces in institutions, more and more space for talking, for relaxing, for private meetings, etc. Also, the designers of institutions tend to divide up the large spaces (spaces for masses), replacing them with intimate corners and sitting places. We also find more and more signs of personal achievements on display, and people surround themselves with personal objects (souvenirs, gadgets), thus personalizing their workplaces. They show events of their private life (birth of children, weddings, etc.). If a colleague dies, they create a memorial to his or her memory.

There is a special sign of individualisation at schools. In the sixties a strict line of seats was typical; the school-desks were clipped together. In 1985 the seating was a little less rigid; then a typical form was a table for two persons with two chairs behind it. In 2005 the line of seats sometimes was replaced by a circle of tables and chairs, or a round table. Sometimes we can find a table and chair for one person: everybody has a private – and mobile – sitting place. This particular trend has also spread to churches, where traditional, long seats have been replaced with separate, moveable chairs.

6. Symbolic signs of ideologies

One of the most impressive changes of the last fifteen years was the change of ideological signs. In 1985 the symbols of the Marxist-Leninist ideology dominated the visual effects of the institutions. Five pointed stars (pentagrams), portraits of Lenin or the aforementioned “Holy Trinity” were everywhere; with a lot of formal slogans, and signs of formal official celebrations around them. The militaristic character had lessened since the fifties, but some signs of it remained visible, even at schools. (At that time the main associative circle around socialist ideology was the atmosphere redolent of the “happy days of youth”.)

It is a self-evident fact that the Marxist-Leninist ideology was totally gone in 2005. Some symbols of it might be found in special restaurants, where these relics played a double role; mostly they are a means of irony, a caricaturist reflection of a dead system, but at the same time they could be instruments of nostalgia for believers in “socialism”. We were eager to know which ideology had taken its place in the last decades.

6.1. Religious symbols

We supposed that we would find a lot of symbols of rehabilitated religion. This hypothesis was verified only partially. In 1985 Marxism was the official “religion”, which used many elements of religious symbolism. Communist heroes were portrayed as “saints”, sometimes with a halo of light around their head. Communist slogans were similar to religious slogans such as “Faith, Hope, Love” and the like; the “communist future” had a similar character, something like the Christian “heaven” and similar.

At that time the signs of religion (in the traditional sense) were visible only in churches. After the system change, the official “quasi-religion” disappeared and freedom of worship was restored. Some schools became ecclesiastical (again), crosses (and sometimes Menorahs, as well as symbols of Buddhism and other exotic religions) appeared in public squares. We could find some symbolical signs of traditional religion (crucifix, Bible, angels, saints, Virgin Mary, doves and other symbols) at various places – not only in churches and ecclesiastical schools, but in nurseries, state schools (as themes of children’s drawings or other decorations), in libraries, and even in some restaurants²). But this tendency did not become general.

6.2. Symbols of the “green” ideology

The idea of environmental protection became popular in the last decades of the twentieth century. This “ideology” has a lot of manifestations in different institutions. At schools and nurseries there are green corners; rooms and corridors of institutions are sometimes overwhelmed by green flowers; there are collections of samples of natural beauty (rocks, shells, etc.); many photos of beautiful landscapes; several notice boards, bearing posters with the themes of environmental or health protection. They often thematically portray the danger of pollution, assorted healthy and unhealthy foods; they also contrast the facts of pollution with the beauty of untouched nature. Gardens became organic parts of institutions, and are much better cultivated than earlier. Restaurants set up more and more sitting places in their gardens. In short: Nature became a key value.

6.3. Symbols of national identity

After the system change national ideology and national traditions received greater emphasis. Signs of national identity are found in different institutions. National colours (red-white-green) are emphasised on different objects. National flags fly at almost every institution, but after the system change they also appeared on private houses and in the gardens of private houses, which became a sign of the emphasised declaration of national identity. In institutions the symbols of emphasised national identity are those of ancient Hungary or symbols of Hungarian conquerors (of the

9th century). A frequent symbol of national identity is the old map of the historical “Greater Hungary”, which shows the country before the Trianon decision. (After the First World War, the Trianon Decision caused Hungary to give up two thirds of its former territory.) Glorious events of national history, famous representatives of national art, national sport heroes are also frequent symbols of national identity. We often find their representations at schools and other institutions (nurseries, restaurants and naturally in council offices). Sometimes we can find national symbols (for example, flags) even in churches: religion and national feeling are connected. National identity is also closely connected to tradition. For a long time, it was a guarding of peasant traditions. It is an interesting change that in the last two decades “tradition” has become associated with a higher social status, and the guarding of traditions has been concentrated rather on those of the nobility and the *bourgeoisie*.

6.4. Symbols of the EU

The symbolic signs of the EU are presented as representations of a new (artificial) meta-national identity. In Hungary these symbols are most used by the liberal and socialist parties. The EU has only a few symbols: the obligatory flags, the stars of the EU, maps (showing members of the EU). We can find information posters, about EU tenders, or about different courses, which prepare their participants for accommodation to different expectations of the EU. A special symbol is the “EU-tree”: in some places memorial saplings are planted on the day Hungary joined the EU.

6.5. Symbols of consumption

The ideology of market and consumption has become the strongest of all ideologies since the system change. The main signs of this ideology are as follows: a plethora of advertising;³ cults of money, riches, and celebrities (these cults appear in many elements of everyday life: on posters, in newspapers, on TV, etc.). A typical instrument of this cult of money the slot machine; this instrument of gambling appears in nearly every place of amusement. Symbolic messages of media enforce the idea that the aim of life is amusement, consumption, and hedonistic pleasures.

The “flagship” of the mainstream is the US; hence symbols of the US are closely connected with this ideology. Symbols of the US (and Anglo-Saxon world) have become status symbols, signifying richness and the (successful) market-economy. These have penetrated into various areas of everyday life. Signs of this process include: the prestige of the Anglo-American language; Anglo-American trademarks; the celebration of typical Anglo-American holidays (Halloween, Valentine’s Day, Challenge Day); increasing popularity of typical Anglo-American sports (baseball, golf, basketball); and the successes of American products (such as Coca Cola or McDonalds), which embody a typical feeling and way of life.

If in 1985 we could draw up a Lenin-iconography, in 2005 we could have drawn up one for Coca Cola.⁴ Signs for this beverage appeared everywhere, even in nurseries, party headquarters, etc., and in very different forms. Coca Cola advertisements appear in different sizes, from match-boxes to the bulkheads of multi-storied houses; on different objects (parasols, sunshades, fences, signboards, posters, kitchen counters, on refrigerators, and so on). The “Coca Cola Universe” spans the whole century: there are old advertisements which breathe the atmosphere of nostalgia, and there are pictures of young (dynamic and carefree) men and women, who wear up-to-date clothes and present the signs of fashionable behaviours. Coca Cola sometimes gets into very strange contexts: we can see, for example, a Coca Cola advertisement next to a Che Guevara poster (in a club), or a huge Coca Cola advertisement in the entrance of the office of the formal communist party. Coca Cola has a very wide circle of symbolic associations. It is a symbol of the American way of life; a symbol of the “free world”, the symbol of richness and a high standard of living; the symbol of modernity, the symbol of urban civilisation and sometimes the symbol of uniformity, the symbol of unhealthy life styles, etc.

6. Conclusion

To sum up: the change in the political system provoked a lot of changes in the visual and symbolic sign systems of Hungarian institutions. One part of the changes is a result of the advance of Hungarian society as one of the central countries of the European Union, by making accommodations to a higher civilizing standard and more democratic forms. Other changes reflect the transformation of value systems (individualisation, dominance

of market economy, and so on). The changes of symbolic elements of our visual surroundings are results and – *last but not least* -- instruments of the transformation of society's values, ideologies, and systems of political power.

Notes

1. The reason for this may be explained by the fact that the Danube – the Roman Empire's border – was a demarcation between “civilized” and “non-civilized”; the consequences of this gap, according to one theory, exert an influence on the mentality and the cultural traditions of people who live on opposite sides of the Danube, which flows through the middle of Hungary.
2. It depends on personal leanings: if the owner of a restaurant, or the director of a library is religious, he can (and may) put a cross or an icon on the wall.
3. A bibliography of advertising would fill an entire library. Our main “guides” were Packard (1964), Baudrillard (1984), Pratkanis & Aronson (1992).
4. Coca Cola has become an idol, a product with its own mythology, in the same sense as Roland Barthes (1957) uses this category; hence to draw up its “iconography” would be a normal task for a cultural anthropologist.

Montage vs photogénie

Cinema and mythological language

One of the most dominant topics in semiotics of cinema elaborated in the West in the 1960s and early 1970s was the “verbal-visual nexus” in cinema. The interdependence of the verbal and the visual in cinema has been asserted, denied, and generally critiqued by film theoreticians. The coexistence of iconic and conventional sign-process in a filmic text is an unavoidable theoretical subject for semiotics of cinema.

On the other hand, the dichotomy between the verbal and the visual opens up a host of further, directly or indirectly related problems. Specifically, the opposition between two different aesthetic positions is manifested as “montage” vs “*photogénie*”. Montage theory was based on aesthetic of narrative structure, that is, the *language-based* aesthetic, and thus reflected the rationalistic character of that aesthetic, whereas the term “*photogénie*” implies a dimension which exceeds language and thus embodies the indeterminate character of an *image-based* aesthetic. As is well known, the concept of *photogénie*, generated by the French Impressionists in the 1920s, was designed to account for that which is inarticulable, that which exceeds language and hence points to the (visual) essence of cinematic specificity; it “names a supplementarity, an enhancement, that which is added to an object in the process of its subjection to a photographic medium” (Doane 2003: 89).

From the semiotic viewpoint, *photogénie* is associated with the indexical aspect of cinema, rather than the iconic. Of course, photographic (and cinematic) image has iconicity in that image resembles what it represents, but in respect of sign type it corresponds more to indexical sign. Photographic image, made by mechanical reproduction (by camera) first of all – is a “trace” (imprint) of referent, which is related with the sign not by rule of resemblance but on the principle of contiguity and causality in Peirce’s sense (Peirce 1931–58: 281, 554): *Photogénie* is pure fact of presentation, of

showing – a “here it is”, while montage is always a relation (“collision” for Eisenstein), a connecting of parts; *photogénie*, as a rule, is an autonomous entity, a “for itself.”

But what is more problematic in this concept is its semantic aspect. The concept of *photogénie* as autonomous entity seems to be aiming at a certain level of “beyond” the cultural signification. Paraphrasing Barthes’s terminology, we could say: whereas the iconic sign process in cinema is still regulated by the rule of “cultural code” and for that reason can be regarded as “*studium*”, the photogenic level in cinema seems to verge on the zone of “*punctum*”. It is not the domain of communicative and symbolic meaning, conditioned by cultural context. Rather, it comes to “break through” the complacency of that first. It is what “pricks,” “wounds” and “bruises” me, but at the same time I can’t grasp its meaning clearly – it is a certain “outside (*hors-champs*)” of the meaning (Barthes 1981). As is well known, in another article on cinema Barthes proposed to call this “excessive” level of signification the “obtuse meaning”:

As for the other meaning, the third, the one “too many”, the supplement that my intellection cannot succeed in absorbing, at once persistent and fleeting, smooth and elusive, I propose to call it *the obtuse meaning* ... it already provides us with a theory of the supplementary meaning ... the obtuse meaning appears to extend outside culture, knowledge, information. (Barthes 1977: 54–55)²

It is hard to say what exactly Barthes meant when he called this inarticulable level “the filmic”, but there is one thing we can say with certainty: whatever it might be, it’s not the same as the iconic sign. That dimension of “the other,” which is not fully covered by the process of cultural signification, obviously verges on a zone “beyond” semiotics, so to speak, “outside culture, language and codes”.

We can sum up the main question as follows: how can semiotics of cinema deal with this elusive and ineffable phenomenon, which is extremely hard to manipulate? Two paths might be taken. The first: we can resolutely refuse this “other” dimension of meaning, adhering to the classical position of film semiotics, regarding all iconic level in cinema as culturally coded. The second: we can decisively throw out a few basic assumptions crucial to the semiotics of cinema, already by and large relying on the phenomenological position. While the former asserts that there is no com-

pletely autonomous cinematic image which is outside of cultural codes (Eco 1985),³ the latter insists that cinematic image isn't a sign (system) in origin (Ямпольский 2004).⁴

What I intend to try in this paper is not groping for a final solution for this dilemma. Rather, my question is quite simple. Do ways exist for seeing this specific kind of cinematic phenomenon whose domain cannot seem to be explicated fully by the semiotic model, not just rejecting it altogether or allocating it to a transcendental (mysterious or subjective) realm? Then, will there be any alternative way to explain this, admitting the problematic aspect of this situation? In the following, I will try to demonstrate how U. Lotman's view on cinema, in particular, his thought on the "mythological" essence of cinema, can provide productive insight on this question. In the course of this argumentation I hope that the profound meaning of this important "the other" in modern film theory and its inevitable (supplementary) value for semiotics of cinema can be revealed.

First of all, it is noteworthy that Lotman's interest in mythological essence of cinema is far from being the main part of his semiotics of cinema. On the contrary, we have to say that it is extremely marginal. Naturally, we can't find his interest in myth around such familiar topics as the problem of cinematic language system (montage) or correlation of two different (conventional and iconic) sign processes in cinema. Rather, it is found at the most elementary level of cinematic phenomenon – namely, the problem of (re)presenting humans on the screen. Lotman's idea in relating cinema with myth is originally derived from the question of appearance of a person on the screen.

This question, which is essentially associated with those problematic concepts that I have already mentioned – Epstein's "*photogénie*" and Barthes's "obtuse meaning" – was, as is well known, at the same time the main topic for the film theory of B. Balazs in the name of "visible man" (Balazs 1924). According to Lotman, this question "created a situation which was so new, in a semiotic sense, that it was not a question of mechanical development of some already existing tendencies, but of creating a new language" (Lotman 1976: 85).

Then, in which sense and to what extent does this elementary level of cinematic representation have something in common with "the mythological"? Before answering this question, we have to know what Lotman means by the notion of "myth". Lotman's interest in myth is not about a specific

narrative text or structure of mythological plots. Speaking of “the mythological” he always means myth as a specific “phenomenon of consciousness”, according to which a special (mythological) type of world model is constructed (Lotman & Uspenskij 1977: 234).

In the mythological world, the governing rule of semiosis is quite different from the ordinary type. According to Lotman, “in a mythological world ... a quite specific type of semiosis occurs, which amounts to a process of naming: the sign in mythological consciousness is analogous to a proper name” (ibid.: 235). In myth everything – not only human beings but also all objects – has its own name. An object’s appellative in the mythological world also has its individual proper name (Roland’s sword is *Durendal* and Sigfried’s sword is *Balmung*).

The proper name is itself a quite specific component in our natural language. Name does not mean certain abstract model of object, or conception about it, but only designates the object to which this name is ascribed. As Roman Jakobson has properly commented, “proper name ... takes a particular place in our linguistic code ... there are many dogs called Fido, but they do not share any property of ‘Fidones’” (1971: 131). Owing to its principal individuality (singularity), the proper name is not able to be translated to any abstract generalized sign. It is not a sign, which can be separable from object being signified, but is its indivisible feature.

But an even more important feature of mythological semiosis in relation to the proper name is its supremely “intimate” character. Using proper name does not only mean the principle of “singularity” of the object being referred to. This single object must be directly known to the one who calls it; a name “Mary” can acquire its genuine meaning only for the person who knows the woman called by that name. Therefore, as far as everything (even object-things) has its own name in this world, this world is made up of extremely “intimate” relations. In a world where everything is called by proper names, everything must be extremely well known, familiar and intimate to everyone.

It is not difficult to understand to what extent all of these features characteristic of “the mythological” are also essential for cinema. According to Lotman, presenting everything as something old, kind, familiar and so closely correlated with people, is not just a typical feature of myth, but also of cinema. If a portrait can be regarded as a “proper name in the language of plastic art”, this definition fits even better for cinema. In a certain

sense, cinema is none other than a proper-name world, where we can see a series of images-shots “portraying” someone or something. Just as every common noun in myth can be functionally equated to a proper name, cinema transforms whatever it films into an extremely intimate thing, which is characterized as non-repeatable individuality. And exactly this kind of “mythologizing” role in cinema, according to Lotman, is played by the “close-up”:

The close-up in cinema can voluntarily be associated with seeing a live human face at extremely close distance, seeing – typical for a child’s or a very intimate world. Cinema brings us to the world, where every person appearing on screen – friend and enemy – is interrelated with spectators in an extremely close, intimate relationship. The relationship in this case means not only knowing an actor’s character in detail, but directly seeing wrinkles on his face and the minute pulsing of his veins. (Lotman 1998: 658, translation mine)

Close-up in cinema – it is seeing a human face very closely. In Lotman’s context this can actually mean that in cinema we don’t see a human face as a common name, but as a proper name. What we see in cinema by close-up is not (only) a “role” of an actor, but the “actor” himself as a proper name. He is an individual singularity, which in essence can’t be translated (that is, generalized) into common names.

The problem is that the “face” of an actor, or more accurately, the image of his face on screen, can hardly be completely explained as a “cultural sign”. Of course, his face, his body, and further, all of his “techniques of body” (Буракова 2005) can be regarded as cultural signs and interpreted as such. They can be described in various axiological, ethic and aesthetic categories, and these categories themselves are also changing by cultures and ages.⁵ But is that really all? All together with these, on screen we come to see an actor as a phenomenological object. It is the face of man as *punctum*, which can never be fully “used up” by the *studium*. Quoting J. Aumont, we can say: this face is a book, a “readable text” that demands to be read, but at the same time it is a deeply experienced entity, a “sensible thing” that is to be an object of affection (Aumont 1992: 85).

The human face is the very best site for experiencing “excessive” sensual meaning. As is well known, exactly in this site Epstein, Balazs and Barthes sought to affirm the existence of the problematic “other” level of significa-

tion – an autonomous entity as potential semiotic threat. The close-up, which once had so deeply fascinated Epstein – he called it “soul of the cinema” (Epstein 1977: 9) – was at the same time one of the main topics in the so-called “physiognomic” film theory of B. Balazs (1953).⁶ Just like all common names functionally changed into proper names, the close-up transforms whatever it films into a quasi-tangible thing, producing intense “phenomenological” experience of presence.

What I want specially to emphasize here is the principle of “alterity” of mythological semiosis in Lotman’s concept. According to Lotman, “from the viewpoint of the development of semiosis, mythological consciousness can be interpreted as <asemiotic>” (Lotman & Uspenskij 1977: 236). It must be taken as “asemiotic” exactly – it can’t be “nonsemiotic”, for example, because it refers to the “outside” (beyond the bounds) of semiosis rather than just denying it, as it just goes with the notion of *photogénie*: “Epstein’s *photogénie* – the invocation of an otherwise unknown dimension, a radically defamiliarized alterity” (Doane 2003: 91).

The unquestionable advantage of Lotman’s association of cinema with myth is that in his idea we don’t have to set aside (that is, transcendentalize) this “asemiotic” dimension of signification as some mysterious “thing-in-itself”. In the theoretical framework of Lotman, we could have a chance to admit positively this “other” level of semiosis in the name of “the mythological”. Obviously, it might not be the one which could be reconstructed “as it is” by our ordinary natural language. Nevertheless, we could affirm its undeniable existence and constant influence left in the form of trace: in poetic metaphor,⁷ in children’s child’s semiosis and particularly in the proper name. According to Lotman, the asemiotic level of mythological type is just “another” legitimate side of semiosis, which expresses an essential property of our consciousness – namely, the “heterogeneity” principle of our thought (Lotman & Uspenskij 1977: 239).

Actually, this heterogeneity must be proved in one more important moment – namely, in the “pragmatic” aspect of mythological semiosis. The mythological type of communication is in essence an “I – I communication” (autocommunication) rather than an ordinary type of “I – (s) he communication”. (Myth always speaks about me, and its meaning is tautological in principle.) This aspect would be the key for explication of the indispensable “subjectivity”, crucial to the concept of *photogénie* (and *punctum*). But this will be the subject for another separate article.

So, what Lotman's mythology tells us again in relation to the "another" dimension of cinematic signification is the principle of "heterogeneity" of our consciousness and culture. Apparently, we are still more accustomed to making extinct the dichotomy between various oppositional parts: language vs image, symbol vs icon, the logical vs the sensual and *montage vs photogénie*. A more productive next step must be taken in the direction of finding some "mixed" area, by which we can prove the imperative necessity of their coexistence and interplay. For instance, an attempt to find a "phenomenological" aspect in montage theory or to verify reflection of "proto-logical" thinking in Eisenstein's sensual images (Ямпольский 2004; Yampolsky 1993) would be appropriate examples of this. But in order to do that, first of all semiotics of cinema itself has to develop so that it could meet the quite "unfamiliar self" inside oneself.

Not long before passing away, Lotman expressed his wish for the Moscow-Tartu School as follows. It seems also to be relevant for semiotics of cinema today:

Scientific thought ends up when its bearer starts to make every effort to protect purity of principles. The snake, as symbol of wisdom, grows up, throwing off its skin. The idea also develops, outgrowing itself. (Lotman 1994: 501 translation mine).

Notes

1. "Photographs, especially instantaneous photographs, are very instructive, because we know that in certain respects they are exactly like the objects they represent. But this resemblance is due to the photographs having been produced under such circumstances that they were physically forced to correspond point by point to nature. In that aspect, then, they belong to the ... class of signs ... by physical connection [the indexical class]." Peirce, *CP*: 281, 554.
2. According to Barthes, this third meaning constitutes the essence of cinema, what he calls "the filmic", which "begins only where language and metalanguage end" (Barthes 1977: 64).
3. "A semiotic of film is possible if one accept that semiotics is neither a province nor a byproduct of linguistics. But one should at the same time accept the hypothesis that movie images 'say' something and, since not everybody understands them, there must be semiotic rules governing this kind of communication ... A semiotics of cinema and film is still to be completely

- outlined. But its laws lie outside cinema and film, they are the laws of signification in general” (Eco 1985: 206).
4. “Today, I think, the most important thing is to abandon the assumption that the essence of cinema – whether it is iconic sign or not – is a sign process, and that we must regard it as a specific kind of sign system. In our consciousness we never operate with iconic signs, which are given to us as a representation of something not here existing” (Iampolsky 2004: 10, translation mine).
 5. Oksana Bulgakova’s (2005) latest study on how cinematic “gestures” become signs might be taken as the best example of this position.
 6. “But the camera gets so close to the face that it can show ‘micro-physiognomic’ details even of ... regions of the face which are scarcely or not at all under voluntary control” (Balazs 1953: 74). For Balazs, the close-up image is inherently anthropomorphic; it always represents a face, human or otherwise.
 7. Strictly speaking, poetic metaphor is not mythological. It is “a natural translation of the myth in our habitual forms of consciousness” (Lotman and Uspenskij 1977: 240; hence the fundamental distinction between myth and metaphor.

Karel Kleisner and Anton Markoš

Mutual understanding and misunderstanding in biological systems mediated by self-representational meanings of organisms

1. Three models in biosemiotics

The key word in our title is *mutual*. We maintain that, for a genuine biosemiotics, it is necessary to develop a model of a biosphere of communicating, semiotic entities. To illustrate this need, we briefly describe three competing models, each in some context labeled “semiotic” by various authors.

(1) At the level of *organic codes* (Barbieri 2003), the task is to produce a reliable translation of one coding system into another, according to a given and finite coding table. Hence, what is given beyond the physical system are rules obeyed by either a sentient being or by *hardware* of a sort. It follows that, at this level, the quasi-semiotic process does *not* require understanding, and no meaning is being extracted during the process. Examples of this level include the genetic code, signaling cascades, and perhaps also the bacterial biosphere. All cybernetic networks are included at this level.

(2) The second level concerns the understanding of signs in one’s Umwelt. The being (animal) recognizes signs in its environment and reacts to them accordingly. The paradigmatic example here is that of the “oak tree”, as given by Jakob von Uexküll (Fig. 1).

The tree is perceived differently in the various Umwelten of different living beings (the forester, the girl, an occasional tramp, the insect inhabitants of the tree, etc.). The tree, however, has no say in *how* it will be present in those Umwelten. It is passive in relation to them as is, say, a stone or a cloud. More precisely: like a stone or a cloud, it also can evoke meanings

Figure 1. Different interpretations of the “same” oak tree in the *Umwelten* of a forester and a frightened girl (after Uexküll 1956).

for all those beings, but without manifesting any interest from its side, nor putting forth any effort to signify something.

(3) Finally, there is a level of shared space and of mutually and deliberately influencing other players in the game, by recognizing them *as* possible receivers of the message. On this level belongs the concept of *biosphere*, the Heideggerian concept of being-together (*Mitsein*), and Portmann’s notion of self-representation (*Selbstdarstellung*). Here, all living beings communicate *actively* with their co-habitants in the environment, and in doing so display the whole gamut of interactions: orders, deceit, mutual warnings, consensus, mimicry, and more. What living beings communicate here is the presentation and perception of likeness; i.e., a gestalt of *some* cues by which a being gives itself to others, and which others will recognize as such. We maintain that deep understanding of one’s partner(s) is a prerequisite of such phenomena. Here, we shall concentrate on this level at which meaning is communicated.

2. Self-representation

Adolf Portmann suggested that the visible surfaces of living organisms represent new kinds of organ; these perform the self-representation of the inwardness of organisms and interactions among organisms: “Such a surface is not merely a ‘border’, not just a barrier for the containment of an inner milieu or for the safeguarding of metabolism, that is, for mechanical

protection. No. This surface becomes an organ with entirely new potentialities. ... The surface display is a part of the presentation of self of a living being” (Portmann 1990: 25).

In line with this view, the expressive pigmentation patterns and integument ornaments on outermost surfaces are conceived as a non-random, active achievement of a specific kind or lineage of organism. These organism surfaces, which may be quite intricate, play a semantic role; and despite their superficial nature, they are as important as other biologically adaptive structures. In what follows, we introduce different types of outermost organization developed by living beings, with special attention paid to the importance of surface ornaments to the mutual interplay between and within various life forms. We restrict our discussion here mainly to instances involving the optic channel of a receiver, though similar reasoning may be easily extended to other modes of perception, such as chemical, electrical, acoustic, tactile, and more.

Various shapes, patterns and colorations have evolved according to how they are perceived by another party, which recognizes them as a sign and interprets them within a specific context. As such, the external appearances of different life forms may be divided into those that play primarily a signaling role and those that do not, or those that take on such a role secondarily. As a good example of the latter, consider the semi-transparent bodies of embryos or of adult animals that inhabit environments where visual perception is confined or disabled (e.g., troglobionts, pedobionts). It is highly probable that the evolutionary transition from nonspecific semi-transparent bodies to intricately structured opaque surfaces (or conversely to full transparency) such as pigment patterns, physical colorations, and integumental ornaments, varies according to the evolutionary appearance of sight. This was an important evolutionary event that led to increase of communicative abilities among organisms.

In Portmann’s view, an aptitude for mutual understanding arises from a living organism’s accentuation of selfhood. The importance of this self-relation is manifested by the vital processes of self-construction, self-maintenance, self-identification and, very clearly, by *self-representation*. These features, which characterize every living being, are precisely those lacking in inanimate nature. An organism’s *self-representation of inwardness* – i.e., the active presentation of the self, in which the very innermost is expressed via the very outermost – represents the keystone of Portmann’s biological

thought. This was aptly expressed by R. B. Carter in his assessment of Portmann's writings: "Thus whereas Galileo said, 'Nature likes to hide,' Portmann saw that nature likes to reveal, but that very revelation quite often hides precisely what it is which makes that revelation!" (Carter 1990: 268). Simply put: mutual understanding among organisms depends on what is exterior, exposed, and hence easily perceptible; it also depends on something internal, something deep down inside, which cannot be discovered in any simple way. In this sense, every mutual understanding is mediated, on the one hand, via the externalization of inwardness in a process of self-representation, and on the other hand, via the internalization of signals that fit meaningfully the inwardness of a receiver, in a process or mode not unlike that of empathy. This inwardness can never be fully unveiled or comprehended by a researcher. It may, however, be partially revealed by study of the outermost expressions of organisms, such as specific features that have emerged in the process of self-representation. One way to understand the innermost is to analyse that which is outermost. Portmann's concept of inwardness (*Innerlichkeit*) may rightly be taken as a parallel to Uexküll's term, *Umwelt*; both of these concepts stand for the *self-experience* of an organism, i.e., for something that cannot be directly apprehended by a human observer. An organism's experience of "self" was the main quarry of both Uexküll's and Portmann's biological research.

3. *Organs of self-representation (semes)*

To conceive of an organism's visible surfaces as *organs of self-representation* allows us talk about these entities in terms of homology and analogy. These last are crucial for comparative biology, which deals with parts of greater wholes, such as body parts, organs and even organic processes (Ghiselin 2005). Therefore, to conceptualize *organs of self-representation* within the context of analogy and homology may help us to understand the manifold diversity of organic surfaces in biological terms, such as function, form, organization, phylogeny etc. Such kinds of biological explanation are of course very important; but they are insufficient if we want to gain a full understanding of organs of self-representational meaning; this is because their nature is not objective but interpretative. These organs are always dependent on the aptitude of the receiver's perceptual world (*Umwelt*).

Nevertheless, if we want to submit these semantic organs to comparison in terms of homology and analogy, we should first specify exactly what we mean by the term *semantic organs of self-representation*. And yet, how can these entities be compared, or even defined, if, as we have said, their performance may change according to the perceptual aptitudes of an interpreter? Any rushed attempt at definition may potentially lead to an inappropriate objectification. Nevertheless, in what follows we shall establish a preliminary definition of semantic organs in animals, using optical examples, that is to say, the semantic organs perceived by the visual interpreter.

Animal surfaces represent organs (or rather, organ systems) which are just *as* real as the internal ones, such as liver, lungs, pancreas, nervous system, etc. This does not mean, however, that the properties of the internal anatomy and molecular constitution of an organism have no effect on its external display. Semantic organs are visible motifs of animal display that are partially dependent on both the outer (skin, coat) and the inner (skeleton, muscles) constitution of a body. As Portmann (1960: 222) has shown, the color of internal organ systems, such as blood vessels and molecular qualities of hemoglobin (redness), may also contribute to the external appearance of an animal. The organs of visible surfaces are co-structured by various constituents, in the same way as the lungs, for example, are interlaced with nerves, blood vessels, integuments, etc. Semantic organs of visible surfaces function meaningfully if interpreted by the seeing eyes of an interpreter. We have proposed that such *semantic* organs of visible surfaces be referred to as *semes* (Kleisner and Markoš 2005). Semes do not represent only the properties of a specific morphological arrangement of certain species, but rather they arise in the process of interpretation by being watched by a second party. Semes are coming into being during an interpretative act, so they are generated and specified in dependence on the Umwelt of an interpreter. Lastly, semes are shaped within the Umwelt of an animal where they are recognized as existent and potentially meaningful. In sum, *semes* as organs of visible (or anyhow perceptible) organic surfaces are, on the one hand, physically anchored in the inherited organization of the body of a living being; and on the other, their high profile is achieved in the act of interpretation within the Umwelt of a “seeing” organism.

4. *Mimicry and homosemiosis*

If self-representation is considered a genuine and important characteristic of living beings, then the acquisition, modification, or loss of a species-specific appearance is not to be counted as trivial, because these changes in the outermost level inform us about the internal changes of an organism. For example, take the numerous cases of mimicry where the appearance (and often the behavior) of a model is imitated by one or more mimicking species. In the case of Batesian mimicry, the model is somehow protected (e.g., by unpalatability, hurtful weapons, poison, etc.), whereas the mimics usually lack such protection. It is apparent that mimic organisms gain a selective advantage by adopting the *semes* of a model. In this respect, we can talk about a kind of *semetic parasitism*. But this great advantage in survival is necessarily connected with a less apparent disadvantage in terms of *self-representation*. That is to say, species-specific *semes* are traded for reproductive success. The self-representation of mimics no longer stands for the presentation of the self, but is rather the presentation of the *semes of a model* on the body of the mimic. In other words, the bodies of the mimics serve as a screen on which are projected the *semes* of the model. So, in fact, the mimic's display stands for the “self”-representation of the model.

The signaling role of a particular organismal display (a wasp-like pattern, for instance) influences not only the receivers; the bearer, too, is often “self-aware” of its “aposematic” vestment in the warning signal it emits; such is the case whether we are talking about the model (wasp) or the mimic (fake wasp), such as various hoverflies, clear-wing moths (*Sesia*), longhorn beetles (*Clytus*, *Plagionotus*, *Strangalia*), and so on.

Figure 2. Two unrelated species of insects displaying a homosemiotic, “wasp-like” pattern. Left: Longhorn beetle *Strangalia maculata* (Central Europe); right: Grasshopper *Phymateus saxosus* (East Africa).

The generation and use of warning coloration presupposes a certain “pre-understanding” on the part of the bearer as to the perceptual faculties (Umwelt) of the signal’s receiver. A trained human researcher can distinguish model organisms from their non-allied imitators. He will also note, for instance, the black and yellow pattern on the wing-cases of longhorn beetles as analogous (non-homologous) to what is seemingly the same pattern on the abdomen of a wasp – the patterns in question have different phylogenetic and developmental origins, despite all superficial similarity and congruence of warning functions. It does not matter, however, whether the wasp is a real wasp from the genus *Vespulla*, for instance, or an imitator from some other group. What matters is that both the real wasp and the fake wasp are interpreted as the same animal by the receiver (e.g., a predator). The mimic relies on the fact that its appearance and behavior will be interpreted by the receiver as wasp-like enough to avoid predation. We cannot say much about the inner characteristics of this reliance; but a lot of indirect evidence suggests that aposematically colored animals behave in ways that differ from the behaviours of cryptic ones (e.g., Wickler 1968). We propose the term *homosemiosis* for situations where signals (*semes*) emitted by model and mimic organisms are taken as the same in the receiver’s perceptual world (Umwelt). Homosemiotic organs are neither analogous nor homologous. Analogy means a correspondence in function (and similarity), but analogous organs are conceived as different organs (non-homologous). Homology is ontological sameness; homologous organs are the same organs because they are theoretically traceable to precursors in their immediately common ancestor, irrespective of function and similarity. Organs, by contrast, are *homosemiotic*, because they are recognized as the same organs in the Umwelt of the interpreting organism, irrespective of whether a human biologist sees them as analogues or homologues.

5. Concluding remarks

The self-presentation of organisms is the generator of semblances (*semes*) that play an important role in the evolution of communicative coupling among and within species. Based on the foregoing discussion, we propose adding a biosemiotic perspective to comparative-biological terminology, by introducing a new term *homosemiosis* (from Greek *homos* = same, *semeion* = sign), to describe phenomena resulting from a congruence of meaning.

The terms analogy, homology and homosemiosis can be defined in the following way: (1) *Analogy*: correspondence of different organs having the same function or being superficially similar; (2) *homology*: correspondence (sameness) of organs that are inherited from their precursors in the most recent common ancestor; (3) *homosemiosis*: correspondence of organs that are interpreted as the *same* organs in the Umwelt of a particular organism or group of organisms under investigation, irrespective of the developmental and phylogenetic origin of the organ.

An absent encyclopedia? Meaning making according to Umberto Eco

1. Introduction

How do we make sense of the signs, sentences and texts that saturate our lives? Quite instinctively, it seems. But a closer look will reveal how much is presupposed even by the simplest acts of understanding. Words do have several meanings, so do sentences and other expressions, depending on the context. What about written texts? Much collaboration is required from the part of the reader to fill in the gaps inherent in a text to give it its flesh, its content. And we are even able to agree on the meanings thus created, often.

How is all this possible? One obvious answer is that understanding builds on the common cultural background which we share. As members of the linguistic community we are supposed to use the same *cultural encyclopedia* which can be formulated as “the shared communal or cultural knowledge about the world, the cognitive background of world-construction and world-reconstruction” (Dolezel 1997: 18). But what insight does the very concept of encyclopedia offer us? Is it only another way of saying, once again – though this time using the metaphor of encyclopedia – that any understanding requires some pre-understanding. Apart from its intuitive appeal, is there anything else that the concept of encyclopedia can tell us about the nature of our meaning making?

In an effort to answer these questions I will study the concept of encyclopedia as presented by Umberto Eco. In the semiotic sphere, Eco is the one who has made most of the concept of encyclopedia. He has also taken seriously the challenge of theoretically explicating it. In his writings the encyclopedia occupies a central position – it forms the very background

of his semiotic and literary theory (see, e.g., Eco 1976, 1979a, 1984, 1997). However, despite the centrality of the notion of encyclopedia in Eco's semiotic theory, it is not clear whether it is the one and the same concept he refers to in his various writings. What is more, in spite of his efforts to stress the physical testability of sign-functions, he has been accused of "an idealist understanding of sign" – by, for instance, John Deely (1997: 83–84). In what follows, I will, on one hand, study the different forms of the notion of encyclopedia Eco invokes, and, on the other hand, inquire why and how Eco, who stresses the materiality of meaning making processes, can be claimed to have an idealistic and abstract concept of encyclopedia.

2. *The dictionary*

The first thing to note about the concept of encyclopedia is that there is a complementary notion of dictionary in contrast to which the notion of encyclopedia is being explained and understood. The idea is simply to distinguish between the knowledge of the semantics of a language and the knowledge of the real world. This idea dates back at least to John Locke, who wanted to know which complex ideas are known to us from experience and which are acquired via other ideas. Thus in line with this idea, encyclopedias relate words to extra-linguistic facts whereas dictionaries relate words to other words. Later, Bertrand Russell made a distinction between *object-words* and *dictionary words*. We acquire the meaning of the object-words by direct association between a word and a thing, whereas we learn the meaning of the dictionary words through verbal definition. However, for Russell, the distinction between knowledge by acquaintance and knowledge by description varies between people, depending on their life-experience.

Eco, for his part, wants to show that the distinction between dictionary and encyclopedia is untenable *even* theoretically: linguistic knowledge and world knowledge coincide with each other. Eco launches his argument by examining the possibility of giving a componential analysis to meaning.

In the dictionary, the meaning of linguistic expressions is represented through a finite number of semantic primitives (which can be also called components, markers, units and so forth). In principle, the number of the primitives could also be infinite – but obviously this makes the task of componential analysis impossible. So, at least ideally, the dictionary

should be composed of a limited number of primitives. Then the problems are, first, how to determine the primitives and, second, how to guarantee that their number is finite.

Now Eco proceeds by claiming that the two questions cannot be solved at the same time. As different researchers propose different primitives, one can legitimately ask whether there actually are any primitives that would be intuitively known to all speakers. And if there are not, then the primitives should be interpreted, too. In order to make the primitives interpretable they would need to be considered as an unordered set and having cross-classificatory relations between them. But the only way to limit the number of the primitives is to have the meaning relations hierarchically structured. Consequently, either one has a limited number of uninterpreted primitives or, then, the primitives are interpreted but the meaning relations are unordered and potentially infinite. Thus we have arrived to the encyclopedia. The dictionary was but an encyclopedia in disguise.

3. *The encyclopedia*

The concept of encyclopedia preserves the idea of componential analysis, but denies that signs could be analytically reduced into a limited number of meaning components in any sensible way. In the case of an encyclopedia then, it is not reasonable to talk about primitives any longer. On the contrary, as we saw above, any analysis of meaning is potentially endless. A sign can invoke a limitless number of markers and this Eco explains by using the Peircean notion of *interpretant*. The only way to explain what a given sign means is to give another representation. A sign's interpretant can thus be defined as "another representation, which is referred to the same 'object'" (Eco 1976: 68). And of course the only way to establish an interpretant of the sign is by using another sign, which in turn invokes another interpretant, and so on.

From this insight Eco (1976) proceeds to his idea of *model Q*, which is devised in accordance with M. Ross Quillian's proposal for a model for semantic memory. Model Q is an n-dimensional network, where one can move from a sign (which is taken as a *type*, for example "type A") by employing a series of sign-vehicles to any other place in the network, from the center to the periphery. These sign-vehicles, as interpretants, are included in the model as *tokens*, but each of them becomes, in its turn, a new type,

for example “type B”. One can think of Model Q as an intertextual space or an ever-growing hypertext, where any point can be connected to another in a rhizomatic way.

This universe of meaning-units, the *Global Semantic System*, is one theoretical representation, which Eco (1976) has bestowed to his idea of encyclopedia. In practice, however, no single interpretative process is unlimited, and this Eco explains by the fact that some connections are statistically more probable than others. But the existence, at least virtual, of this Global Semantic System explains – according to Eco – for instance the phenomenon of metaphor. Metaphors are basically metonymical for Eco, instead of long laborious wandering through the encyclopedia one is sometimes able to make shortcuts through this intertextual space. Thus, that what seems to be a genuine invention is already implicated by the complicate networks of Global Semantic System. “The truth is”, claims Eco, “that the metaphor is the tool that permits us to understand the encyclopedia better” (1984: 129).

4. *Encyclopedias and competencies*

As a matter of fact, Eco approaches the notion of encyclopedia in quite a few ways, and it seems that it is not the same encyclopedia he talks about in his various writings (see Violi 1992). I would propose that Eco has principally two kinds of encyclopedias. The first of these is a kind of semantic intertextual space, as described by the Global Semantic System. The second is the encyclopedia of our linguistic or semantic competence. When exposing the encyclopedia as semantic competence, Eco is appealing to such notions as frames and scripts, used in the fields of cognitive psychology and Artificial Intelligence.

It seems questionable, however, whether these two types of encyclopedias are really the different sides of the same coin, as Eco’s texts seem to suggest. The Global Semantic System is decidedly something shared and extra-individual, whereas our competencies are not. Eco appears to claim that the concept of encyclopedia and the concept of encyclopedic competence are synonymous or, at least, they somehow explain each other. For Eco, our encyclopedic competencies consist of the parts of the global encyclopedia which are at our command. It is as if the Global Semantic System

was a common database for all of us, and our encyclopedic competencies consisted of our access to that database.

Still, individual competencies, semantic or other, are very different. So it seems that our abilities to use that database (presupposing that such a database exists) vary considerably. What are our abilities then made of? How are our competencies born? Surely this cannot be explained by the properties of the database only, and therefore, the relationship between our competencies and the Global Semantic System seems to be left in the air.

To be sure, Eco is not describing any individual or empirical competencies with his concept of encyclopedia but rather the competence of a whole (linguistic) community. But how can a *community* have a semantic *competence*? Clearly, the concept of encyclopedia is here at the edge of transforming into a plain metaphor. “In reality”, Eco concedes, “what was called ‘the code’ is the sum of the individual competencies that constitute the code as a collective convention” (Eco 1976: 125). One may wonder what is the status of this “code”? Does it deserve to be called a *hypercode* – as Eco does – if it is just a hypothetical aggregate of individual competencies? To questions like these Eco is careful enough to answer that his encyclopedia is finally only “a semiotic postulate, a regulative idea” (1976: 68). But then one cannot avoid asking why this kind of postulation should be made.

5. Methodological remarks

Why should a proponent of a materialist understanding of semiosis characterize his encyclopedia as an “auto-clarificatory” and abstract semantic system? One reason for this may be that Eco thinks that he is avoiding the *referential fallacy* by claiming that an expression does not designate any real object. In a way, he is justified in asserting that, because “an object” is a product of semiosis. Yet it seems that the relations of sense, in themselves, are useless unless the words are at some point anchored in reality.

One reason for Eco’s desire to avoid the referential fallacy is that he seems to think that the referent must be a single concrete entity. Not wanting to identify the meaning with such a referent, he makes the sign to refer to a cultural entity, a *cultural unit*. In the end, the cultural unit is in Eco’s analysis nothing else than meaning and, consequently meaning swallows the real referent in Eco’s semiotic theory. But if meanings are explained

with the help of interpretants that, according to Eco, circumscribe “cultural units in an asymptotic fashion” (1979b: 198), and the cultural units, in turn, are “the meaning to which the code makes the system of sign-vehicles correspond” (1976: 67) the situation becomes quite hermetic. One cannot help feeling that one is left circulating in the self-referential system of signification with no way out.

This being the case, there appears to be a tension in Eco’s theory between the requirement of “testable” material expressions and the postulation of an abstract, self-referential signification system. Eco is aware of that, too, and attempts to justify his position by appealing to methodological reasons. “Semiotics must proceed to isolate structures *as if* a definite general structure existed”, claims Eco, otherwise it could not be explained how meaning comes into existence (1976: 129, 83).

There are two points I would like to make concerning these methodological claims of Eco’s. The first is philosophical, the second, more practical. There is, actually, a philosophical point of view to which many of Eco’s methodological statements fit: the movement of logical empiricism in the philosophy of science, which was born from the critique of logical positivism, while being also a descendant of that movement. According to logical empiricism, the theories are hypothetical-deductive structures that can be evaluated only through their testable empirical consequences. The Global Semantic Universe of Eco is certainly not a deductive structure, but a hypothetical structure, which is known only through its material incarnations, that is, according to Eco, through testable empirical expressions. Eco’s views on general semiotics also fit this picture. He envisions general semiotics as an attempt to subsume the various fields of semiotics under some very general common concepts. The theory of scientific explanation preferred by the logical empiricists was the covering-law model of Carl Hempel, according to which scientific explanation should, indeed, subsume the various phenomena under a single general law.

There are differences, however. The majority of the logical empiricists were realists and thought that theoretical terms refer to authentic existing entities, even though these are not, at least directly, observable (like atoms). But Eco does not claim that any semantic structure or significative system exists, but more moderately, that semiotics must proceed *as if* such a system existed. Usually *as if* – theorizing is defended on instrumentalist grounds. A theory is a good theory if it is a handy and simple enough

a tool, especially, if it predicts well. But Eco's intention is to explain and describe, not to predict.

Here we come to the second, practical point. Do we really need a hypothetical semantic structure, or network, to explain how meaning making and understanding is possible? There are other alternatives to that kind of explanation too: the Wittgensteinian, Pragmatist or Marxist ones. I think that the crucial question here concerns the relation of individual meaning making to our public conventions. It seems that a signification system of some kind is actually needed if we treat the sign production predominantly in terms of individual work, as Eco does. Otherwise, it would be difficult to explain how we succeed to communicate with each other. But seen from the Wittgensteinian, Pragmatist or Marxist points of view, meanings are born and produced in practical activities and they are publicly shared already from the beginning. These activities, or life forms, are collective and local and only within the sphere of these activities can the created meanings and competencies be explained. (Although words also travel, to other activities, which explain their multiple uses.) Seen from these perspectives there are no such things as meanings existing independently of our life activities, not to mention any abstract hypothetical signification system. Meanings are produced and reproduced, time and again, in the processes of our activities – such is their life.

6. An absent encyclopedia?

Eco's writings on encyclopedia(s) open up a fascinating vision on semiosis as a never-ending process of transformations of meanings in a flux of pictures, words, gestures etc. Moreover, Eco's concept of encyclopedia stresses the importance of inferring and interpreting in meaning making. As such, it provides a corrective to all those semantic or semiotic theories, which try to hypostatise meanings by fixing them onto structures of some kind. Still, paradoxically, Eco ends up also to posit a structure, though a hypothetical one.

This hypothetical encyclopedia is dictionary-like in the respect that it is presented as a self-sufficient semantic space, in which it is possible to move without any referral to real world. Eco reads both the subject and the real world as elements of content. Everything has to be first represented in the language, or with the help of some other (coded) signs, before it can be an

object of semiotic inquiry. Yet, such an encyclopedia is not representable in its totality, a point that Eco readily admits. Perhaps it is not representable even locally (if we are to take seriously John Searle's argument that it is not possible to specify all the background assumptions needed to describe our competencies to act even in the most everyday situations). Are we thus talking about an "absent encyclopedia"?

Not necessarily. Instead of using the concept of encyclopedia metaphorically, we can also take it more literally. One of the (numerous) characterizations Umberto Eco gives to the concept of encyclopedia is the following:

By "Encyclopedia" I mean the totality of knowledge with which I'm only partly acquainted but to which I can refer because it is like an enormous library composed of all books and encyclopedias – all papers and manuscripts, documents of all centuries, including the hieroglyphics of the ancient Egyptians and the inscriptions in cuneiform. (Eco 1994: 90)

The theme of the encyclopedia as a huge arsenal of artifacts, historical and present, is running through Eco's writings on encyclopedia, never quite making its way to the forefront however (although it does that in his fiction). In this, Eco is not alone. Much of semiotic study proceeds *as if* there were "meanings" or "sign systems" that could be perceived and approached somehow directly, like an ideal big book of our collective texts ready for reading. I suggest that the encyclopedia should rather be understood artifactually and materially, including also tools and other instruments. Interestingly, seeing the encyclopedia in the concrete artifacts created by humans has the advantage of explaining how the encyclopedia is both the storage of our knowledge and how it also carries part of our competencies as well as provides an extension of them. This also allows the concept of encyclopedia to be linked to the recent discussions on the distributed knowledge taking place in the cognitive sciences (e.g., Hutchins 1995).

Metaphors of energy and force in Brian Ferneyhough's music

The notions of energy and force are an essential part of Brian Ferneyhough's compositional aesthetics. These notions are related to the basic materials of Ferneyhough's music, and are crucial in shaping it. In this paper, I examine the metaphors of energy and force in Ferneyhough's compositional aesthetics and examine ways in which they are related to other features of his compositional idiom. Further, I illustrate with musical examples ways in which energy and force might manifest in his music. I also suggest how the notions of energy and force are related to the syntax of Ferneyhough's music. In doing so, I compare the syntactical qualities of Ferneyhough's music with tonal syntax. In describing the syntactical aspects, I employ the notions of compositional space developed by Robert Morris (1995). The paper concludes by discussing the ways in which energy and force are connected to expression and meaning.

The notions of energy and force are intertwined with other aspects of Ferneyhough's compositional idiom. First, the basic units of Ferneyhough's music are gestures and figures, consisting of various parametric properties. Energy and force are intimately connected with the behaviour of gestures and figures. Second, energy and force are related to temporality, as the lines of force take place between gestures, when music unfolds in time. This evokes the dynamic perspective of the music's formal shaping. On the other hand, we may describe relations among musical objects on a more abstract level, as out-of-time structures, by employing the concept of a compositional space. In such modelling, the relationships based on energy and force are modelled as an abstract system of relationships between objects.

Ferneyhough's music makes acute the question of energy and force. Ferneyhough (1993a: 13) defines energy as being "invested in concrete musi-

cal objects to the extent that they are capable of rendering forces acting upon them visible.” Lines of force are described by him as arising “in the space between objects . . . in the act of moving from one discrete musical event to another” (Ferneyhough 1993a: 13). As the question of energy and force is connected to the music’s gestural material, and their parametric properties, the functioning of the parametric properties in time becomes significant. How wide is the field of resonance of various parametric properties and what kind of processes can be built in moving from one object to another? Ferneyhough (1993c: 37) describes gestures and figures, and processes upon them, as follows:

A gesture whose component defining features – timbre, pitch contour, dynamic level, and so on – display a tendency towards escaping from that specific context in order to become independently signifying radicals, free to recombine, to “solidify” into further gestural forms may, for want of another nomenclature, be termed a figure.

Accordingly, it is through the figural properties of gestures that the lines of force are created. Thus, in this system it is not so much a question of relationships between gestures, but rather a question of an activation of parametric properties within gestures through musical processes. To summarize, parametric properties, that is, the figural properties of gestures, are those that form, as they activate, lines of force between gestures. Gestures are units that contain potential energy.

The distinction between a gesture and a figure is interesting and offers possibilities for nuances of interpretation. Composer Alessandro Melchiorre (1987: 70–71) has discussed how in Ferneyhough’s description the notion of gesture is placed in opposition with the notion of figure. This contrast reflects the more general twofold way of conceiving form. The opposition between gesture and figure reflects, according to Melchiorre, in some ways the distinction between form and energy-force. From this point of view, a gesture is a static element and a figure a dynamic element; a gesture is a vocabulary’s defined element, closed, dead, whereas a figure is open and implies becoming. A figure can be reformed and recombined. A figure is not a moment, where the flux of energies stops, and it does not live in the present time and dimension. A figure is never a figure, but it becomes a figure at the moment when it opens to the future, because it is transitory in nature (Melchiorre 1987: 70–71). In this description Mel-

chiorre captures some characteristic aspects of the ways in which figures are related to lines of force and become components in formal processes.

There are further ways in which energy and force are related to formal shaping. First, context becomes essential: processes based on gestures and figures form lines of force only through the context created for them.¹ That is, as the music unfolds, musical processes create a framework, with which future events will be related. Second, processes based on lines of force evoke the question of the quality of the wider framework within which smaller units are situated. Ferneyhough (1995: 414) has aptly called this more global framework as texture, and has compared it to a background level. In this interpretation, gestures and figures form the middle ground and foreground levels. The description explicates how local events, that is, gestures and figures, receive an added meaning through the ways in which they are related to a wider framework, the texture.

Importantly, the description of the elements of the music as consisting of structural levels evokes the sense of depth. The sense of depth in Ferneyhough's music has a special quality, which is connected to physicality. Energy and lines of force are significant in forming a tactile quality of musical materials. Ways in which the parametric qualities of gestures form a variety of multidirectional and multileveled processes contribute to the sense of depth and physicality of the music. Figural qualities of gestures, their multidimensionality – in comparison to, for example, pitch-oriented musical syntaxes – enhances tactility.²

Finally, an act of performing is intimately connected to energy and force. That is, the performer adds his or her energy to the musical figurations. The virtuosity of Ferneyhough's music, and its rather demanding notation, are vehicles through which the act of performing becomes a part of the musical syntax and expression.

These various characteristics of Ferneyhough's musical idiom enable the forming of different kinds of processes, temporalities, and formal shapes. In Ferneyhough's music, time is molded and manipulated and through this made feel almost like physical material. Importantly, time may be manipulated precisely through regulating and directing the flow of musical energies.

In the following, I will illustrate ways in which energy, force, gestures and figures might appear in Ferneyhough's music, with examples from *Etudes transcendantales*, a song cycle for voice and a small ensemble. The

song cycle is composed between the years 1982–1985 and has been called Ferneyhough’s compositional diary. I provide short examples from three songs, numbers 2, 5, and 8. These songs and their basic affects are very different: the agitated second song is based on strong contrasts, and processes upon them; the fifth song has a calm and undulating texture; and the eighth song is a duet between the voice and harpsichord, where the drama of musical processes is diminished.

In the second song, written for oboe, cello and voice, there are two types of contrasts: first, the vocal and oboe lines contrast with the cello, and second, there are alternating contrasting α - and β -sections.³ This song, with its agitated expression, well illustrates the ways in which the figural properties of gestures contribute to the linear processes. To exemplify this, Examples 1a and b show the oboe gestures in the first and second sections. In the α 1-section, shown in Example 1a, the oboe’s “long-note” gesture consists of sustained notes with a sharp beginning attack. In the *subito agitato* β 1-section, shown in Example 1b, the oboe plays fast *arpeggio* gestures. The properties of these gestures are contrasting, one being a bare sustained note and the other a rapid dense figuration. This juxtaposition between gestures forms a tension, which launches the process that permeates the oboe’s part in the movement. In this process, the figural properties of the two types of gestures become combined, and through this process the oboe gradually eliminates itself.

a)

b)

Example 1a. Ferneyhough, *Etudes transcendantales*, Song no. 2, beginning of α 1-section, oboe.

Example 1b. Ferneyhough, *Etudes transcendantales*, Song no. 2, beginning of β 1-section, oboe.

Examples 1c and d show extracts from the following sections, and the very end of the oboe's line. The figural properties of the two gestures recombine to form new gestural forms. As shown in Example 1c, in these reformations the sustained "long-note" gesture first becomes decorated by grace-notes, thus adapting aspects of the *arpeggio* gesture; Example 1d shows how the *arpeggio* gestures finally evaporate into grace-note figurations through which the oboe fades away.

The image contains three musical staves for oboe (Ob.).

- The top staff is labeled '2.36' and '8'. It begins with the instruction 'passidioso' and a dynamic marking of *ff*. The notation shows a series of notes with grace notes and slurs, ending with a measure marked 'mb. arpeggio'.
- The middle staff is labeled 'd)' and '12'. It starts with 'tranquillo' and a dynamic marking of *pppp*. It features a complex rhythmic pattern with slurs and dynamics ranging from *pppp* to *mf* and *mp*. A 'rall.' marking is present above the staff.
- The bottom staff is labeled '19' and '20'. It begins with a 'rall.' marking and a dynamic marking of *ppp*. It shows a sequence of notes with slurs and dynamics ranging from *ppp* to *pppp*. A '(2.36)' marking is placed above the staff.

Example 1c. Ferneyhough, *Etudes transcendantales, Song no. 2, beginning of α_2 -section, oboe.*

Example 1d. Ferneyhough, *Etudes transcendantales, Song no. 2, end of β_2 -section, oboe; and end of oboe line.*

The second contrast, the simultaneous contrast between the instruments, is introduced at the opening of the song, which is shown in Example 2.

In this section, the oboe and the voice repeat their rather bare, agitated long-note gestures in the middle register, whereas the cello plays several different and parametrically rich gestures in the low register. This contrast

Example 2. Ferneyhough, *Etudes transcendantales*, Song no. 2, opening.

propels the highly dramatic events and processes of the song. In this song, the interactions, recombinations, and also separations of the figural properties of the gestures form the basis of its linear processes. The quality of gestures and the regulation of the flow of energy are significant for temporality, and for the general expression of the songs. This may be exemplified with the fifth song, whose opening is shown in Example 3.

Example 3. Ferneyhough, *Etudes transcendantales*, Song no. 5, opening.

The texture of this *Adagissimo* song consists of rather homogeneous gestures forming an undulating dreamlike atmosphere where the temporal quality is almost static. For example, the opening gestures of the song are extremely soft, beginning from *piano piano pianissimo*, evaporating to *niente*, having space between them, and consequently implicating small and gradual changes. The opening vocal gesture, nine equally spaced,

evenly articulated *pianissimo* tones, adds upon the static quality. In this song, where the forward moving processes are extremely subtle, almost non-existent, prominent becomes the shadings and fluctuations of the overall texture.

The last example is from the song number 8, where the affect is once again different. As shown in Example 4, in this duet for voice and harpsichord, the performance direction is “coldly but much pressure beneath”.

Example 4. Ferneyhough, *Etudes transcendantales, Song no. 8, opening.*

In this song, the aim has been not to form dramatic continuities between the two participants. Indeed, Ferneyhough has employed chance operations in the compositional process to enhance the undramatic quality. The voice and harpsichord parts are kept separate, and their gestures, both locally and more globally, do not form such directional continuities, where the lines of force would pull the events into forward moving processes; rather, events are juxtaposed, placed side by side. In this manner, the lines of force between and within instrumental parts have a non-directional quality. The temporal and formal quality thus created consists of different situations, where the events become juxtaposed kaleidoscopically in novel ways.

As I hope to have suggested, energy and lines of force between gestures are closely related to questions of temporality and timing. Ferneyhough (1993b: 24) writes:

It's clear that, if we have several musical objects following on from another, we will perceive the flow of time differently according to whether (e.g.) these objects are crossrelated, whether they are connected by gradualist transformations in one or more parameters, whether there exist codifiable consistencies in intervening “buffer materials”, and so on.

Thus, energy and force become key factors in the forming of musical continuities, formal shapes, and different types of temporalities.

Processes in Ferneyhough's music can be approached as dynamic multi-directional processes, where musical objects possess potential energy, which activates through figural properties as lines of force. This can be compared to tonal music, where dynamic processes arise through the forces inherent in tonal functionality. For example, in a move from a dominant to a tonic, the dominant can be considered to possess a particular type of energy, which is activated as it moves towards the tonic: a line of force is created between these events. In the same fashion, in functional tonality, various scale steps become energized in different ways and into different degrees. Such energies and lines of forces arise from the properties inherent in functional tonality. In addition to the dynamic chronological processes, we may model functional tonality as an out-of-time compositional system, that is, as a compositional space.⁴ Such space shows functional relationships between the objects of the system. This interpretation models the forces and orientations that underlie progression in tonal music and that are the basis for its forward moving, goal-oriented motions.

In the same fashion as in tonal system, we may consider that the forces and orientations formed through Ferneyhough's compositional idiom could be modelled with a compositional space. Here, however, as also in other types of non-tonal idioms, such a compositional space is more piece-specific because of the lack of a common non-tonal musical language. Further, in Ferneyhough's idiom, the plenitude of parametric dimensions suggests a more multidimensional compositional space than the one modelling pitch relationships.

A similar relationship between communality and contextuality, to borrow Milton Babbitt's (1987) terminology, underlies the question of the expressive meanings of gestures. Because there does not exist a common non-tonal rhetoric language, a post-tonal composer faces the demand to develop his or her own rhetoric vocabulary. Furthermore, this vocabulary, in order to be pregnant with rhetoric expressive meanings, which communicate through actual compositions, necessitates the recognition of the relation between the gestures, and bodily hearing and culturally conditioned listening practices. It is important to remember, however, that in forming expressive meanings, a rhetoric vocabulary interacts with the syntax of the music, and with the ways in which the relationships estab-

lished within this syntax contributes to the conveyance of shadings of moods and expressions.

Ferneyhough adds still further aspects to musical expression. He emphasizes the dynamic and volatile nature of expression, thus relating expression to the notions of energy and force. Ferneyhough (1993: 12) writes: "What, after all, is 'expression' but a sort of passage from one state to another, in which neither the presumptive beginning and end points are primary, but rather the 'no longer' and 'not yet' whose *impression* they bear."

In Ferneyhough's music, all its aspects – from the qualities of its smallest components to its formal shapes, temporality and expression – are tied together under the metaphors of energy and force. This may reveal something specific about Ferneyhough's music and its characteristic qualities. But it also reveals something essential about music in general and about how we approach music. Ferneyhough's compositional idiom invites us to pay attention not only to the qualities of the musical objects and elements, but also, and more importantly, to the invisible energies and forces that are built within and between these objects and elements. It is there that the crucial attributes of the music reside.

Notes

1. Ferneyhough (1993a: 12) writes: "[T]he figure is proposed as an element of musical signification composed entirely of details defined by their contextual disposition rather than their innate, stylistically defined referential capacity."
2. Ferneyhough (1993b) discusses "tactility".
3. The song is also discussed by Richard Toop (1991).
4. The notion of a compositional space is defined in Morris (1995).

Interpictoriality and intermusicality

The interartistic text of Sartre's *Nausea*

*The real life, life finally discovered and enlightened,
the only life really lived – this is Literature.*

– Proust

Textuality in Sartre's *Nausea* is expressed through strange forms that can challenge the careful reader. It is "hidden" in some key words, the analysis of which takes one beyond purely literary discussion and into a quest for philosophical meaning in the general field of the other arts, of which it is a part.

The etymological meanings of names, particularly that of the main character, are extremely important to understanding the novel, since they form one, purely artistic layer of this highly "embossed" text-picture. The name of Roquentin evidences the enormous amount of reading the hero has attempted – Sartre himself in the role of a reader, writer, author – to the point of becoming bookish. The interpretations of the name vary so much that the authors and works we read through him are arranged in literary layers formed around a single center. Lecarme (1986: 196) mentions a number of Maupassant's works that *Nausea* includes as a hypertext. Sartre uses the names of regions in Normandy, among which is *Roqueville* (Rockville), Roquentin's town, its hearty breath of bourgeois spirit penetrating the poisonous atmosphere of *Nausea*. Flaubert's presence is also evidenced by the name of Roquentin. Can we feel the extremely deep scar this realist has left on Sartre's professional life through the direct use of the name of Flaubert? Sartre read and re-read *Madame Bovary* in his early childhood years (Sartre 1968). In *Situations IX* (Sartre 1972) he states: "No philosophy can be made out of *Madame Bovary* because this is one single book.

More single than its author”. Flaubert’s *L’Education sentimentale* acts as another source of names (Lecarme 1986: 195): Père Roque, Louise Roque, and the three old men, the *roquentins*. In *Nausea* the name multiplies; e.g., Rollebon marries Mrs. *Roquelaure*.

The name Roquentin, of unknown origin, has been known since 1630, in its older spelling as *rocantin*. In the seventeenth century, this word denoted a singer of satirical songs as well as the songs themselves. Thus, Roquentin *is* the text itself, a hero without his own personality. One of the best interpretations of the name is found in the Larousse of the nineteenth century: “A name, which was once given to songs made up of other songs’ fragments, patched together, centonized, so that they create strange, interesting effects through a change of the rhythm, [and] funny and scary surprises in the course of the ideas.” Sartre himself knew this meaning of *rocantin*, but stated that it had influenced neither the creation of the text nor the choice of hero. Be that as it may, in *Nausea* *rocantin* closes and shrinks into itself through the hero bearing this name. In this sense, the Roquentin text turns into a *mise en abyme*, a novel within a novel, both within and encircling the *Nausea* text. Villon used the expression *vieux roquart* (*Dictionnaire historique* 1992), meaning a gloomy, sad old man. We may refer the word to the onomatopoeic radix /rok/ denoting the noise objects make when they collide with each other. Metaphorically speaking, in *Nausea*, /rok-/ reflects the collision of the multitude of texts that dwell in it. It is assumed that the noun “rocantin” was made up by the present participle of the verb *roquer* (hit, munch) and the suffix *-tin* (e.g., *ignorantin*, *plaisantin*). We can thus draw up a palimpsest of *rocantin* due to its frequent use by the writers mentioned in Scheme 1.

<i>roquart</i> - Père Roque, Louise Roque, roquentins	–	Roquentin	–	Roqueville
Villon		Flaubert		Maupassant Sartre

Scheme 1. A palimpsest of rocantin.

The list of authors could be continued and a gigantic palimpsest formed. The hero disperses as a text in the quoted, pastiche texts (of Proust, Stendhal, Balzac) in *Nausea* through the trans-textuality of the polysemantic name, which is a mirror image of the authors it contains. In chess, *roquer* – to make exchange as an action – means exchange of the

castle. This move symbolically expresses the spiritual change in Roquentin. In search of the etymology of the name, we find numerous similarities between *rocantin* and Roquentin; for example, the nouns of *roc /rock/ and roche, rocher*. The meaning of *roche* is “a block of mineral material, hard ...”; but also in the eighteenth century: “an assembly of minerals, which serves to make syntagms” (*Dictionnaire historique* 1992).

Physically, *roc* in its indefinite form refers to the structure of the text. Supposing that Roquentin is a text, he bears this indefiniteness in himself in the philosophical sense, as a person with a restless spirit, always in quest of something. The text is a *mineral*, which has not found its shape and looks like a stone that has split naturally off the rock surface; it remains crude, intact, unprocessed. It also reflects the ambiguity of the novel as a genre – both fiction and philosophy. Sartre once compared a piece of art to a mineral. *Nausea* could be a mineral as well (see Scheme 2).

Scheme 2. The “minerality” of Nausea.

The hard root of the derivatives *roc, roche, rocaille* resembles a crab shell, in which Roquentin hides himself from the look of the Other, who turns him into existence-in-himself (*être-en-soi*). *Rocaille*, in the eighteenth century, was part of the vocabulary of decorative arts, and designated a piece of mineral, as well as a work created with materials characterizing the genre of decorative baroque.

He continues to change his personality, sometimes seeing himself as a Descartes man, sometimes as a “novel hero”, which in fact he is. Even the creators of his favourite song, the black singer and the Jew, could be novel heroes.

There is analogy in the name structure of Rollebon (another character in the novel) and Roquentin. The structure of the names with *ro-* expresses the closeness between them. Roquentin tries to keep his Ego and get closer and closer to the marquis’s personality. But Rollebon keeps slipping away, “rolling” (*Collins English Dictionary*: 1995). *Rouler/Roll* – when some-

thing rolls or when you roll it, it moves along a surface, turning over many times. The grapheme *roll* – is contained in the French expression. According to the *Dictionnaire historique*, *rouler* comes from the ancient French *roler* (*roll-er*), “to turn into”.

On the other hand, Roquentin, going through a bout of insanity, “sways from side to side” (to roll – *balancer* – to rock: “il court, il court le furet”. The circle of this game becomes so vicious that it breaks. The verb *to roll* has a double meaning. Roulbon “runs”, “rolling” in front of Roquentin, and Roquentin runs after him. The circular motion symbolizes the difficulty of historic knowledge. At the semantic level, Roquentin embodies this difficulty: a “rocky situation” means an uncertain situation full of difficulties (*Collins English Dictionary* 1995). The onomastic phenomenon, which establishes such a close link between the two names, could be mere coincidence. Still, we can feel rock-and-roll music at the global level of the text, and something which enters the jazz context, even at the level of historical research. What is more, *rock-and-roll* is American music originating from the Blues, which when associated with Jazz, implies an activity free of obligations and restrictions.

The multi-layers of various arts interwoven in this strange and original text reveal its uniqueness. The names in *Nausea* add to these, as in the case of music, which plays a main part in many respects. It exists both as a text and melody, i.e., as inter-text (music as text) and also as an interartistic phenomenon, which is manifested in various ways. The most original and exciting quotation which is enmeshed in the text is the musical one. It refreshes and transforms the profound meaning of the book. The verses of the *refrain* are cyclical, coming back three times: “One of these days, You’ll miss me, honey” (39, 244, 247)

On the one hand, art (music) arouses art (literature) at an interartistic level. On the other hand, there is an intermusical level: music runs like an invisible thread through the novel, influencing the global melody of the text. This is a polyphony created by the numerous types of discourses which live together in the book. Text turns into music. The interference between text melody and the *leitmotif* (Tarasti 2006) of jazz is subordinated to the relationship of the other arts. Tarasti explains from a semiotic point of view the presence of *leitmotif* in the realm of music. Here we have a literary *leitmotif* that fuses with the artistic intermedial realm.

The influence of music, which is obviously of significance for the novel, is expressed mostly through interartistic phenomena. Take painting – *Melancholia* by Dürer – and Literature – *Nausea* by Sartre.

The structure “art in art” becomes clear exactly at this point – music exists in the book, and the book “lies” on the picture: as an *inner* structure, through musical quotation, and as the *outer* urge to create the literary text:

- a/ painting – *Nausea*
- b/ music – book

Scheme 3. Interartistic levels of painting, music, and literature in *Nausea*.

Dürer’s *Melancholia* prompted Sartre to write *Nausea*. Even the publisher initially suggested the book should bear that name. Michelet’s *History of the Fifteenth Century* – to which Sartre often referred, which Ani deliberately reads, is the secret hiding place of the same engraving, which sneaks out of the book with the same transartistic function. And music, as an outer source, triggers Roquentin’s desire to write a book. The interartistic phenomenon appears exactly as the interweaving or interdependence between two or more arts. The picture is a book, and vice versa. Painting and music constantly slip into Sartre’s text in one form or another, as an interartistic phenomenon appearing in different configurations.

Genette, in studying the origin of parody in Aristotle’s time, retraces the term in order to prove that one cannot give an exact definition of its various uses: “Etymologically, by origin: *ôdè* means a song, and *para* means lateral, side, by; *parôdem*, where *parôdia* originates from, will thus mean ‘singing aside’, i.e. falsetto or in another voice, or in several voices, in counterpoint or another tonality: to distort, in fact, or transpose” (Genette 1982: 20). In the quotation “rhapsody” of *Nausea*, doesn’t the tune of the song stand out in relief over the other musical voices?

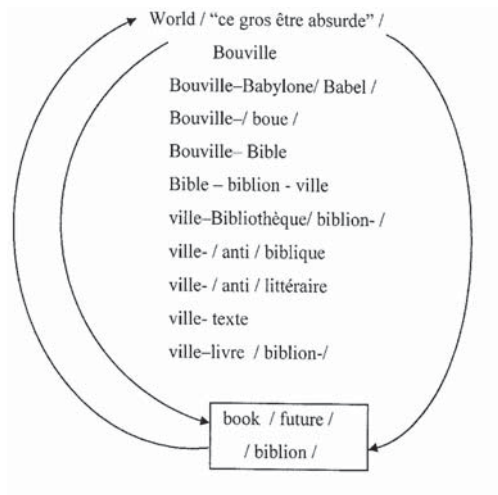

The replacement of a book by a *picture* occurs many times in the novel. One of them is Emily Brontë's portrait, hung over Ani's bed, which immediately calls to mind *Wuthering Heights*. Also, the pictures at the museum are real *mises en abyme* with intertextual and interartistic functions. Despite their unattractive appearance, these works of art hide real treasures. A whole library of books comes out of a picture – Montaigne, Horatius, etc. Then the *mise en abyme* develops an intertextual function, when the picture showing the dying man and the kitten becomes the distorted vision of another picture – the one by Greuze, which Diderot analyzed in *Les salons* (IDT 1971: 74).

Sartre's text ridicules both the manner of writing and the manner of painting through the presence of the picture. In his capacity as an art expert, Roquentin notes that looking at pictures is "just a psychological analysis, as in novels". Helbo (1982: 113–125) shares: "... the quotation: an unfinished, mosaic of discourses segregates the meaning: the story is penetrated by repeated discourses". And this is what recreates the musical effect of which Helbo speaks, in likening the novel to a sonata.

We find an inverse form of the interartistic phenomenon in its pictorial version (interpictoriality), when writing becomes "embossed", like an Impressionist painting in pastel tones or bright touches: "... nigger in a cream raincoat, yellow shoes and green hat ... small blonde woman under the opal sky ... bonbon colours, beautiful blue overcoat ... light raincoat, red glasses of the lantern ..." (my emphasis).

Bouville, whose background remains mainly dark, apart from the flashing lights, which at certain times illuminate it rather brightly. The name is also very important in its etymology, since it creates an impression of piled up literary layers, which are abstract in terms of the context. The /B/ recalls various relevant terms: book, biblios, babel ...

In the novel, the book is of significant importance. The novel itself is the genesis of a book world. In the biblical book of Genesis, Babylon (Babel in Hebrew), in its purest sense means "disorder". Isn't this novel a "bookish disorder" of thrown in names, pastiches, all overlapping in various paragraphs? (See Scheme 4.) The maze of streets in Bouville calls to mind the maze of bookshelves in a library, where we get lost. Bouville is an anti-biblical and anti-literature town, the notion of book (Bible, biblos) being degraded in its name. According to Borges (1989: 112), the world is a universal library, whose spherical shape symbolizes the unachievable.

Scheme 4. *Bouville: Macro- and microworlds.*

In Scheme 4, the only curved arrow pointing to the right shows that The Bible contains the world. The left arrow going down to the book marks the creation of the future book, which Roquentin will write. And the line turning again upwards symbolizes the cause and consequence link between town and book, a world found in each book. The cycle of the circular motion in the scheme allows for a constant renewal of meaning, letting the poly-semantic search go on forever. We witness how the circle closes due to the future book, and go back following the direction of the arrow. We circle around the letter "bb" with the book, but the world also comes down to one book – The Bible, the book about the creation of the world. The connection between Genesis and creation in its artistic sense is very strong. This is also acknowledged by Butor (1993: 129–130), when looking at the stained glass of a sixteenth-century cathedral. The glass told the story of Cain, whose sons The Bible considers to be the first creators of the towns, industrialists and makers of musical instruments. We have again the symbiosis – Bible, town, music – presented in *Nausea*. The concept of God's Creation and the Creator is not only literal; it can be discussed at a deeper level. When depicting a *muddy town* /*bou* – mud – *ville*/, Sartre gives his concept of the creation of the world, and he becomes a creator himself, taking the place of *the* Creator. The existentialist difficulty of existence and writing is presented not only through the picture of the man

made of mud, but also through the sheets scattered in the mud, denying in a new ironic, way the literary concept. In a way, Sartre has rewritten The Bible, such that *Nausea* is a Bible turned “inside out”. In the year 1223, *bible* meant a big work, which ridiculed society in its various forms, as it is done in *Nausea* as well, though here the concept of negation is given a wider philosophical meaning.

Art touches Roquentin, and with this Sartre asks a question: Can Art give meaning to the human life? The components of this novel – names, town, book – are funneled through a single point: Art. They are no longer real, due to the textual elements they contain, which are an integral part of this spiritual energy, i.e., Art. This is the world as a book, Art in the shape of a sphere, whose ends can never be found, symbolizing the connection between music, painting and literature.

Nikolay Komedchikov

The evolution of map language

From Italian Renaissance maps of the fourteenth century to the beginning of graduated measurement in the mid- eighteenth century

In my paper I attempt to trace the evolution of map language over the course of almost 400 years, from the mid-fourteenth to the mid-eighteenth century; that is to say, during the flowering of cartography, which resulted from the great geographical discoveries, from the development of trade and sea travels in Europe, and from the rise of economies and military power in European countries. The analysis of map language is one of important issues of the modern cartography. The study of the evolutionary principles of graphical map symbols, and their combination over the centuries and in various countries, facilitate the development of strategies of formulating cartographic symbols today, and no doubt, in the future as well.

The history of the map is well-documented. Extant specimens of early maps exemplify how map language “works” in different human cultures and during various periods, and allow us to distinguish the main stages in the evolution of map language. Of course, the temporal borders of these stages do not always coincide in different cultures, and in some cases, similar stages do not exist. More importantly, the multiple contacts between peoples of various countries and cultures resulted in a powerful mutual influence during the evolution of map language, such that national peculiarities began to disappear from maps.

It is possible to distinguish the following main stages in the evolution of map language:

1. *The map as a system of natural symbols.* Classical examples of such maps are Eskimo maps of Greenland and the stick-charts of the Marshall

Islands made by aborigines. Natural objects, such as sand, stones, small shells, central ribs of palm leaves, serve as map symbols.

2. *The map as a system of pictographic symbols.* Such maps were common, e.g., among Indians of Central America.

3. *The map as a system of iconic signs.* The iconic signs number among those visual (imaginative) symbols that have been the most common in cartography since primitive times. Because of their similarity to the depicted objects, they are easily understood by all users, even those belonging to different cultural spheres. The iconic signs were gradually complemented by symbolic signs which organized all icons into a system, by classifying them into groups and attributing these groups with specific features.

4. *The map as a system of conventional signs.* As civilization evolved, iconic symbols were gradually complemented by signs that are conventional and arbitrary. The emergence of conventional signs made it necessary to explain them. Initially such an explanation could be placed either directly beside the depicted object on the map as a commenting inscription, or separately in the form of a legend. Later the separate explanation of conventional signs in a special legend became a rule. Thus, the legend is a metalanguage that lists all symbols of the system together with the real objects that they depict, thus regulating the possible combinations of symbols and providing a key to their understanding.

There are intermediate stages between the main stages, described above. An interrelatedness of different systems of cartographic symbols and their coexistence on the same map is one of the distinguishing features of map-language evolution. Up to now many modern maps display a sort of “symbiosis” of iconic and conventional signs.

Analyses of cartographic depiction techniques were carried out in some studies (for example, Lynam 1945, Dainville 1964, and others). My paper is devoted to map analysis in terms of the “map language” concept, the development which was greatly aided by the Russian professor A. A. Liouty (1988).

1. Map languages: Sublanguage I

Map language is understood as an objective phenomenon evolved naturally within the social and historical practice of humans, as the core of cartography as a systematic science. A dualism is characteristic of map

language because it consists of two relatively independent sublanguages, which distinguish map language from other languages (script, painting, mathematical graphics, and others). *Sublanguage I* provides a spatial definition of mapped objects – their geographical position, spatial forms, and orientation. *Sublanguage II* provides an essential definition of depicted objects, their qualitative and quantitative peculiarity and structure.

While displaying spatial data in cartographic depictions, primitive peoples retained existing topological relations; in other words, they retained mutual spatial relations of depicted geographical objects without exact mathematical parameters. The first Italian and Catalan portolans also had no strict mathematical base. There were nets of compass lines instead of map graticules. As geodetic measurements evolved and knowledge about the Earth as a globe emerged, a transition took place from topological cartographic depictions to metrical ones.

The Sublanguage I evolution goes on independently, without close connection to the evolution of Sublanguage II. It displays and expresses a diversity of cartographic projections used for showing the surface of the terrestrial ellipsoid on flat maps. Various azimuthal projections are known to have been used as early as in Ancient Greece. There were detailed descriptions of conic and pseudoconic projections in Ptolemy's *Geographia*.

The Renaissance period gave new incentives to the development of map projections. In the second half of the fifteenth century, Donnus Nicolaus Germanus invented a new trapezoidal projection. The number of new projections increased steadily during that century. Some of them were modifications and further developments of Ptolemy's pseudo-iconic projection of the entire globe; for example, in cordiform or heart-shaped projections. Among others, the oval projection designed by Petrus Apianus and Benedetto Bordone should be noted, as well as the Mercator's cylindrical projection, which continues to be the main projection for navigational charts even today.

Thus, the number of known projections reached already twenty by the late sixteenth century (Keuning 1955). There were practically no new developments in the sphere of map projections during the seventeenth and first half of the eighteenth century. As late as in 1650 Nikolas Sanson designed a new pseudocylindrical equal-area projection for the depiction of the entire globe.

The tradition of showing map graticules goes back to the Ancient Greeks. Unfortunately, this tradition was not always held to by some map-makers. As a rule, a network of meridians and parallels is shown on all world maps. On regional maps this network remains sometimes only in the form of numbered ticks at the map's inner border. As a matter of fact, these ticks present a legend made with the help of map Sublanguage I. Some maps have no graticules, or numbered ticks, at all; and this is a break with the established tradition, because the graticule is an obligatory element of any map and one of the main foundation stones of cartographic culture. Since the mid-sixteenth century, the maps' inner borders as well as the equator line have contained divisions into degrees and minutes.

Compulsory elements on Renaissance maps were the Latin designations of the four corners of the earth (North, South, West, and East) in the middle of each inner border line. In fact, the map graticule – a network of meridians and parallels – serves as the core of Sublanguage I. The outlines made in map Sublanguage I are filled with specific contents, which make up map Sublanguage II.

In addition to the graticule, the map *scale* is also a manifestation of Sublanguage I, such that it determines shapes and sizes of depicted features. Graphical scale appeared first on marine navigation charts, or portolans. The place of the scale on maps was rather arbitrary. Map margins have been preferred, but the centers of maps were also used sometimes. One portolan could contain in different places several graphical scales in the form of straight or curved bands. In the first half of the sixteenth century, in order to expand the demand for maps, graphical scale began to be shown not in just one, but in two, three, or more length measures used in different countries. One of the first depictions of the graphical scale in various length measures (Roman and French miles) is given on Georg Erlinger's map of Central Europe issued in 1530.

In addition to graphical scale, since about the mid-seventeenth century, large-scale maps have been provided with a transverse scale for exact measurements and calculation of distances. Later, in the early eighteenth century, numerical scale also appeared on maps.

We have seen how map Sublanguage I evolved, manifesting in the development of various map projections and in compilation of maps on different scales. Let us consider now evolutionary characteristics of map Sublanguage II, which displays the subject matter of the depicted features

and phenomena. Due to space restrictions, I shall consider closely just the evolution of some iconic and conventional signs used for the depiction of hydrographic features (seas, rivers, lakes), topography, vegetation, and settlements.

1.1. Sublanguage II: Depiction of hydrographic features

From earliest times, for the depiction of large expanses of seas, iconic signs were used that resemble water color and sea waves. Seas were painted blue; the only exception was the depiction of the Red Sea, which was traditionally painted in red-and-brown on Portuguese portolans. Most common were special marks that resemble cross-sections of various sea wave types – ripples, simple waves, swell, surfs. The iconic signs for the depiction of the sea's surface were superseded gradually by a conventional sign in the form of specks. By the late sixteenth century, specks were used for the depiction of both sea surfaces and inland bodies of water. Besides that, in order to accentuate the sea/land division, coastal “shading” was used, in the form of straight-line tints. This straight-line tint covered the sea surface along the coast, but on navigational charts it was used to fill in the coastal strip of dry land.

Rivers were also shown with the iconic sign of two lines; therefore their actual width was significantly exaggerated. The space between the side lines was filled with various marks resembling, for example, water flow; or with straight parallel lines, drawn perpendicularly to the riverbanks, or with specks or dashed lines along the current, which was sometimes painted in blue.

Since the mid-fifteenth century, ribands have been used for the depiction of water surfaces (rivers, lakes). This method of graphical depiction indicated water surfaces with the help of lines running parallel to coasts. Wolfgang Lazius was one of the first cartographers to employ this technique, while making the map “*Marchia orientalis*” (1561). These lines running parallel to coasts of water bodies, if considered as map language signs, occupy an intermediate position between iconic and conventional signs.

Perhaps, this method influenced the emergence of such conventional signs as isolines – initially as lines of equal depth, used for the depiction of dry-land topography. Nicolaas Samuel Cruquius was known to have made

one of the first attempts to employ water depth lines on maps, while compiling his isobathic chart of the Merwede River in 1729.

1.2 Relief representation

The representation of mountains is one of the most important problems in cartography. Approaches to solving it have undergone the most radical changes, as compared with methods of mapping other terrain features. Up to the mid-seventeenth century, attention was paid mainly to the representation of mountains and hills. In the iconic signs used for their depiction, it is easy to recognize mountains' profiles. Up to the late eighteenth century, it is possible to distinguish three principal approaches to the iconic representation of mountains on maps.

The first of these was a combination of mountain signs which formed a chain showing the mountain range. Such sign-combinations initially resembled coxcombs. Then depictions of mountain chains became increasingly realistic, more and more resembling mountain ranges from a bird's eye view. Of course, the engraver's skill was the main factor in determining how real the representation of mountain ranges looked. In the second half of the eighteenth century, some map-makers began to depict mountain chains so that they looked like "hairy caterpillars".

The second approach was characterized by the depiction of isolated (not connected into a chain) iconic signs for mountains in the form of simple vertical profiles. As in the first approach, there was great diversity in the artfulness of these iconic signs.

The third approach was the most progressive one. It is a planimetric, perspectival representation of iconic signs for mountains within the whole mountainous area on the map. The topography in such depictions was displayed not in the form of single bodies but as a surface. This type of representation gave impetus to the development of important new methods employed in the orthogonal representation of topography. Drastic changes in mountain representation took place in the early 1640s; it was a transition from perspective pictures to a planimetric (orthogonal) depiction when Johann Morell showed topography with the help of vertical shading on his map of the town of Lindau at the Bodensee (Lake of Constance) in 1642.

This method of topography depiction led to a breakthrough in cartography and map language. There was a transition from iconic signs for mountains to conventional signs in the form of vertical shading, from a random distribution of “hills” on a map to the strictly fixed, localized depiction of topography as a continuous surface. Further development of this method and its mathematical grounding are found in the work of the Saxon map-maker Johann Georg Lehmann (1799) and in the proceedings of the Military Topographical Department of the Russian Army General Staff (1832).

A great contribution to the realistic depiction of sea coasts was made by the Dutch naval surveyor Lucas Janszoon Waghenaer. In the sea atlas “*Spiegel der Zeevaerdt*” (The Mariners Mirror) (1584–1585) all the coasts were depicted for the first time with the help of coast profiles facilitating navigation.¹ Some profiles were given within maps as well. The atlas became so popular that it was issued in different languages. The same technique for coastal depiction was used later by other map-makers. In terms of map language theory, the coastal profiles can be regarded as conventional signs, despite the fact that there was not yet any vertical scaling, and the physical parameters of coasts were presented through such topological indicators as “higher” and “lower”.

1.3 Depiction of vegetation

The representation of vegetation cover on maps primarily concerned the characteristics of forests. Iconic signs were used to resemble deciduous or coniferous trees. These signs were placed either at a distance from each other, touching each other, or locking into each other with crowns in the form of a “forest carpet”, as one would see from a bird’s eye view. These three main distribution patterns of the iconic signs allowed presentation of such forest characteristics as density and accessibility. Besides that, the iconic signs indicated dominant species of a forest and its age. Of course, it was impossible to show forest borders exactly enough with iconic signs, because the size of these signs were rather large. Technically, an engraver was not able to repeat a sign several times identically. For such reasons, a search for new linguistic means to depict forests took place; it was necessary to replace the iconic signs by conventional ones.

One of the first attempts to depict forests by conventional signs instead of iconic ones was made by the German map-maker Nikolaus Person from Mainz. On a map of the district of Erfurt published in 1675, he has used dense hatching to show an area covered by thick beech forest. Unfortunately, this conventional sign for the depiction of forests was neglected for a long time. Its application resumed as late as in the twentieth century, this time in form of colored background (usually green).

1.4 Depiction of settlements

Up to the sixteenth century, settlements were represented on maps without any classification; for example, in terms of their position in administrative hierarchy, type of community, number of inhabitants, dominant religious affiliations, etc. When there was no classification of represented settlements, of course, it was not necessary to explain at length the signs used for their depiction. Settlements were shown by three main types of sign: an iconic sign in the form of a castle, fortress, or church drawing; a conventional sign in the form of a circle; or a sign combining features of an iconic settlement depiction with the conventional sign (circle). Community names confirmed additionally that the signs in question represented settlements. Sometimes, in order to accentuate the size or administrative importance of towns, the iconic sign was enlarged or its drawing supplemented with additional towers, spires and houses. There were also attempts in the sixteenth century to display the size hierarchy of communities through using of profile-plans of settlements, without special explanations in legends. The need emerged for distinguishing settlements on maps according to some classificatory parameters. This resulted in a breakthrough in cartography, in the form of a gradual transition from iconic signs to conventional ones.

Cardinal qualitative changes in the map language were brought about by the need to develop a map metalanguage in the form of a legend. The use of new cartographic symbols, the design of which still made their meanings hard to understand, emerged in the form of explanatory legends on map margins. One of the first legends containing explanation of four settlement symbols was designed by Oronce Fine in 1525; it was placed into the map as a supplementary text. As for a separate legend for settlement signs, it seems to be the German humanist Sebastian von Rotenhan who

first introduced it, on his map “Das Francken Landt ...” in 1533. He used five different signs to depict settlements, explained in a separate legend. These signs were not obviously conventional in character. On the contrary, they looked like common iconic signs used on contemporary maps for the depiction of castles, villages, or towns. The first attempt to apply new conventional signs for the depiction of settlements seems to have been made by Sebastian Münster in Ptolemy’s *Geographia* (1545). He showed on the map the settlements classified according to the prevailing confessions.

With the advent of the map legend, there was spectacular progress in the development of map language as well as in cartography as a whole; new perspectives and opportunities opened up, thanks to virtually unrestricted possibilities to depict any characteristic of geographical features traditionally shown on maps. Moreover, new objects and phenomena with their properties and functions, could be depicted.

Since then, the development of a legend became a necessary, important, and responsible procedure for compiling any map. The legend determines to a great extent the purpose and contents of a map, methods of its use, as well as scientific and applied aims that can be achieved with it.

2. *Conclusion*

I would like to close by emphasizing once more the decisive milestones in the evolution of map language, from the Renaissance to the beginning of extensive graduated measurement in the mid-eighteenth century.

First, there was a gradual transition from topological cartographic depictions without exact mathematical parameters, to metrical depictions on a strict mathematical base. Second, this was a transition from iconic signs for the depiction of topography and settlements to conventional signs. It was the transition from perspective pictures of mountains to a planimetric (orthogonal) depiction of topography with the help of vertical shading, as done for the first time by Johann Morell in 1642, along with the use of water-depth lines by Nicolaas Samuel Cruquius in 1729. Third, the map legend was introduced, initially for explanation of the settlement classifications, as done by Oronce Fine in 1525, Sebastian von Rotenhan in 1533, and Sebastian Muenster in 1545. Later on, legends were used to represent other features as well.

Of course, my review has no pretensions to comprehensive analysis of all means used in map language during this period of some 400 years. Some propositions need further specification and development. Nevertheless, the present map analysis allows us to conclude that map language follows the general laws of evolution of sign systems generated by human society.

Note

1. Earlier attempts to depict coastal profiles can be also found in the book on navigation by Piri Reis, *Kitab-i Bahriye* (1521–1526).

Traductions interlinguale et intersémiotique dans un message publicitaire grec

Rapports entre les messages verbaux et les systèmes non verbaux

1. Publicité et traduction

Le champ du marketing et de la publicité est constitué de multiples univers conceptuels qui posent les fondements d'une sémiotique qui dépasse la sémiotique classique. La publicité, démarche essentiellement communicative et destinée à une lecture publique, s'offre comme le terrain privilégié d'observation des mécanismes de production de sens tant par le message verbal que par l'image. Publicité et traduction sont un excellent exemple de contact entre langues et cultures qui s'inscrit dans le contexte de la mondialisation du texte publicitaire par le biais de la traduction. Notre recherche étudie la *publicité bilingue* d'un nouveau grand magasin d'Athènes (Attica) parue dans la revue *Blue* de la société aérienne hellénique Aegean Airlines (Figure 1).

Barthes (1964: 41) avait distingué dans le langage publicitaire trois types de signes: le signe linguistique, le signe iconique et le signe plastique, ce qui fait le langage publicitaire un monstre sémiotique, amas parfois de signes hétéroclites. D'après Guidere (2000: 40), on ne peut pas parler au sujet de la publicité de trois signes différents, mais d'un seul et même signe que Guidere appelle *publisigne*. Dans notre étude, nous nous appuyerons sur cette triple distinction, en approchant le signe iconique et le signe plastique dans la conception de Jakobson (1963: 78–96) qui a parlé de trois types de traduction. D'après lui, il y a *la traduction intralinguale*, *la traduction interlinguale* et *la traduction intersémiotique*. La première consiste

Figure 1. La publicité bilingue.

en l'interprétation des signes linguistiques au moyen d'autres signes de la même langue. La deuxième cible l'interprétation des signes linguistiques au moyen d'une autre langue et la troisième l'interprétation des signes linguistiques au moyen des signes non linguistiques. Notre étude porte sur la traduction interlinguale qui est l'objet de la Traductologie et sur la traduction intersémiotique qui est celui de la Sémiotique.

2. La traduction interlinguale

Saussure (1972: 100–101) souligne l'importance du système linguistique soutenant que la linguistique peut devenir le patron général de toute sémiologie, bien que la langue ne soit qu'un système particulier. La relation entre

message linguistique et message iconique a fait réfléchir beaucoup de chercheurs sur ces deux systèmes sémiotiques. Barthes (1964: 43) se demandait si l'image double certaines informations du texte, par un phénomène de redondance, ou si le texte ajoute une information inédite à l'image. Barthes n'exclut pas le cas de la traduction intersémiotique telle qu'elle a été décrite par Jakobson. Ce que Jakobson appelle traduction interlinguale dans le cas de la publicité peut être appelé *tradusigne*. Le terme appartient à Guidère qui nomme *tradusigne* le signe qui est déterminé par l'énoncé traduit, mais seulement dans le sens dans lequel il sera interprété. Le tradusigne est l'équivalent du publisigne, mais c'est un faux-semblant car l'équivalence relève de l'interculturalité (Guidère 2000: 40). Cette équivalence apparaît dans le message linguistique de la publicité qui s'articule en deux langues, en grec et en anglais, et où les éléments lexicaux de ces deux langues coexistent à part égale. Le grec constitue le message source et l'anglais le message cible, puisque la compagnie aérienne tout comme le grand magasin sont grecs. Ce type de passage d'une *langue faible* à une langue non seulement *puissante* et *internationale*, mais *hégémonique*, suit le mode de penser des publicistes qui utilisent l'hégémonie de l'anglais pour élargir le groupe cible des consommateurs. Le fait que la publicité examinée est bilingue et non plurilingue montre que la pratique de la traduction publicitaire en Grèce s'oriente vers l'anglais tenant en compte que la Grèce appartient au monde anglophone et Chypre, qui était dans le passé une colonie anglaise, aussi. Donc, la traduction devient un moyen privilégié par les publicistes pour la diffusion de leur message commercial. Le message linguistique s'articule en quatre parties: le slogan, le message principal, le message d'informations complémentaires et l'adresse.

Commençant par le slogan publicitaire, l'utilisation de l'anglais dans le slogan publicitaire d'une compagnie aérienne se fait pour connoter la notion de l'internationalisme et du cosmopolitisme (Holmes 2005: 71-72). Le slogan peut verbaliser un ou plusieurs concepts centraux sur lesquels fonctionne la publicité, il est un moyen efficace pour attirer l'attention (*fonction d'ancrage*) et inviter à l'action et, d'habitude, il contient une devise. Les deux concepts centraux de notre publicité incitent les passagers de la compagnie aérienne à faire leurs achats dans le grand magasin et le profit qu'aura dans cette compagnie aérienne chaque acheteur au cas où il ferait ses achats dans ce magasin. La devise est "volez" (πετάξτε/fly), mais quel est le rôle de la traduction dans cette procédure?

Dans la première partie du message publicitaire nous constatons qu’il y a des similitudes. Les deux verbes *πεταχτείτε* et “fly” (volez) sont des verbes non transitifs, à l’impératif (forme injonctive) et entre guillemets pour annuler le sens dénotatif du mot et de l’énoncé en général. Au niveau du langage, le verbe *πετάγομαι* (voler) est utilisé dans la réalité hellénique pour faire des achats dans une expression du langage quotidien (“*πετάγομαι να κάνω ψώνια*” qui signifie “aller faire des achats”). Par contre, en anglais on dit “go shopping”, pourtant les guillemets et le message iconique dans notre publicité contribuant à la compréhension du message linguistique. Holmes (2005: 8) remarque que les agents de publicité essaient de s’adresser aux consommateurs dans leur langue et que d’habitude les slogans proviennent de la réalité quotidienne. Dans la deuxième partie, la particule “με” (avec) est remplacée par la conjonction “and” (et). En plus, le substantif *δώρο* (cadeau) est remplacé en anglais par le verbe “win” (gagner), fait de transposition qui affaiblie, d’après nous, l’énoncé grec, étant donné que l’emploi de la phrase “με δώρο” (comme cadeau) connote que le billet est gratuit pour tous ceux qui “volent” pour faire des achats au grand magasin Attica, tandis que l’utilisation du verbe “win” ne le définit pas et connote que le client peut gagner le billet (peut être dans un tirage au sort). En plus, l’addition du verbe transitif “win” contribue au fait que l’énoncé obtient une *connotation de dynamisme*.

En plus, il est évident que le slogan publicitaire en grec ne définit pas le moyen de transport auquel appartient le billet (*εισιτήριο*), s’il s’agit d’un billet de cinéma, de théâtre ou de concert. Dans le slogan publicitaire en anglais, il est clair qu’on parle de billet d’avion (“airplane ticket”). Selon nous, le créateur du slogan publicitaire en grec a lié connotativement le verbe “πεταχτείτε” (volez) avec le billet d’avion, tandis que dans le slogan en anglais il semble nécessaire de définir, de donner de l’emphase, qu’il s’agit d’un billet d’avion. Cette addition est la seule qui modifie la symétrie esthétique entre les deux énoncés, puisque le slogan en grec compte neuf mots et le slogan en anglais dix. Nous pouvons ainsi parler d’une *équivalence esthétique* basée sur une symétrie de construction. Il s’agit d’une équivalence qui est aussi basée sur *la dualité du slogan publicitaire* qui est divisé en deux parties presque équivalentes non seulement au niveau esthétique, mais aussi au niveau des incitations connotées (allez→gagnez). Sur ce point nous devons mentionner que la ponctuation (les guillemets et le point d’exclamation) continue dans le slogan en anglais de donner de l’emphase

aux mêmes mots que donne le slogan en grec (*équivalence de ponctuation*). L'équivalence esthétique et l'équivalence de ponctuation, nous donne, d'un premier point de vue, la sensation que les deux langues partagent assez d'éléments communs non seulement au niveau du sens (*équivalence de sens*), mais aussi au niveau de la structure (*équivalence de structure*). Nous pouvons aussi parler d'*équivalence directe*, puisque les formes grammaticales et syntaxiques s'apparentent dans les deux langues et soutiennent la même valeur référentielle (Nenopoulou-Drosou 2001: 50).

Passant à la traduction du message principal, qui est le lieu d'un développement textuel de nature argumentative, nous remarquons dès le début qu'il n'y a pas d'*équivalence quantitative*. Dans notre étude cela est le cas du slogan publicitaire. Pourtant, l'effet d'équivalence n'est pas toujours le souci essentiel de la traduction publicitaire, et parfois, la transposition culturelle ou l'adaptation est inévitable dans ce type de traduction (Au 1999: 105), surtout quand le groupe-cible est plus sensible à l'information comme le sont les Grecs (Sidiropoulou 1998: 202). Le fait que la publicité s'adresse aux clients d'une société aérienne précise montre que le groupe-cible est défini, puisque la publicité ne s'adresse pas à tous les passagers de l'aéroport d'Athènes, et que le groupe-cible partage certaines caractéristiques d'un mode de vie aisé comme, par exemple, faire des achats de bonne qualité rapidement et dans des magasins réputés. Cet effet connote une nouvelle tendance paradoxale parue dans les publicités. Cette tendance montre que la publicité n'est pas toujours une communication ouverte, mais qu'elle commence à cibler un public spécifique.

Nous voyons dès le début des deux messages publicitaires principaux qu'il n'y a pas d'*équivalence de forme et de sens*. Le message grec "ετοιμάστε βαλίτσες" (préparez vos bagages) est traduit en anglais "make your purchases". *Le code de voyage* connoté en grec est remplacé en anglais avec *le code de marché*. En plus, dans le message en anglais, il y a omission non seulement de la firme du magasin (*omission linguistique*), mais aussi du point d'exclamation (*omission extralinguistique*). Il est à remarquer que le verbe "χαρείτε" (jouissez) disparaît dans le message principal de la langue cible, malgré une tendance à l'humour dans les messages publicitaires (Sidiropoulou 1998: 193). Nous voyons aussi que l'impératif est fréquent dans le message anglais. Il a fait son apparition dans le slogan aussi (le verbe "fly"), mais dans le message principal ce n'est pas seulement le verbe "make" qui continue de donner l'impression d'incitation, mais aussi le fait que l'ex-

pression “σας κάνει δώρο” (vous fait un cadeau) qui est traduit en anglais par un verbe à l’impératif “get for free”. D’habitude, en grec, on évite l’impératif et la première et la deuxième personne (Sidiropoulou 1998: 199), tandis qu’en anglais l’utilisation de l’impératif est assez fréquente dans la publicité (Dryer 1982: 139). En plus, la phrase en grec “που έγινε ποτέ” est traduit en anglais “in Greece”, c’est à dire *le code du temps* est remplacé/ traduit par *un code toponymique*, fait qui connote une tendance de diminution de la valeur de l’énoncé grec et cela n’est pas dû au hasard. L’utilisation de la langue anglaise dans le message publicitaire, une langue qui constitue la lingua franca dans le monde économique, connote l’universalité du produit de la publicité. Si la phrase grecque était traduite en équivalence directe, la traduction produirait un fait qui est faux, parce que Attica n’est pas le plus grand magasin au monde. Donc, la traduction peut être utilisée pour séduire un plus grand nombre de consommateurs, mais la séduction n’est pas synonyme de mensonge. C’est pour cela que les agents de publicité évitent ce type d’hyperbole. Un autre point intéressant du message publicitaire principal est qu’il connote l’*indivisible* de la grécité parlant de Grèce et de Chypre, même dans le message traduit. Une société aérienne hellénique a comme point de référence la capitale de l’état, Athènes, donc l’allusion à Chypre serait bizarre pour un anglophone qui ne connaît pas l’histoire de Chypre. En plus, ce consommateur anglophone ne pourrait pas comprendre pourquoi dans la parenthèse est mentionné le nom d’une ville (Larnaca), autre que la capitale de Chypre, Nicosie. La traduction dans ce point du message est fidèle au texte original et le traducteur évite de poser le problème de l’occupation de l’aéroport de Nicosie par l’armée turque. Donc, parfois, malgré le désir des agents d’orienter la publicité vers la mondialisation, la traduction peut servir l’idée ethnocentrique, ce qui est une contradiction. Dans notre cas, le message original grec ne pose pas de problème pour les consommateurs grecs, mais sa traduction en anglais peut inciter le consommateur anglophone à s’informer sur ce problème politique.

En ce qui concerne la traduction du message d’informations complémentaires nous voyons que les deux messages sont équivalents, sauf la présentation de la firme de la compagnie aérienne (Aegean Airlines) dans le texte en anglais. Cette addition est jugée nécessaire probablement pour rappeler la compagnie aérienne aux anglophones, puisque cette firme est assez connue en Grèce. Il est à remarquer aussi que la dernière phrase de

ce type de message “Πληροφορίες στο 211 1802600” (Informations au 211 1802600) est en caractères gras (*équivalence graphique*), fait maintenu aussi dans la traduction de la phrase en anglais. Pourtant la traduction anglaise “For more information 211 1802600” comprend l’addition “for more” qui est en accord avec l’*équivalence culturelle* des messages anglais qui sont considérés comme plus polis et qui incitent plus les lecteurs à chercher des informations. Enfin, la traduction de l’adresse, dernière partie traduite du message linguistique publicitaire, comprend des éléments additionnels et des éléments explicatifs. Ainsi, l’appellation ancienne de la rue Panepistimiou et l’addition de l’abréviation “sq” qui montre que “Syntagma” est une place, ce qui est déjà connu pour les Grecs et ce qui justifie son absence dans le message linguistique en grec. En plus, en anglais il est mentionné que le siège du grand magasin est à Athènes, dans un effort de rappel pour les consommateurs.

4. La traduction intersémiotique

D’après Eco (2003: 302), la définition de Jakobson pour la traduction intersémiotique ne contient pas les transmutations dans des systèmes autres que la langue, au contraire de l’utilisation du terme par ses successeurs. Pourtant, la pratique de la traduction intersémiotique aujourd’hui inclut la transmutation entre des systèmes sémiotiques non verbaux. Dans notre cas, toutes les transmutations en systèmes non verbaux ont comme point de départ le message linguistique de publicité, fait qui correspond à la première définition de l’expression traduction intersémiotique donnée par Jakobson. L’universalité des images constitue un obstacle dans le processus traductionnel, c’est pourquoi il est nécessaire d’accorder une attention particulière au système iconographique lors de la traduction, afin de renforcer le transfert des connotations d’une langue à l’autre. C’est *la technique de supplément* (Beguin-Verbrugge 2006: 175) selon laquelle une branche du savoir se développe plus particulièrement sous forme d’images.

Ainsi, en ce qui concerne la traduction intersémiotique au niveau iconographique, nous remarquons que les verbes “πεταχτείτε” et “fly” dans le message linguistique en grec et en anglais sont visualisés à travers la présence du message iconique de l’avion ayant la marque de la société aérienne Aegean Airlines, un élément qui ne passe pas inaperçu puisque l’avion laisse des traces pendant son vol. En plus, cet élément iconique se trouve,

du point de vue de la localisation, près du logo du grand magasin Attica (*code de proximité*). En plus, *la valeur antonomastique* (Eco 1972: 244) des femmes présentées dans la publicité connote que le message publicitaire s'adresse à tous les passagers de Aegean Airlines qui font des achats d'un certain montant. Le fait que l'agent de la publicité utilise seulement des femmes (ce qui n'est pas clair du point de vue du sens dans le message linguistique, ni en grec, ni en anglais) montre que les spécialistes de la publicité s'adresse à un pouvoir d'achat considéré comme *fort*, celui des femmes. Mais, si le message visuel constitue un signe basé sur la valeur antonomastique, les deux logos celui de Attica en haut de la publicité et celui de Aegean Airlines, constituent un autre signe basé sur *la valeur onomastique*, puisque les deux logos sont dotés d'identité commerciale. En outre, ce n'est pas par hasard que les deux logos avec leur valeur onomastique clorent la valeur antonomastique, parce que cela peut être traduit par "n'importe qui peut gagner en faisant des achats, mais en participant à une réalité établie seulement par la société aérienne Aegean Airlines et le grand magasin Attica". La valeur antonomastique perd de son efficacité si nous prenons en compte que les femmes présentées sont des femmes belles, élégantes et bien habillées. Donc, l'agent de publicité limite la valeur antonomastique de son message étant donné que nous parlons des femmes qui sont *citoyens du monde* et non des femmes qui vivent, par exemple, dans la province et veulent faire leurs achats dans le grand magasin de la capitale. Cependant, ni le message linguistique de la langue source, ni celui de la langue cible, n'implicite que la publicité s'adresse seulement à une catégorie de consommateurs.

Au niveau du chromatisme, dans notre publicité, nous pouvons voir qu'il y a un symbolisme des couleurs qui permet d'associer les messages linguistiques "Aegean Airlines" et "Attica" avec les couleurs bleu, rouge et gris clair qui dominant au niveau iconique. Ces couleurs sont les couleurs synthétiques du logo de ces deux entreprises, un autre système sémiotique non verbal qui traduit les messages linguistiques en les connotant.

5. *Pour conclure*

Au niveau de la langue, le message linguistique en grec qui connote la grécité devient à l'aide de sa traduction en anglais un message qui connote la mondialisation. La structure du message publicitaire traduit s'adresse

au consommateur international sophistiqué qui est bilingue, voire trilingue, cosmopolite et très mobile. L'hyperbole dans le slogan de la publicité et la simplicité du discours et les couleurs vives semblent être des moyens efficaces pour persuader et inviter le consommateur (Shakir 1995: 69). Si l'utilisation des comparatifs peut paraître superflue, il y a cependant une préférence pour ce type de comparaison par rapport à d'autres structures à cause de la nature compétitive de cette activité (Sidiropoulou 1998: 201). Pourtant, cette fonction ne se reproduit pas dans le système sémiotique du chromatisme et du graphisme. La notion d'équivalence reste centrale dans la réflexion traductologique. L'équivalence littérale, par exemple, entre les deux slogans publicitaires de notre étude, est un phénomène de traduction assez rare, si on tient compte que c'est l'adaptation qui est associée au genre de publicité (Bastin 2001: 6).

Au niveau iconographique, la présence des consommatrices non reconnaissables connotent la mondialisation, mais la présence des deux logos limitent cette perspective nous rappelant que dans un message publicitaire l'image littérale est dénotée et l'image symbolique connotée (Barthes 1964: 43). La traduction du message linguistique représente plutôt une expression symbolique qu'une expression structurale ou sémantique, fait assez fréquent dans la publicité (Eastman & Stein 1993: 200). Ainsi, la traduction intersémiotique n'a pas une valeur complémentaire, mais une valeur fortifiante du message linguistique en reproduisant les connotations de celui-ci dans un effort de bombarder le lectorat de la publicité des mêmes connotations. Ainsi, le message linguistique ne fait alors que confirmer les dispositions de l'image qui porte la plus grosse partie de la charge sémantique. L'image publicitaire a très rarement un caractère d'essentialité ou d'urgence, comme peut l'avoir la transmission d'un message linguistique (Bertin 2002: 172). Il ne s'agit pas de faire savoir, mais généralement de faire valoir et l'état d'attention du destinataire potentiel est plutôt faible face à ces multiples images communicationnelles qui l'entourent. Cette position affaiblit l'efficacité de la traduction intersémiotique, pourtant nous pensons que la présence de la traduction interlinguale valorise l'efficacité communicationnelle de la publicité connotant que le fait de la traduction interlinguale est aussi un fait de traduction intersociétale, au moins pour le monde occidental.

Enfin, le fait que tant la traduction interlinguale que la traduction intersémiotique se caractérisent d'une sorte d'équivalence montre la notion

de l'harmonie choisie inconsciemment par les agents de publicité. Effort d'équivalence dans la traduction interlinguale et intersémiotique, effort de créer une harmonie dans toute la publicité. D'après nous, la présente publicité respectant l'équilibre entre tous les systèmes sémiotiques synthétiques gagne les impressions connotant un nouveau mode de vie, celui de la mondialisation, qui est beaucoup critiqué de nos jours.

Intermédialités proustiennes dans *Rendez-vous à Bray*, un film d'André Delvaux d'après la nouvelle *Le Roi Cophetua* de Julien Gracq*

Le narrateur du *Roi Cophetua*, la nouvelle de Julien Gracq dont le cinéaste belge André Delvaux s'est inspiré pour son film *Rendez-vous à Bray* (1972), a été décrit comme un "guetteur de l'instant". Invité par un ami, Jacques Nueil, compositeur et, par ailleurs, aviateur au cours de la Grande Guerre, à quitter le Paris de 1917 pour le rejoindre dans sa villa La Fougeraie à Bray-la-Forêt, ce personnage qui dit "je", que la nouvelle ne nomme pas et que le film baptise Julien Eschenbach, goûte, tout le long d'un après-midi et d'une soirée, le "singulier silence de l'heure qu'il est". Seul, quoiqu'entouré par les soins discrets d'une servante, Julien attend un événement qui ne se produit pas: l'arrivée de son ami Jacques – sur lequel plane le soupçon de la mort. Le tableau de Burne-Jones qui donne son nom à la nouvelle lui fait comprendre la nature des rapports qui existent entre Jacques et cette femme silencieuse, énigmatique. La nuit, cette attente à La Fougeraie culmine, avec la précision et la rigoureuse logique d'un problème mathématique, dans une substitution subtile, qui laisse le sentiment étrangement inquiétant que le narrateur n'a fait que coller à un "scénario" orchestré par Jacques Nueil, "affectueusement de loin", comme un rituel initiatique.

"L'absence n'est-elle pas pour qui aime, la plus certaine, la plus efficace, la plus vivace, la plus indestructible, la plus fidèle des présences?" (Marcel Proust, *Les Plaisirs et les Jours*). Si le narrateur gracquien vit "tout à l'heure à travers maintenant", le film de Delvaux évoque le passé de Julien par des *flash-back* associatifs (comportant, bien sûr, quelques distorsions de la mémoire): l'attente solitaire éveille en lui des souvenirs de ses rencontres,

“à des intervalles irréguliers”, avec Jacques, comme pour combler l’absence de son ami qui ne vient pas au rendez-vous.

Quel souvenir gardons-nous d’une amitié, d’un paysage, d’une époque disparue à jamais, mais aussi d’une église, d’un quatuor, d’un tableau, d’une poésie, d’une nouvelle, d’un film? Comment ces expériences résistent-elles au temps ou sont-elles déformées par lui? Lorsque se posent de telles questions, la rencontre avec Proust et son cycle romanesque *À la recherche du temps perdu* devient inévitable. *Rendez-vous à Bray* frappe en effet par les multiples allusions à la vie et à l’œuvre du grand écrivain. Notre analyse sera tout particulièrement guidée par ces résonances proustiennes.

1. Burne-Jones, Vermeer

La nouvelle de Julien Gracq accorde une place importante à une peinture d’Edward Burne-Jones, *King Cophetua and the Beggar Maid*. Ce tableau apparaît à la plume de la nouvelle comme du film. Le protagoniste l’aperçoit accroché au mur situé en face de sa table pendant le dîner préparé et servi par la servante (dîner dont le menu, dans le film, est identique à celui du repas organisé par Julien pour Jacques et son amie Odile à l’auberge de campagne).

Proust et Burne-Jones? Une étude récente a tenté de déterminer l’influence du peintre anglais préraphaélite sur l’auteur de la *Recherche* (Maya 2001). S’il est certain que Proust connaissait Burne-Jones par les articles que John Ruskin lui avait consacrés, notamment dans son livre *The Bible of Amiens* (que Proust a traduit), l’artiste anglais n’est nulle part nommé dans la *Recherche*. Néanmoins, on ressent son atmosphère (médiévale, mystérieuse, brumeuse...) autour de certains personnages féminins, surtout ceux de M^{me} de Guermantes et M^{me} de Stermaria.

Mais c’est surtout en évoquant l’œuvre de Vermeer que *Rendez-vous à Bray* assure la rencontre picturale entre Gracq et Proust. L’admiration de Proust pour les tableaux du peintre hollandais et surtout pour *Vue de Delft*, le “plus beau tableau du monde”, est bien connue. Gracq admire Vermeer comme Proust. *Le Roi Cophetua* ne contient qu’un seul passage (ou peut-être deux) qui fasse allusion à Vermeer. La référence est subtile, mais elle semble s’imposer, car c’est à l’aide d’une *camera obscura* que le peintre composa la plupart de ses œuvres (et notamment *Vue de Delft*): “Les menus objets de la pièce s’y reflétaient avec cette même netteté de chambre noire

qui envoûte les tableaux des intimistes hollandais” (Gracq 1970: 219). Un peu plus loin, la servante est décrite ainsi: “La lumière du flambeau qu’elle avait posé devant moi sur la table accentuait bizarrement le caractère rituel de ces ornements blancs qu’elle semblait avoir revêtus plutôt que noués à son front et à sa ceinture” (ibid.: 221). Ce passage souligne d’abord, bien sûr, l’aspect initiatique que prennent progressivement les rapports qui unissent le narrateur et la servante, mais, comment ne pas penser, devant cette description, aux femmes immortalisées par Vermeer. Par ailleurs, tout comme la servante du *Roi Cophetua*, elles semblent presque impassibles, non pas par pauvreté des sentiments ou apathie, mais davantage par leur dissimulation des émotions qui ne doivent pas être communiquées au spectateur. Les séquences situées à La Fougeraie baignent dans cette atmosphère, en culminant par le plan de la servante, qui, assise au coin d’une table de cuisine – on voit même un bord de carrelage de couleur “bleu de Delft” –, la figure cachée dans la paume des mains, lève, surprise, le regard vers Julien.

Ces allusions à l’œuvre de Vermeer donnent encore plus de relief à la présence de la peinture de Burne-Jones. En effet, dans maints tableaux du peintre hollandais, l’on voit, sur le mur du fond, telle une clé permettant de comprendre l’idée exprimée par le tableau, des toiles qui ont un lien sémantique apparent avec les personnages. Le tableau de Burne-Jones a même plusieurs fonctions. Au niveau diégétique, il permet au protagoniste de saisir que la servante est en même temps la maîtresse de son ami. Plus subtilement, la peinture est présentée par Gracq comme une “annonciation” (à l’envers). La servante est aussi l’Étrangère, l’ange étant par définition celui qui vient d’ailleurs, le messager du *tout autre*. Cette femme permet au narrateur gracquien (et à Julien) de franchir ce “rideau de silence un peu initiatique derrière lequel l’oreille déjà se disposait, se tendait vaguement vers un *autre* bruit” (Gracq 1970: 192)/

2. *Du côté de Marcel*

L’intérêt pour l’œuvre de Marcel Proust s’est toujours accompagné d’une curiosité quasi insatiable pour les détails de sa vie. Roland Barthes, qui parla souvent de Proust lors de ses conférences données au Collège de France, l’a formulé ainsi:

Marcel, être singulier, à la fois enfant et adulte, *puer senilis*, passionné et sage, proie de manies excentriques et lieu d'une réflexion souveraine sur le monde, l'amour, l'art, le temps, la mort. J'ai proposé d'appeler cet intérêt très spécial que les lecteurs peuvent porter à la vie de Marcel Proust (l'album des photographies de sa vie, dans la collection de la Pléiade, est épuisé depuis longtemps) le *marcellisme*, pour le distinguer du *proustisme*, qui ne serait que le goût d'une œuvre ou d'une manière littéraire. (Barthes 1982: 830)

Rendez-vous à Bray cède quelque peu à ce *marcellisme* en parsemant, ça et là, des allusions à la vie de Proust. Citons quelques exemples (tout en veillant à ne pas tomber dans le piège d'une interprétation abusive).

Le dédain de Jacques pour le cinéma, "un divertissement d'ilotes, un passe-temps d'illettrés, de créatures misérables ahuries par leur besoin et leurs soucis" selon l'expression tristement célèbre de Georges Duhamel, est aussi celui de Proust. La plupart des intellectuels de son temps – Appollinaire était une exception – partagent d'ailleurs, on l'a assez répété, ce credo anti-cinématographique.

Comme dans la famille de Proust, le père de Jacques mourut avant son épouse. La mère du compositeur ressemble d'ailleurs physiquement à la mère du grand écrivain, telle que nous la connaissons par la célèbre photographie qui la montre, assise, entourée de ses deux fils. L'engouement de Proust pour la photographie est bien connu. Il attachait toute sa vie une importance extraordinaire à la possession de photographies. Il en avait toute une collection, la plupart étant dédicacées. Son acharnement à obtenir un portrait de personnes qui répugnaient à s'en dessaisir est un trait de caractère qui donne toute la mesure de sa passion. Les photographies de la famille de Jacques ou de ses proches, qui ornent le salon de La Fougeraie, évoquent subtilement cette passion proustienne.

Quelquefois, le film se réfère explicitement à la vie de Marcel Proust. Par exemple, Illiers et Cabourg font partie de la litanie de "noms de pays" que Julien et Jacques s'amuse ensemble à aligner, lors d'une promenade. De même, au moment de la déclaration de guerre, on entend, *en voix off*, la mère de Jacques s'écrier: "Odilon! Marcel!"

Le 26 février 1913, à la salle Pleyel, Proust écouta le quatuor Capet jouer les quinzième, seizième et dix-septième quatuors (ou Grande Fugue) de Beethoven. Entre 1914 et 1917, il invita plusieurs fois chez lui, 102 boulevard Haussmann, les quatuors Capet et Poulet pour entendre Mozart,

Ravel, Schumann et surtout Fauré, Franck et les derniers quatuors de Beethoven. À cette époque, la musique était son principal aliment spirituel. Dans le film, Julien continue la chronique musicale que Jacques tenait avant le début de la guerre. (D'emblée, la substitution est au cœur même des liens qui unissent les deux amis.) Le pianiste discute avec son rédacteur en chef du compte rendu qu'il a écrit d'un concert donné par le quatuor Capet. Au programme: des œuvres de Debussy et de Franck. De ce dernier, Julien joue le *Prélude, Choral et Fugue*, lors du récital qu'il donne chez les Hausman (*sic*).

3. Franck, "La communication des âmes"

César Franck a été novateur dans le domaine de la musique de chambre en introduisant le principe de la *forme cyclique* qui, par la résurgence des thèmes, d'un mouvement à l'autre, et par leur superposition dans le volet final, assure une grande cohérence à la structure de la composition. Selon Alfred Cortot, *Prélude, Choral et Fugue* "est l'un des dix plus grands chefs-d'œuvres de la littérature de piano". C'est aussi une page d'une étrange et forte nouveauté lorsqu'elle est publiée en 1884. Le film en fait entendre un extrait de plusieurs minutes. Par ailleurs, *Prélude, Choral et Fugue* constitue l'unique accompagnement musical d'un film de Luchino Visconti, *Vaghe stelle dell'Orsa* (*Sandra*, 1965). Or, dans ce film, comme dans celui d'André Delvaux, une relation triangulaire entre deux hommes et une (ou plusieurs) femme(s) occupe une place primordiale. Le morceau de Franck est caractérisé par une composition ternaire indiquée d'emblée par le titre en triptyque; le passage du diptyque (voir un "prélude et fugue" à la Jean-Sébastien Bach) au triptyque, par l'introduction du choral intermédiaire, accentue une figure dramatique présente dans le film de Visconti: à chaque couple s'ajoute un troisième élément. La même conclusion est valable pour *Rendez-vous à Bray*: entre Jacques et Julien s'interpose (si l'on peut dire) la mère, à Odile et Jacques s'ajoute Julien, l'absence de Jacques plane sur les rapports qui existent entre Julien et la servante.

La musique est le lien privilégié qui unit Jacques et Julien; elle ressuscite le passé et restitue au pianiste la personne de son ami. Inspiré par la tonalité du dernier Brahms (une imitation qui n'aurait sans doute pas déplu à l'auteur des *Pastiches et Mélanges*), le nocturne que le compositeur a dédié à Julien ponctue les moments-clés du film. L'élément musical assure

la communication des âmes. Ainsi Proust: “De même que certains êtres sont les derniers témoins d’une forme de vie que la nature a abandonnée, je me demandais si la musique n’était pas l’exemple unique de ce qu’aurait pu être – s’il n’y avait pas eu l’invention du langage, la formation des mots, l’analyse des idées – la communication des âmes” (*La Prisonnière*). Si les photographies de Jacques et de ses proches, qui décorent le salon de La Fougeraie, affirment visuellement *le ça a été* barthésien, la musique accompagne les souvenirs de Julien, les déclenche parfois, et en est une trace audible qui persiste au présent.

4. *Un rendez-vous proustien*

Julien Gracq note: “L’enchaînement des séquences dans *À la recherche du temps perdu* ressemble souvent – plutôt qu’à l’articulation habituelle en chapelet des scènes romanesques selon l’écoulement du temps – à la multiplication cellulaire par dédoublement des noyaux. Dès qu’un foyer d’intérêt inédit ou inattendu se densifie suffisamment sur les marges d’un des tableaux animés qui constituent la *Recherche*, il centre sur lui l’attention et le regard du narrateur et devient le noyau d’une séquence neuve, laquelle organise aussitôt son autonomie” (*En lisant en écrivant*). Cette remarque portant sur l’architecture de la *Recherche* s’applique aussi à la structure (musicale) de *Rendez-vous à Bray*. C’est là encore un aspect proustien du film. Nous avons déjà évoqué un certain nombre d’allusions à la vie de l’écrivain. Citons maintenant quelques références à son cycle romanesque (sans perdre de vue, répétons-le, les hasards d’une lecture *proustifiante* par trop enthousiaste).

Commençons par les références proustiennes liées à la Grande Guerre, toile de fond du *Temps retrouvé*. Les interventions de la censure, les blancs dans les journaux que lit Julien, évoquent les exclamations de M^{me} Verdurin, qui constate avec regret que “l’on a encore *caviardé* toute la fin de l’article de Norpois”. Quant à la qualité des informations fournies par la presse, le narrateur proustien les commente à plusieurs reprises. Le tremblement qui secoue un instant la solitude et l’attente de Julien à La Fougeraie n’est d’ailleurs pas sans rappeler l’effroi du narrateur devant la “rapidité avec laquelle le théâtre de ces victoires [annoncées par les journaux] se rapprochait de Paris”. De même, l’incitation du rédacteur en chef de Julien: “Si vous avez une opinion personnelle sur Wagner ou sur la guerre, dites-la!”

rappelle la germanophilie de M. de Charlus et de son neveu, Robert de Saint-Loup. (“Il faut décidément l’arrivée des Allemands pour qu’on puisse entendre du Wagner à Paris.”) Comme ce dernier, Jacques part à la guerre “comme on part à une fête”, une guerre dont les deux hommes prévoient qu’elle sera “l’affaire de quelques semaines” seulement. Contrairement à son ami, Julien ne part pas au front: étranger (il est luxembourgeois), il est exempt de toute obligation militaire vis-à-vis de la France. Son statut évoque celui du narrateur de la *Recherche*, qui, souffrant, ne participe pas non plus à la guerre.

D’autres éléments rapprochent Julien du narrateur proustien: un certain détachement des événements et, surtout, le fait que le passé soit ressuscité à travers lui, comme vu par ses yeux. Au salon de La Fougeraie, la caméra se focalise sur lui, elle s’attarde sur son visage; l’espace du salon n’est jamais montré d’un point de vue qui permettrait au spectateur d’en saisir la globalité.

Si Jacques ressemble par moments quelque peu à Charlus ou à Saint-Loup, Julien partage certains traits avec Morel: lors de la soirée chez les Hausman (dont les mondanités évoquent les réceptions chez M^{me} de Sainte-Euverte ou chez les Guermantes), le pianiste est le protégé du compositeur – un rôle contre lequel il se révolte. Les deux musiciens, Morel comme Julien, ont d’ailleurs obtenu un Premier Prix de Conservatoire et sont d’origine modeste.

Les noms de lieux (Toutainville, Cabourg, Criqueville, Criquebœuf etc.) que Jacques et Julien s’amuse ensemble à aligner, lors d’une promenade, font penser au goût du narrateur pour la toponymie – un goût qu’il partage avec le curé de Combray – et aux stations balnéaires desservies par le petit train de Balbec.

Tout aussi proustien est le mécanisme associatif, ébranlé par des impressions sensibles (perçues par l’ouïe, la vue, le goût etc.), qui provoque les réminiscences de Julien. Ainsi, la saveur du vin, du repas entier que goûte Julien, est semblable à celle du repas qu’il avait commandé, à l’auberge de campagne, pour Jacques, Odile et lui-même (à la Fougeraie, les rôles sont inversés: c’est Jacques qui a commandé le (même) repas pour Julien); et cette saveur ressuscite cette évasion à trois. Significativement, les images ressurgissent de façon palpitante, d’abord par bribes et détails, pour ensuite prendre forme et consistance dans la durée. Proust: “Quand d’un passé ancien rien ne subsiste, après la mort des êtres, après la destruction des

choses, seules, plus frêles mais plus vivaces, plus immatérielles, plus persistantes, plus fidèles, l'odeur et la saveur restent encore longtemps, comme des âmes, à se rappeler, à attendre, à espérer, sur la ruine de tout le reste, à porter sans fléchir, sur leur gouttelette presque impalpable, l'édifice immense du souvenir" (*Du côté de chez Swann*).

La comparaison avec la *Recherche* a toutefois ses limites: dans le cas de *Rendez-vous à Bray*, on ne peut parler de mémoire involontaire. En effet, la madeleine, les clochers, les pavés, la serviette, le bruit de la cuillère ou d'une conduite d'eau, ces impressions sensibles sont comme le signe d'un tout autre objet, à déchiffrer, à interpréter (Combray, les jeunes filles, Venise...). Un pareil travail de décryptage ne s'impose pas à Julien. Son parcours n'est pas celui du narrateur proustien, qui perçoit, à travers les éclats de la mémoire involontaire, une image instantanée de l'éternité, la joie du temps retrouvé, "un peu de temps à l'état pur", et qui reçoit, à la fin du roman, la révélation de la rédemption par l'Art.

5. Conclusion

Quel est alors l'itinéraire de Julien? La nouvelle de Gracq suggère discrètement que la servante n'est pas seulement la maîtresse de Jacques, mais aussi la prêtresse d'un rituel initiatique, conçu par lui pour le jeune pianiste. En route pour Braye-la-Forêt, le narrateur gracquien s'exprime ainsi: "On traversait alors, après le vacarme parisien, ces forêts nobles et vides qui barricadaient les avancées de la vie civile comme un rideau de silence un peu initiatique derrière lequel l'oreille déjà se disposait, se tendait vaguement vers un *autre* bruit" (Gracq 1970: 192).

Dans le film, la communion (la communication) avec la Mort – la quête de Julien Eschenbach rejoint celle d'Orphée – est assurée non seulement par la musique, mais aussi par le repas (que, significativement, Julien mange seul, ce qui en affirme le caractère sacré) et par l'union charnelle de Julien et de la servante – *Eros et Thanatos*. Le lendemain, après cette "nuit transfigurée", le narrateur gracquien (percé par le contact avec l'au-delà?) repart pour Paris; dans le film, Julien demande un journal à la gare de Braye-la-Forêt et constate qu'aucun avion n'a pu décoller depuis 48 heures, en raison du mauvais temps – Jacques serait-il encore en vie? Julien reprend le chemin de la villa de son ami.

Les questions de langage et d'identité sont au centre de l'œuvre de Delvaux. À plusieurs reprises, le film insiste sur le fait que Julien est un

étranger; on se méfie même de lui à cause de son accent luxembourgeois (qui est donc d'une sonorité plutôt germanique): dans le train, le soldat veut savoir s'il est alsacien et, à Bray-la-Forêt, les deux enfants auxquels le jeune homme demande le chemin de La Fougeraie se taisent et l'observent avec suspicion.

On peut penser au statut de *metoikos* ou *resident alien* que revendiquait T. S. Eliot pour les poètes. Ou aussi à Gilles Deleuze et son "devenir-minoritaire", la recherche d'une langue mineure à l'intérieur d'une langue. Ou encore, à un ange de Rilke qui effrayerait Julien par sa beauté et son mystère, ce Julien candide, dont la volonté de ne pas compromettre une certaine idée de pureté qu'il se fait de lui-même transpire à travers les discussions qu'il a avec Jacques.

Et Proust, nous permettons-nous de demander une dernière fois?

Dans le film comme dans la nouvelle, le protagoniste s'annonce à La Fougeraie par un coup de sonnette qui paraît "étrangement hors de saison" à l'oreille du narrateur gracquien: "La main levée déjà vers la sonnette de la grille, hésitant à m'annoncer, j'écoutai une fois encore, intimidé, une saute de la rafale coucher les arbres de la venelle. Le tintement de la sonnette au fond de cette cépée morfondue me paraissait étrangement hors de saison" (Gracq 1970: 197).

Un indice infime, certes, mais comment ne pas penser aux visites de M. Swann à la famille du narrateur, un soir de Pâques, à Combray? Il y a peu d'idées sur lesquelles Proust ait autant insisté que sur la composition de son livre, dont la structure circulaire est apparente. Dans la mesure où la sonnette de Combray, au bruit "ferrugineux, intarissable et glacé" et dont le tintement est décrit comme "rebondissant, ferrugineux, intarissable, criard et frais", ouvre et ferme la *Recherche*, le "rendez-vous urgent avec moi-même" du narrateur qui décide, à la fin du *Temps retrouvé*, de ne vivre désormais que pour son œuvre, le renvoie au village où, enfant, il passait les vacances de Pâques chez sa tante Léonie; et c'est une expérience *initiale* mais aussi *initiatique* (la tasse de thé, la madeleine) qui "lance" le roman en faisant resurgir Combray. Le rendez-vous à Bray-la-Forêt est donc – peut-être – aussi un rendez-vous avec Combray – d'où la disparition de la lettre "e"? Bray, Bray, Combray.

* Ce texte est dédié à la mémoire de Francis Ramirez.

Nonverbal communication in dance, theatre and art

1. Introduction

In oral communication a speaker must not only be heard, but seen as well. Communication includes gestures and facial expressions, body and eye movements, etc., all of which function both as units of separate sensory channels and as a part of one integrated whole.

Corporeal signs are always rooted in a particular type of thinking and culture, which provide for the existence and realization of nonverbal meanings and ideas that an individual may want to communicate. Culture is a specific system of representations. People live in the culture and reproduce it not only in their speech and language, but also in different semiotic activities that they perform in everyday life, in special rites, and liberal arts. People also codify culture in a rhythmic magic of dancing and singing, in theatre and cinema – in any important human act.

2. Dancing

Artistic subsystems of nonverbal languages of ballet theatre and dances, such as the language of Indian classical dance *abhinaya* (LaMeri 1941), occupy a special place in culture. Hands and arms perform the main role in this dance, which has been known for more than 2000 years. The specific meaning is attributed to various positions of hands and their movements, *hasta*, and to their orientation relative to the head and body of a dancer. Some researchers distinguish two separate sublanguages in the language of *abhinaya* – one of the sign movements made by one hand, *asamyutta*, and one of paired sign movements made by two hands, *samyutta*. Especially significant among gestures that are incorporated in *abhinaya* is the sign behavior of fingers, which is similar to *mudra* movements. The positions

of fingers including the way and degree of their deviation from the vertical axis, the character of finger movements, the presence/absence of space among the fingers, and even their position in relation to the thumb, are semantically loaded.

Abhinaya dance is extremely complex in its form and meaning, but the system of ball tango, simple at first sight, also represents a specific domain of culture with its own nonverbal semiotic code, etiquette and ceremonies. At the tango-dancing parties called *milongas*, popular in many big Russian cities, men invite women for a dance with a special glance or a nod. And a slight nod of a woman partner without any accompanying words means agreement to dance. The blocks of *milongas* consist of four musical parts, and according to the dance etiquette, you should speak to your partner about something and only then proceed to dancing. Following the canons of tango and *milonga*, a couple dances in full silence not touching other dancing couples. If after the dancing tour a man thanks his female partner with words or with a nod, it means he does not want to dance with her anymore.

In Russia dance and ballet played a very special role starting from the nineteenth century up to the beginning of the twentieth century. “Dancers played in drama performances, tragic actors danced” (Krasovskaya 1958: 82). Dance was regarded as one of the social skills necessary for moving up the stairs of the empire bureaucratic hierarchy. William Todd (2005) relates symbolic dancing elements with the Russian environment of the nineteenth century. It is the choreography that helps to restore the evolution of Pushkin's characters and to understand relations among them and the outside world. For example, Eugene Onegin is experienced in worldly activities of noble people. He easily dances a rather difficult dance *mazurka* and performs difficult movements such as bows, not just casual nods. In Russia of 19th century young people belonging to high society learnt the art of bowing together with the art of dancing. Dance teachers worked out special rules of beautiful positions of the body, head and legs for bowing. The instruction written by a dance teacher dated 1825 says that two things – walking and bowing – are among the most important in the high society. “When seeing a stranger in public, people pay attention to his/her appearance and movements before learning the social position. There are many kinds of gait and bows. They depend on the character, status and educational background. A passionate character can be spotted through agitated

gait and bows. If a person holds a high position in the society, his rank prevents him from excessive liveliness. Finally, a well-educated person knows where and what kind of bow to perform. One cannot expect anything pleasant from those who have never learnt to walk, sit and bow correctly.”

In a Russian village of the 19th century, the gentry and landowners, balancing between the culture of their serfs and the culture of urban aristocracy, had an opportunity to follow both traditions. A folk dance – a reel – in the juvenile lyrics of Pushkin meant any circle dance, either real (Greek, Circassian) or imaginary. But later, in *Eugene Onegin*, for example, the word *reel* (Russian *khorovod*) means already only a Russian folk dance. It is not accidental that the landowners Larins keep up some features of folk peasant dance: a reel is one of the habits of sweet olden times in their peaceful life.

Thus, a dance is the reflection of conventional process of generation of nonverbal text according to the given meaning. Being both a semiotic system of art and a type of nonverbal sign of meaningful social behavior, a dance can embody many of the highest values of the prose – creativity, beauty, stamina and poetry, perceived as the unity of meaning and technique.

3. *Theatre*

Staging in theatre is always done within a tradition and presumably presents the following things: (a) authentic reproduction of material elements of cultural traditions – the objects of everyday life, rites and technical devices, such as furniture, clothes, weapons, contemporary cars, etc., i.e. the stage-property of theatrical culture; (b) attention to space and body aspects -- features of theatre which will be of particular interest to me. Below I will discuss space issues and space behavior of actors in theatrical staging.

In his guide to proxemic behavior, Edward Hall writes: “The study of culture in its space aspect is the study of how people in different emotional states, environments and contexts, how people performing different actions and entering different relations use their ability to perceive space” (Hall 1974: 3). While directing staging, a theatre director should realize that every nation has its representation of space organization of life, the representation that can be called the national space conceptualiza-

tion (Kreydlin 2002). The notion of space and communication of people within this space are always reflected in staging a play.

For example, Korean beliefs and an unusual (for Europeans) notion of space organization are reflected in the Korean theatre. A spectator in Korean theatre should know that (a) if there is a house with rooms on the stage, then in every position of the house there are living spirits who help in everyday activities, take care of people who live in the house, protect them from troubles, disasters, etc. Thus, in the hall with wooden floor *maru* lives a spirit *Songdgu*, and in the female part of the house lives the spirit called *Samsin*. In the kitchen lives *Jovang*, in the yard – *Todgu*, etc. Each of the spirits performs his own role: *Songdgu* guards the house, *Samsin* governs the childbirth; *Todgu* protects the yard from evil spirits, etc. A spectator should also know that (b) *maru* is the most important place in the Korean house. The word *maru* supposedly originates from Evenki word *malu* (holy place). That is why it is not surprising that *maru* is always in the centre of the stage.

Body aspect of action and theatrical gestures are also highly important. The theory and history of culture, and following them nonverbal semiotics, distinguish two clearly opposite attitudes to human body. These are: (a) apophetic attitude, or non-disclosure of the body. This attitude tries to present the body as concealed, undistinguished and at the same time, so to say, ideal, in particular, it desires to make a male body undistinguishable from a female one, and

(b) the attitude that can be called attracting attention to the body. The stereotypical means to attract attention to the body, besides verbal manifestations, are somatic signs – gestures, postures, etc, as well as perfumes, clothes and accessories.

From the 16th to the end of the 18th century, European theatre presented a bodiless performance. Directors and actors had only words and several rare elements of stage property. European dramatic art did not allow assimilation to something or to somebody in body masks, so that it would not affect the uniqueness and unity of a man. It was only at the end of the second third of the 18th century when the apophetic attitude changed for attentive attitude to the body. Now the audience not only heard the voice of the actor but also saw the body of the actor and his actions with the body and performed on the body. This dual perception of the actor by a spectator is very important. First, owing to such perception

all signs expressed by the actor become true. Secondly, the dual perception emphasises that the actor performing a role cannot be identified with the character of the play, that we cannot equate the actor with the person he represents, that his costume and mask, as well as the gestures of the actor, are only signs of represented performance (Bogatyrev 1975: 20).

Partners exercise various body contacts, master new gestures and perform different actions with objects and over objects, with people and over them. Characters point with their hands and eyes to each other, touch one another (these gestures probably gave birth to new attitude to a body and corporeality in Russian theatre). Characters take each other's hands, hug, kiss, put their head on the knees of their partner; slap, fight, assume new postures and later they come off the stage space and go in the house.

Strange as it may seem, theatrical gestures and theatrical space have been studied separately so far, though it is very important to tell a story in the theatre using actively the languages of proxemics, touching and gestures all together. Quite often a gesture performed in a certain part of the space impresses more than words said or a static posture assumed by an actor in another part of the space. Moreover, pauses and silence, combined with gestures and postures, can also reinforce the impression during particularly significant parts of the performance.

The leading theorist of theatre in the 20th century, Konstantin S. Stanislavsky, divided theatrical actions into three components: outer, or body action, verbal action and inner action, a thought or feeling. Peter Brook saw paralinguistics and kinesics as sign systems, which can follow the verbal code or contradict it. In a lifeless monotonous, or, according to Brook, dead theatre, gestures of actors often contradict the playwright's intentions expressed in the text or director's ideas on how to interpret an event. A Macedonian researcher Sasho Ognenovsky, a specialist in drama studies, writes in his "Paralinguism in Theatre and International Theatre Festivals" (manuscript), "In the middle of the 20th century the fact that Molière's *Tartuffe* is hypocritical can be seen only in nonverbal, paralinguistic and gesture structures, which all reveal the nature of *Tartuffe*." Shakespeare's Hamlet is not a man who does not know what to do when confronted with the tragedy of his own and of his family. If one replaces whisper for cry, sorrowful sign movements performed by Hamlet for the indignant though at the same time passive gestures for furious and energetic ones, then a spectator will see quite a new Hamlet, the character who perfectly

understands his lot. Indeed, Hamlet has to work out a plan to achieve his aims – this results from his nonverbal behavior, thus gestural reincarnation becomes possible.

Chinese culture presents a typical example of using features of appearance in theatre productions. The Chinese divided the face into 3 zones. The upper zone, forehead, shows a person's course of life from 15 to 30 years old and in extreme old age; the middle zone, from eyebrows to the tip on the nose, – from 35 to 50; and the lower zone, from upper lip to chin, – from 51 to 77. An ideal forehead (considering its form and complexion) denotes a perfect condition of body and spirit. Harmonious middle zone witnesses balanced mind, regular lower part – balanced character.

In traditional Chinese theatre the presentation of face and make-up play a special semiotic role. Red face (red paint for make-up) means loyal, devoted man, a pink one means an old person. Black face meant fair and just man, white – a cunning and sly one. A married woman worn-out by constant heavy work had a yellow face, which was considered ugly, and an ill person had a gray face. The color of the face means emotions as well. And a face without any color does not mean “colorless”; a colorless face also always reflects emotion, e.g. the meaning “he is death-pale from fear, sorrow, fatigue” in ancient Chinese is communicated with the words *mjn' y zhen'se*, which means literally “face without human color”.

In many other cultures the color of face and facial expressions are also very significant. The Jesuit missionary Sanches Labrador described how enthusiastically kaduveo tribe people from the Southern America spent whole days painting the faces and bodies. Claude Levi-Strauss (1983: 229) writes that *kaduveos* believed that a non-painted man was simply silly.

A director and actors staging a play of Russian classical writers have to master nonverbal instruments used in everyday life and coded in modern Russian. They should know, for example, that rubbing or scratching of an ear in the language of Russian gestures and culture imply, besides other things, a subconscious desire to isolate oneself from words, to close one's ears.

A relaxed position of the body reveals trust towards a partner. If American people prefer, even in a private conversation, standing a little bit sideways to one another, Russians will regard this position as disrespectful. Scratching the neck or somewhere near the earlobe while communicating means in the Russian body language, “I'm thinking, because I'm not

sure I can eagerly agree with you". A Russian yawn means that a person is bored, while an Italian yawn, for example, can mean that a yawning person is hungry. Arms crossed on the chest during the conversation mean not only protection and concealment of a body, but also a passive resistance to what the partner is saying.

And how can silence be shown in the Russian theatre? How is it possible, for example, to stage the famous Pushkin's remark *narod bezmolvstviet* (people keep silence)? Zinovij Korogodsky in Leningrad Theatre for Young Spectators found, I think, a brilliant scenic solution: on the stage a huge bell is being rocked, but one can not hear any sound. Moris Meterlink, a writer and a theorist of drama pauses and mute (silent) drama, believed that speech should reflect only historical, actual and temporal human relations, that verbal communication and the expression of inner state verbally is only possible on the surface of human existence, while eternal elements stay silent. Silent lips and tongue can explain the soul. Indeed, true life, which is the one that leaves some trace on the Earth, is woven from silence. We keep silence on the first shy date, we keep silence when we read or watch something interesting, when we reflect about something important. We fall silent at the threshold of parting, in great joy or sorrow, at the wedding, funerals or at the deathbed, we keep silence being amazed by the beauty of nature or generosity of human deeds. Meterlink, with his disposition to surprising and nice paradoxes, remarked once that the words pronounced have some sense only thanks to silence which surrounds them, and that if the first man met the last inhabitant of the planet, they both would keep silence when kissing, being frightened or crying, when feeling something that should be clear without lies.

The language of gestures and voice reflected in art, and sometimes in life itself, becomes a text, a subtext, a parable, a hint, a metaphor or a realized metaphor, both a riddle and a solution. Let us take a smile on stage or in painting. They are gestures, a body cipher that has to be solved. When the author of a play writes something like "smiling" in a remark, the type of smile is usually hidden in the text and it is necessary to recognize its form and meaning.

4. Painting

Various art schools differ not only in their attitude to space and aesthetics of its perception, but also in special nonverbal languages of its representation. Special attention is given to structural and informative organization of space, to semantics and pragmatics of spatial forms, to discovery of cultural universal and specific spatial components, notably specific both for the given artist and this or that art school. Nonverbal semioticians are interested also in how artists and sculptors represent time, how time interacts with space, its apposition and superposition with space.

The correlation between time and space, presented on the canvases or in sculptures, is not trivial. The masters of realism, particularly those of Russian art school, communicated time and its flow with the change of colors and hues, as well as with static positions of objects and bodies, their bends and turns. French impressionists, in their own words, were ready to sacrifice space to triumph the continuity, for the sake of “the thrill of the moment” and “hour of life”. One should not be an art expert to feel the air, space and movements on the canvases of the best Impressionists of the French school, such as Pissarro, Monet, Degas, or Cézanne. Their language of painting reflects temporal relations. The boats and steamboats are sailing in blue-grey distance; we can feel the fog in the field, the blue dancers circling in a dance, and people moving on the Montmartre Boulevard. We can see the reflection of fading light on the walls of the cathedrals and flowing sun specks on the rocks. The units of time for impressionists were the symbols of nature and life, and light combines many important features of time and space.

Futurists tried to express time in another way in their paintings, namely with the help of spatial relations of forms. They often depicted time by including some objects and their parts into other objects. To convey temporal meanings on the canvases, futurists used different intersections, overlaps and shifts of forms. In this relation, we can remember biblical and folklore plots on the pictures of Mark Chagal with images of people, houses, chairs, etc., bending, overlapping or being inserted one into another. Chagal himself said once that these signs were dreams and memories of the past times. In such an artistic language he depicted his native town Vitebsk, the events and images of his childhood, in which houses, people, animals, and fish are freely flying and creeping during the flight one into another. In one of

his numerous interviews the painter stressed, “I always wanted to solve the riddle of time, to catch its magic. Long ago, when I started depicting a man and his memories, his reflections as something both existing and visible, my pictures were considered mere eccentricity. But this is the time of a person as (s)he is. Isn’t our memory a form of time? Our memory is always with us, our past is always with us. And our thoughts... They look like one whole entity. And I depict it. This helps me to understand a person.”

Supremacists pictured time in some absolutely different way. The most famous of them, Kazimir Malevich, deemed that time as such did not exist at all, it was shrunk into one point. The structure of paintings of supremacists, who were so different in their personalities and creativity, was extremely spatial-geometrical. Good examples of these time-space images are the famous “Black Square” by Malevich, “Life in a Big Hotel” and “The City” by El Lysitskiy.

5. *Conclusion*

There is a vast amount of evidence that different sorts of movements, manual gestures, postures, facial expressions and spatial signs play a highly important role in human communication. They have a certain pragmatic effect on the audience and govern aesthetic perception of people and objects. Further semiotic studies analyzing in detail the contents and form of aesthetic nonverbal signs are necessary to present the complete and precise description of these units in gesture and language dictionaries, grammar descriptions and databases.

Dialogue of Estonian and Hungarian literary semiotic approaches

**The legacy of Russian classics and the
Lotmanian critical heritage as “Our text”**

Introduction

The issue of “*our text*” was very important for Lotman’s semiotics of culture. As he wrote in one of his last publications, “Theses towards a Semiotics of Russian Culture”: “The study of Russian culture from a semiotic perspective may take two directions. On the one hand, the researcher may utilize the broad achievements of semiotic studies and describe Russian culture on their foundation. The other approach implies a certain dissatisfaction with existing semiotic studies of culture and a desire to find a basis for other methods and approaches in the material of Russian culture. Our approach is precisely the latter. We propose that the study of the material of Russian culture from this angle may provide new impetus to the general methodology of the semiotics of culture. *The dynamism, instability and persistent internal contradictions of Russian culture cause it to be a sort of historical and theoretical proving ground*, leading both to unavoidable losses and, at times, prophetic insight into this inherently experimental field of study” (Lotman 1994: 219, our italics).

In the context of this article, *our text* also means the specificity of dialogue between the empirical research object and theory created for the analysis of this object. Lotman’s theoretical system mostly rests on the literature of the late 18th to early 19th century. We try to create a new dialogue with Lotman’s semiotics of culture using new material, analysing the works of Dostoevsky.

This article comprises two case studies given in a theoretical framework partly rooted in the Lotmanian principles of his *ad hoc* semiotics and, on the other hand, his general semiotic theory. Here we turn – in the context of Fenno-Ugric literary semiotics – to some aspects of cultural and, in a narrower sense, literary *meaning-emergence*, involving these aspects in the scope of the semiotic interpretation of Dostoevsky's novel *Crime and Punishment*, a novel which has quite a broad and rich tradition of semiotic explanations in critical literature (e.g. Toporov 1995). The two approaches to the problem of cultural (literary) meaning-emergence examined in the first and second parts of the paper are presented below as conclusions emerging from works belonging to two spheres of separate, individual investigations into cultural/literary theory and the question of the legacy of Russian classics in these fields (e.g., Torop 1997, 2000, 2003; Kroó 1994, 2002, 2008, and forthcoming). They are connected here by both putting into focus the concepts of dynamic complementarity in the complex processes of semanticization (meaning-generation and meaning concretization) in the literary text integrating various cultural (sub)texts.

In the first part of our paper the question of the *complementarity of cultural languages* will be treated, the accent being on the interrelation of discrete narration and pictorial depiction, with a reference to the structure of manuscripts, i.e. a (quasi) pre-verbal state of the final literary text. In the second part, *complementarity as a dynamic semiotic correlation* will be examined in two dimensions from the point of view of semiosis generated in certain (sub)semiopheres. One is the context of the double systematization of the sign in certain semantic referential processes ensuring the dynamics of meaning-evolution and thus giving it a dimension of internal historicity. The second is inseparable from the aforementioned theoretical aspect and concerns meaning-emergence as a process of semantic reconstruction, meant in a special way in which discrete vs. non-discrete languages are interpreted in terms of explicitness and implicitness.

The term *dynamic complementarity*, so intimately connected to the Lotmanian interpretation of the semiosphere and also embracing the concepts of *own text* and the *alien text*, consequently, in this paper is scrutinised from various angles, all of them elucidating the nature of the interrelation of traditional narration with other semiotic languages. On the one hand, we address the interrelation of verbal narrative with pictorial depiction and/or performance and with meaning-structures generating implicit

meanings. On the other hand, all this is put into historical context, such that we interpret history by splitting the concept into history in the sense of the genesis of the text (e.g. manuscripts, the interiorization of external cultural texts) and into the internal history of meaning-generation within the text (e.g. the evolution of implicit meaning-structures, intertextual and intercultural semiosis, etc.).

Returning to the Fenno-Ugrian context in which our common lecture at the Symposium of IAFUSS within the 9th International Congress of IASS was originally presented, it is necessary to underline that realizing methodological complementarity as a semiotic tool for examining theoretical problems in the realm of cultural semiotic studies goes far beyond being a method. In fact it embodies a practical interpretation of the semiotic essence of dynamic complementarity within the semiosphere of the exchange of Estonian–Hungarian critical thought and approaches investigating cultural semantics. It is an active mode of giving a metaconceptual orientation to the interpretation of the concept which stands in the centre of our paper. Fenno-Ugrian literary semiotics as representing a multicultural semiosphere itself contributes to fulfilling the most important function Lotman attributes to semiospheres when evaluating them by their capacity for engendering and creating new ideas and meanings. Hence the main topic of our paper, *meaning-emergence and meaning-generation*,¹ through the various aspects of theoretical grounding and the two case studies, will we hope be given a twofold interpretation – one concerning meaning-evolution as an object-concept, and another conceiving it as a meta-concept.² The sense of the latter one can easily be interpreted as an element of the self-reflexive definition given by us to the cultural phenomenon of Fenno-Ugrian semiosphere.

Part I (Peeter Torop)

Simultaneity of two languages and two types of text-generators

In order to understand the concept of meaning-generation and the emergence of meaning in Lotman's semiotics of culture, his typology of cultural languages proves to be very important. In 1978, Lotman wrote an article, "The Phenomenon of Culture", where he created a typology distinguishing between statics and dynamics (cf. Lotman 2000a). The basis for this

typology is the distinction of the static and dynamic aspects of cultural languages. From the static aspect, cultural languages divide into the discrete and the continual (iconic-spatial), and for Lotman this forms the primordial semiotic dualism. In discrete languages, the sign comes first, and meanings are created through the meanings of signs. In continual languages, text comes first and meaning emerges through a holistic text that integrates even the most heterogeneous elements. These are the two languages between which it is difficult to create translatability and which are understandable as a complementary whole.

On the level of text we can find an identical logic: “Thus both the individual, and the collective consciousness, contain two types of text-generator: one is founded on discreteness, the other is continuous. In spite of the fact that each of these mechanisms has a self-contained structure, there is a constant exchange of texts and messages between them. This exchange takes the form of a semantic translation” (Lotman 2000b: 36).

In the case of Dostoevsky, we can analyze this binarity in two aspects. From one side, it is possible in the context of word and picture, narrative and performance; and from another side, in the context of two ideologically different worlds – anthropocentric and theocentric. For example, we have some symbolical frame by joining the first sentence and the two last sentences of *Crime and Punishment*: “On a very hot evening at the beginning of July a young man left his little room at the top of a house in Carpenter Lane, went out into the street, and, as though unable to make up his mind, walked slowly in the direction of Kokushkin Bridge. [...] But that is the beginning of a new story, the story of the gradual renewal of a man, the story of his gradual regeneration, of his gradual passing from one world to another, of his acquaintance with a new and hitherto unknown reality. That might be the subject of a new story – our present story is ended.” (Dostoevsky s.a.: 19, 559). These two worlds exist continuously in the novel and have different features (see Scheme 1).

Chronotopical levels

To speak seriously of an authorial agent or concept of work, it is necessary to specify the interrelations of plot and narration, beginning and end: any story concerns events and human movements (or states) in space and time, or more exactly, in *chronotopes*, because these notions are complementary.

SEMIOSPHERE			
LEVELS	ANTHROPOCENTRIC WORLD	THEOCENTRIC WORLD	
TOPOGRAPHICAL CHRONOTOPE HOMOPHONY	STUDENT THEORIST (ARTICLE)	RASKOLNIKOV	NAPOLEON, LAZARUS, CHRIST.
PSYCHOLOGICAL CHRONOTOPE POLYPHONY	THEORETICAL BEHAVIOUR CRIME	RASKOLNIKOV RASKOL: SPLIT	NATURAL BEHAVIOUR SAVED CHILDREN, GIVING MONEY
METAPHYSICAL CHRONOTOPE HETEROPHONY	PROFANATION SOURCES OF THEORY: STIRNER, CARLYLE, NAPOLEON III, MILL, BENTHAM	RASKOLNIKOV BALANCE	SACRA- LIZATION SOURCES OF DREAMS: NEKRASOV, PUSHKIN, LERMONTOV, VOLTAIRE)

Scheme 1. Levels and worlds in Crime and Punishment.

First, we can specify the *topographical chronotope* that fixes the succession of events and the real world, more or less recognisable to the reader. The reader comes into contact with real time and space. In this chronotope moves the man (hero), whose language, behaviour and costume reflect his subjective attitude to time and space. A man (hero) is the centre of the *psychological chronotope* which conveys the character aspect to the reader: self-evaluation and evaluation of other people and events. The author produces a novel from certain aims or conceptions, the main purpose of which is to create a whole, to communicate the conception to the reader in an individual form. This is possible by means of the *metaphysical chronotope*, i.e. the conceptual chronotope, its authorial interpretation.

In *Crime and Punishment*, on the topographical level we have a story and a proto-story; a story about a young student and theorist, Raskolnikov. As Scheme 1 suggests, the proto-story is a neo-mythological device for creating parallelism between the hero and his existential and symbolic roles (Napoleon, Lazarus, and Christ). On the psychological level, we have a character and a proto-character, or self-consciousness and sub-consciousness. On the metaphysical level, we have two types of sources: the theory of Raskolnikov consists of profane texts, and his dreams have sources in literature and the Bible.

SEMANTIZATION			
LEVELS	NARRATIVE WORD	PERFORMANCE PICTURE	
TOPOGRAPHICAL CHRONOTOPE HOMOPHONY	STORY	POSSIBLE WORLD INTERTEXTUALITY STRUCTURE OF MANUSCRIPT	EVENTS
PSYCHOLOGICAL CHRONOTOPE POLYPHONY	NARRATION	POSSIBLE CONFLICT SELF AND OTHER	PERFORMING
METAPHYSICAL CHRONOTOPE HETEROPHONY	VERBAL DESCRIPTION	IDEOLOGICAL CONCEPTION, GROUNDS OF HISTORY, NEOMYTHOLOGISM	PICTORIAL DEPICTION

Scheme 2. Narrative and picture worlds in Crime and Punishment.

Dynamic complementarity

On the topographic level there is one world, whereas the psychological level hosts many different worlds, because the space of every character is in accord with his mental world. On the metaphysical level, however, there are two worlds, and the greater part of the novel's symbolism serves to differentiate between those worlds.

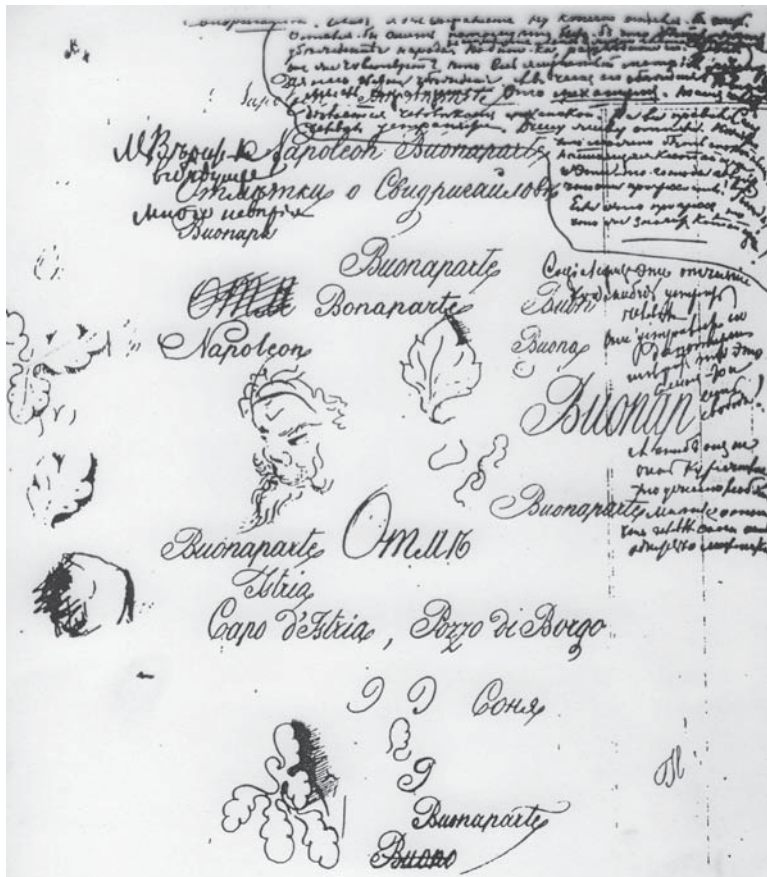

In regard to Dostoevsky's poetics, we can speak of meaning-generation (or semanticization) simultaneously in both cultural languages in a Lotmanian sense. From one side, we can analyse a discrete story, structure of narration and verbal description. From other side, we can analyze events where picture (pictorial depiction) or performance – not narrative – is the most important. We can also see some similarity between the structures of the different events (performances) and the structure of the manuscript. The manuscript page structure is a reflection of the writer's style and mode of thinking (especially in the intersemiotic relationship between picture, drawing, calligraphy and word).

For example, in one event – Svidrigaylov's suicide – we can find some intertextual world: "A little man wrapped in a grey *soldier's coat* and with a *carved Achilles helmet* leaned with his shoulder against the large closed

gates of the house. He cast a drowsy and cold glance at Svidrigaylov. His face wore that everlastingly peevis and webegone look, which has been so sourly imprinted on *all the faces of the Jewish race* without exception. Both of them, Svidrigaylov and *Achilles*, stared at each other in silence for some time. *Achilles* at last thought it highly irregular for a man who was not drunk to be standing three feet away from him and staring at him without uttering a word. ‘Vot you vont, pliss?’, he said, without stirring from his place or changing position. ‘Nothing at all, old man,’ replied Svidrigaylov. ‘Good morning!’ ‘*Dis ain’t no place.*’ ‘I’m going *abroad*, old man.’ ‘*Abroad?*’ ‘*To America.*’ ‘*America?*’ Svidrigaylov took out the revolver and cocked it. *Achilles* raised his eyebrows. ‘Vot you vont? Dese shokes (jokes) *no place here.*’ ‘And why not, pray?’ ‘Cos it ain’t de place.’ ‘Why, old man, it makes no difference to me. The place looks all right. When they ask you about it, tell them he’s gone to America.’ He put the revolver to his right temple. ‘*You can’t do dis here – it ain’t de place!*’ *Achilles* gave a violent start, his eyes growing bigger and bigger. Svidrigaylov pulled the trigger.” (Dostoevsky s.a.: 522–523, italics mine).

The scene of Svidrigaylov’s suicide takes place simultaneously in different spaces: the actual St. Petersburg, as well as Troy and Jerusalem. It is a symbolic intertextual event where Svidrigaylov–Hector–Napoleon III–Jesus Christ and Achilles–Napoleon I–Ahasverus, the eternal Jew, are operating simultaneously (Torop 1997). The page of manuscript with the first characteristics of Svidrigaylov is an intertextual picture. In this case, on the page where he drew a portrait of Napoleon III, Dostoevsky wrote Buonaparte, Pozzo di Borgo and Capodistria calligraphically. Pozzo di Borgo and Capodistria were Russian diplomats who organized an anti-Napoleon movement in Europe. As a result, we have different conflicts on the level of manuscript and on the level of finished text, but the intertextual nature of this conflict is the same (Torop 2000).

Dynamic complementarity is very important for understanding the movement of the writer’s idea from the first pages in the manuscripts to the finished text. This page contains first and last the names of Pozzo di Borgo and Capodistria. But after understanding the mechanism of intertextuality it is possible to understand, via Capodistria and his role in Greek history and Adrianopol’s peace, why Svidrigaylov started his last journey from “Adrianopol”, a non-existent hotel in St. Petersburg.

Part II (Katalin Kroó)

Why Crime and Punishment?— Semanticization at the level of plot thematics

One may wonder what prompted the choice of this particular novel to illustrate the different semiotic modes of meaning-emergence in Dostoevsky's text and the nature of theoretical and metamechanical discourses on it in the framework of Fenno-Ugrian cultural semiotic studies. In answering this question we cannot avoid realizing the peculiarity of the novel; in its plot sphere, we can discern the activation of certain paired notions – often given even in thematic formulations – such as *the own* vs. *the alien*,

part vs. whole, dialogue and translation – all being conceptual elements of the thematic interpretations of the idea of *semiosphere*. Apart from these, one of the most important semantic attributes relevant to the notion of semiosphere is placed at center stage by a large range of motif variants of the frontier/ border(line). We could even risk stating that one of the main thematic concerns of this novel is the formulation of a meaning which is very close to the concept of the semiosphere. *Crime and Punishment* seems to represent predominantly a novel *on* the problem of semiosis; on the question of how to formulate new signs, how to articulate a “new word”; on aspects of the productive and fruitless interaction of old texts and new texts; on problems of translating the content of the own’s life-sphere into the content of the contrasting, alien life-sphere; etc. The crucial motif of the novel, the frontier, not only conspicuously engenders a plot organization as designated by the title of the novel (cf. in the Russian original “Преступление” standing for *Crime*, with its hidden sense of etymological connotation: “stepping over”). Here, the protagonist has to encounter his own problem of crossing the border (his crime). This can only be done under the condition that Raskolnikov is constantly reflecting on other persons’ crossing of the border, trying to grasp intellectually the interrelation of the alien act of stepping-over and his own deed. He also has to interpret the reciprocal relationship of his own word (his own text) and the alien text, the two of which are permanently transformed into one another as the plot evolves. This problem is also given nuanced poetic elaboration at a higher level of text construction, within the framework of the intertextual poetics of the novel, and also at a level where the process of an intensive meta-poetical self-interpretation continuously evolves in the text.

*Semanticization in light of meaning-evolution:
The principle of double systematization*

Interpreting the notion of meaning and meaning-evolution within the problematics of the frontier, we must remember one of Lotman’s definitions from *The Structure of the Artistic Text* (Lotman 1977), according to which the event in the text is the movement of the literary character over the border of the semantic field. It is evident that semanticization itself is meant here as an *event*, i.e. a semantic stepping-over, representing a process of certain transformations. If we are now referring to Juri Tynyanov’s inter-

pretation of literary evolution projecting well ahead of his time, it is only to remember Tynyanov's accentuation of the dynamic aspect of meaning-formation viewed in a historical context. The essence of this dynamism is revealed by the scholar's suggestion that literary evolution results from a kind of systematization as a consequence of the sign's belonging to two different systems at the same time: one consisting of the internal components of the text at different levels, and another that defines the meaning of the sign in its relation to literary tradition, that is to say, literature construed as a whole system (Tynyanov 2002). The sign acquires its poetic meaning from its belonging to both systems, i.e. to the text-internal and text-external components. The *double systematization* in which the sign is involved (in fact the double orientation of its semanticization) conveys the characterization of the nature of a certain kind of literary evolution. Evolution in this sense is defined in terms of semantic relations, more precisely: in terms of the complex semanticization of these relations. Tynyanov's concept of literary evolution harmonizes with his differentiation of two kinds of *sjuzhet* (сюжет), two kinds of semantic formation which can in fact be interpreted in terms of events in the text: one is identified with *fabula* (Tynyanov says: "сюжет как фабула", which in a simplified interpretation refers to the initial, "aboriginal" plot, but it can also mean a developed plot-construction); the other is the semiotic work, embodied in the text, that makes the semantic plane dynamic. In Tynyanov's interpretation of Pushkin's *Evgenij Onegin*, this is connected to the poetic phenomenon of the text's orientation towards the plane of verbal expression, i.e. the plane of word formulation ("установка на словесный план", according to contemporary uses: *semantic sjuzhet*; cf. Tynyanov 1977: 60–61). This second orientation – as stated above – covers *semantic activation*, engendering and representing the type of semantic event which evolves in the text as a process. Here, we consider it important to underline that what in fact constitutes the semantic *sjuzhet* is the result of a kind of double systematization: meaning at the level of plot construction ("сюжет как фабула", cf. Tynyanov: *ibid.*) as related to meaning at the level of artistic verbal formulation taken as a semantic event. We have arrived at nothing other than the dynamic complementarity of fiction (plot, the narrative itself) and narration. It is not at all a static binary opposition, but rather a dynamic relation which guarantees semantic evolution within the text. Without the reference of one system to the other, a significant part of the

poetic message would be lost. But if the semiotic act of constant reference of one system to the other – i.e. the constant stepping over the border of the two semiospheres – is not neglected, the process of meaning-evolution may become conspicuous to the reader.

Hence meaning-evolution for us brings forth the idea of a kind of *double* systematization leading to the semiotic act of placing systems into meaning-relations with one another (whether the relationship between Tynyanov's synchronic and diachronic aspects, or the relationship of previously described *sjuzhets* 1 and 2). The permanent and mutual, semantically referential acts, as a chain of mutual references, constitute the process of meaning-evolution conceived as a semantic event. (Here we return to Lotman's definition, and more specifically, to our notion of dynamic complementarity taken as a source of meaning-emergence.)

Semanticization as semantic reconstruction

We now must ask the following question: What does meaning-evolution, understood as meaning-emergence, have to do with the concept of semantic reconstruction? First of all, we must state that semantic reconstruction has a very concrete, contemporary meaning in the above-defined critical context of possible interpretation of a semantic *sjuzhet*, in the sense of the text's orientation towards its artistic word formulation. It thus represents a methodological procedure which, in its full-fledged form, may be found in Vyacheslav Vsevolodovich Ivanov's and Vladimir Toporov's works dedicated to etymological reconstruction. In his Dostoevsky scholarship, Toporov had recourse to etymological reconstruction so as to reveal certain kinds of semantic motivation in the writer's works. We must likewise mention a certain trend of linguistic investigation made in this field, the essence of which was characterized and concisely summarized in the 70s in Dmitrii Segal's great overview, *Aspects of Structuralism in Soviet Philology*: "Research into diachronic semantics and the reconstruction of the underlying situations (mythologemes and ritual complexes) is believed to be an integral part of the structural analysis of language" (for all quotations from this work, see Segal 1974). As the most important feature of this kind of research, which also held a place in comparative linguistics, "the inclusion of semantics in the field of structural reconstruction" is evaluated. This involves the reconstruction of certain semantic situations which fit

logically into the study of cultural typologies. In other words, this method covers the concentration on the semantic motivation of linguistic forms. According to Segal, in Toporov's research into *Crime and Punishment* we find a combination of "structural analysis of contextual meaning with the general semiotic orientation provided by the general semantic model inherent in the text." "Thus – Segal goes on to say – "concrete lexical observations go side by side with interpretations derived from the overall conceptual model". And this conceptual model has much to do with the idea of the "typological applicability of mythopoetic thinking" also manifested in *Crime and Punishment*. The presentation of this model in this work presupposes the reconstruction of a "universal semiotic complex". Linguistic analysis of Dostoevsky's text gains meaning in this context.

Semantic reconstruction from another point of view

It is obvious that the notion of semantic reconstruction presupposes the idea of bringing to light meanings and meaning-relations which have sunk into oblivion (e.g. meanings in archaic systems that are not conveyed or understood in present experience, that is, not "given in immediate experience"; Segal 1974). In the previously mentioned overview, however, reconstruction is used in another sense, when the author of the article speaks about "enciphered allusions" that entail the reader having to "reconstruct all additional meanings". Taking into consideration these two aspects implied in the notion of semantic reconstruction – i.e. reconstructing something which is (a) forgotten or (b) which is indicated, yet enciphered, its additional meanings nevertheless having to be reconstructed – we can conclude that semantic reconstruction may be used as a more flexible notion. The term may lend itself to a broader usage, turning into part of our theoretical and methodological foundation. On this basis, semantic reconstruction is used in our work as an analytical tool for the semiotic reading of literary texts. What has to undergo semantic reconstruction has a semiotic presence in the text. However, its structuring semantic motivation is left either without direct explanation, or is given with reduced, enciphered, or in a broader sense: implicit explanation. This explicitness vs. implicitness makes it possible to interpret the notion of semantic reconstruction in the context of semantic evolution. As we argued above, meaning-evolution presupposes a kind of double systematization, the constant dynamic

reciprocal reference of one meaning system to the other. The same holds true for semantic reconstruction, which also embodies a kind of meaning-evolution. Double systematization appears here as the sign having a double semantic orientation, in the sense of its belonging to two systems, one of which has an explicit meaning, the other one being semantically implicit. The implicitness of the meaning reveals itself owing to the reciprocal reference of one system to the other. If this is so, semantic reconstruction as a specific case of meaning-evolution realized in the text itself can be understood as the *turning of implicit meaning into explicit meaning*, which can only be the consequence of reciprocally referential acts, whereby the implicit sign system gradually acquires a kind of completion. In this sense, semantic reconstruction belongs to the semiotic practice of the literary text. The external reconstruction of this process of internal semantic reconstruction belongs to critical metadiscourse (and as a meta-concept it is very close to the notion of interpretation).

A short case study

We shall finish this part of the paper by giving a brief illustration of the semiotic work of semantic reconstruction in *Crime and Punishment*, indicating two realms of meaning-emergence where semantic reconstruction may evolve: one concerning the process of metaphorization, and the other relevant to intertextuality. Semantic reconstruction always and necessarily involves a significantly higher degree of abstraction than explicit semantic formations usually do.

We are taking a look at the scene in which Katerina Ivanovna, Sonia's stepmother, with whom Raskolnikov, the protagonist of the novel, becomes connected in the final moments of her life, goes out into the street with her children, forcing them to beg for money by singing and dancing. Then she dies in Sonia's room. Nothing can be simpler when describing a death – one would think. We know that Katerina Ivanovna suffers from an incurable illness and that she acts as if she were in the delirium preceding inevitable death. And death comes. We could enumerate many other elements at the level of the plot-construction to reveal a clear message at the level of narrative. Following the long process of semantic reconstruction, however, the evolution of some implicit meaning units in the text of the novel leads us to the conclusion that, in the description of Katerina Ivanovna's death, we

can discern Sonia in the role of a figure depicted in Lermontov's poem, *The Dream* (Lermontov 2007). In the poem, this role is assigned to the young girl who, in the dream of the lyrical hero, is sitting in the evening feast among young women crowned with flowers, and who, in the midst of merry talk, is immersed in deep thought. In the "melancholy dream" in which her soul is immersed, she can see "the corpse of one she knew" – who is without doubt the lyrical hero of Lermontov's poem.

What does Sonia have to do with Dagestan "in noon's heat" and what does Ekaterina Ivanovna have to do with her children in the street, with Lermontov's lyrical hero, who is lying with lead inside his breast as a soldier in Dagestan? At the plot level, the most explicit message of the scene seems to contradict the mentioned identifications or at the very least, does not seem to prove that they are true. The less explicit or purely implicit facts, however, do so all the more. They form a semantic chain, which, in the end, results in a semantic reconstruction, at the same time furnishing the reader with additional meanings and revealing for him/her their more abstract sense. Without going into much detail, we shall mention only the following: Katerina Ivanovna herself quotes two lines from Lermontov's *The Dream*, even reciting the first line twice. This quotation, which conspicuously signals the emergence of an important intertext in the Dostoevsky novel, is structured in a peculiar way. It is built into Katerina Ivanovna's sequence of utterances before her death, and is in fact placed very close to her last words, which culminate in the dying woman's most intimate confession to Sonia. In it, she finds a metaphor to express her crime of destroying Sonia's life by making her a prostitute. In this way, the Lermontov-intertext becomes part of Katerina Ivanovna's awakening before her death, which covers the formulation of a kind of self-accusation. The last moment before death outlines the peak of self-understanding, Katerina Ivanovna's coming to terms with herself (the *own*), which is inseparable from the act of coming to terms with the other, Sonia (metaphorically speaking: the *alien*). It is very telling how Katerina Ivanovna becomes endowed here with the semantic attribute of Sonia, who is a *gentle*, meek creature: "Sonia! Sonia!" she said, *gently* and affectionately, as though surprised to see Sonia before her. 'Sonia, my dear [...]' (Dostoevsky s.a.: 448; our italics). It is equally important to note here that Lermontov's poem also develops the process of self-awakening and self-recognition, which totally merges with the idea of the validity of love that the elegiac dreamer, the young girl, dedicates to

her lover in her dream. In the death scene, Sonia does not have a dream. In a metaphorical reading earlier in the novel, however, Sonia, as if delirious, foresees her stepmothers's death. And we cannot forget that the very name of the heroine contains the phonic chain *Son(ia)* with its meaning, *dream*. The motif of *dream* (сон) has a rich circle of variations in *Crime and Punishment*. Taking all this into consideration, we can conclude that, although Sonia is not dreaming in "noon's heat, in a dale of Dagestan", and physically is not equal to Lermontov's young girl seeing the lyrical hero's corpse, her *semantic figure* is nevertheless formed by the motifs of love and the ability to give all her heart and soul to those she loves. She is also characterized by gentleness within the motif-evolution associated with the emergence of the sense of dreaming. In a semantic sense, this Sonia must be actively analogous to the figure of the girl-dreamer in Lermontov's poem, *The Dream*. And if this is so, it means that the Lermontovian intertext is in fact developed in the novel.

From another point of view, this also means that semantic reconstruction works in the novel as well. That which is given implicitly forms a semantic pattern; we witness the emergence and evolution of meaning at a metaphorical level. This has more to do with the level of the text which Tynyanov called the level of verbal formulation, distinguishing it from *sjuzhet* as *fabula*, i.e. from the explicit plot-construction (narrative). However, the lack of permanent reference by the implicit semantic units to the explicit plot or thematic elements would make it very difficult to identify the process of semantic reconstruction. It is within this double systematization that new semantic patterns evolve, with and without various intertexts. The system of the explicit and the implicit semantic structures can also be conceived as belonging to different realms operating in the semiosphere of the text of *Crime and Punishment*. The explicit is regarded at once as belonging to the text in its own capacity, while the implicit seems to be alien from the text for a time. However, the reciprocal acts of cross-reference motivate reconstruction of the entire range of implicit meanings, transforming them into a definite semantic pattern. When this process of meaning-evolution is realized, the pattern proves to be the text's own message and not the interpreter's personal input.

Notes

1. For a broader context of Estonian and Hungarian interdisciplinary investigations into the problem of meaning-emergence, see the project directed by Peeter Torop: *Meaning-generation and Transdisciplinary Methodology of Semiotic Analysis of Culture* (target financed theme 2006–2011) and the Hungarian special issue (compiled by Katalin Kroó and Mihály Szívós) focusing on the thematics of *Emergencia* in *Semiotica* 2008(2) – forthcoming. The present research was supported by the European Union through the European Regional Development Fund (Center of Excellence CECT) and Grant No. 7594 of the Estonian Science Foundation.
2. On the interpretation of “semiosphere as simultaneously an object- and a meta-concept”, see Torop 2005: 164. “Semiosphere is what is being studied in or as culture and semiosphere is the means that is used in studying culture” (ibid.).

W. G. Kudzus

Friedrich Nietzsche's late notes and Wilhelm Roux

Microlinguistic performance and microphysiology

In Nietzsche's late notes, the linguistic impetus thrives on risk, failure, and that scattered illumination which defies definition and concerns emergent thought. At times, a lettered, hardly perceivable substratum appears. In this elemental zone, sounds acquire particular intensities, begin to speak on their own, away from their semantic assignments. In this shift toward a microlinguistic underground, Nietzsche's readings of *Der Kampf der Theile im Organismus* (*The Struggle of the Parts in the Organism*) by the contemporary anatomist Wilhelm Roux (1881) play a decisive role. Power struggle, disease, and seminal motility, physiologically inflected and linguistically cast, animate – and fracture – Nietzsche's late notes.

It is likely that Nietzsche acquired the anatomist's book soon after its first publication in February 1881: a copy exists in his personal library (Müller-Lauter 1978: 192), and first responses to Roux occur in the notebooks and on various sheets from spring to fall 1881. Nietzsche notes: "The freest human being has the greatest *feeling of power* over himself [...], the relatively greatest *independence* of his individual forces, the relatively greatest *struggle* in himself; he is the *most discordant* being, and the *most alternating one*, and the *most long-lived* and abundantly desirous, self-feeding one – the being who is the most *excreting* and *self-renewing*" (Nietzsche 1988: IX, 488').

Change, desire, food, and intestinally resonant activity dominate an extended, dramatically unfolding sentence. The physiological metabolism, which Roux discusses at some length (Roux 1881: 69), acquires philosophical significance in Nietzsche, and one that reflects a dynamic of intake and digestive productivity. Nietzsche's rhetoric narrows the gap toward its

subject matter: repetitions, superlatives, and a quick pace – unencumbered by subordinate clauses and final stops, rich in enumerative conjunctions – signal a vitality not unlike that of the rapidly regenerating physiological entities in Roux (1881: 69). In the course of Nietzsche's entry, the present participle arises ever more strongly, in tandem with the ever-present struggle of the parts. These parts acquire a pronounced and combative presence: fiercely "discordant" and incessantly changing, they aggressively excrete and regenerate in instantly sequential formulations.

In Nietzsche's physiologic-philosophical discourse, reason (*Vernunft*) is associated with an erroneous belief in harmony. In a further passage from the period of his first encounter with Roux, Nietzsche notes:

Reason! *Without knowledge* it is something entirely foolish, even with the greatest philosophers. [...] The belief in harmony and in the absence of struggle is a *fundamental error* – this would be death! Where there is life, there is associative formation, where associates struggle for [their] nutrition [their] space, where the weaker ones attach themselves meekly, live shorter lives, have fewer offspring: difference rules in the smallest things, in sperm [*sic*] eggs – equality is great madness. Countless beings perish in struggle – a few rare cases sustain themselves. – Whether reason so far has been more sustaining than destructive overall, imagining to know it all, to know the body, to "will" – ? Centralization is not at all that perfect – and *reason's imagination to be* this center certainly constitutes the greatest lack of this perfection. (Nietzsche 1988: IX, 490)

Nietzsche sharply critiques the centrality (Babich 1994: 6) of reason: in the struggle of life with its physiological processes, difference and inequality, far from responding to signals from a central, let alone reasonable, core are indispensable.

In this decentralized environment, Nietzsche emphasizes "the smallest things", and connects them with seminal entities, sperm and eggs. Productivity in its extreme smallness immediately involves language: behind sperm a flow ensues with the comma lacking; eggs appear without delay, followed by a dash and a reference to the major madness of an equality associated with a realm insulated from struggle. In critiquing reason and equality viscerally, Nietzsche's language loosens its hold on itself, begins to forego elements of punctuation and syntactical order. Nietzsche engages in a process whose greatest energies and strongest statements occur close to

its demise as an instrument of reasoned communication, and in the proximity of a physical, regenerative force.

Resonant with microphysiological struggle, there is pressure on syntactic space in this environment: the comma between “nutrition” and “space” evaporates in Nietzsche’s above-quoted notation. “Thus already each sperm and each egg is different from the other [...], Roux” (1881: 71) preformulates in a comparatively distanced manner.

Nietzsche’s first encounter with Roux, which is richly reflected in the former’s notes (Müller-Lauter 1978: 192), energizes his philosophical work with physiologically inspired formulations that tend to enact his reading in his writing. In the microphysiology presented by Roux, Nietzsche engages a generative power before and after the word and its syntactically confined configurations. At heightened moments in Nietzsche’s notations, a visceral linguistic motility animates a strongly expansive spatial dynamic.

In the spring and summer of 1883, Nietzsche again reads Roux (Müller-Lauter 1978: 192). Nietzsche notes: “Relative independence of the parts even in the highest organisms Roux p [*sic*] 65” (Nietzsche 1988: X, 274). Roux on that page refers to Rudolf Virchow having written on “the independence of cells” and on cellular transplants from one organism to another. Linguistically, this independence of small units resonates with various passages in Nietzsche’s subsequent notations where particular sounds and letters proliferate.

Departing from Roux, Nietzsche’s writing approaches a sphere of linguistic fluidity and emergence: semantic constrictions begin to dissolve, and particularities set out to supersede conceptions of wholeness. Parts proliferate in Roux and in Nietzsche, but the latter moves toward letters, sounds, and flows before and beyond distinctions. Nietzsche’s notational stylistics, time and again, takes off from microphysiological investigations, toward microlinguistic tones and dynamics. A visceral linguistic motility appears in which performance in its minute manifestations turns paramount. Exceedingly multivalent and phonologically alive, Nietzsche’s notational runs turn delirious, sick with insight past willful restrictions, productive in conjunction with physiological states that defy organic containment.

In a fragmentary passage of spring 1888, Nietzsche privileges disease in artistic states that incorporate sound and the language of the letter, such that a linguistic physiology begins to appear. A wide-ranging significance

of bodily phenomena energizes Nietzsche's vision. A strongly expansive movement sets in – an “*intoxication*” or even “*rapture*” (Nietzsche 1988: XIII, 356) – in which a “heightened feeling of power” at first operates in a large dimension. Such power is associated with an “inner compulsion” to turn “things” into a “reflex of one's own abundance and perfection” (ibid.). “Things” react in the manner of a largely autonomous physiological occurrence, a reflexive response before cognitive intervention.

As “physiological states” unfold in the notational body of Nietzsche's prose – from “intoxication” via an “*extreme sharpness* of certain senses” to “vascular changes” and bodily “secretion” (ibid.) – they they resonate with the dynamics Roux discusses with regard to cellular and molecular units that incessantly influence, impact, destroy, and supersede each other. In Roux (Müller-Lauter 1978: 203), Nietzsche finds a countermovement to Darwin's “nonsensical” emphasis on large developments in the outer world (Nietzsche 1988: XII, 304; cf. Pearson 1997: 85-122; Babich and Cohen 1999: 272; Gayon 1999: 154-97, Moore 2002: 27-28; Brobjer 2004: 23). Of cells, Roux writes:

As specific processes ... are not firmly standardized as such, and as from the beginning not all cells of the same tissue will have exactly the same vitality, there must be struggle among the cells during the time in which the cells of a particular tissue still multiply: for those cells that under the given circumstances are most favorably disposed toward multiplication will multiply more quickly than the others and thus – given the limitation regarding space – will more or less take away the locus of the others' offspring, thereby impeding their further development and multiplication. (Roux 1881: 88)

Cells in Roux struggle in the context of the same “tissue,” a constellation of parts not far from “texture” and a textuality sensitive to its spatial limitations. Roux refers to a spatial scarcity that has cells struggle for their places. Nietzsche's texts under the sway of “physiological states” (1988: XIII, 356) show phonetic pressure, syntactic strain, and a dynamics of excess that challenges given frameworks of linguistic communication. Cellular struggle in Roux relies on procreation and its rapidity. The faster cells multiply, the more effectively do they occupy space that would have been available for competing offspring. Time as well is limited here. Roux invokes procreative phases whose passing marks moments of cellular vic-

tory and defeat; the time during which cells “still” (Roux 1881: 88) multiply is crucial for spatial conquest. Nietzsche’s texts are energized by exuberant, powerfully extended, trans-syntactical exhalations.

Roux formulates the spatial infringement one cell imposes onto another as *Hemmung* (Roux 1881: 88). In Nietzsche’s passage, a “Hemmungsapparat” (Nietzsche 1988: XIII, 356), “constrictive apparatus,” figures prominently. Once this apparatus is disabled, subjected to interruption as well as to a certain exhibitionistic emphasis, namely: “ausgehängt” (as on a bulletin board), Nietzsche’s physiologically imbued prose accelerates and deepens, immeasurably.

An unrestrained wildness, *Hemmungslosigkeit*, also lurks at the fringes of the struggle Roux envisions. Pathology, a theme present in Nietzsche’s passage from its onset, enters into cellular analysis in terms of observational proof. Roux refers to “pathological occurrences where cells grow into others, thus for example in the lacunar depletion of muscle fibers by sarcoma cells” or where there are “wandering cells as a consequence of a temporary suspension of blood circulation” (Roux 1881: 94).

Cellular struggle in Roux is an encompassing process that, like the exceptional artistic states in Nietzsche’s notation, is not circumscribed by notions of pathology or health, but surpasses both. The close proximity of destruction and regeneration in cellular strife relates to Nietzsche’s both destructive and creative exuberance, particularly in his physiological engagements. Once again, a realm of fluid transitions appears.

Regarding “normal processes in the regeneration of the epithelium,” Roux emphasizes a “pressure” (*Druck*) in cellular interactions, which lead to the “atrophy” and “expulsion” of old cells in epithelial tissue via “breaches, partitions, and dismemberment” (Roux 1881: 94). Normal processes in cellular interactions thus include violence, as do pathological occurrences. Is it a coincidence that the word “Druck,” “pressure” here, but elsewhere also meaning “print,” denotes the energy at work in the regenerative destruction of tissue that covers bodily surfaces, and lines most anatomical cavities? Print language in the context of Nietzsche’s self-reflective notations: a linguistic surface across cavernous terrain.

On a visceral level, Nietzsche’s late notations resonate with the struggle of parts that in their microphysiological processes encourage microlinguistic explorations. Time and again, such explorations occur in Nietzsche’s efforts to formulate an elementary “will to power” (e.g., Nietzsche 1988:

XIII, 360). Nietzsche's notational style serves him well in these efforts. At the same time, as a consequence of his microlinguistic precision, a philosophically cohesive inquiry into the human condition turns increasingly elusive. It is no coincidence that this human condition itself, to the extent that it relies on its linguistic coinage, is a major issue in Nietzsche's language critique: most saliently with regard to microperformative transgressions of semantic boundaries.

The proximity of "Menschen" and "überhaupt" (Nietzsche 1988: XIII, 356) in the "human being in general", for example, touches upon an expansive linguistic movement that simultaneously pushes the limits of human integration. While the *Übermensch* is absent here semantically, a vertical component associates with *Menschen* and is amplified in the subsequent "rapture" with its "heightened feeling of power". In the microphonetic manifestations of this passage, the "ü" turns increasingly active and becomes part and parcel of the artist's emanation. There is an overflow across rudimentary sentences and notations, a sense of excess that generates the words and – they themselves part of an excessive mobility – loosens their semantic adherence. The "ü" expands from "Künstler" (twice) via "gezüchtet" and "Machtgefühl" to "Fülle", in which the "füh" reappears in a more focused phonetic form: feeling, powerful emotion creates, or rather – less mentally, closer to physical activity – "makes" (from *machen*) abundance (Nietzsche 1988: XIII, 356).

In a further fragment from spring 1888, Nietzsche's notations regarding "power quanta" (*Machtquanta*) traverse the general rubric of a "critique of mechanism" (Nietzsche 1988: XIII, 257). Specifically Nietzsche critiques "necessity" and "law" (Douglas 1999: 324). In necessity, he emphasizes a component of coercion; in law, a "false freedom" – as if one could discern and impose rules and regulations in quantum activities. "Things", as Nietzsche envisions them, do not follow paths of regularity; they are superficially stabilized, fictional entities (Nietzsche 1988: XIII, 257).

These notions of *Machtquanta* correlate with linguistic features in Nietzsche's late writings. The power of his language in its microcosmic manifestations embodies his quantum theory. Bodily elements come into linguistic play and reflect the physical and physiological sphere of *Machtquanta*. Such quanta do not occur in a realm of "mere semiotics" (Nietzsche 1988: XIII, 258): referential signs, Nietzsche implies here, operate at surface levels, even if "the human language of senses" is involved

(Nietzsche 1988: XIII, 258). Sensuality is mediated, transposed into secondary communications from pretranslative phenomena; although sensually inflected, it is ultimately mechanistic in its fictional cohesiveness.

In their formulated presence, *Machtquanta* partake in semiotic signification; but it is their indirect appearance only, cast in words of effect, that enters into such form: “A power quantum is characterized by the effect that it exercises [*übt*] and that it resists [*widersteht*]” (Nietzsche 1988: XIII, 258). These words stand at a distance from quantum forces themselves: they mostly signify rather than embody. Their rhythmic quality in the flow between “*übt*” and “*widersteht*” may indicate a certain back-and-forth before signification, a movement of “effect”; but that quality remains contained within Nietzsche’s argumentative statement.

At times, however, Nietzsche’s language moves about beyond and before “mechanistic” configurations (ibid.: XIII, 259). In its quantum energetics, language undercuts and supersedes subjective control. A powerfully embodied language announces itself; quantum sounds and minuscule transformations in which a linguistic physiology asserts itself immediately and with ultimate consequence.

Quantum zones elude authorial delimitation. Insight there occurs beyond the chains of law: “There is no law: each power at each moment realizes its final consequence” (ibid.: XIII, 258). While this in itself is a syntactically structured and semantically conventional statement, it formulates the unruly force of quantum power.

Nietzsche is engaged in departing from, “thinking away” (*weggedacht*, *wegdenkt*) mechanical order, character, and referential language. In this process thought itself loses its argumentative force vis-à-vis power quanta whose effects engage and transform language into something other than one’s medium: “Subject, object, a doer of the doing, the doing and what it does, separately: let us not forget that this refers to a mere semiotics and not to something real” (ibid.).

In related passages Nietzsche further affirms the universally interconnected nature of power quanta, whose “essence consists in exercising power over all other force quanta” (Nietzsche 1988: XIII, 261). At outer horizons of Nietzsche’s “will to power,” in spring 1888, this dynamic begins to sound Freudian at the time when Freud’s thinking begins to approach psychoanalytic horizons. “If the innermost essence of being is will to power,” Nietzsche writes, “if all growth of power is lust, and all feeling, not to be

able to resist and to dominate, is lustlessness: may we then not posit lust and lustlessness as cardinal facts? Is will possible without these two oscillations of yes and no? But *who* feels lust? ... But *who* wants power? ... Absurd question: if essence itself is will to power and consequently a feeling of lust and lustlessness" (ibid.: 260).

Affirmation and negation oscillate in micromovements before will, and will to power, might occur. Lust and lustlessness are posited here before any notion of subjective agency. In such affectively charged micro-oscillations, language – not Nietzsche's anymore – reflects a rapture in which physiologically imbued letters outperform their assigned roles, turn colorful, secretory, hot, and cold.

In Nietzsche's physiological notations, then, science – with physiology in particular rapidly developing at his time (Moore 2002: 1-111) – and philosophy break apart together, engendering decompositions and possibilities. The micromovements performed in Nietzsche's late entries concern primary force and incessant fluidity. Sounds and movements emerge in trans-sentential rhythms. Physiology and philosophy, thus recast, speak of lust and *Aushängung*. Nietzsche's quantum notations engage and embody physiological analysis in a project of boundless – groundless – emergence.

Women in semiotics

The Finnish tradition in semiotics of the 1970s and 1980s

1. Global semiotics – The semiotic web as an international institution

Semiotics became global at the end of the 1960s mostly thanks to the Hungarian-American semiotician Thomas A. Sebeok, who instituted the Centre of Semiotics and Linguistics at Indiana University. Nowadays chairs of semiotics departments can be found all over the world, and the subject is taught at most institutions of higher learning. Sebeok himself discusses the beginning of the institutionalizing of semiotics in the following way:

Interestingly, it was only in May 1962, starring at yet another transdisciplinary conference of more than sixty participants, that Mead had a spur-of-the-moment sweeping insight: to apply the term *semiotics* “to this whole field ... which in time [would] include the study of all patterned communication [that is, institutionalization] in all modalities. I am not enough of a specialist in this field to know what word to use”, she continued, “but many people here, who have looked as if they were on opposite sides of the fence, have used the word “semiotics”. It seems to me the one word, in some form or other, that has been used by people who are arguing from quite different positions. (Sebeok 2001: 150)

Further, we can say that “Global Semiotics”, the semiotic web (launched by Sebeok in 1975; cf. Sebeok 2001: 1–2), and the institutionalizing of semiotics began with congresses such as those held in Bloomington and Moscow. The International Association for Semiotic Studies / Association Internationale pour la Sémiotique (IASS/AIS) was founded in 1969, and *Semiotica – Journal of the International Association for Semiotic Studies – Revue de L’association Internationale de Sémiotique* was launched in 1969.

The first world congress of semiotics was held in Milan in 1974. With this historical context, and with global, international semioticians as Victoria Welby (1837–1912), Susanne K. Langer (1895–1985), Margaret Mead (1901–1978), Ethel M. Albert (1918–1989), and Irmengard Rauch (b. 1933) in mind as pioneers in semiotic studies (cf. Sebeok with Susan Petrilli 1999; 2001), I will discuss the local national Finnish semiotic tradition as it was presented by women in early Finnish semiotics (cf. Tarasti 1990; 1991a; 1991b); e.g. Satu Apo (1974; 1986), Johanna Enckell (1974a; 1974b), Marja-Liisa Honkasalo (1988), Anna Louhivuori (1988), Päivikki Suojanen (1982; 1984); Pirjo-Maija Toivonen (1986), and Sinikka Tuohimaa (1986; 1988; 1991). I will outline semiotic approaches, theories and methodologies advanced by women who have contributed to the development of semiotics from their own perspective in the Finnish semiotic tradition, as presented in linguistics, literature, folklore studies, anthropology, arts, musicology, and medicine, the first semiotic fields of Finnish semiotics.

It is remarkable that in 1979, The Finnish Academy offered a grant for the project *The Semiotics of Finnish Culture* led by Henry Broms, Hannu Riikonen, and Eero Tarasti, and later on, the quarterly *Synteesi*, a journal for interrelations of arts was published in 1982 (2–4/1982: 11–47) with articles including Finnish semiotics by Henry Broms, Eero Tarasti, Matti Kuusi, Oscar Parland, Hannu Riikonen, and Päivikki Suojanen, the only woman among them. The semiotics of the 1960s and the 1970s was already defined as communication, i.e. as a message from A to B that presumes semiotic means, i.e. signs and languages, which can exist only in the use and production of signs and exchanges of information (cf. Lévi-Strauss in anthropology). From the very beginning, semiotics has had an integrative approach, an interdisciplinary view toward combining disciplines. For instance, Victoria Welby ([1903] 1983; [1911] 1985), a pre-semiotician, who corresponded with Peirce (cf. Welby 1977), discussed in her early “significs” issues of axiology, sense, meaning, and significance, becoming an early forerunner of semiotics. Semiotics continues to deal with studies around *semioethics* (Ponzio, Petrilli, Deeley, Tarasti), as the 9th World Congress of Semiotics shows; the primary aim is to promote understanding and self-understanding in order to avoid local and worldwide conflicts, and to promote peace and understanding. Says the patron of the 9th World Congress of Semiotics: *Communication: Understanding / Misunderstanding* in Helsinki and Imatra: “Semiotics studies all forms of communication. By

analyzing cross-cultural misunderstandings it promotes the self-understanding of mankind” (President Martti Ahtisaari, Patron of the Congress 2007).

The *existential semiotics* advanced by Eero Tarasti (2000) is also a science of the new millennium, in Finland and worldwide, resulting in applied research presented by both male and female researchers. Semiotics, whether it is a scientific discipline or a world-view, always involves signs. Semiotics is the study of signs, what they represent and signify, and how we act and think in their universe. As Tarasti states, much of the power of semiotic enterprise lies in its phenomenal ability to adapt to various changes of scientific paradigms and technological innovations, trends and schools of thinking, and also national traditions (Tarasti 2007).

2. *First World Congress of Semiotics in Milan 1974*

Amidst the linguistic turn and structuralist developments in the 1960s and 1970s, the First International Congress of Semiotics was held in Milan on June 2, in 1974. In his opening address Roman Jakobson (1896–1982) summed up things in this way:¹

We deal with language as a universal invariant with respect to varied local languages which are variable in time and space. In the same order of things, semiotics is called upon to study the diverse systems of signs and to bring out the problems which result from a methodical comparison of these varied systems, that is to say, the general problem of the *sign*: sign as a generic notion with respect to the particular classes of signs. (Jakobson 1987: 436)

Jakobson (1987: 436–454) discusses the question of the sign from Antiquity, the Middle Ages, and of the Renaissance, and around the end of the seventeenth century, i.e. John Locke’s *An Essay Concerning Human Understanding* (1690) and Jean Henri Lambert’s *Neues Organon* (1764) as a background for the development of semiotics into modern semiotics at the beginning of 19th and 20th centuries. Jakobson covers the philosophical study of signs from ancient Stoic philosophers continuing through the Church fathers in the Middle Ages, and later from John Locke to the great semiotician of the Anglo-Saxon world, philosopher and polymath Charles S. Peirce (1834–1914) and the linguistic study of signs by

the Swiss linguist Ferdinand de Saussure (1857–1913), from whose writings so-called European “semiology” originated. Empirical semiotics was launched by the medical science of antiquity: a physician who explored symptoms (signs) of a disease was a “semiotician”. Today, empirical study of the sign covers many fields, from neurosciences and cognitive studies to applied research of various sign practices such as media sciences. The latest branch of empirical semiotics is “biosemiotics”. Founded by members of the von Uexküll family, biosemiotics studies the life of organisms in relation to their environment, or *Umwelt*. Biologists today claim that every living organism functions as a sign system in relation to the environment. Thus the verbal signs of spoken and written language – texts – no longer form the main concern of semioticians, who have widened their vision to include the non-verbal activities of people and animals. (Tarasti 2007.) The fourth major type is cultural semiotics. This school of thought, formulated by scholars who followed and developed the teachings of Jurij Lotman in Tartu, examines cultures as texts, comprised of all the signs that make up the content of that culture’s *semiosphere* (total store of cultural signs; cf. Petrilli 2003).

The semiotic web of the 1960s and the 1970s was of a *structural* and *semiotic* nature. Internationally, and in Finland, linguistics (my research field) featured structural, i.e., syntactic, analyses of language (cf. Chomsky 1957 and 1965). The semantic structure was in fact “a problem”, when we remember Greimas ([1966] 1980: 14) who characterizes in 1966 semantics as “the poor relative of language” in his *Sémantique structurale*. But in linguistics there were also attempts in the 1960s to describe the semantic structure of language (e.g., Katz & Fodor 1965) in terms of binary features, semantic components, phonological models, and paradigmatic analysis of semantic structures (cf. Kukkonen 1989; Greimas 1966). In folklore and anthropology especially, structural and semiotic ideas were applied rapidly. Jakobson (1987: 454) concludes his opening address with a definition of semiotics:

By way of concluding, we can propose a tautological formula: Semiotics, or put otherwise, *la science du signe et des signes*, the science of signs, *Zeichenlehre*, has the right and the duty to study the structure of all of the types and systems of signs and to elucidate their various hierarchical relationships, the network of their functions, and the common or differing properties of *all* systems. The diversity of the relationships between

the code and the message, or between the signans and the signatum, in no way justifies arbitrary and individual attempts to exclude certain classes of signs from semiotic study, as for example nonarbitrary signs as well as those, which, having avoided “the test of socialization”, remain individual to a certain degree. Semiotics, by virtue of the fact that it is the science of signs, is called upon to encompass *all* the varieties of the signum. (Jakobson 1987: 454)

In the foreword to their *Language in Literature* (1987), Pomorska & Rudy quote V. V. Ivanov, who describes Roman Jakobson as a scholar in the following way:

Jakobson belongs to that powerful trend in our culture that is larger than just linguistics and literary studies, one to which the names of Bakhtin and Vygotskij also belong. Roman Jakobson ... always thought about the most general matters in concrete terms, with reference to particular examples, and always spoke about this clearly and understandably. We shall always remember Jakobson as the man who proved that one can do scientific work with joy, without pedantry or routine, that one can do it as something great and meaningful, under any circumstances, even in the face of catastrophes – and successfully (Ivanov 1983: 56–57; Pomorska & Rudy 1987: 10)

In this quotation Jakobson’s heritage can also be seen as a parallel to semiotics, a tolerant interdisciplinary allowing various theoretical and methodological views, a discipline which deals with global and local issues; it has many schools and has gone through many phases. Nowadays, we can speak, as Tarasti (2007) writes, of “neosemiotics”, which is not bound with any national or other school, but freely exploits the long tradition of semiotics in order to elucidate current phenomena of modern society and sciences. Semiotics is a wide-ranging theoretical, methodological, and also practical discipline, one that is innovative, interdisciplinary and universal in scope. It has become a global language of scholars (Tarasti 2007).

3. *Global ideas in structuralism and semiotics in Finland*

In Finland, the history of semiotics dates back to, among others, folklorists and the so-called Finnish school of semiotics, starting with the school of folklore studies at the end of the nineteenth century. Scholars in this field founded a method of classifying folk tales and songs which was later

adopted by Vladimir Propp. Their methods also influenced research in narratology, story-telling, and folk music. The background of Finnish semiotics consists in other human sciences, ranging from anthropology to philosophy to the existential semiotics founded by Eero Tarasti (2000). The first semiotician in Finland was the Finland-Swedish writer and essayist Henry Parland (1908–1930) who, among other things, championed the ideas of Russian formalists among Finnish intellectuals in the 1920s and the 1930s. Finnish semiotics naturally forms part of the European state of the art, while remaining open to disciplinary trends in Estonia, Russia, and the United States. Though a “Finnish School of Semiotics” may not yet exist, Tarasti (1991b: 198) writes, Finland at the least has a semiotic tradition with its own history, reflecting a multiplicity of projects and ranging from explicitly national issues to quite universal themes (cf. Tarasti, ed. 1999). Nowadays Finland is home to all manner of classical and post-structuralist semiotics, from Greimassians and Peirceans to deconstructionists and Lacanians. What accounts for the extensive semiotic studies going on in Finland and elsewhere? According to Tarasti (1990: 37–38), it is the changeable nature of semiotics, its ability to engage with a variety of theories, including formalism, structuralism, post-structuralism, and de-constructivism. All these international ideas were reflected in the semiotics in Finland in the 1960s and 1970s and on. Moreover, Finland as a bilingual country had research contacts with Sweden, where, for instance, the linguist Bertil Malmberg (1959; 1972; 1973; 1977) and others presented Roman Jakobson’s linguistic and structuralistic ideas. The anthology of Roman Jakobson’s writings, *Poetics and Linguistics (Poetik och lingvistik)*, was published in Swedish in 1974; the Swedish anthology, *Form och struktur*, appeared in 1971, discussing ideas from formalism to structuralism. After semiotics had become established in the international scientific world in the 1960s, in Finland it became a central issue, especially in the humanities and political sciences since the 1970s. In the 1980s and 1990s semiotics gained momentum both nationally and internationally, due to cultural exchanges and the ample flow of texts.

4. *Women in Finnish semiotics –
The tradition of the 1960s and the 1970s*

The “*Structuralism Group*” at the University of Helsinki was established in 1971 with Eero Tarasti and others. To this group belonged such women scholars as Satu Apo, Elli Kögäs Maranda, Maija Lehtonen, and Johanna Enckell. Semiotic interest in Finland started to grow even more, thanks to Eero Tarasti’s contributions and his dissertation in musicology in 1978, *Myth and Music*. On March 7, 1979 Eero Tarasti, Aatos Ojala, Osmo Kuusi, and Pertti Karkama, founded the Semiotic Society of Finland, along with Henri Broms, Hannu Riikonen, Erkki Pekkilä, Matti Kuusi, Pentti Leino, Pentti Malaska, Tarmo Malmberg, Lauri Routila, and Olli Välikangas – of these 15 persons only 3 were women. The society nominated the following semioticians as members of honour in 1979: Umberto Eco, A. J. Greimas, Roman Jakobson, Jurij Lotman, Claude Lévi-Strauss, and Thomas A. Sebeok. Julia Kristeva, however, was not among those honoured in 1979; she did become a member of honour in 1995, Jean Umiker-Sebeok in 1994, Sinikka Tuohimaa in 2004, and Pirjo Kukkonen in 2006. (Tuovinen 1988.)

In 1980 (August 28–29) the Semiotic Society of Finland arranged its first symposium at the University of Helsinki with the theme *Suomalaisen kulttuurin semiotiikka – Semiotics of Finnish Culture* (30–60 participants) with papers by Eero Tarasti, Eila Tarasti, Henri Broms, Vilmois Vogt, Kari Aronpuro, Tarmo Malmberg, Osmo Kuusi, Lauri Routila, Aatos Ojala, Pirjo-Maija Toivonen, Kari Salosaari, Erkki Peuranen, Hannu Riikonen, and Erkki Pekkilä – only two women semioticians took part. In Tarasti’s publications (cf. 1990: passim; 1990: 35–40, 1991a; 1991b), we can follow international history as well as the national Finnish history of semiotics (see also, *Semiotica* 87: 3–4 (1991), a special issue on semiotics in Finland; and *Synteesi* 1982; 1986; 1988).

Semiotics in Finland began with Finnish folklorists who developed a typology of tales; their efforts profoundly affected the work of Vladimir Propp, and hence extended to later semiotic studies of literature. In the philosophical analytic school represented by George Henrik von Wright’s modal logics and Jaakko Hintikka’s theories, Eero Tarasti’s semiotics of music and study of myth and music have contributed to the development of semiotics, both in Finland and worldwide. Among the instructors of the

first courses in structuralism at the University of Helsinki was professor Irma Rantavaara (1908–1979), and at the University of Jyväskylä, professor Aatos Ojala (Tarasti 1990: 35–36). Important also was the Finnish folklorist Elli Köngäs Maranda (1932–1982), whose research from the 1970s reflects the early Finnish structural and semiotic tradition (cf. Köngäs Maranda 1971: 189; Maranda & Köngäs Maranda 1971: Introduction, ix–xxxiv). But Finnish semiotics actually began, as mentioned above, with the little “structuralism group” at the University of Helsinki at the beginning of the 1970s; in 1979 it became the Semiotic Society of Finland, starting with 5 members, and growing to a membership of 100 in the 1980s.

A central semiotic figure and pioneer since the 1970s has been Eero Tarasti, professor of art education (1979–1983), and professor of musicology (1983–1984) at the University of Jyväskylä, and professor of musicology at the University of Helsinki since 1984. The Structuralist group arranged annual meetings first in Helsinki, then in Jyväskylä, and from 1988 on, in Imatra, which housed the International Semiotics Institute (ISI), a global institution for promoting semiotics. Many doctoral dissertations from the 1980s show the development and establishment of semiotics in Finland; still, as Tarasti (1990: 37) states, we cannot yet talk about “a Finnish semiotic school of semiotics” because the approaches are so different (Peircean, Greimassian, Lotmanian, etc.). Of the doctoral theses from the 1980s, 14 are on structural-semiotic topics, six of them written by female researchers which I will discuss later on.

5. *Structuralism, semiotics, and poetics*

In 1974, the first Finnish anthology of semiotics appeared: *Strukturalismia, semiotiikkaa, poetiikkaa* (*Structuralism, Semiotics, Poetics*), edited by two women, Satu Apo and Johanna Enckell, and two men, Osmo Kuusi and Eero Tarasti. In this anthology Aatos Ojala’s was entitled “What do structuralist methods have in common?” Ojala (1974: 239–240) states that the structuralism sweeping France, with Paris as a centre, became familiar also to Finnish scholars. The common feature of *structuralism* is that it takes its model from Saussure’s linguistic theory (1916), which signaled a transition from substantial to relational thinking (*system*), relations, the sign itself, its *value*, and syntagms/paradigms. Saussure’s considered his model adaptable to human culture in general, and by the 1970s structural-

ism was indeed turning into “semiology”. In this field, Lévi-Strauss’s (1955; 1958; 1964; 1967) method was the most stringent in its adherence to the linguistic model.

The folklorist tradition was strong in Finnish semiotics, as mentioned above. In her dissertation, *Ihmesadun rakenne juonien tyypit, pääjaksot ja henkilöasetelmat satakuntalaisessa kansansatuaineistossa* [*The Structure of the Fairy Tale*] (1986), the Finnish folklorist Satu Apo presents a vast study of Finnish folktales with a structural method. Vladimir Propp’s *Morphology of the Folktale*, published in Russian in 1928, is one of the oldest and best-known models describing the syntagmatic structure of stories, with its structural model of 31 functions. After 1958, when an English translation of the work was made, it began to influence the study of tale structures, especially among folklorists and literary researchers of the 1960s. Lévi-Strauss, Greimas and Bremond were not interested in describing the concrete folk-tale material; rather, they developed Propp’s analysis and function-model, paying attention to logical-semantic relations that dominate in it. A model describing the syntagmatic structure of fairy tales was developed by Greimas on the basis of ideas that Lévi-Strauss had presented in his critique of Propp’s *Morphology of the Folktale*. Today Apo’s structural studies remain at the very core of Finnish folklore (Apo 1974: 43–68, 241–242; 1986).

Structuralism in literary studies reached Finland as an international fashion in the 1960s, especially due to French scholars – the anthropologist Lévi-Strauss and his studies of myths, the linguist A. J. Greimas, and critic Roland Barthes, among others. Structuralism and semiotics both aim to study the world, man, and art as a whole, i.e., to phenomena and their meanings in terms of structures and systems. After the structuralist fashion came the post-structuralist period. Linguistics, semantics, and discourse became central also in literary studies. For instance, Jonathan Culler’s *Structuralist Poetics* (1975) deals with the relation between language and literature; if a literary work is language, we can apply linguistic methods to it as a system, with its own rules and formal grammars. If literature as a whole is the *langue*, then literary works are its “parole” (cf. Lehtonen 1989: 95–127).

Johanna Enckell’s (1974a: 129–156, 245–247) contributions to the above mentioned anthology were also important in applying ideas from French structuralism to the study of literature. She begins with the aesthetics of structuralism of the 1960s in France, which combines different lines

of thought and various sciences, including among others Saussure's linguistics, Freudian psychoanalysis, Marx's social analysis, French literary and philosophical tradition, the Russian formalism of the 1920s and the Czech structuralism of the 1930s. All these were precursors to French structuralism as it manifested in literary research, which in the 1970s surfaced as "poetics" and narratology, grounded in Propp's methods. Jakobson's and Lévi-Strauss's famous structural analysis of Baudelaire's "Les Chats" generated extremely complex grammatical structures. Enckell (1974a: 129–156, 245–247) discusses this very complicated method in literary communication, suggesting that a hermeneutic method might better serve in such cases. Roland Barthes combines a structural technique with a hermeneutic reading method in his analysis of Balzac's short story "Sarrasine", using five codes to depict the interaction between material and thought, *signifiant* and *signifié* (cf. Enckell 1974b: 224–235, 250–252, her interview with Lucien Goldmann).

After Tarasti's dissertation of 1978, structural-semiotic dissertations in various fields were published, starting at the beginning of the 1980s. Within a music-anthropological and hymnological framework, Päivikki Suojanen's (1984) study examines the content and contexts of hymn singing, conceptions of hymn singing, the production and functions of hymn singing in the main Evangelical-Lutheran revival moments in Finland: Pietism, Laestadianism, Evangelism and Besecherism. The research is a general synchronic and inductive survey of folk hymn singing in Finland, and a basic case-analysis examination of the folk-hymn singing tradition of Western Finnish Besecherism in particular (from 24 localities, mostly in Western Finland during the period 1968–1982). Hymn singing is religious, ritual, symbolic and musical behavior which in Finland has retained its original form. Suojanen's theory and methodology is based on text analysis, speech act theory (Searle 1969), and thematic content analysis. As Suojanen (1982: 43) writes, it is "a kind of semiotic description of hymn text structures" that tries to catch their dynamism and cohesion. She (1982: 44) studies various action relations and illocutionary nuances (description, thanking, requesting, wanting, wishing, etc.), and other textual functions. However, it is not clear what the term "semiotic" actually is in Suojanen's (1984: 59) analysis; there is no explicit semiotic model in use, except a mention of Ogden's & Richard's model from their influential book, *The Meaning of Meaning* (1923), with its triadic relations showing *symbol* – *referent*

– *thought*. In my view, her eclecticism of method was intended to describe hymn singing as a creative event (Suojanen 1982: 42). Despite the vague definition of semiotics, however, Suojanen’s research is an important presentation of the structural ideas from the 1980s.

In 1981, Tarasti (1991a: 32) wrote in his reports from the Semiotic Society of Finland that Pirjo-Maija Toivonen had published the booklet *Johdatus kirjallisuuden semiotikkaan* [*Introduction to the Semiotics of Literature*] (1981) which also showed how semiotics might influence teaching at the university level. Some years later, Toivonen (1986), in her doctoral thesis, examined the aesthetics and history of modernism. She focused particularly on the relationship between modernism and existentialism, using a structural-semiotic method and theory by which to examine the early lyric poetry (1946, 1952) of the Finnish female author Aila Meriluoto (b. 1924), with its mix of modernistic and existential characteristics (in her work, one encounters the metaphor of the eye, as with Rainer Maria Rilke). Themes dealing with the philosophy and aesthetics of modernism are found in Toivonen’s investigation of the superordinate oppositions of texts, and she uses many semiotic-structural theories and methods.² She (1986) combines these various semiotic approaches with existential philosophy (e.g. Heidegger, Husserl), drawing on semiotic ideas from the 1960s and 1970s, and applying them in Finnish literary research especially in the 1980s.

In her dissertation, Sinikka Tuohimaa (1986) discusses reflection symbolism in the poetry of Finnish author Eeva-Liisa Manner (1921–1995). Tuohimaa’s model is largely hermeneutic, but notes that she “took advantage of her interest in semiotics”, with references to Lotman (1972: 89–91) in her discussions of poetic imagery, especially as regards mirroring and reflection as verbal expressions (cf. also Greimas [1966] 1980: 27, 32; Jakobson 1960). With references to Kristeva (1969: 255, 332–333; 1974: 83–86) and the process of intertextuality, Tuohimaa shows that a text may have more than one code (e.g., allusions to a mythical, scientific or political contexts) and how a phenotext produces the genotext; e.g., in Eeva-Liisa Manner’s poetry there are intertextual connections to myths and philosophers. In her discussion of the “mirror” theme, Tuohimaa (1986: 40) references Lacan’s (1966: 93–100) notion of the mirror stage. In problematic areas encountered in her analysis of poems, Tuohimaa (1986: 22–23) applies Greimas’s models ([1966] 1980: 27, 32), showing how meaning is usually manifested through binary oppositions (Greimas [1966] 1980: 260). She

analyzes the poems' lexemes into abstract semes (op. cit. 28–30), and also makes use of Greimas's *modalities* (33).

In 1988, Tuohimaa published her book *Nainen, kieli ja kirjallisuus* [*Women, Language, and Literature*] in which she discusses such French poststructuralists as Julia Kristeva (1969; 1974; 1977; 1980), Luce Irigaray (1979), and Hélène Cixous (1975). Using Barthes's and Kristeva's theories (cf. Tarasti 1991a: 169), Tuohimaa analyzes the output of certain Finnish authors (see, also, Tuohimaa 1991: 371–379). Taking a feminist-poststructural approach to literature, she discusses aspects of poetic language and comes up with a coherent theory of language and subject. Tuohimaa's articles and studies in feminist criticism, post-structural theories, and Finnish poetry deal with questions of language, world, and subject (Althusser, Foucault, Derrida), showing how different languages produce meaning in different ways. Traditional linguistics used a correspondence model, i.e., a link between words and objects of reality, whereas these later authors pointed up the constructive aspects of language as a creator of realities (cf. de Saussure's theory of language as an abstract system consisting of chains of signs). In poststructural thought, language is considered the place where actual and possible forms of social and political organizations are defined; on this view, language is the place where our subjectivity is constructed – subjectivity is not genetically determined, but socially produced. Language carries within it ideologies and value systems that are inherently sexual, as Tuohimaa (1991: 372–373) has showed in her research since the 1980s. Psychoanalytic theory can account for aspects of the semiotic and the feminine, this last predominating in the pre-Oedipal period, when the child is still connected to the maternal body. This Tuohimaa (1991: 375), in her semiotic analysis of the poetic language of Finnish female authors, has followed Kristeva (1974: 23–30, 44), positing the Lacanian mirror phase as the first step of the subject – now detached from the semiotic *chora* – into the symbolic order. The *chora* will be repressed and found only as a pulsating pressure (cf. *sujet en procès* Kristeva 1974: 37, *la chora pulsionnelle* p. 96–97) on symbolic language, manifesting itself as contradictions, silence, and absence.

Kristeva's "speaking subject" (cf. Välimäki 2005) is one that is divided between unconscious and conscious motivations, between psychological and social processes. In the production of meaning there are two types of signifying process: the *semiotic* (Lacan's "imaginary", 1966) and the *sym-*

bolic (ibid.). The semiotic is related to the *chora*, whereas the symbolic process refers to the establishment of signs and syntax; this last, as Kristeva states, embodies the paternal function, as manifested in grammatical laws and social constraints. Tuohimaa, following Kristeva, demonstrates how the semiotic is manifested in *poetic language*, in its heterogeneity of meaning and signification, as particular articulations between the symbolic and semiotic disposition of rhythms and intonations which are prior to the first phonemes, morphemes, lexemes, sentences, etc. Tuohimaa (1991: 374–375) has discussed such issues in her post-structuralist and semiotic analysis since the 1980s. Her publications also show how feminine textual politics are manifested in contradictory elements at the level of both discourse and themes, where there is a conflict between masculine and feminine values. These conflicts are reflected in style, rhythm and musicality that break with syntax so as to present hidden symbolisms of a text. Symbols act, as Freud has shown, as a bridge between soul and body, psyche and nature. French post-structuralism also figures into Tuohimaa's book *Kielen kapina [Revolution in language]* (1994) which reflects the idea of Kristeva's "la révolution du langage poétique", and points up the creativity of feminine poetic language.

6. Semiotics of medicine: Studying symptoms and applying Peirce

In 1989 Tarasti (1991a: 96, 168, 182–183) writes that the teaching of semiotics in Finland really began as early as 1988 in the medical field, with Marja-Liisa Honkasalo's courses on diagnostics, the psychoanalytic aspects of symbols, Kristeva's theory of depression, death as an act of semiosis and more. In her groundbreaking moves into semiotics and interdisciplinary fields, Honkasalo (1988: 11–25; 186–192) analyzed the language of symptoms and signs in medicine (cf. Tarasti 1991a: 96, 168, 182–183), as an alternative to mainstream medical concerns (such as cell structure and behaviour). She analyzes symptoms as signs having both indexical and symbolical meanings. Many such meanings have relations to specific sicknesses and other biological processes, as well as to the social and cultural world. Communication between people involves both mental and cultural processes (cf. Eco 1976). Cells and physiological processes, Honkasalo (1988: 20) writes, are not part of communication in this sense. Rather, a human

being can be seen as a system comprised of information on the biological level. Honkasalo (ibid.) combines semiotics with the system-theoretical approach (Bertalanffy 1968), i.e., the study of wholes and wholeness. Thure von Uexküll (*Semiotica* 38 1982; 1984) had already studied the concept of sickness from a semiotic point of view, and developed a system theoretical approach, for example, by “translating” various biological processes and their semiosis as “biosemiotic” processes. This was to form an important aspect of Honkasalo’s (1988: 24) theoretical framework in her dissertation.³

If in the 1970s symptoms were studied as signs in the French tradition – as the language of psychoanalysis – in Peircean semiotics, by contrast, they have been seen as indexical signs. Eco (1976) argued that only psychiatric symptoms are conventional and symbolic signs, whereas for Sebeok (1976: 124) the symptom is “an automatic, natural sign”, embodying signifier and signified. Honkasalo’s (1988) semiotic work presents a conceptual and empirical analysis of the polysemous character of symptoms. It is a study on basic social medical research, concentrating primarily on problems intrinsic to this discipline. She used two methods of data collection and analysis, based on the assumption that the different levels of the symptom involved different domains, thus requiring systemic and semiotic inquiries. The systemic aspect pointed up the hierarchical realities of the symptom. Honkasalo’s research (1988: 192), based on Peircean semiotic theory, revealed the polysemous essence of the symptoms on different levels and in multiple relations.

In a special volume of *Semiotica* (no. 87, 3 and 4, 1991) there are 14 contributions by Finnish semioticians, two of them women: Honkasalo in medicine, and Tuohimaa in literature. The volume, edited by Eero Tarasti, is divided into socio- and cultural semiotics, semiotic theory of art, semiotic analysis of art, and gender analysis. These articles date from different periods, the oldest from 1984, and the more recent one from 1989. As Tarasti notes in his Foreword (1991b: 198–199), the articles are not meant to provide an “overall or exhaustive paradigm of Finnish semiotics, but simply to introduce in an international context some of our strongest areas in semiotic research. Therefore, for example, such fields as folklore, anthropology, linguistics, and musicology are not adequately represented”. Honkasalo (1991: 251–268) uses medical semiotics and socio-semiotics (Peircean theory) to study symptoms as a language in a community of

female factory workers. In this article, Honkasalo discusses the symptom as a sign, explaining problems of psychosomatic and psychological symptoms and especially the social meanings, along with the communicative functions attributed to them in her research based on empirical fieldwork (cf. Honkasalo 1988). She demonstrates how a Peircean semiotic perspective (cf. CP 1–8 1931–1958; EP 1 1992; EP 2 1998), using his categories *Firstness*, *Secondness*, and *Thirdness* (cf. Honkasalo 1991: 252), can form a relevant approach to the semiotics of medicine. Honkasalo has demonstrated quite systematically that, for medical semiotics, symptoms are essentially polysemous and multireferential, hence requiring semiotic and other interdisciplinary methodological approaches.⁴

7. *Semiotics of art – Applying Peirce*

The last dissertation I will discuss is Anna Louhivuori's (1988) *Myths as Images: A Structural-semiotic Interpretation of Marc Chagall's First Paris period, Works 1910–1914* (ten paintings and one gouache). Her interpretations of visual signs emphasizes art education, and is based on Peirce's phenomenological categorization of modes of being (Louhivuori 1988: 12–13). The *Firstness*-phase represents the level of qualitative possibilities of the works of art, as well as the phase of perception and emotion, based also on the recipient's non-cognitive pre-knowledge. The *Secondness*-phase represents the actual facts related to the work of art and the deductions made on the basis of these facts. The *Thirdness*-phase forms a synthesis of the former two, also constituting the criteria for judging the work of art.

In her theoretical and methodological section, Louhivuori (1988: 12–13, fn 150) writes that the semiotics of art in 1988 does not have solid traditions in the same vein as the semiotics of literature and musicology. One premise of Louhivuori's study was the profound *mythic dimension* in Chagall's work during the period in question. In her analysis of myths, Louhivuori used an interdisciplinary method drawn from semiotics (Greimas, Barthes), philosophy and anthropology (Eliade, Bachelard), psychology (Jung), and Hassidism (Buber, Wiesel). It was during the first Paris period that myths gained their strongest manifestation in Chagall's works. Another period with strong mythical elements occurred toward the end of his long life, evincing poetic visions based biblical texts. In semiotic terms, the central issue in Louhivuori's study is the relationship between Cha-

gall's modes of expression and other modes of artistic expression of this period, focusing on the mythical content of Chagall's works compared to that of other contemporary art. Her semiotic analysis shows ample interactions between Chagall's work and various common trends of the period. Quite unique and influential, however, were the content (*signifié*) of the works analyzed. In Louhivuori's analysis (1988: 16) Etienne Souriau's four existential dimensions of art are employed: *physical, phenomenological, fictive* and *transcendental*; the first two belong to the plane of expression (signifier), the other two to content.

As a summary, it can be stated that early semiotic analysis in Finland took various forms: Greimassian, Peircean, Kristevian, etc. We would agree with the linguist and philosopher Esa Itkonen (1982: 74–82) that, if the main aim of a semiotic analysis is to reveal structures, the concept of “semiotic structure” has remained unclear and partly controversial. According to Lévi-Strauss (e.g., 1955) and Eco (1976), it is axiomatic that modern semiotics has been developed on the basis of linguistic theory. Like natural language, society ought to be seen as a huge complex of communication processes, and every communication process implies a certain code, or several synchronic codes. Itkonen (1982: 74) argues that it was therefore “natural” to presume that the concept of linguistic structure could shed light on the concept of semiotic structure and thus affect the scientific status of semiotics. In Finnish structural-semiotic dissertations from the 1980s, the definitions of “semiotics” and “semiotic” are not always very explicit; the theories and methodologies are eclectic and various, displaying a richness of interdisciplinary aspects. These studies have often applied (all) the main structural and semiotic ideas from the 1960s and 1970s in the same dissertation. Despite such eclecticism, the publications from this time meant a new period in the scientific community in Finland – the start of semiotic research in Finland. The women semioticians presented above were pioneers in such fields as folklore, literary studies, linguistics, anthropology, musicology, medicine, and socio- and cultural studies.

8. Semiotics in the twentieth and twenty-first centuries: Finnish trends and traditions

Tarasti (1990: 5–6) defines semiotics, using a metaphor from Hermann Hesse's *Glasperlenspiel* (1943), as a union of arts and sciences. In *Semiotica*

Volume 87 in 1991 Tarasti (1991b: 197) argues that the development of semiotics in Finland in recent years (since the 1970s) has been, “without exaggeration, surprisingly rapid”. It all began with the small student circle in 1971 called the “Structuralism group”, consisting of students from various disciplines who gathered for regular sessions where they read difficult French and Italian texts. From there, and almost overnight, Finnish semiotics developed into a national and international semiotic and scientific community. Ten years later this group gave birth to the Semiotic Society of Finland, which began to organize international colloquia culminating in the International Semiotics Institute in Imatra in 1988. Since then, development has been very rapid, and has included female semioticians with backgrounds in 1960s structuralism, 1970s post-structuralism, and the semiotics of the 1980s and the 1990s (see Figure 1). These names are central also in the teaching and education of students.

Name	Time	Field
Apo, Satu	1970s–	Folklore studies
Bauters, Merja	1990s–	Art studies
Enckell, Johanna	1970s–	Literature
Hannula, Erja	1990s–	Linguistics, Roman philology
Hartama-Heinonen, Ritva	1990s–	Translation Studies, Swedish translation and interpretation
Honkasalo, Marja-Liisa	1970s–	Medicine, Women studies
Knuuttila, Tarja	1990s–	The Philosophy of science and technology
Knuuttila, Sirkka	2000–	Literature
Koivunen, Hannele	1990s–	Systematic theology
Kukkonen, Pirjo	1980s–	Linguistics, Scandinavian languages and literature, Translation Studies
Köngäs Maranda, Elli († 1982)	1970s–	Folklore, anthropology
Lehtonen, Maija	1970s–	Finnish literature
Lehtovuori, Eeva	1980s–	French literature, Linguistics
Louhivuori, Anna	1970s–	Art studies, art education
Rantavaara, Irma († 1972)	1970s–	Art studies, aesthetics
Sivenius, Pia	1990s–	Psychosemiotics, Women studies
Sivuoja-Gunaratnam, Anne	1980s–	Musicology, Women studies

Sorvali, Irma	1990s–	Linguistics, Scandinavian languages, Translation Studies
Suojanen, Päivikki	1980s–	Music anthropology, hymnology
Tarasti, Eila	1970s–	Musicology
Toivonen, Pirjo-Majja	1970s–	Finnish literature
Tuohimaa, Sinikka († 2004)	1970s–	Finnish literature, Women studies
Uotila, Minna	1990s–	Fashion
Vihma, Susann	1990s–	The semiotics of design
Välimäki, Susanna	1990s–	Musicology, psychoanalysis

Figure 1. Women in Finnish semiotics 1970s–.

Women semioticians in Finland represent the fields of art, literature, and linguistics; also, translation studies is a rapidly growing area of research today, along with the semiotics of science and technology.

Finnish semiotics, which began with “the linguistic turn” as a background, has grown into a field that embraces such different areas as philosophical speculation, biosemiotics, global semiotics, and semioethics. Semiotics is a tolerant research field, accommodating a wide variety of perspectives on the central issues of human life. The women scholars surveyed above were not only influential in Finnish semiotics – their work, and that of their students and adherents, holds a well-earned place in the global semiotics of today.

Notes

1. Jakobson’s opening address to the First International Congress of Semiotics, Milan, June 2, 1974 was first published in French in 1975 by Indiana University Press under the title *Coup d’oeil sur le développement de la sémiotique* (Bloomington 1975); cf. Pomorska & Rydy (1987: 531).
2. For instance, Barthes 1980; Eco 1972; 1976; Greimas 1966, 1970–1983; Hjelmslev 1969; Jakobson 1960; 1972; Kristeva 1972; Lotman 1972–1980; Morris 1971; Ojala 1953–1982; Posner 1972–1978; Tarasti 1974; 1976; 1980; Toivonen 1974–1984; Tuohimaa 1969.
3. *Translation Translation* (2003) ed. with an introduction by Susan Petrilli shows how translation concerns not only verbal texts and their relations among different languages, but also the entire biosphere or biosemiosphere, as evidenced by research in biosemiotics.

4. There are arguments from Barthes (*Eléments de sémiologie*, 1964), Eco (*A Theory of Semiotics*, 1976), Foucault (*The Birth of the Clinic*, 1973), Freud (*Inhibitions, symptoms, and anxiety*, 1926), Greimas (*Semiotics and Language*, 1982), Kristeva (*La révolution du langage poétique*, 1974), Lacan (*Speech and Language in Psychoanalysis*, 1981), Peirce (CP = *Collected Papers*, 1931–1958; *Semiotic and Significs: The Correspondence between Charles S. Peirce and Victoria Lady Welby*, 1977), de Saussure (*Course in General Linguistics*, [1916] 1966), Sebeok (*Contributions to the Doctrine of Signs*, 1976), Shands (*Semiotic Approaches to Psychiatry*, 1970), Staiano (*Interpreting Signs of Illness: An Ethnosemiotic Study*, 1981; *Medical semiotics: Redefining an ancient craft*, in *Semiotica* 38 (3/4)).

Non-communication systems: Signification and referent

*1. Semiotics of the system and semiotics of discourse
on the system*

The purpose of this paper is to propose a theoretical, methodological, and technical framework for the semiotic delimitation and analysis of semiotic systems of material objects and practices which do not belong primarily to the sphere of signification. We call such systems, for the purposes of this paper, non-communication systems. By their very nature, the study of such systems does not fall wholly within the domain of semiotics, a domain that we consider as coextensive with the study of cultural attitudes and practices. Thus, these systems differ structurally from communication systems, such as language, literature, and the arts, whose primary function is to be used for communication between members of a society and whose structure is primarily semiotic.

The means for identification and analysis of non-communication systems is a communication system into which they are transcribed, and the most frequent and powerful such system is natural language in its written or oral form, i.e., the main means for the analysis of non-communication systems is the use of linguistic texts. Due to this transcription, the communication system becomes the vehicle of the non-communication system and four structural characteristics come to surface: a) the field of the non-communication system, what is 'out there', becomes the referent of the communication system, a referent demanding its own, separate analysis; b) the semiotics of the non-communication system is intermingled with the semiotic structure of the communication system; c) the communication system may incorporate elements of other systems, communication systems or not, related to a greater or lesser degree to the non-commu-

nication system; and d) the communication system integrates both the semiotically relevant and the semiotically non-relevant aspects of the non-communication system. In other words, when the transcription is made using natural language: a) purely linguistic elements entailed by the use of language, b) elements of natural language referring to the non-semiotic aspect of the system being transcribed, and c) those which are relevant to its semiotic aspect, as well as d) elements belonging to some other system or systems, that is, four different aspects having the linguistic system as vehicle are all mixed together, confusing the semiotic analysis of the target-system as such.

Considering this difficulty in the semiotic delimitation of a non-communication system and the ambiguities which may follow from it, the above theoretical framework is needed in order to allow us to differentiate between these various aspects. The first step in such a differentiation is easily understandable, since what distinguishes the elements of the linguistic system as such, and those of the other system(s) it may integrate, from the elements of the non-communication target-system that it also integrates is the referential function: the references to the non-communication system, and only these, are relevant to its analysis. Even within a poststructuralist and postmodern context, according to which the reality of an object referred to by a sign is only an effect of signification (e.g., Baudrillard 1972), there is still reference (though no referent). Then, a second step is needed, which is to differentiate between semiotically relevant and non-relevant aspects of the non-communication system.

However, an analytical comment is necessary here. What is semiotically non-relevant in the context of the second step, is semiotically relevant from the very beginning, since it was assumed by the transcribing linguistic system. If, for example, the non-communication system, as delivered by the linguistic text, is analyzed using the concept of isotopy (see Greimas and Courtés 1979: *Champ sémantique, Classème, Isotopie, Micro-univers, Sème*), both the semiotically relevant and non-relevant aspects are given this form. This general “semiotization” of the non-communication system delivers a *semiotics of the discourse on it*. This is not the same as the whole of the text, which also includes the aspects (a) and (d) above, and which concerns general semiotic theory rather than specifically the semiotics of the particular non-communication system. Needless to say, while the semiotics of the discourse on a particular non-communication system gives a semi-

otic investment to that aspect of it that is not of a semiotic nature, it cannot claim to be a scientific analysis of this aspect, since this is a task assumed by specialized scientific fields other than semiotics. In addition, the semiotics of the discourse *on* the system does not yet allow us to identify the *semiotics of the system*, which presupposes the second-step procedure.

If the use of the concept of isotopy leads, in respect to the non-communication system, to a classification of the semiotic units, the differentiation between semiotically relevant and non-relevant aspects of the system offers a new and more general classification. We just saw that the aspect of a non-communication system that is semiotically non-relevant in comparison to the semiotic aspect *par excellence* of the system becomes semiotically relevant for the semiotics of the *discourse* on this system, that is, for another relevancy, perhaps of secondary importance, but not without interest. However, the *object* of this semiotized-in-or-by-discourse aspect cannot be investigated by semiotics, as we mentioned above, because its relevancy corresponds to an approach to the object as *referent*, and remains *external* to the semiotics of the non-communication system. On the other hand, the semiotic treatment of the semiotically relevant aspect of the system delivers semantic elements which are *internal* to the system. With reference to systems of objects of whatever kind, whether constituted by cups, trees, or cities, we may consider that at the very foundation of such a non-communication system lies a primary system focused on its signifiers, which are accompanied by immediate signifieds of a nature particular to the system, midway between direct (cultural) *perception* and linguistic formulation (*conception*). This primary system could be investigated by scientific fields other than semiotics, such as psychology, but still the linguistic system may offer access to it.

The differentiation between semiotically relevant and non-relevant aspects of a non-communication system offers the general guidelines for the desired classification, a classification that is theoretically based, but that should also be given an operational form, since its aim is to be able to lead to the actual semiotic delimitation of a non-communication system. As we shall see, we also need to proceed to a classification internal to the semiotics of the non-communication system according to its strata.

2. *The components of urban discourse*

We shall use as a test case for the study of non-communication systems the urban system, which represents an extreme case, since because of the nature and extension of the substance of its expression it is probably the “hardest” of all the non-communication systems. This hard materiality is in striking opposition to the “soft” materiality of the linguistic system, especially in its oral aspect, so soft that it frequently deceives us into thinking of this system as immaterial. There are theoretical discourses by specialists concerning the production of urban space and excellent studies on this matter are due to Françoise Choay, who turned to the role of written discourses for the semantic and formal constitution of a theoretical urban space, a space aiming to be a model for actual planning. According to Choay, these discourses which have urban space as their specific object constitute a specific genre, a discursive class. Choay distinguishes two major and different types of discourse, two different “structural modalities”, which have constituted the foundation of these specialized Western urban texts ever since the Renaissance, when she considers that these discursive types emerged (Choay 1973 and 1980: 9–17). The first type, the architectural treatise, derives from Leone Battista Alberti and consists in the application of principles and rules; the second, the utopia, is due to Thomas More and proposes the reproduction of a model.

To illustrate the problems that appear when we want to analyze the non-communication system of urban space through its representation in language, we propose to apply the four different aspects coexisting in an urban text as posed in the beginning of this paper to the seven constitutive features that allow us, according to Choay, to classify a text as a utopia. These are (Choay 1980: 46): (a) the utopia is an eponymous text; (b) it is written in the first person, by the author or his spokesman, visitor and witness of utopia; (c) it has the form of a narrative, describing in the present indicative a model society; (d) the model society presented is opposed to an historically real society, to the criticism of which it is indissolubly related; (e) the model society is supported by a model space, which is a necessary part of it; (f) the model society is located ‘elsewhere’; and (g) this society is not constrained by time and does not change.

These seven features can be homogenized and situated on one and the same level only when seen as parts of a linguistic text, but from the

viewpoint of the semiotics of the urban system, i.e., urban semiotics, they belong to different aspects (cf. Lagopoulos 1997: 364–365). Features (a), (b), and partly (c) belong to the aspect related to the linguistic system, both in its narrowly linguistic and its textual form, which is the communication system acting as a vehicle for the non-communication system of urban space; features (d), (f), (g), and partly (c) belong to the aspect concerning a system other than the urban system, namely the sociological system; and only feature (e) is related to the aspect(s) derived from references to urban space, but is ambiguous as stated, because it may cover semiotically relevant and/or non-relevant elements.

The simultaneous treatment of all these aspects may deliver a textual class, constituted on the occasion of a discourse on urban space, but this class is attached to the undifferentiated discourse as a whole and, as we already stated, it is of interest to general semiotic theory, but does not belong to urban semiotics. Only the feature (e) leads to the latter, and if it covers both the relationship between the semiotically relevant and non-relevant aspects or only the latter, it leads more specifically to the semiotics of urban discourse, but still not to the semiotics of urban space.

To recapitulate: in texts about space, the linguistic system assumes the urban system, and we shall call this kind of vehicle “urban text” and its semiotic analysis “semiotics of the urban text”. The semiotic analysis of this text delivers the semiotics of the semiotically relevant aspect of the urban system, that is, the semiotics of the urban system, or *urban semiotics*, together with the semiotics of its semiotically non-relevant aspect, both constituting the *semiotics of urban discourse*. Following the delimitation of the semiotics of urban discourse, a second procedure, referred to in the first section of this paper, is needed in order to achieve the new delimitation leading to the semiotics of urban space as such. This procedure must be founded on the rule of relevancy (*loi de la pertinence*), which demands the definition of the perspective on urban space that is relevant to semiotics. The relevant viewpoint of semiotics in general is convincingly argued by Umberto Eco, who also integrates into this perspective the relevancy for the semiotics of architecture, a perspective which is also valid for the greater scale of urban space. Eco considers it of central importance to approach social and spatial phenomena semiotically, “*sub specie communicationis*”, that is, from the viewpoint of signification (Eco 1972: 25–30 and 1979: 6–7, 26–27, 158).

The semiotic relevancy in respect to urban space, a semiotic “vertical” view on it, delivers three successive strata, “vertically” connected: the stratum of the urban signifiers, the stratum of the denotative urban signifieds, and that of the symbolic, connotative urban signifieds (see Eco 1972: 274–281 *passim*). There is also a parallel vertical view on urban space, covering the semiotically non-relevant aspect of it. The above three strata, which are integrated within the semiotics of urban discourse, deliver a classification internal to the semiotics of urban space, and constitute the semiotics of urban space *par excellence*. Together with the parallel aspect addressed to the semiotically non-relevant elements of urban space, which also forms part of the semiotics of urban discourse, they constitute the matrix for the organization of the units of urban discourse, i.e., for the classification of these units. Such a classification is founded on linguistic *parole*, not *langue*, irrespective of the fact that the semiotically relevant units may allow the identification of the *langue* of the urban system.

We should clarify that we are using here a narrow definition of urban discourse, as discourse referring only to the isotopy of *physical* space, which has been the traditional focus of the semiotics of space. As an example of each of the four components above in respect to this isotopy, consider the following references to the same urban entity, the grid pattern. (a) A statement such as “the grid pattern creates traffic problems, because for every city block there is a street crossing” is an example of the semiotically non-relevant aspect of the grid pattern. (b) For the three semiotically relevant strata of the grid pattern appertaining to urban semiotics, (i) “the grid pattern is a figure consisting of a set of parallel lines crossed perpendicularly by another set of parallel lines” illustrates the grid pattern as an urban signifier; (ii) “the grid pattern facilitates the understanding of the general city plan” uses the grid pattern as a denotative signified; (iii) a possible connotative signified of the grid pattern, typical of Greek and Roman antiquity, would be “the grid pattern reflects the organization of the universe.”

3. The aspects of urban discourse, the epistemology of urban space, and the epistemology of sciences

Undoubtedly, the matrix of isotopies constitutes a semiotic classification of urban units, but our central argument focuses on the four-component matrix discussed above, as offering a wider framework for the basic clas-

sification of these units. We believe that this classification is fundamental for urban semiotics and of a general validity. Doubts about its well-foundedness can be overcome, because, as we shall argue, it has much wider epistemological affiliations. Actually, these affiliations do not derive from all four components, but from the two opposed aspects of the semiotically relevant and semiotically non-relevant elements of the urban system, the two aspects that may be considered as the contribution of the present paper to semiotic theory and as radically challenging the received wisdom in the semiotics of space. We shall discuss these affiliations on two levels of generalization, the first concerning the whole of the domain of spatial studies and the second the epistemology of sciences in general.

The nucleus of spatial studies is human geography and we shall try in few lines to give a schematic overview of its development after World War II. The “new geography” of the 1950s is based on the positivist hypothetico-deductive approach and seeks to formulate specifically spatial and formal (“morphological”) universal laws, applicable to both physical space and the natural environment, by using quantitative data and model-building. Marxist geography was propagated and extremely successful in Anglo-Saxon geography from the beginnings of the 1970s, but originated in France, where its landmark was May ’68. Marxist geography, the political-economy approach to geographical space, is radically opposed to new geography. For it, space is social and a social product, i.e., socially produced; thus, there are no spatial laws but only sociospatial ones and, consequently, these laws are not universal: capitalism, for example, as a socioeconomic system shapes space in its own image. In spite of the great distance separating the paradigms supporting these two geographies, their common object is space as *referent*.

An earlier reaction to new geography appeared in the early 1960s and came from behavioral geography, also of positivist orientation. For behavioral geography, spatial organization and movement are due to geographical conception: the cognitive representations, “cognitive maps”, “mental maps”, or “mental images” held by people. About a decade later, humanistic geography introduced a new philosophical paradigm for the study of spatial signification, phenomenology. Finally, toward the end of the 1980s, postmodern geography entered the scene as a forceful current. Its foundation is French poststructuralism and its fundamental thesis is that space is

a text. In spite of their differences, all three of the above geographies focus on space as *signification*.

The domain of spatial studies is not constituted by human geography alone but also by a whole series of subfields of sciences with objects other than space, as well as by the applied fields of architecture and urban and regional planning. In this vast domain, a split has appeared, similar to the one we distinguished in human geography, between the study of space as *referent* and its study as *signification*.

This split is well formulated by humanistic geography. This geography does not want to have as its object space as a physical reality, but approaches it as a meaningful entity, a turn that moves away from *physical space* as a referent and selects as its object *semiotic place*. Space is seen as the result of an abstract and neutralizing manner of indirectly and intellectually looking at geographical entities from a distance, while *place* is related to intimate, subjective, direct, and profound experiences in consciousness; place is invested with signification, feeling, and value. For humanistic geography, this experiential recuperation of space as place contains its original nature; it is place that shapes architecture and the urban environment (see, for example, Tuan 1977: 5, 17; Saarinen and Sell 1980: 531).

Geographical approaches having as object space view it externally and as a material entity, independently from the semiotic world of the social subjects. They constitute together what we may call the *materialist, objectivist, (super)paradigm* (this latter term is used here in a very loose sense). The other approaches, which have as object place, view it as a semiotic entity, a part of the experiential world of the subjects. They compose as a whole what we may call the *conceptual, subjectivist, (super)paradigm*, which is semiotic in nature.

We see that the dichotomy traversing spatial studies corresponds exactly to our typological differentiation between semiotically non-relevant and semiotically relevant aspects of the urban system in urban discourses. We need not be confused by the fact that the focusing on the referent, space, excludes the corresponding scientific approaches from semiotic interests, while we have considered that references to “space” constitute part of urban discourse, that is, of a semiotic entity. The reason is that the four aspects we detected *within* an urban text – the aspect relating to the linguistic system as such, that relating to systems other than the urban system, that of the semiotically non-relevant elements of the urban system, and

finally the aspect of the semiotically relevant elements of the urban system – are all aspects of an initial general relevancy, which is semiotic. This initial relevancy reflects the decision to treat the object of analysis as a text, i.e., as a semiotic object, and not as a source of information on the referent. It is, of course, absolutely legitimate, but it cannot eliminate the existence of a non-semiotic relevancy in this object. To take the extreme case, we can do a semiotic analysis of *scientific* discourses on *space*, but this cannot change the fact that they are about space and it does *not* transform them into discourses on *place*.

It is true that the extreme postmodern approaches in geography reject the differentiation between space and place in the name of the poststructuralist rejection of the referent. But this position is just a local, if fashionable, position, coexisting with the position opposed to it, and indeed may lead to a logical misunderstanding. The reason is that, even if *actually* the referent were totally inaccessible, ordinary people and the majority of scientists nevertheless treat it as an existing entity. Thus, the logical deduction from the poststructuralist premises should be that there are two different semiotics: one semiotics of meaningful space and another of space (wrongly) considered as referent.

So far, we have discussed the first-level generalization following from the affiliations of the differentiation between semiotically relevant and non-relevant aspects of the urban system. The second-level generalization, into which the first-level generalization is integrated, is far-reaching and concerns a radical split in the epistemology of sciences. According to their epistemological position in respect to reality, scientific theories are classified into two major categories: *realist* and *anti-realist* theories. Realist theories assume that it is possible to identify the really existing objects in the world and their states, relations, and processes (ontological realism) or at least the structures ruling them (structural realism), consequently to know the essence of the world as such, independently from the observing scientist, with the result that realism is an essentialist realism. For realism, scientific theories are true, at least approximately, in the sense that they correspond to an external reality. They re-present a real preexisting referent, of which they are a kind of duplicate, although an incomplete and imperfect one. Due to this *semantic realism*, they are theories-reflections and their truth is truth-correspondence.

Contrary to realist theories, anti-realist theories exclude truth-correspondence. For instrumentalism, the main body of anti-realism, scientific theories are not to be taken literally, because they are just instruments for classifying, predicting, and acting on phenomena. Instrumentalism states that scientific theories build, that is, invent, entities and processes, which are simply useful intellectual fictions. Contrary, then, to the theories-reflection of realism, the theories of anti-realism are generally theories-instruments. For anti-realism, truth-correspondence is not valid, because truth depends on an, individual or collective, subject and the means at its disposal; truth is not a reality, but a constructed event.

The two major tendencies within anti-realism hold a different view on the referent, or (which is the same thing) a different relation to essentialist realism. They either retain a contact with the latter – in which case we have a “mild” anti-realism – or reject any contact whatsoever, whence they tend to idealism. For the first tendency, while the extralinguistic referent, as part of the world-as-such independent from humans, cannot be represented, it nevertheless exerts pressures on the content of theories. In this framework, a scientific theory cannot be just anything. The second tendency does not retain any connection to the referent. Thus, for radical conventionalism, observations do not pose any constraints on the researcher and science is a purely human creation, totally disconnected from any referent. This extreme relativism holds that the scientist is completely free to formulate whatever s/he chooses in respect to his/her object, thus discrediting scientific views and, ironically, its own views (on the above observations concerning the epistemology of sciences, see Soler 2000: 43, 109–126). We recognize in this last tendency the epistemological stance of poststructuralist and postmodern theorizing.

To conclude, we can relate the opposition *space* vs *place* first to the epistemological opposition *scientific realism* vs *scientific anti-realism*, and then to both the current professional urban discourses and the spontaneous approach to urban space by the ordinary individual. The approaches that study *space* necessarily adopt the viewpoint of scientific realism, though this did not prevent the existence of one approach within realist human geography (namely behavioral geography) and another one within realist psychology (namely environmental psychology) which are oriented towards place. But, in this last case, a kind of anti-realism enters through the window, with the dominant idea that place, and no other factors

(such as socioeconomic processes), is the factor creating space. On the other hand, scientific anti-realism in spatial studies is by definition turned towards *place*, while there are also instances, found among humanistic or postmodern geographers, in which the existence of space is acknowledged, but is given a secondary position.

However, urban *discourses*, whether professional or ordinary, reveal that individuals approach geographical entities *simultaneously* as space and as place, as a neutral material object and as a signifying object. We may manifestly generalize this conclusion to every non-communication system, and even generalize it further to communication systems, keeping in mind that in this case their material part is a secondary quality and not a primary quality as in the non-communication systems. We would suggest that these two fundamental modes of our connection to the world do not lose their value even within the anti-realist camp. Though in that case there may be no referent, there is still *reference*, and these two major modes of reference are not without importance, even if the referent were, as this camp maintains, just a semiotic construct.

Post-structuralist insight and the time-dependent structure of the sign

Towards sub-semiotic analysis

1. Sign and structure

It is hard to speak about semiotics without any reference to the concept of *sign*, which was the key concept of the whole movement of structuralism dating back to the mid-twentieth century. But nowadays we may ask: what structuralism? Or even: what structure?

Of course we may remember that structuralism started from linguistics – Saussure's famous lectures were published in 1916 – and spread to many other scientific disciplines (anthropology, philosophy, psychology, psychoanalysis, politics, musicology etc.) until the late 1960s, when it was confronted by something called post-structuralism. And of course we still in the semiotic field acknowledge the structure of the sign as a mutually defined, oppositional pair between expression and content (or signifier and signified), although it is gradually more and more (and rightfully!) questioned by Peirce's famous three-level classification of signs (Peirce 1955). But contrary to our present post-modern attitude, the arousal of post-structuralism was *not* simply a rejection of structuralism. After all, Peirce's general classification of signs was developed independently of linguistic based movement of structuralism and influenced in Europe later on after the breakdown of structuralism since 1970s. So we may ask, what – if not the sign-structure as such – was the main target in post-structural critique of structuralism and what new possibilities does Peirce's three-level definition of sign offer us?

As an answer to these questions it is important to consider the role of *structure* in the realm of signification and meaning production in gene-

ral. This means that we have to take account of the *temporal* and *spatial* aspects, which are connected with *direct perception* of any sign or sign-function. To do this, we will first concentrate on philosopher Gilles Deleuze's essay "How do we recognize structuralism?" (Deleuze 1998),¹ which as a post-structuralist interpretation of the whole structuralistic movement is at once unexpected and fascinating, giving us possibilities to find connections to many other fields of scientific inquiry. Deleuze's interpretation enables us also to make short contacts with the dynamical theories of classical mechanics and further to more recent ideas concerning quantum physics, information, and especially physicist David Bohm's concept of *implicate order* (Bohm 1980 and 1993). And it is precisely these contacts, which show us the power of Deleuze's astonishing framework and give us possibilities – somehow still hidden in his essay – to define better what is meant by the concept of structure, its role in perception, and its relations to the concepts of space and time. Finally at the end of the article the above considerations will lead us to suggest a new approach of semiotic analysis, which will be here outlined as *sub-semiotic analysis*, creating future possibilities of art research especially in the field of music analysis.² This sub-semiotic level has also some connections with Peirce's three-level classification of signs.

2. Deleuze's definitions of structuralism

2.1 The symbolic order

Deleuze's definitions of structuralism start by the delimitation of three orders, which are central to our conscious awareness. He points out that the first criterion or dimension of structuralism is the discovery of a third order – that of the *symbolic* – not to be confused with *real* and *imaginary* (Deleuze 1998: 260). This idea to extract structure from concepts of real and the imaginary is aiming to define a structural object, which already in the field of linguistics is placed "beyond the word in its reality and its resonant parts" and "beyond images and concepts associated with words" (ibid.). But this division between the real, the imaginary and the structural is not without relations between different levels, nor it is an abstract conceptualization. We could clarify Deleuze's first criterion by saying that there cannot be anything real without a certain relation to structure, and that in

every structure we find already the minimal conditions of the symbolic order. This is why the real and the symbolic cannot be imaginary, because before any imagination, structures and reality have to “make sense”: they must be perceived (Figure 1).

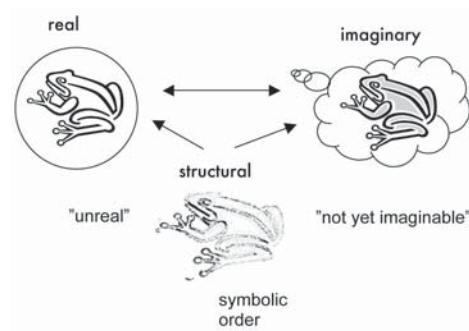

Figure 1.

So the idealistic notion that we can imagine whatever we want does not hold, because imagination needs its counterpart of “what it is not”, the real, which can only appear to us by actualization of sensible structures. According to Deleuze, this was the reason why the whole movement of structuralism in the twentieth century gained its revolutionary character in diverse fields of inquiry: it bridged the gap between the real and the imaginary. As Deleuze puts it: a structural object formed a third realm of being, “at once unreal and yet not imaginable” (ibid.: 261). So already in the first chapters of his essay Deleuze gives us something unexpected, which becomes clear to us only after a deeper contemplation: three states of mind, surely different in modes of existence, but necessarily related, and the idea, that in the realm of structures we already find the minimal conditions of symbolic order.

2.2 Spatial relations and the production of sense

Deleuze’s first criterion of structuralism has many consequences (and although he deals with seven distinct criteria in his essay, I will summarize the most important ones here in a more compact manner).

Firstly, if structural elements cannot be defined by pre-existing forms of reality, nor by any imaginable figures derived from them, what do symbolic elements consist of? Although the above-described division between real, imaginary, and structure sounds reasonable, we might have some doubts about Deleuze's insistence that the "symbolic element and the corresponding structure have no relationship with sensible form" (ibid. 261). But once again Deleuze refers, by "sensible form", to pre-existing, autonomous reality, which as a whole – or Gestalt – *cannot* form the ground for definition of structural elements and their role in perception. On the contrary: it is precisely the interplay of structural elements and their relationships, which are responsible for the formation of wholes and for the variation of their parts. This reversal enables Deleuze to conclude (in accordance with Lévi-Strauss's definitions) two important aspects concerning the nature of structural elements: first (1), that "they have nothing other than a *sense*: a sense (which literally refers to meaning and direction) that is necessarily and uniquely 'positional'" (ibid. 262); and second (2), that "sense always results from the combination of elements that are not themselves signifying" (ibid. 263). These conclusions have several far-reaching implications.

(1.) As Deleuze points out, "the scientific ambition of structuralism is not quantitative, but topological and relational" (ibid. 262). The interplay of structural elements is always occurring in a concrete level of direct perceptions, which are necessarily connected with time-dependent spatial relations concerning *proximity*, *conjunction/disjunction* and *placement/displacement*. These spatial relationships put the emphasis on the importance of the geometrical description of any sign production and create further possibilities for Deleuze to define the basic framework of structuralism. The necessity of geometric and topological levels of descriptions in sign-function – with special stress on the *iconic* level in Peirce's classification of signs – has more recently proposed by mathematician René Thom (1985).

(2.) If sense – as Deleuze defines it – is always a result of the combination of structural elements that are not themselves signifying, then all concepts and all those entities connected with them in our surrounding world cannot exist "ready-made". This was already evident earlier in Deleuze's interpretation, where the interplay of structural elements were understood to be responsible for the formation of wholes and for the variation of their parts. But following this line of argumentation, we logically confront inevitably the post-structuralist critique of the concept of (self-)

identity (notably in Derrida's deconstruction and especially in his concept of *différance*; see Derrida 1982) and end up defining structural relationships by *infinite differentiation*. Although the key idea of differentiation leads Deleuze once again to define ever more subtle levels of structural elements and their functioning, it is interesting to point out that by Deleuze's definitions, the critical attitude towards closed, finitely definable entities was already a central aspect in the movement of structuralism since 1950s.

(3.) While it is evident that the idea of differentiation and the concept of difference became the main figures of so-called post-structuralist philosophy and can even be traced back to the simple dualities and binary oppositions that influenced the whole movement of structuralism and structural semantics in general (e.g., the binary oppositions in famous Greimas's square), there was still a deeper line of thought in Deleuze's definition of sense. He points out the following:

There is, profoundly, a non-sense of sense, from which sense itself results. Not that we return in this way to what was once called a philosophy of the absurd since, for it, sense itself is lacking, essentially. For structuralism, on the contrary, there is always too much sense, an overproduction, an overdetermination of sense, always produced in excess by the combination of places in the structure. (Deleuze 1998: 263; see also, Deleuze 1990: 71.)

So we can see more clearly now that it is not anymore *only* a question of the importance of the above-described spatial relationships (localities and positional placements) between structural elements, but something concerning every structural element itself. Deleuze draws our attention to another important aspect concerning a structural element: structural elements cannot have definite boundaries – or identity of itself – because *when producing sense it is always necessarily related to something which it is not: to non-sense*. And this necessary relation of a structural element to “what it is not” cannot be reduced to simple, equally defined binary oppositions, because there is always an excess of sense: “an excess produced and overproduced by non-sense as a lack of itself” (Deleuze 1990: 71). We shall see further implications of this relation especially in sign- and meaning-production and their connection with direct perception later on in this article. It is also interesting to notice here that Deleuze's definition of structural elements – which are not based on well-defined, closed entities – points towards structurally *invariant* relationships, which have been

considered the most important carriers of *information* in perception (in optics, see Gibson 1966, 1979; in physics, see Bohm 2003.)

(4.) But Deleuze's idea of infinite differentiation leads us to consider still two other important consequences.

First: if infinite differentiation leads us unavoidably to overproduction of sense with all its multiple relations to non-sense, it follows that structuralism is necessarily linked with "certain games and a certain kind of theatre, for certain play and theatrical spaces" (Deleuze 1998: 263). But this is not to suggest the impossibility of analysis. It is just pointing out that investigation of structures, which form the basis of any sign or meaning production, it is not a question of absolute quantities but multiple relations of structures, which as a play (or theatre) are always revealed to us as differentiation qualities. So it is qualities that are perceived as positional, occupying a certain location – and it is qualities, which are due to formations of sense in relation to non-sense. The idea of game (or play) as a *strategic* mode of analysis is also similarly illustrated by Derrida in his description of the concept of "différance" (Derrida 1982: 7, 11).

Second: the previous discussion of elementary structural process, in its relation to differentiation including spatial aspects and formations of non-identical sense, makes it evident that structuralism is in a certain way "inseparable from a new materialism ... [or] a new anti-humanism" (Deleuze 1998: 264). But this is not suggesting anything against humanity. As Deleuze explains (ibid. 264):

For if the place is primary in relation to whatever occupies it, it certainly will not suffice to replace God with man in order to change the structure ... the death of God surely means the death of man as well,^[3] in favour, we hope, of something yet to come, but which could only come within structure and through its mutation.

So as a final consequence of preceding considerations we end up with a new line of analysis, which necessarily goes far beyond the anthropic level of structural formations, and touches more profoundly the totality of all organic existence – even towards spaces, which are commonly understood as inorganic or inanimate. So it is not anymore only a question of zoo-semiotics operating on an animal level, not even a doctrine identified as bio-semiotics. This kind of new line of analysis as Deleuze's "something yet to come" will be suggested in the end of this paper as *sub-semiotic analysis*.

2.3. Differentiation as an operation of the differential and the singular

In the preceding section we have been rushing forwards quite rapidly. As a matter of fact, we have used only Deleuze's first criterion of structuralism to define at least the next three following ones and by further implications pointed out many important aspects of the remaining criteria. But there is one central issue left untouched: we don't yet have a clear idea how infinite differentiation is operating. To understand this, we need to explain Deleuze's concept of *differential*.

Once again Deleuze defines the term differential by his first criteria, in relation to the real, the imaginary, and the structural, now in a mathematical context. If different whole numbers (e.g., 2 and 3) and their relations as sums, products, or even their divisions, can be said to be real, we can always change that reality to imaginary by introducing a variable x (or y), which can have whatever value we can imagine (e.g., $x+3$ or even $x^2+y^2-R^2=0$). As a consequence we have two types of relation: (1) In the first type, the different elements and their relations as sums, products, and divisions are real; (2) in the second type the different elements can be unspecified as variables, but the outcome of relations "in each case, must however have a determined value. Such relations can be called imaginary" (Deleuze 1998: 264–265; see Figure 2).

Figure 2.

But the differential, as Deleuze points out, has a profoundly different nature. It constitutes again a third type, which structurally and symboli-

cally mediates between the real and the imaginary. This is due to the fact that the differential as a relation has *no* specific values for variables x and y until the moment they interact and determine each other reciprocally, producing a specific outcome, which in mathematics is called a derivative of differential equation. So the most crucial point here is that it is no longer a question of giving variables imaginary values; nor is it the case that they are real, predetermined entities. Rather, it is the case that in the differential, variables are in continuous change. This is mathematically expressed as a relation between dy and dx (defined as dy/dx), and only their interaction and reciprocally defined relationship gives the differential a specific, *singular* value (ibid. 265; see Figure 2).

But the above-described mathematical definition, given by Deleuze, still leaves us some doubts. By its nature, we can surely infer that structures cannot be point-like entities, but some kind of *extended properties* in continuous inference with each other. But what kind of properties are we dealing with? The answer, in connection with the mathematical formulation is a striking one: We are dealing with a certain property (Δy), which can be perceived changing in time (Δx ; see Figure 3).

Figure 3.

By this clarification it becomes more evident that Deleuze's definition of differential is not simply a mathematical one. If we consider it more deeply from the structural point of view, we notice that it is not based only on abstract formulation and value of differential calculus, where the time change (Δt) is considered to be infinitesimal (as infinitely small), which causes the *relation* between the perceived change of a property and time to *reduce* to a (zero!) point. As Deleuze points out, while the mathematical origin of structuralism must be sought in the domain of differential

calculus, it has to be liberated “from all reference to the infinitely small” and integrated “into a pure logic of relations” (ibid. 265). But even beyond the pure logic of relations, Deleuze’s concept of differential is connected with something much more concrete: as an extended structure it defines *movement* (see Figure 3). This definition leads us to some final conclusions about Deleuze’s definitions of structuralism.

First: the relation between the concept of differential and definition of movement is highly influential, because it is precisely the definition of movement, which has been the most important concept in classical physics since Galileo and Newton, defining the existence – or absence – of *perceived force*. This underlines the ontological status of Deleuze’s concept of differential.

Second: differential defined as movement describes Deleuze’s structural element, which is necessarily related to *spatial localizations* (proximities, conjunctions and placements) and moreover to *temporality*.

Third: although movement can be defined abstractly by reference to measurements between stationary, fixed points, it is by its nature an *extended structure*, which cannot concretely be measured (according to Heisenberg’s uncertainty principle) by exact positions of a moving object. This is also the reason why its definition as *sense* (and not as an identified entity) is always related to the background of *non-sense*.

Finally: Deleuze’s concept of differential and its necessary relationship to singularity leads to the question: What is it that coexists in the structure? Answer: For Deleuze the surrounding world exists to us as enormous “virtual reality” constituted by *infinite differentiation*, which in a time-dependent and necessarily singular manner becomes *actualized* to us differentially by our sense organs (Figure 4).

Figure 4.

In the next and last section of this paper, we will see that this double aspect, which in Deleuze's terms is composed by virtual totality as different[*t*]iation and its actualization as different[*c*]iation (ibid. 268), has interesting connections to quantum physicist David Bohm's theory of implicate order. The preceding discussion connected with Deleuze's definitions of structuralism points also towards the re-evaluation of the sign-structure and especially to the investigation of its relation to the continuous movement of time.

3. Further reflections

In brief: Bohm's idea of *implicate order* relies totally on the possibilities to define movement as an ordering principle of perceived structures. And it is precisely the idea of movement that relates it to Deleuze's definition of the structure as constituted by differentials. If we consider the fact that perceived structures – as defined by Deleuze's criteria of structuralism – are necessarily extended, it follows logically that we are, in our perceptions, somehow in the middle of the things. This is based on Bohm's theory of the idea that structures are necessarily *enfolded* within each other (see Figure 5).

Figure 5.

So it is never a question of something being in itself, but that structural elements are temporarily enfolded within each other, and it is by this enfoldment as related to implicate order that they can become *explicated* by our perceptions (Bohm 1980: 141–213). This kind of structural enfoldment points also straightforwardly to the idea of recent quantum physical innovation: we meet the idea of *quantum information* (qubit), where we

find the same structural conditions. It is true that, in the quantum information, the opposite structural elements (for example, electrons spins up and down) prevail simultaneously in an *entangled* (or enfolded) situation of oppositions during a certain time-period; as a result they make up the organizational situation, which is no longer disordered, but in fact totally organized (von Bauer 2004: 183–192). So we find that differentials described as changes of movement can also be understood as fundamental differences (or even binary oppositions, which refer to Deleuze's idea of sense and its relation to non-sense), but only if we consider their nature in relation to time. This stresses once more the role of temporality, which is more clearly seen even in Peirce's three-level classification of signs, where *firstness* describing the iconic level of signs is more connected with temporal and concrete aspects of direct perceptions, and where *thirdness* as abstract and time-independent symbolic-level can be understood as gradual formation mediated by *secondness* of indices. The importance of the iconic level of signs was indicated earlier in connection with Deleuze's definitions of structuralism and the central role of spatial relationships in sign production.

The above considerations lead us to a final reflection, which concerns the role of any study (for example in semiotics): the tendency to concentrate on the future much more in relations of concrete structures changing in time. As a matter of fact we have to do with a kind of *sub-semiotics*, which should be investigating the structural features in a context of the unity of space and time. It is precisely temporality which gives us the idea that our reality is not constituted by ready-made, closed entities but is necessarily related to extended and complex structures evolving in time. As a consequence, we cannot rely anymore on static structural oppositions (like expression and content), but must concentrate on structural features in a content level in order to understand the formation of any possible expression (see Figure 6).

Therefore these structural features can only be described by differences (or differentials) even in situations where those differences turn out to be invariant. This will lead us finally to a better understanding of the time-dependent structure of the sign.

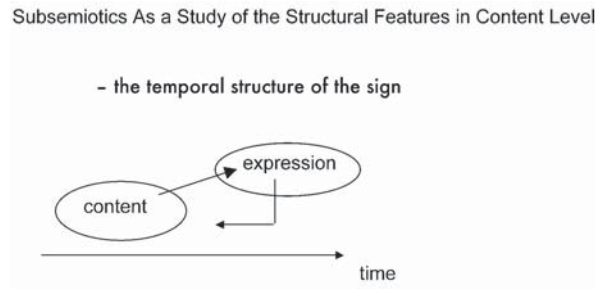

Figure 6.

Notes

1. This essay was written in 1967 but was published not until six years later; see Deleuze 1973.
2. Because of limited space, I am not dealing here with concrete applications of music analysis, which will be the subject of my forthcoming Ph.D. dissertation.
3. For more on the “death of man” and its relation to Foucault’s philosophy, see Deleuze 1986: 124–132.

Semiotic commodities or nationalistic pathos?

Mediating between interpretations of pro-Putin youth organizations

1. Introduction

My aim here is to conceptualize some key features of the language use of two pro-Putin youth movements, Idushchie Vmeste (henceforth IV) and NASHI in the context of post-communism. The analysis is based on tensions that emanated from the language use of those movements. This tension has two dimensions. First, various texts and announcements of the movements emphasize certain a nationalistic pathos and monopoly of truth. In addition, they often stress the importance of both individual and plural values. The following quotations, from the key text of IV, the Moral Codex, illustrate this contradiction in content:

Cuss – and you will never receive respect from the people of high culture and intellectual. Cuss – and you will be never employed in a serious and responsible job. Cuss – and you will never get out from the circle of people [who are always] drinking beer, doing and reading nothing, listening to moronic detstlas.^[1]

If you only listen to Russian popular songs, then try to listen to the best pieces of Western ones, too. If you only listen to serious contemporary music, try to orientate yourself with classical tradition, ethnic or spiritual music, though only once. If you are a student of a university of technology, then listen to what serious students of humanities are talking about, visit a conference or exhibition. And vice versa.

The second tension concerns the stylistic aspects of this contradiction. Quite often the “pathetic” style of the movements exhibits a certain playfulness. Here I concentrate on this aspect of the language use of the

movements. Playfulness and other “tongue in cheek” elements – which I call “semiotic commodities – are not treated as argumentation strategies but as semiotic aspects of the sociocultural space, as realized by the two pro-power Russian youth organizations. In this respect, the term “semiotic commodity” refers to a condition of communication in which the meaning of the message is based on principals of form and a certain hybrid content (meaning). The notion of “nationalistic pathos”, in turn, refers to the view according to which these movements are regarded more or less as “puppets” or “rubber stamps” of Kremlin.

The concepts of “semiotic commodity” and “nationalistic pathos” can be understood as two sides of the same coin. Repetitive use of national topics (for example, recalling “The Great Patriotic War”²⁾ can be easily recognized as promoting a kind of nationalistic pathos. The aesthetic side of this pathos activates the “semiotics” of the movement’s social activity, in which various signs are used to create a nationalistic rhetoric. In this sense, the title of this paper could well read “semiotic commodities” and “nationalistic pathos”, or “two sides of the coin called pro-Putin youth”. A question could be asked here: Why not just “nationalistic rhetoric”? Especially in a case where the traditional, ancient Greek template of logos and ethos will not be applied? My answer is that, by putting “semiotic commodities” and “nationalistic pathos” as presumed alternatives to each other, we can fruitfully complement but also criticize the rather superficial critique often found in western media, wherein these movements are seen as mere puppets of the Kremlin. I am not saying these movements are not related to the Kremlin – in many ways they are puppets – but the puppeteers “who pull their strings” should not be characterized in an overly one-sided fashion. Thus, the term “pathos” in my title refers to the general Western interpretation of these movements. Let us look at a provocative example of this:

Putin Channels Lenin: A Translation of the Nashi “Manifesto”

For the first time, the ideological “manifesto” issued by the Kremlin youth cult known as “Nashi” (“us Slavic Russians”) is made available in English. Read the full horrifying details as the Kremlin’s ideologists lay out the foundation for a neo-Soviet state, starting with the indoctrination of young people just as in Soviet times (Publius Pundit).

My argument is that quotations like these, strongly underlining the political instrumentality of the pro-Kremlin youth organisations – Nashi and its predecessor, IV – maintain and construct an understanding according to which these movements act only under such organizational names. On this view, the movements themselves do not carry any specific importance, but instead follow orders from “the top” (i.e., from the parent party). Although the quotation from the *Publius Pundit* is overtly radical in its “western individualism”,³ it shows a basic trend to illustrate the role of the pro-Putin youth movements as completely subordinate to the Kremlin’s commands. For example, here is a quotation from the *New York Times*:

Nashi’s opponents, in fact, deride the organization as a modern manifestation of Komsomol, the youth wing of the Communist Party of the Soviet Union. The colors and symbols are similar; members carry red books to record their participation in rallies and lectures. And, like the Komsomol, membership in Nashi is viewed as a stepping stone to jobs in government and state corporations. (*The New York Times*)

My semiotic-constructivist and discursive approach is not a counterpoint to the account of political instrumentality seen in the quotations above. Rather, my aim is to question simplistic reductions of these movements to fit certain ready-made political frameworks. It is thus my goal to point up some embedded values of these movements, i.e., their “symbolic capital” in a special social field.⁴ In this field, the key issue is that of analysis of “semiotic attractiveness”.

2. The exchange of books of Idushchie Vmeste

In 2002 *Idushchie Vmeste* conducted an action called “The Exchange of Books” which was targeted against those writers and books regarded as morally and culturally harmful to Russian culture. The movement’s website made the following announcement concerning the accomplishment of the action:⁵

THE EXCHANGE OF BOOKS

THE ACTION OF THE EXCHANGE OF BOOKS ACCOMPLISHED

Approximately 6600 books were collected altogether. For more information, see our press-release.

According to the news: during the first day of the action 1922 books were collected whose authors are divided as following:

- 564 - Marinina
- 97 - Serova
- 92 - Polyakova
- 84 - Dashkova
- 48 - Doncova
- 21 - Marx
- 18 - Pelevin
- 998 - other authors who include, for example, such as Neznanskii, Karenyi and Malysheva.

February 6th at 2 pm in the information agency “Interfax” a press conference was held, devoted to the current action.

At the same time, [on February 6th] the action “The Exchange of Books” was restarted, to continue till Sunday, February 10th. The books may be exchanged for classical works [by approved authors].

The places of exchange, listed below, are open from 11a.m. till 6p.m.

MAIN PLACES OF THE EXCHANGE:

Monuments: A. S. Pushkin (metro station (ms) Pushkinskaya), AP Chekhov (ms. Okhotnyi ryad), K. Marx (ms. Teatralnaya), F.M. Dostoyevskii (ms Biblioteka im. Lenina).

Book stores: “Young Guard”.

CONDITIONS OF THE EXCHANGE:

1. Each person can exchange books, including the mentioned authors.
2. Each person can exchange any amount of books.
3. Books will be collected in any condition [...]
4. Only those books whose authors are listed below are accepted for exchange.
5. Each person has the right to complete the list of the exchange of contemporary writers only at the address Zemlyanoy Val 56/4, Moscow.
6. In your presence the given books will be labelled with the stamp “To be returned to the author” in order to prevent another exchange.

List of authors: Pelevin, Sorokin, Marx

- Footnotes: The list of authors has been compiled according to their social damage to our society and culture in general.
- The books of Pelevin will be exchanged with coefficient 2, i.e., for two books of Pelevin, one classic will be given.
- The works of Marx will be sent to the writer's homeland, Germany, to the town of Karl Marx Stadt.
- No exchange will be give for books not mentioned on the list, but we will accept them as a gift.
- Books given to us as gifts are not thereby assessed to be of low quality.

The essential point in this announcement is the combination of different discourses, or more precisely, “discursive practices” (see Fairclough 1992) that form part of a larger discourse type. This larger discourse type can be arguably recognized as official because of its informational content, its rather systematic arrangement (heading and subheading), its its relatively formal prose style.⁶ However, the topic semiotized in the announcement – the exchange of books – may also arouse a question about the seriousness or playfulness of the topic. From the western point of view, this sort of provocative action against writers is easily interpreted as an attack on freedom of speech. This interpretation also caused a crisis for the movement, and was partly responsible for the establishment of a new “official” youth movement by Kremlin authorities.⁷ However, relying on my points earlier, I would argue that this interpretation pays little attention to the hybrid features seen in the announcement of IV as well as to symbolic and semiotic practices, and struggles over these practices, in Russian society. Although the whole action of IV is clearly symbolic (including the exchange of concrete things in concrete places), it would be overly generalizing to see the symbolic dimension only as a reference to a particular dictatorship or to the hegemony of certain, canonized culture. This hegemony, indeed, is present in the announcement, but only as part of a larger discursive practice. For example, besides the aspects of playfulness,⁸ the account of individual choice is clearly highlighted in the part “the conditions of the exchange”, and in this light the action is actually constructed as “a matter of choice”. This discursive element has some point of contact, at least on the surface, with certain neo-liberal discourses of global dimensions (see Chouliaraki & Fairclough 1999). Moreover, the individual's choice to

dispense with certain literary works is compensated for by their receiving other books in exchange. In brief, the notion of “nationalistic pathos” may be justified – especially in the context of Russian history where freedom of expression has been heavily impugned – but the semiotic wholeness of this pathos is more complex than a straightforward, dictatorial imposition of particular or “approved” cultural values. Furthermore, this semiotic complexity – a mixture of various discourses – implies those aspects which are drawn together into the nation-building process by this pro-power, political youth movement. I next illustrate some concepts of this semiotic play in the Russian context.

*3. Styob as discursive practice:
The removal of the Estonian embassy*

Because of their close relationship to the political power (i.e., Kremlin), the basic tension which comes about in the case of IV and Nashi is related to their communicative role: they need to issue legitimation in at least two directions at the same time: to the political power and to the “common” youth. This point refers to my earlier notion of the importance of semiotic attractiveness for these movements. In the space of post-communism, more precisely in the case of nostalgia for the past,⁹ a certain rapport must be maintained with Soviet discursive tradition. However, it would be too simplistic to assume that formal and informal (or anti-formal) elements of the previous example by IV would work on a simple axis of “formal Soviet” and “informal post-Soviet” discursive practises; rather, these elements are complexly interconnected.

Mikhail Bakhtin (in Yurchak 2005: 250) points out that “men who composed the most unbridled parodies of sacred texts often sincerely accepted and served religion”. This statement is made in reference to his famous concept of carnivalesque parody in different cultures, such that features of carnival cannot be understood simply as a form of resistance to authoritative symbols, but also involve a feeling of affinity and warmth toward those authorities and symbols (ibid). This element is vividly present in the announcement of IV above, but as a discursive practice rather than merely a carnivalesque parody. In other words, the action of IV is not a carnival, but evidently a well planned, social and political action conducted by a semi-official youth movement that supports the official policy of the Kremlin.

In addition to the formal discourse of their actions, however, informal elements also played a key role. In this respect, the carnivalesque elements in the IV announcement come close to the concept of *styob* (Yurchak 2005), which is a special realisation of parody in Russian culture. *Styob* functions in broader array of contexts, literally as an everyday aesthetic of living. In Yurchak's words:

The aesthetic of *styob* was based on grotesque “overidentification” with the form of an authoritative symbol, to the point that it was impossible to tell whether the person supported that symbol or subverted it in a subtle ridicule. In the best examples of *styob* these two positions were merged into one, and the authors themselves did not draw a clear line between them. In addition to the act of overidentification with the symbol, the *styob* procedure involved a second act: the decontextualization of that symbol. (Yurchak 2005: 252, his italics)

Yurchak points out that the aesthetics of *styob* was not limited to esoteric artistic groups,¹⁰ but on the contrary became truly widespread among the last Soviet generation (people who lived their youth in the last decades of the Soviet Union). Nevertheless, we need to place reservations on that aesthetic as applied to pro-Putin youth organisations. Most importantly, the social context in which these youth movements act is no longer totally political, as was Soviet communism, but is rather one of post-communism. In other words, the movements themselves, as well as the political power they support, are not hegemonic actors in the Soviet sense; rather, they seemingly aim to be just actors among various other actors in the political field. Hence, although we can read the IV announcement above in terms of *styob* as defined by Yurchak, we can justifiably characterize IV as a promoter of Putin, who is not a common citizen, and certainly not a political dissident. Hence to read the whole “Exchange of Books” as a form of “subtle ridicule” is out of the question. It works, instead, as symbolic capital (semiotic commodities) in the communicative repertoires of pro-Putin youth organisations. Let us take an example from the successor of IV, the youth movement Nashi:

The removal of the building of the Estonian embassy decided

Federal Commissar of the movement “NASHI”, Vassili Yakemenko, announced the date of the removal of the headquarters of the Estonian

embassy in Moscow – 12.6.2007. As stated in the official announcement of the movement “NASHI”: According to the juridical framework, it is necessary to remove the embassy of fascist Estonia to another place, one that is more proper for it. (Opredelena data)

This announcement follows from the rally against Estonian embassy in Moscow in April-May 2007, due to the removal of the statue of the Bronze Soldier in Tallinn by Estonian authorities. In my view, hardly anyone really assumed that this announcement would be realized, i.e., that the Estonian embassy building would be actually removed.¹¹ Instead, this announcement perfectly shows the overidentification of the topic: highly formal discourse in the context of the Bronze Soldier, as a semiotic response to potential official announcements by the Estonian government and authorities concerning the removal of the statue; the announcement also exhibits a decontextualisation of this formality so as to apply it to the Estonian embassy building. In this light, I would argue that the real information of this announcement has more to do with its value in the social field of youth activity, than it does with the literary meaning of this message.

4. Conclusion

Both the IV “Exchange of Books” and Nashi’s announcement about the Estonian embassy illustrate the fact that the intense political implications of the actions and the language-use of these two pro-Putin youth organisations include many elements.¹² Moreover, it appears that the contradictory features in the language-use of IV and Nashi are not limited just to those groups, but are general discursive practices in post-communist Russia, which may be used in a variety of contexts. Ongoing nation-building processes in Russia – including nostalgia for the Soviet past as well as adoption of various western discourses – are not working as they might do in the west. In addition to the mix of pluralist values with authoritative elements (for example, in the Moral Codex), one may note various affective or “pathetic” elements that are connected with discourses of parody (for example, the use of *styob*). All this points to the variety of cultural values in the space of post-communist Russia. Hence, the language-use of the movements is not only based on their “pathetic” content, but also on their engagements with various, culturally recognizable forms which I call “semiotic commodities”.

It is likely that the value of these last is based more on their socio-cultural “image” and “sound” than on their strictly defined meanings.

Notes

1. The term carries pejorative associations related to the Russian pop star Detsla.
2. This is the generally used term for World War II in Russia. The term, established in the Soviet era, is strongly emphasized by Nashi, as well as other patriotic actors in contemporary Russia. For example, Nashi’s actions against Estonia due to the Bronze soldier issue is related to the sacred interpretation of this war as “great” and “patriotic”.
3. According to the web site, Publius Pundit was “founded in January, 2005, by Robert Mayer as a manifestation of a developing political ideology based on small-government libertarianism and liberal democracy as a means by which to improve the lives of everyone and end all major conflicts in the world.”
4. These terms refer to Pierre Bourdieu’s (1991) sociological theory according to which language-use is one, essential resource for multiple social distinctions as forms of symbolic capital in the social reality where individuals and groups live.
5. This announcement includes two drawings: scales loaded with books, showing that one book (seemingly a “good” classic) is clearly heavier than two books (seemingly “worthless” contemporary works); and a pile of books, of which one bears the text “Pelevin”. In addition to these, there are links to photographs of this action. See the original “Obmen knig”.
6. This aspect of officialdom is closely linked to the Soviet tradition of formality, especially its specific linguistic features as realizations of authority (see Yurchak 2005; Romanenko 2003; Gorham 2003; Guseynov 2004).
7. According to Tatyana Stanovaya (2005) The Democratic Antifascist Youth Movement – Nashi was established in early 2005 as the main youth organization supporting the political course of the Kremlin. The moment of establishment was not a coincidence. After the cultural-political rallies in 2002–2003 against some well known Russian writers, at the head of which was Vladimir Sorokin, the pro-Putin youth movement Idushchie Vmeste achieved almost the opposite effect for which they had hoped: the sale of Sorokin’s works skyrocketed, casting doubt on Idushchie Vmeste as a model of the official state youth movement. In late 2004 the leader of Idushchie Vmeste, Vassili Yakemenko, was called to the Kremlin in order re-establish a new, less marginal “political motivation system” for youth. This was necessary in order to motivate the majority of Russian youth to

- get behind the Kremlin's political course to block the "orange danger" in Russia. (See Stanovaya 2005; also, Savelyov 2006: 76–112.)
8. "Playfulness" refers to the interactions between "official-sounding" semiotic and discursive elements (arrangement, exact numeral listing, formal style) with topical and content elements: books instead of necessities, which were in short supply (food or gasoline, for instance); as another instance, the request to send the works of Karl Marx to Karl Marx Stadt is clearly sarcastic, as the town no longer exists.
 9. Nostalgia for the Soviet past is widespread in contemporary Russia; see, for example, Dubin 2001 and 2004; Gudkov 2002; Sabonis-Chafee 1999.
 10. Yurckak pays great attention to an esoteric group realizing various forms of *styob* in Leningrad in the 1980s (Yurchak 2005: 238–243).
 11. This announcement was dated May 1st. On June 12th, when the embassy building was scheduled to be removed, Nashi announced that although they had sent out various pleas for the removal of the embassy, it was still standing. (Pust stoit. Poka, <http://nashi.su/news/19015>)
 12. Schmid (2005) points out carnivalesque features in the rhetoric of Nashi, although his account strongly relies on an analogy between Nashi and Komsomol, the official youth organisation of the U.S.S.R.

Symbolic mediation and dialogical communication

1. The sign as a medium of communication

I would like to begin with a captivating expression which appeared in a Sunday School textbook (M. Wilson, Foreword to Young 1995): “Jesus was a good Christian boy who went to church every Sunday/” A very interesting aspect of this expression stems from an intertwined relationship between interpretation and representation. As one commentator has pointed out: first, “Christian” should be replaced with “Jewish”; second, “church” should be replaced with “synagogue”, and third, “Sunday” with “the Sabbath”. The disparate representation and interpretation of Jesus by the Sunday School textbook extend to the issue of representation and interpretation in daily cognitive activity.

Apparently, one purpose of the Sunday School text was not successfully transmitted to the commentator, insofar as there was a major discrepancy between representation and interpretation. This aspect involves a semiotic activity of interpretation for communication. The symbolic representational Sunday School textbook is a medium for communication between an utterer (intentional interpretant in Peirce’s term) committed to representing, and an interpreter (effectual interpretant in Peirce’s term) entitled to interpret. The Sunday School textbook functions as common interpretant, as something to be transmitted between the two.

According to Litzka (1996: 89), three formal conditions are prerequisites to communication based on Peirce’s definition of it: (1) There must be an utterer and an interpreter. (2) There must be something transmitted between utterer and interpreter. (3) What is transmitted between utterer and interpreter must be something which is capable of establishing “common interpretants” in both utterer and interpreter.

The last of those three – common interpretants – are actualized as symbolic cultural forms to be transmitted in communication (as in my paper). Based on Peirce's doctrine of sign, and focusing on symbol as a Third in connection with Vygotsky's cultural-historical theories, this paper focuses on two key concepts for communication, namely, symbolic mediation and dialogical interaction. This approach to communication has the merit of showing how meaning is generated by symbol-mediated interpretative activity. In this activity, interpretation and representation are considered as one act of communication, and compound act of interpreting and representing is a purpose-driven activity for constructing a symbol-mediated representational system. Interpreter and utterer interact indirectly by symbolic mediation in order to transmit cultural ideas and concepts.

2. *Vygotsky's psychology meets Peirce's semiotics*

2.1. Why sign?: Mediation

Many Vygotsky scholars agree that this his cultural-historical theory of psychology is quite non-traditional. One scholar in particular, D. B. El'konin, has connected human consciousness with signs, and realized Vygotsky's contributions in this area. He writes:

The primary forms of those structures of human consciousness that are the repositories of feelings and meaning exist objectively external to each individual: they exist in human society in the form of works of art, or in some other material creations of people, i.e., these forms exist prior to the individual or subjective structures of feeling and meaning.... I call this a non-classical approach to psychology.... One can truly understand and evaluate Vygotsky's genuine contribution to the formation and development of the problems associated with the role of sign and symbol systems in the genesis of human consciousness (and with the definition of the content and functions of operations with signs in this process only if one fully appreciates what, precisely, this psychology entails). (El'konin 2002: 10)

The quote claims that Vygotsky's cultural-historical theory is necessarily involved in signs for mediation. This leads to the idea that human consciousness requires a Third to mediate between subject and object.

For Peirce as a semiotician, consciousness is also a great subject in his phenomenology, in which three categories of consciousness are based on

the ideas of First, Second, and Third. The ideas also connect consciousness with his doctrine of Sign based on the three types: Icon, Index, and Symbol.

Perhaps both Vygotsky and Peirce consider the concept of mediation in their attempts to objectify and explain subjective psychological phenomena as taking place by virtue of mediation of signs. The semiotic “self” may be explained in terms of cultural-historical psychology.

2.2. Why activity? – Thirdness

Vygotsky’s cultural-historical thought opened the way to activity theory, though Vygotsky himself did not develop one. Nevertheless, according to his views on the psyche as a methodological unit, activity plays a major role in higher psychological processes. The psyche and action are fused one with the other by mediation of a Third.

Both Peirce and Vygotsky used the concept of a Third as mediation or process. Coincidentally, both thinkers used “giving” to illustrate their ideas. First, Peirce:

... you will convince yourself thoroughly that every genuine triadic relation involves thought or *meaning*. Take, for example, the relation of *giving*. *A gives B to C*. This does not consist in *A*’s throwing *B* away and its accidentally hitting *C*, like the date-stone, which hit the Jinnee in the eye. If that were all, it would not be a genuine triadic relation, but merely one dyadic relation followed by another. (Peirce 1956: 92)

Peirce described the Third as thought or meaning. For him, a Symbol is also a Third. According to Peirce’s description, a symbol as thought mediates between indexical signs and iconic signs. In my view, the Third is actualized in Symbol or symbolic forms in relation to two types of sign, Icon and Index in cultural contexts. The Symbol, as a Third, involves an iconic-indexical relation on the surface structure.

The example of a relation of giving is similarly interpreted by El’konin, who places emphasis on the function of the sign as a modeling system in society, stressing the sign’s social nature. Interpreting Vygotsky’s sign, El’konin writes:

The sign is a kind of gift. A gift serves as a reminder of the giver. That is why a sign is social, and that is why it organizes behavior. A sign has the same

sense and meaning in the history of culture (ritual, myth, and even religion)... (None of the examples that he [Vygotsky] gave in connection with the problem of the organization of behavior is interpreted and understood in this way at all!). (El'konin 2002: 11)

The idea of “gift” as a metaphor of sign is remarkably helpful for understanding both a genuine triadic relation in Peirce’s sign theory and a sign’s third-character in modeling human behavior in Vygotsky’s cultural-historical approach. Moreover, it is notable that the Third may be understood as both a process and a purpose. This brings us to the topic of “activity”.

3. Features symbol-mediated interpretative activity

Two important aspects of activity theory are mediation and the study of consciousness through psychological processes. Based on these two, I have a model of symbol-mediated interpretative activity (SMIA). In this activity, we can observe psychological processes by virtue of the Peircean Symbol. The Symbol as a Third, in my definition, functions firstly as mediator between two opposing entities, Icon and Index; secondly, it serves as an interpretant through which the human interpreting agent becomes embodied in the semiotic structure as, for instance, the expressive self, virtual self, and concrete self with respect to the Symbol, Icon, and Index. As Peirce states: “Every symbol must have organically attached to it, its Indices of Reaction and its Icons of Qualities” (CP 5.119); a Symbol entails Index, and Index entails Icon. The expressive self, as a Third, mediates between the virtual self and the concrete self in the interpreting mind, and the symbolic cultural text, as a Third, mediates between utterer and interpreter.

In the SMIA, psychological process within semiotic structures is important, enabling dialogical processes between two selves or two minds, positioned as the virtual self and the concrete self, or utterer and interpreter, interacting on the surface level through psychological interactions so as to internalize the process at a deeper level through intrapsychological interaction in the course of communication. In this sense, a process of outer and inner activity comes to determine the ultimate goal of symbol-mediated interpreting activity, which appears as transformations of culture and the individual.

4. Features of dialogical interaction

4.1. Interpsychological dialogue: In the case of 2 and 3

Basically, Peirce's semiotics is described as the dialogical in a relational structure. Applying the dialoguing situation of the Peircean semiotic, it is understood that the utterer communicates cultural concepts to the interpreter by virtue of sign. In an interpreting community, utterer and interpreter cooperate so as to construct common knowledge in the process of interpreting activity. Otherwise, successful communication would not be feasible.

This aspect becomes clear when we see dialogical interaction between an adult, as the social self, and a child, as individual self, in the activity of learning. According to Vygotsky, in the development of a child's concepts, there is a genetic line of cultural development which transits from the interpsychological plane to the intrapsychological plane (Vygotsky 1986: chapters 5 and 6). The trajectory of this process is shown in Figure 1, where the child is positioned in 3 and the adult is in 2 at the outset; however, as dialogical process proceeds, the child constructs capacities so as to take the place of 2, by representing what he received on his own.

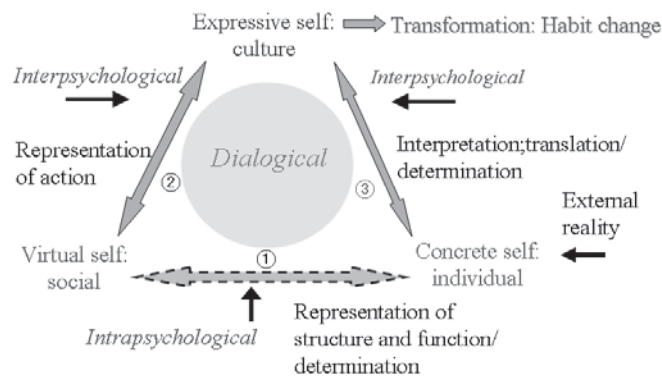

Figure 1. Dialogical interaction in interpreting mind.

4.2. Intrapsychological dialogue: The case of 1

This type of dialogue takes place between one and the self, taking a form of inner activity for internalizing outer activity. For example, the child inter-

nalizes the learning activity by virtue of internalized dialogical interaction between the social self and the individual self.

4.3. Cultural-historical psychology of dialogue: The case of 1 and $2 + 3$

Based on Lotman's asymmetrical dialogical mechanism, I will attempt to describe interpsychological dialogue on the cultural level according to two types. Interaction between the social self and the expressive self is placed in the central position, (2), where it assumes the role of utterer in the communication and interaction between the expressive self and the individual self. By contrast, 3 is situated on the periphery, taking the role of interpreter in communication. However, the roles are not fixed, but dynamic in semiotic space.

The change of role is affected by a deep structure in which interaction between the social and the individual (1) is based on a causal relationship. That is, the social self appears as effect, and the individual self appears as cause.¹ This causal relation of a deep structure on the temporal dimension affects the expressive self on a spatial dimension of culture. At this point, historical factors from remote contexts play a role, being suffused with cultural aspects from contemporary contexts in the expressive self.

In addition, the concrete self, which is situated in an actuality of Secondness, provides a source of determination in two ways. First, the concrete self determines the virtual self by causality in the historical dimension; second, the concrete self determines the expressive self, in the cultural dimension, by its "presentational immediacy" (Sherburne 1966). All these dialogical characteristics of interaction contribute to communication in an interpreting community, aiming to function as symbolic forms in cultural mediation, and connecting culture and the self. More importantly, the role and function of the interpreting subject as the concrete self serve to determine a cultural system.

5. On the goal of an interpreting community as it pertains to cultural development

In communication, utterer and interpreter are united in a cultural form that Peirce called the "cominterpretant". The very term implies a dialogical

situation; however, this does not necessarily suggest “communality”, since no actors or agents are involved in the functioning of autonomous roles. If it precludes the trait of culture as a dynamic and heterogeneous force (see Lotman 1990 and Randviir 2004), then the notion of cominterpretant as ultimate goal of communication in a discourse community cannot adequately describe the aims of that community’s semiotic activity.

To avoid the cominterpretant lapsing into nominalism, it is essential to bring in interpreting agents: the utterer and interpreter, which function in dynamic cultural texts. Pertaining to cultural identity, actors execute or perform a goal-directed activity in the semiotic structure. The way I see the culture as having an identity requires acting bodies, namely, an utterer and an interpreter. Put differently, interpreter’s determination should function in the individual, personal domain from which subjective determination arises.

An organism’s subjective determination in the real world is intertwined with objective determinations in a sign system, which means that, without social consciousness, it would not be possible for a human organism to have cognitive ability. Therefore, an interpreting community, composed of objective and subjective determinations, tends to unify the whole community in a dynamic way. This occurs precisely through the Symbol’s ability to reconcile opposing entities on the surface level.

From this perspective, the symbolic structure of form and reference is analogous with indexical reference in a proper name, where a name does not have a nominalistic feature since the name-bearer exists in actuality. In actual existence, the proper name functions as Symbol and thus models, in the most felicitous way, the person who bears the name.

Symbolically speaking, the objective of an interpreting community is to keep the proper name in the right place. Eventually, the resultant phenomena will be seen in cultural modeling in an interpreting community where culture and individual develop in a dialectic way through interpreting activity.

Note

1. Whitehead’s notion of symbolic reference has two pure modes of perception: presentational immediacy and causal efficacy. In my argument, it is related to two directions of determination of the concrete self: determin-

ing the virtual self on causal efficacy and determining the expressive self on presentational immediacy (see Whitehead 1927; Sherburne 1966).

Otto Lehto

Humanism, existentialism, semiotics

1. Humanism and history

Why humanism, still/again? The very same question was asked – not for the first time, nor for the last – by Sartre, in a rhetorical mood, in his 1946 landmark treatise, *L'existentialisme est un humanisme*, a work which propounded many of the topics and doctrines that were to become the core of the new French existentialist movement in philosophy and literature. In differentiating “his” philosophy from the other humanist traditions of the time – from those allied with it, like Marxism, to those hostile to it, like Christianity – he chose to define “existentialist” humanism as radically distinct from “essentialist” or “classical” humanism (basically everything pre-Sartre or pre-Existentialism). Humanism he defined as “une theorie qui prend *l'homme comme fin* et comme valeur supérieure” (1970: 91, my emphasis). In his reading of history, this pre-existentialist humanism of his forebears, as represented by Enlightenment’s offspring, unduly emphasized such things as “human nature”, “human rights” (god-given or natural) and social law-likeness – all essentialist, anti-individualistic theories of the human condition. Existentialism wanted to strip away the last vestiges of any essentialist salvaging of the absoluteness of Man’s condition: “l’homme est libre, l’homme est liberté” (36–37); “Nous sommes seuls, sans excuses ... l’homme est condamné à être libre” (37). Instead of history or the social condition being the sculptor of man, it is *man himself* who is the author of his own destiny and of the course of history. Under the subsection “l’homme invente l’homme”, he quotes the poet Francis Ponge: “l’homme est avenir de l’homme” (38), to which Sartre adds: “C’est parfaitement exact” (ibid.).

This “becoming” (cf. Nietzsche), this “liberty” (cf. Liberalism), this “end-in-itself”, this “condition of no excuse”; all this is Man. Following

the Protagorean maxim of “man is the measure of all things”, the existential subject (without essence) makes (without compulsion) an act (without hesitation) that defines him as Man; “[L]’existence précède l’essence” (1970: 17).

Like humanism, he divides existentialism itself into two “schools”: the theological or “Christian” school (K. Jaspers, G. Marcel) on the one hand, and the “atheist” camp on the other, exemplified by “Heidegger, et aussi les existentialistes français et moi-même” (1970: 17). This is an oversimplification; what about the theological training of the “atheist” Heidegger, for example? At any rate, the passage – “Heidegger, et aussi ...” – clearly pinpoints the importance of the German thinker at the root of existentialism. Indeed, a humanistic rendering, or interpretation, of Heideggerian philosophy is found, most perceptibly, in Sartre’s *L’être et le néant*, at the basis of whose “phenomenological ontology” is Sartre’s reading and re-reading of *Sein und Zeit* (and Husserl); more on Heidegger later. Sartre himself, a devout non-believer, professes an atheism close to Secular Christianity, not only in utilizing the language of “fallenness”, “bad faith” and “existential Angst” (via Heidegger) and by relying on Kierkegaard and others, but also in Sartre’s re-appropriation of the epistemology and ontology of the transcendental subject: “Il n’y a pas d’autre univers qu’un univers humain, l’univers de la subjectivité humaine. *Cette liaison de la transcendance, comme constitutive de l’homme ... et de la subjectivité ... [C]’est ce que nous appelons l’humanisme existentialiste*” (1970: 93, my emphasis). This “univers humain” is the Humanist Weltanschauung. The humanity of *homo humanus*. “Transcendence”, too, is just another name for Existence. Incidentally, this more or less “Christian” hermeneutic of *existential transcendence*, utilized by Kierkegaard, Dostoyevsky, Jaspers and Ricoeur, finds its way ultimately to Tarasti (2000), who emphasizes transcendence as the movement of Dasein’s self-negation and self-affirmation. Now, while Sartre’s atheism is rather theistic and his existentialism is rather essentialistic, his humanism, too, is rather anti-humanistic, in the vein of Nietzsche and Heidegger; his Marxism, however, is authentically Marxist – as authentic as his failure to critically *overcome* humanism’s promises, programmes and pogroms (cf. Stalin and Mao’s “humanist” statesmanship).

So, this Sartre-inspired “existentialist-humanist” post-war Zeitgeist formed loose alliances and sympathetic relations with such traditions as Classical Liberalism, Marxism (later: Maoism), Anarchism, Libertinism

and, yes, even Christianity. For example, Dostoyevsky, whose Christianity is only eclipsed by his Pessimism, is quoted by Sartre: “‘Si deux n’existait pas, tout serait permis.’ C’est là le point de départ de l’existentialisme. En effet, tout *est* permis ...” (1970: 36, my emphasis). But if everything is permitted, what *must* be done? In an ambiguous irony he failed to articulate, Sartre emphasized the (objective) necessity for a Socialist solution – a total revolution – and a clear commitment (“free” and “subjective” as much as “necessary”) to its cause. He thus tried to reconcile the seemingly incompatible “facts” of 1) absolute human freedom and 2) class struggle; this process of dialogue and interchange is crucial to understanding Sartre’s life’s work, its failures and successes. Ultimately, in lived life, Sartre’s “existence” entailed a modern, nihilist “essence”: “an essence-*less* essence”. This new human essence was free, empty and absolute.

We have seen that existentialism relates to, and is in dialogue with, other “Humanisms” of our time, both Spiritual and Materialistic. Sartre craftily synergized Marxism, Existentialism, Modernism & Christianity; a historical alliance of Humanist traditions in a new philosophy of man’s ethical self-empowerment through “authentic” actions & “free” choices. In the end, in his failure to clearly delineate and explicate Humanism as an ideology, a historical tradition and “an attitude”, Sartre’s analysis of Humanism forces him to conclude, in an honest admission of faithfulness and subscription to a doctrine, that “tout le monde est humaniste” (1970: 118); this includes the Liberals, the Christians, the Marxists, the Capitalists, the Artists, the Scientists, the Politicians ... *and* the Existentialists – whom Sartre has already, by now, branded as followers of “l’humanisme existentialiste” (1970: 93), a universal doctrine of liberty. “Tout le monde”: the humanistic worldliness of homo *humanus* as homo *universalis*. (Hu) man(ism)=world(wide).

Humanism is the theory that man is an end in itself, for itself and through itself.

With this in mind, how are we to situate Sartre’s, or Jaspers’, or Kierkegaard’s existentialist humanism in the history of humanism as such? I would propose that we need to understand Sartre’s “break” with classical humanism as just another phase or facet of the slow unfolding of the historical understanding of man as *homo humanus*, exemplified by the classical authors of philosophy and tragedy, the Renaissance visionaries, artists and inventors, the Enlightenment poets and politicizers, the Modern

philosophers of exactitude and progress and the countless other self-made men whose ideals and value reflected man's "essence-less essence" as "free becoming" towards a cosmopolitan, humanitarian and humane social order of humanity.

2. *Humanism, existentialism, semiotics*

We have seen that Sartre's ("humanist-existentialist") transcendental subject, free and absolute, exists in a world of human action, supported by man's neo-humanist "essenceless essence" as the semiotic Umwelt's ethical and social "beginning" (ground) as well as its "end" (meaning). There are no values but those we assign to things as signs. This very same process of semiosis, enacted by the ethical-epistemological transcendental subject, is ascribed by Heidegger (1991) already to Leibniz, in whose rationalism it is the (rational) "humans who determine objects as objects by way of a representation that judges" (118–119). This he relates to "the principle of reason ... *nihil [est] sine ratione*" (118), i.e. Leibniz's "*principium reddendae rationis sufficiens*" (ibid.). Although pre-semiotic, we are able to render this in terms of sign theory. A form of the idea that "*omnes ens habet rationem*" (117) and that "*nihil fit sine causa*" (ibid.) grounds semiotics as "science". Signs, as representations and judgements, belong to the subject-object metaphysics of calculative reason, even in attempting to overcome or supersede this very tradition. Semiotics, you see, *is also a humanism*.

We may now expand our Sartrean-Humanist presupposition, or doctrine, Man=World, into a wider ontological framework: Man = World = Language = Being. Heidegger's anti-Sartrean treatise, *Über den Humanismus* (written in 1949), denies the French claim that existentialism is (or *should* be) a humanism, an ideology which, for him, appears as a Roman interpretation, or loan, of Greek *παιδεία* (see also, Sarsila 1998: 204); "In Rom begegnen wir dem ersten Humanismus" (Heidegger 1975: 11). Extolling "eruditio et institutio in bonas artes," the virtues of the Republic, "homo humanus setzt sich dem homo barbarus entgegen" (10). The Renaissance was a "renascentia romanitatis", and consequently of "humanitas" and "*παιδεία*" (11). Opposing the Dark Ages and Scholasticism, Renaissance itself was subject to the opposition between *homo humanus* and *homo barbarus*.

To understand Heidegger, understand Language: “Die Sprache ist das Haus des Seins. In ihrer behausung wohnt der Mensch” (1975: 5). For Heidegger, Being is the ontological question; Truth is found in/as the horizon of Being’s self-revealing; Language is the “House of Being” and as such as a medium, a (“the”) locus, for Being’s self-revealing; Man “exists”, authentically and transcendently, in this horizon of Being’s self-revelation as Truth. This process is linguistically mediated, or rather propagated or *illuminated* (in the *Schein* of *Erscheinung*). This *im*-mediate connection between Man and World, Truth and Being, is perhaps conducive to an anti-semiotic reading (“our” field being so heavily dependent on mediation), but we should remember the connection between language and semiosis: In understanding, not language in a limited sense (e.g. German, or poetic diction), but language as a system of man’s semiotic structuring in the horizon of Being’s truthful self-revelatory opening, we come closer to (re-)framing the process of Semiosis *as that which mediates and as such establishes an abiding presence*, an abode, for (a framework) of Being. The semiotic relationship, between subject and object, between a thing and the awareness of it, is established *in* language, *via* language, *as* language (here defined as any representational system of signs). Man’s existential role is in the ethical-aesthetical locus of assigning, acting out and re-assessing such representationalist connections and frameworks. For a semiotician, act is always based on semiotic interpretation; consequently, as in Sartrean “literary” existentialism, a “semiotic” existentialism presupposes an acting subject, always-already *transcendentally abiding in semiosis*. This, I venture to say, is implicitly presupposed by most semioticians whenever they utilize the traditional frameworks of representation, relation (dyadic/triadic), the subject-object dichotomy, human interpretation and so on. Furthermore, in emphasising the role of the observer (who is seen as “critical”, “active”, “free”...), the semiotic orthodoxy is in line with humanist orthodoxy.

Even the greatest “heresies” of humanism – masquerading as anti-humanisms – such as Positivism, Fascism and Post-Structuralism, retained some versions of the myth-structure of *homo humanus* (positivism its “irrefutable fact” and “irreducible event”; fascism its “heroic individual”; post-structuralist theory its “liberation of desire” etc.). As for the dominant and “accepted” forces of Western civilization, the uniformity is all the more breath-taking; the Humanist Brotherhood – an organization into which we are born – shares, protects and nurtures notions of progress,

human rights, freedom, technological development (on the “Right”), community life (on the “Left”), human potential, personal achievement, universal education, spiritual fulfilment and so on. Life, today, becomes the fulfilment of the dream and promise of the ennobling of Man, in/as/via Man’s humanistic world-building. I do not intend to say that our whole Civilization is a “sham”; no, we are born into it, we enrich it, and we are enriched by it; but, in the same token, the Western project, one of whose main branches is the Humanist tradition, has to be seen as a *particular* semiotic system and edifice, one with its own unquestioned assumptions and metaphysical drives, structures and programmes. Our Faith in it, perhaps, *is* “Fate”; yet, faith-in-Reason (or Progress etc.) or the so-called “reasonable faith” of Common Sense is no substitute for *the absolute freedom* of the “essence-less essence” that Man as the opening of Truth *is*. In our effort to become a project of Reason/Progress/Humanity/Civilization, we trade off perhaps something (essential) of the (existential) human nature, to the detriment of our *own* equilibrium and of Life on planet Earth.

Existence precedes Essence; Presence precedes History (i.e. Present the Past); Semiosis precedes Structure. The unquestionable need to appropriate the concept of “freedom”, however problematic it may be, lies in the fact that *we have none*. The Humanism of the Tradition holds but the *promise* of Freedom. Freedom *from* what? Freedom *of* what? Freedom of existence, truth, beauty, life, action, belief, thought, expression, representation, work, play, experience ... But also freedom *from* other kinds of experiences, truths, forms of beauty etc. This double-edged promise is “structurally managed” and “essentially manifest” (i.e. existentially absent); we need to be able to *free ourselves even of this (promised-conditioned-absent) “freedom”*. The criticism of Humanist Metaphysics does not work “against” Humanism but above and beyond it. Humanist freedom is simply too limited – but also it’s just one possibility among many. The very best of humanism is also the very worst of humanism; the very best of *humanity* is also the very worst of humanity. Riches bring sorrow, knowledge ignorance and progress stagnation ... Even without accepting Heidegger’s fatalistic notion of “Seinsgeschichte”, History of Being, we can now venture to look at some persistent Humanist fantasies and question their justification and future.

3. *The crisis of science – The crisis of humanism*

A major confusion threatens to persist with the distinction made between the so-called Sciences and Humanities. This might lead one to suspect (“hard”) Science of being anti-humanist. And, indeed, the main trends in Science today are certainly materialistic (strictly speaking *a-humanist* or *non-humanist*) when not “trans”-humanist. But science, as an enterprise of power and knowledge, asks the question of “Man” as an end-in-itself (the subjective position of the observer) and interrogates nature (Bacon: “rapes” Her) in search of her secrets (the objective position of the observed). Science investigates man, *for* man, in the service of humanity, progress and civilization. Knowing this, and the crisis of modern science and the “modern way of life”, one might want to look for the humanities, with their reflective and ennobling progressivist discourse, for an answer. But the so-called “humanities” are, too, what Feyerabend called “special interest groups” (1987: 91) in the struggle for funding and legitimacy, tied up in their role as enterprises for the humanistic science of modernity. Furthermore, what monstrous, naïvely construed wall separates “semiosis of the mind” (Humanities) from “semiosis of matter and *tekhne*” (Science)? Whatever the reason for that edifice of mutual rejection, the gaping *hole* in that wall – the uniting belief-system between the Letters and the Crafts – is the belief in Progress-as-such, Freedom-as-such and Humanity-as-such.

Beliefs and trends may come and go, but the undying eternal flame of these humanist principles illuminates our nocturnal voyages into the unknown – and isn’t it Leonardo da Vinci himself holding our hands in the dark? With Pico della Mirandola sharing hands with Kant and Voltaire in a resonant chant of “freedom for all and let no man be a slave to no-one but himself” ...

Yet, when all is said, I cannot but agree wholeheartedly with the sentiment expressed in Feyerabend’s exasperation, which I will thus appropriate as a sentiment, statement of my own: “[The] difficulties and debates I have just mentioned shrink into insignificance when compared with the *steady expansion of Western civilization* into all areas of the world.” (1987: 120, my emphasis) His criticism is against “Reason and ... Objectivity” (5); he still supports a kind of relativistic humanism. The effects of mono-culture, largely driven by a banalized form of humanist libertinism in defence of the “progress” and “liberation” of Man, are visible in the world around

us as well as in the world hidden from us. Genocidal wars, atom bombs, bureaucracy, stress, cancer, pollution, global warming; the problems of/in/by Western civilization are clear. Twentieth century environmental catastrophes of global magnitude manifest spiritual decay of unprecedented proportions. What has become of Man's self-empowerment? A massive, endless orgy of conspicuous consumption? Yet focusing on the negative isn't *accurate* enough; we still have – *because this is what we want* – authentic beauty, truth, love, power and achievement – but to what end? If the end is man, then the end of man may be near. What has become of alternative worldviews and realities? What has become of the shamanistic, mystical and spiritual traditions of ancient cultures? What has become of deep self-knowing? What of man's ability to intuit and sense world's endless array of wonders? What of our ability, in Blake's immortal rhymes, "to see a world in a grain of sand / and a heaven in a wild flower / hold infinity in the palm of your hand / and eternity in an hour"? Not only what *has* become, but what *will* become: what is the future of humanity, above and beyond humanism?

In seeing the modern condition, with its many related "issues" – not as something to be "saved by" Humanism but as something largely *created* by it, we may liberate ourselves from the mono-cultural illusions of the status quo and overcome the distinctions between the Arts and the Sciences. Wasn't this, already, the point of Renaissance Humanism – to liberate man from the particular into the lure and majesty of the universal? Humanism, despite its problems, remains an important tool and ally of the emerging new framework of consciousness. In combatting death, misery, war, oppression, boredom and the tyranny of banal randomness, humanism *has* a role, but its status, at best, is that of an ally, not a conductor or a dictator. Humans *are* significant and fundamental: But, what exactly – in saying this – do we expect (and treat as if it) *isn't*? Juhani Sarsila, too, has aptly characterized the humanist orthodoxy: "Humanists are pluralists. Nothing gets under their skin (and they cause everybody problems). They were instrumental in setting up the framework of empirical science, which has led humankind on the edge of a precipice. We need to be vocal about this; humanists themselves are silent about their inconvenient history" (1998: 204, my translation). The movement away from humanism, for me, means a movement towards existential semiosis and the life sciences. For others it might mean other directions and avenues. The important thing is to *allow*

ourselves this leap and this freedom. Our existential condition is one of regaining our ground as thinking, feeling, acting, free beings in a universe rich in interlocking semiotic systems. Humanism is, of course, a synthesis, but one that cannot see(k) beyond itself.

Among scholars who have come to question the viability of the current trends of Western metaphysics we have, too, analytical philosophers like Georg Henrik von Wright, Wittgenstein's successor at the University of Cambridge, who turned in his later years (1970's on) to a reappraisal of the technological-scientific enterprise of "Progress". He embraced "Humanism" as the solution. This, in my mind, is not enough; the fundamental problem is *not* "Science", nor even "Humanism", but the underlying epistemology of subject-object metaphysics. Toulmin (1990), too, fails to go beyond humanism in his otherwise brutally accurate depiction of Cartesian modernity. Neither nostalgia, nor more deconstruction, is needed, but new metaphysics! David Bohm (1980), the quantum physicist, has written on the ways in which "Western" science can enter into dialogue with "Eastern" modes of thought, against "fragmentation". On the issue of the possibility of intercultural context, consult Fritjof Capra's *Tao of Physics* and the works of Alan Watts, Gregory Bateson, Jiddu Krishnamurti, Robert Anton Wilson, Terence McKenna and Carl Jung.

As Heidegger put it: "Does the ... determination that humans are the *animal rationale* exhaust the essence of humanity? Does the last word that can be said about being run thus: being means ground/reason? ... That is the question. It is the world-question of thinking. Answering this question decides what will become of the earth and of *human existence* on this earth" (1991: 129, my emphasis). This interconnection between "earth" and "human existence" is, as always, at the crux of the matter, and both the problem and the salvation of our metaphysical conundrum. We must learn to experience our own *conditio humana* and Heidegger's "Angst", Marx's "alienation", Sartre "nausea", Bohm's "fragmentation", Kafka's "bureaucracy" and Feyerabend's "hegemony of Reason" as side-effects of the experiences created by our existential condition as rational, free, thinking animals. Our Dasein exists for humanity. The "existentialism" of "semiotics" must learn to deal with its Humanist legacy as *a beautiful burden*. Only then will the radical freedom promised (*pro-missus*: "sent forward") to us become actual, true and real; only then will Renaissance spirit envelop anew our conscious being by its purifying-illuminating *Aufklärung*, god in human form.

Sara Lenninger

In search of differentiations in the development of a picture sign

1. Introduction

The differentiation between expression and content is fundamental to the concept of sign. Even if notions of signs are often revised, due partly to the attraction of a semiotic approach from markedly disparate objects of study, a common apprehension of the distinctive character of meanings by sign is its dual nature (Saussure 1968; Piaget 1951, 1966; Vygotsky 1999; Sigel 1978; DeLoache 2000). Signs can be understood as objects of meanings, to someone, which also extend their perceptual expressions or sensations. All signs imply sign processes; the sign function is due to a mental capability or inclination in the sign user. But meaning is not equivalent to sign function, and it is an important issue in the study of semiotics to investigate the differences and conditions between meanings that are due to sign relations and meanings that are not (Sonesson). To study the development of a sign function in the child does not only tell us something about child development, but also about signs.

To understand pictures involves mastering sign relations. From my studies of how child becomes sign-minded, and particularly how he or she learns to understand pictures, it has become clear that the differentiation between expression and content is too broad of an outline to be informative. In the perspective of child development, the generic distinction between expression and content in the mature sign needs more specific distinctions to capture the emergence of such a delicate cognitive competence as the ability to master sign functions.

2. *How to study the development of signs?*

At birth, the child is not endowed with the capacity to use signs, but it will learn. Within a Piagetian theory, this cognitive growth is explained in terms of epigenetic, constructive, development, while Vygotskian tradition stresses socially driven mechanisms. Both traditions relate mental processes to the generative constructions of systems that sustain development, i.e., to culture or to the individual interacting with its environment (Wozniak 1996). The development of the picture sign in the child is, like all sign use, related to the emergences of several cognitive and social competences. The apparent obviousness to the adult that the picture is *about* the depicted scene must not be taken for granted in the child. To understand pictures presupposes, but is not equivalent to, identifying depicted objects.

My standpoint is that picture comprehension is a semiotic function, or one of its appearances in behaviour in a Piagetian sense (Piaget 1966: 42). Yet, Piaget does not list picture comprehension among the five manifestations of semiotic function. Drawing is one of them, and is of course related to picture comprehension, not identical with it. Perhaps even Piaget took the understanding of pictures too much for granted. While he argues for a stage related development of the mind, others (Liben 1999) argue for sequential processes and reduce the importance of demarcating thresholds, but maintain the assumption of a general succession of mental competences. Which, then, are the decisive faculties to make the individual sign-minded in general, and for picture understanding in particular? This is an open field for investigation. As noted above, I have become convinced that referring to the ability to differentiate the expression and content in a sign relation, based on a semiotic apprehension of the mature sign, too broad a differentiation to be informative in studying the development of sign function in the child. I think it more feasible to investigate the development of sign function on a general level in terms of its lines of development in the different appearances of its manifestations; for example, in pictures, gestures and language. General outlines may be found within variations of emergent sign functions and with a Vygotskian insight: one also has to consider the means as crucial for the cultural line of cognitive development. This, I argue, opens the way for a theory that draws up implications for development of different streams of thought grounded on different

resources for meaning, that is, different systems of signs affording different structures for streams of thought (Lenninger in press).

At this time I will briefly discern three or four basic differentiations on a general level of developing signs. I do not take it as implausible that the sequences, if there are such or perhaps relations between differentiations, vary in their developmental lines between different semiotic resources, since different semiotic resources afford different constraints on the level of differentiation. One also has to take into account cultural and individual differences. The general differentiations are, in brief, (1) to make a rudimentary differentiation between expression and content (i.e. between related objects); (2) to differentiate a self; and (3) to differentiate the relation of signification. A fourth differentiation that the child has to discern might be to differentiate some categories (objects or events) as superior tools in social interaction. If this be a fourth differentiation in ontogeny it would antedate the differentiation of relation. My belief is that you can find support for these differentiations as not yet “merged”, in studies on the child becoming sign-minded (Piaget 1951; Robinson 1994; Liben 1999). Since sign use primarily is a cognitive-social-ecological project and only secondarily a formal one, I presume three general circumstances for developing sign functions in the child: (1) the child is born into a sign-using social environment but is not yet taking part in it (Vygotsky 1999; Reed 1996); (2) adults introduce the child to the social universe of signs (Vygotsky 1999; Colapietro 1989); (3) the child may be predisposed to social interaction of a special kind (Tomasello 1999; Colapietro 1989).

With these rough differentiations and considerations in mind, I will now return to the investigation of an early picture-understanding. At the 9th IASS conference in Helsinki I tried to stress the complexity of picture-understanding in the child and to point out some indications of different levels of differentiation in the growing child.

3. Retrieval tests, using the picture as guide for action

Since the late 1980s Judy DeLoache has made empirical studies on young children becoming sign users. In a series of retrieval tests she has argued for a rapid change in the ability of children between 2.5 and 3 years of age to use “symbols” (i.e. signs) as guides for action (DeLoache 2004, 1999, 1994, 1987). These findings confirm the idea of a cognitive change as a semiotic

function. My studies have been highly influenced by hers, but I have introduced some decisive variations in the paradigm. My aim is not to argue against DeLoache's assumption of a rapid change in picture-understanding, but to distinguish specific differentiations involved in the latter, and to avoid ambiguity in sign relations within the test proceedings. Next, I present the method of the test in my version, followed by a discussion of some of my observations.

3.1 Method

The children in the test are between 24 and 36 months old, both sexes. Only photographic pictures are used. The test is performed at primary school by an experimenter, with assistance from preschool teachers (or from parents if requested). The supporting adult was informed not to intervene in the test. The test, which in all takes about 20–25 minutes, includes a warm-up phase comprised of match-to-sample tests. On the one hand, the warm-up phase is intended to direct the child's attention to the pictures, and on the other hand, to provide the test with bases of comparison between different levels of basic (or proto) picture-understanding, with or without the necessity of using true sign relations. The warm-up phase is composed of a matching-to-sample trial in an object to picture condition (OP), followed by a recognition task in a picture to picture condition (PP). In matching-to-sample test (OP) the child should choose one out of three pictures, photographs 4x7 cm, matching one object (such as a toy) no larger than 20 cm. in size.

The main test is a retrieval test: the child is asked to retrieve a toy after having seen it depicted at a place well known to the child but not in immediate sight. The target toy, on the other hand, is only known to the child by its pictorial representation. Every child has three warm-up matching-to-samples and four retrieval trials with different locations and different target toys. All retrieval trials are introduced by the picture to picture question (PP) (warm-up part two), "Can you see if this cuddly toy shown in this picture [handing over a picture, 4x7 cm, of a specific toy only, to the child] is also shown in this other picture? [handing over the picture, 11x15 cm, showing the target in context] Point at it!" In the succeeding test the child is told that the cuddly toy "is placed by me at the same place in the nursery school as you can see it in the picture" and "The cuddly toy is at

the same place in the room as you can see it in the picture. Can you go and get it for me?”

Prompting: in the matching-to-sample test (OP), if the child points out the wrong picture, the child is asked a second time, something like “do you really think that this picture shows that thing?” and the correct choice is confirmed. If the child needs help with the PP recognition, the experimenter points to the target toy in the context picture and asks the child a second time. The prompting in the main test goes in three steps; the first one is to return to the picture, the second is again to return to the picture and to ask the child to take the picture along while looking for the right place. In the second prompting the experimenter also asks the child if it could *tell* which room or what place is shown in the picture. The third prompting is to show the place: in front of the right place, the experimenter asks if he or she can see the target. If the child is successful in the third prompting, then it has managed a picture to object recognition (PO).

3.2 Summarizing and observation

The test contains an object to picture recognition (OP), a picture to picture recognition (PP), a picture to object recognition (PO), and if the child finds the toy using the pictorial information, a picture sign condition (S). It is also worth noting that distractors are placed close to all target toys.

The outcomes of the test, so far, are in keeping with DeLoache’s results concerning a change in performance from about the age of 30 months. From that age the children learned between the trials. During the first and perhaps second trial they needed prompting, but in the third and fourth they found the target toy without help. When close to the age of 3, their performances almost never failed. Since the tests are still going on, final results will be presented later. It will be interesting at this phase of my investigation, then, to discuss some observations. At the age of 22 to 24 months the children manage the OP but have difficulties with the PP and PO and have no clue about S. At about 26/28 months of age they pass OP, PP and PO but not S. After the age of 30 months they easily pass OP, PP, PO and they start to learn S. Most astonishing were the performances of the 26–30 months old children who clearly handled the OP, PP, PO and were very keen on finding the target but could still not relate the “picture

situation” to the “reality situation”. They failed, despite prompting and even after they had correctly told the experimenter in which room or at what place they could see the cuddly of the picture, and the experimenter had once again said that “ I have put the cuddly at the same place in the room as you can see in the picture”.

4. *Taking the discussion further*

4.1 A situation in the picture and in the room

According to Josef Perner (1991) the understanding of external representations, like pictures, is parallel with the understanding of one’s mind. Now, these children are “situation theorists”. They keep the situation in the picture apart from the situation in the room. Perner argues that not until the child is about four years old does he come to think about his mind as representational and becomes a “representation theorist”. To coordinate the picture situation with its referent situation requires *metarepresentation*, which is the capacity to take “a cognitive, representational stance when needed” (Perner 1991: 284). Elizabeth Robinson (1994) does not agree; a consequence according to her would be that the three years old children “treat pictures as alternative situations that can match or mismatch reality rather than as representations which can misrepresent” (Robinson 1994: 167). The children tend to operate with assumptions of veridicality for beliefs as well as pictures, but do not relate the two (Robinson 1994; Zaitchik 1990). Robinson suggests that, to the child, the relation between reality and picture is asymmetric but not differentiated. But how can something be asymmetric but not differentiated? To the child, according to Robinson, the relation between the picture and reality is asymmetric but not differentiated since the child presupposes the reality as primary and stable, and *at the same time*, the picture as secondary and unstable (the picture will change if the world changes). Robinson argues that the 3-year old child has constructed belief in the picture-thing as about something, but they misconceive the relation between picture and its referent and therefore also misconceive properties of the picture-thing as well as the picture-sign. Robinson’s principal critique of Perner goes to his assumption on such a close parallelism between the understanding of representations that have physical reality (like pictures) and understanding the mind.

Sabbagh, Moses, and Shiverick's (2006) findings on false belief and false photographs may support Robinson's critique. In their study, understanding of false photographs antedates understanding of false belief in the child. Their hypothesis is that judgements about false beliefs might pose greater executive demands relative to false photographs.

But what about "my" children, not finding the target toy? At 2.5 years old they seem to be "situation theorists", according to Perner; they do not relate the situation in the picture to the situation in the room. But at 3 years old they do.

4.2 Differentiations in the development of a picture-sign in the child

Lynn Liben (1999) suggests a six-level developmental sequence on the emergence of cognitive and perceptual competencies in understanding pictures. The levels proposed by Liben imply differentiations within the child. The levels indicate focal competence for each phase, but the phases also intermingle. Capacities on one level are prepared for on preceding levels and will continue to develop on the next. Ambiguities in earlier phases may cause backlash, triggering "misconceptions" in picture-understanding in later ones. This can, for example, be the case for the child, 21 months old, which by margin passed the difficulty of separating a three-dimensional object from its picture, when he tried the picture object with his mouth.

Liben's assumption is that perception of space is crucial in recognizing depicted objects, since pictures are more or less flat, but the scenes recognized (i.e. understood) are three-dimensional. And in some respect children seem to be sensitive to depth and distance in environment at birth or very soon thereafter (Spelke 1998: 338; Bremner 1993). But sensitivity to depth-specific, pictorial, two-dimensional surfaces, emerges later. According to Yonas & Granrud (1985), responsiveness to "depth cues" in pictures appears when the child is about 5 to 7 months old, contemporary with early recognition of the depicted object, according to DeLoache (1994). Lately Bertin & Bhatt (2006) have argued for this competence to emerge already at 3 months. The point, however, is that in the child, sensitivity to spatial information in the dynamic, three-dimensional, physical world occurs before sensitivity to spatial information in the static picture.

In Liben's sequence of competencies, the first phase is a non-picture category that occurs in the first year of life. This is the case when the young child identifies the referent but appears to confuse the picture with what is depicted; for example, by trying to pick-up, or chew on, the depicted object. Liben calls this level of competency "referential content" but in semiotic terminology this is confusing, since "referential content" implies sign function and this phase antedates the sign. I suggest instead the term "analogon", inspired by René Lindekens (1976) or more simply, "pattern recognition".

The next phase is *global differentiation*, and it emerges in the latter part of the first year. This is when the child begins to differentiate the picture from its image, and responds to them differentially but does not reflect on the correspondence between the two. The third competence, Liben argues, is *representational insight*; the child interprets or assigns a "stands for" meaning to the picture object. This implies that the child assigns a direction, vital to sign functioning, to the relation between expression and content. Passing the retrieval test above can be an indication of representational insight. *Attribute differentiation* is when the child appreciates that some, but not all attributes of the picture are motivated by attributes of the referent, and that some, but not all attributes of the referent motivate attributes in the picture. Liben expects this competence to occur in late preschoolers. The fifth phase is the growth of a system. In *correspondence mastery* the child comes to understand formal and informal rules in the medium. Correspondence mastery is understood within a specific medium while *meta-representations*, the final competence, is the coordination of understanding variations among different representational media. This is a capacity to reflect on the semiotic resource itself, to choose between systems or combinations of systems, and to provide different means of communicating different visions to others. Liben ascribes the last phase to adolescents and adults, but perhaps this also can count for correspondence mastery.

The studies referred to above concern the three earliest phases, so I will focus my discussion on these. But first I will briefly comment on phases III-IV: attribute differentiation, correspondence mastery, and meta-representation. Returning to the assumptions of three basic differentiations in the development of sign use generally (above), it is my suggestion that the emergence of attribute differentiation in picture-understanding also indi-

cates a new shift of focus in development, onto the differentiation of signification generally. This new turn of focus is to differentiate the relation of signification “from the vehicle conveying it and the object it conveys” (Deely 1990: 37). From now on this will be successively more clear, more socially shared, and more sophisticated. This of course highly influences the differentiation of the self, but the differentiation of self and others has already begun in earlier phases.

The first competence, *analogon*, presupposes a former state that lacks the faculty to perceive pictorially rendered information about space relations. Perhaps it is too much to say that there already is a world taken for granted in the child, but there does seem to be a perception of a 3-dimensional world (in constant flux) from which another world, frozen and 2-dimensional, will be differentiated. Thus it already forms a prerequisite for a hierarchy in later phases. Manipulation of objects is surely important for global differentiation, as Liben indicates, but so is social interaction. From 9 months old the child tends toward joint engagement and after that joint attention, according to Tomasello (1999). Paying attention to the picture brings importance to it. There are also studies indicating that infants may imitate or model actions that others take towards pictures prior to having understood the referential function in the picture (Callaghan et al. 2004). In the construction of the picture as a social “tool”, the child may learn more about the picture *thing* as a category, than construe it as mediated information about the referent.

When the child finds the target toy (see above), this is an indication of representational insight: the child understands that the picture shows something about a situation “outside” the picture. In this case the child must relate the situation in the picture to the situation at his nursery school at that moment. Passing OP, PP, PO does not necessarily involve this confrontation between reality-situation and picture-situation, because comparative mapping will do. But still, it is intriguing to find that children at about 2.5 years old so convincingly can tell that in the picture the cuddly is “on the sofa”, but they will not go to the sofa to get it. It seems that at this phase the child has expectations that the picture thing will involve the display of known objects, but he has no expectation that the picture will be involved in his real world, here and now.

Iranian *ta'ârof* and Italian *cerimonie*

On the semiotics of politeness

This paper stems from a broader research project concerning hospitality and its different conceptions and manifestations throughout time, space and cultures. Such a project is meant to elaborate a semiotic model of hospitality in order to reframe conflicts which might arise between individuals, groups or larger communities, when they face the necessity of sharing mutual resources.

The main hypothesis which underlies this paper is at the heart of a semiotics of understanding/misunderstanding; it can be formulated as follows: in studying, describing and analyzing semiosis, signification and communication, many models, from Shannon and Weaver (1949) through Jakobson (1963) to Eco (1977) and beyond, have been guided mostly by the idea that human semiotic interactions are successful if understanding is maximized, i.e., if the semiosis behind the manifestation of some signs resonates with the semiosis behind the reception of these same signs. This paper suggests that such an idea of what successful semiotic interaction is might be biased by what can be tentatively defined as an “individualistic” conception of humanity, prevalent in those societies and cultures where the major semioticians of the last century lived and worked. Further, I suggest here that an alternative conception of humanity, more common in other societies and cultures, might give rise to a completely different idea of successful semiotic interaction, which, paradoxically, would be achieved when misunderstanding is maximized, so as to reach a state where there is no way to determine whether the manifestation of some signs and their reception is underlain by comparable semiotic processes.

This hypothesis has been elaborated upon a thorough ethnological observation and phenomenological analysis of some semiotic interactions

that fall under a typology which natives from Italy and Iran would respectively call "*cerimonie*" and "*ta'ârof*". Probably, the most appropriate English translation for these two terms would be "ceremony", as in the expression "to stand on ceremony".

Proposing an abstract definition of what "*cerimonie*" and "*ta'ârof*" are from a semiotic point of view is intended to be the arrival point, not the departure point, of this paper; as a consequence, it is probably better, in the first instance, to give an idea of what kind of semiotic interactions fall in these typologies through some narrative examples. A typical Italian *cerimonia* takes place when I pay a visit to a relative of mine. I sit in this relative's living room, and this relative offers me a cup of coffee and a piece of cake. When I have eaten my piece of cake, the relative will ask me if I want one more piece. At this point I shall not accept, but stand on ceremony, and refuse. However, the relative too will stand on ceremony: he will not accept my refusal and will reiterate the offer, so giving rise to a rapid exchange of offers and refusals which might end either with me accepting the offer or with the relative accepting my refusal. Iranian *ta'ârof* semiotic interactions are, from many points of view, similar to *cerimonie*, but often take place in such contexts and with such modalities which are startling even for individuals familiar with *cerimonie*. A typical *ta'ârof* interaction arises when I pay a compliment to an object belonging to someone else, for example, a scarf. This person will say to me "*ghaabel nadaareh*" ("it is not worthy of you"), then will add "*maal-e to*" ("it is yours") or "*bardaar*" ("take it"). At this point I shall not accept, but continue the *ta'ârof* interaction by saying "*be tan-e to ghashangeh*" ("it looks good on you"); in this case too, the person who owns the scarf might repeat the offer so giving rise to another rapid exchange of offers and refusals.

A first significant difference between *cerimonie* and *ta'ârof* lies in the fact that, whilst Italian *cerimonie* are now practically absent from economic transactions, Iranian *ta'ârof* still characterizes them in most contemporary Iranian communities: when I ask a shopkeeper the price of an object, for example, the first answer will commonly be, again, "*ghaabel nadaareh*" ("it is not worthy of you"), and the shopkeeper will propose a price only upon my repeating the question.

Discovering what kind of semiosis takes place in these interactions is probably fundamental to penetrating the dialectics between understanding and misunderstanding, as well as the ways in which different cultures,

in different societies, shape a specific equilibrium between individuals and groups through this dialectics.

Although relatively few semiotic studies have been devoted to ceremony interactions (Haverkate 1987), such an abundant scholarship on this topic exists in linguistics, and especially in socio-linguistics, pragmatics and linguistic anthropology, that it has recently resulted in an independent field of investigation, called “politeness studies”. Definitions of politeness by different scholars in this field may vary considerably, and most of these definitions consider only the verbal dimension of ceremony interaction; yet, they are probably the most relevant and promising starting point for a semiotic investigation on this topic.

Very briefly, current politeness studies stem from two roots. The first of these is the work of H. Paul Grice. In describing the Cooperative Principle as a limited set of conversational maxims (Quantity, Quality, Relation and Manner) Grice also mentions, in passing, that this set might be augmented by some further maxims, one of which might be that of Politeness (Grice 1975). From a reconsideration of Grice’s suggestion, Robin Lakoff defines politeness as something “developed by societies in order to reduce friction in personal interaction” (Lakoff 1975: 64). However, it would be hopeless to attempt to use this definition to understand the semiotic interactions of ceremonies, especially in the absence of a clear definition of what is meant by “friction”. For paradoxically, in many circumstances, *ta’ârof* as well as *cerimonia* seem to *increase* conflict in personal interaction, instead of reducing it. For example, consider the following account given by French ethnologist Anne-Sophie Vivier-Muresan, in a recent article on *ta’ârof* interactions that she observed in a village in the Kermân region of central Iran. She describes the play of offers and refusals of food between a host and a guest:

L’invité se doit en effet de refuser au moins une fois, voire deux ou trois fois, selon ses propres habitudes de *ta’ârof* et celles de son hôte. Ce dernier insiste en retour autant de fois qu’il est nécessaire. Le jeu atteint parfois une telle ampleur qu’on ne sait plus si l’on assiste à une séance de politesse ou de bras de fer, l’hôte posant de force la nourriture dans l’assiette de l’invité qui la remet à son tour dans le plat. (Vivier-Muresan 2006: 127)

Iranians are generally aware of this potential conflictive dimension of *ta’ârof*, as is evident in a sketch by performed by Iranian comedians Mor-

taza Aghili and Bahman Mofid, frequently aired by Iranian TV channels: two people in front of a door yield each other the right of way so insistently, that finally they end up stabbing each other.

Also deriving from Grice's work is Geoffrey Leech's definition of politeness as "strategic conflict avoidance", which "can be measured in terms of the degree of effort put into the avoidance of a conflict situation" and "the establishment and maintenance of comity" (Leech 1980: 19); but as Grice, Leech neither defines "conflict situation" nor solves the problem of polite interactions like *ta'arof* sometimes *cause* conflicts rather than avert them. For example, when an Iranian taxi driver replies "*ghaabel nadaareh*" ("it is not worthy of you") to a passenger who asks him the price of a fare, this does not mean that the passenger will get out of the taxi without paying. On the contrary, after the passenger's request is reiterated, the taxi driver will most probably propose a very high price and a very harsh negotiation will ensue.

As concerns the semiotic aspects of *cerimonia* and *ta'arof*, more useful definitions of politeness can be found in scholars who have tried to combine Grice's pragmatics with Erving Goffman's concept of "face" (Goffman 1955, 1956, 1967, 1971, 1981). In one of the milestone essays of politeness studies, Penelope Brown and Stephen C. Levinson define politeness as the series of strategies employed by interlocutors in order to guarantee: (1) the universal need of individual human beings to be valued, respected, appreciated in social groups, i.e. that the self-image that an individual has constructed of her/himself should be accepted and supported by others; and (2) the universal right of individual human beings to relative freedom of thought and action, i.e. to perceive "territory" in both the literal and metaphorical senses of the term (Brown and Levinson 1978). Nevertheless, this definition lends itself to two main objections. First, Richard J. Watts has shown that, whilst "for Goffman face is a socially attributed aspect of self that is on loan for the duration of the interaction in accordance with the line or lines that the individual has adopted for the purposes of that interaction" (Watts 2003: 105), Brown and Levinson distinguish between a positive and a negative face, but seem to overlook Goffman's emphasis on the impermanence of both; as a consequence, what is missed in their analysis is perhaps a thorough understanding of the theatrical, playful dimension of politeness, which has such an important role in semiotic interactions such as *cerimonia* and *ta'arof*. For example, as Vivier-Muresan

points out, Iranians sometimes pass from the interactive level of *ta'arof* to a sort of meta-level of interaction, called "*shukhi*" (more or less, "humor") where they can have fun by pretending that some *ta'arof* rules have been violated: "Un homme peut ainsi, en entrant dans une maison, se plaindre qu'on ne le fasse pas asseoir à la meilleure place, ou qu'on ne lui offre pas assez de pâtisseries" (Vivier-Muresan 2006: 135).

The second controversial point in the model of politeness developed by Brown and Levinson is their universalist approach to politeness phenomena, postulating that their definition of positive and negative face is appropriate for every interlocutor in whatever culture or society. It is therefore not surprising that objections to this assumption have been formulated, mainly by Asian linguists, such as the Japanese socio-linguist Sachiko Ide (1989, 1993) and the Japanese pragmaticist Yoshiko Matsumoto (1988, 1989, 1993). These scholars argue that division between positive and negative face is not adequate in those cultures in which the individual *qua* individual is less important than the social group with which the individual is affiliated. Furthermore, these scholars claim that Brown and Levinson's model of politeness is Eurocentric insofar as it focuses on a volitional conception of politeness, whilst in some non-European societies and cultures, such as the Japanese one, for example, politeness is mostly practiced as *wakimae*, as a form of discernment. Whereas volitional politeness is adopted regardless of the features of the social context in which individuals are involved, discernment politeness is embraced through a continuous assessment of the lines expected in different types of social interaction.

Japanese objections to Brown and Levinson's definition of politeness can perhaps be generalized: many scholars have proposed universalistic models of politeness, yet these models were biased by a particular idea of the relationship between individuals and societies, an idea mainly based on these scholars' experience of such a relationship. Therefore, politeness has been mostly conceived as a series of strategies meant to affirm willfully a certain personality in its interactions with other personalities. In such a conception, polite semiotic interactions are successful insofar as they result in a complete understanding of the shape and limits of all the personalities involved in a certain interaction.

Yet, ethnological and phenomenological analysis of semiotic interactions such as *cerimonia* in small villages of Southern Italy, and even more evidently, *ta'arof* in small Iranian communities in the USA seem to support

the idea that they are characterized by a communicative attitude which is closer to Japanese *wakimae* than to the volitional conception of politeness. These interactions seem to embody a conception of the relation between individuals and societies where politeness mostly consists in a series of strategies meant to wrap personalities with a layer of impersonality. In these “wrapping cultures” (Hendry 1993) polite semiotic interactions are successful insofar as they result in a complete misunderstanding of the shape and limits of all the personalities involved in a certain interaction.

Inferential semiotics is very suitable in for detailed analysis of the kind of semiosis which takes place in these interactions. I am paying a visit to a relative of mine, and I have already eaten the first slice of cake which I was offered. A first limit of linguistic models of politeness consists in the fact that they understand politeness as something resulting from what the relative or I might say at this moment. But the fact is that, before any word is pronounced, politeness is already “in the air”. In the situation described just described, for example, it would be wrong to think that the relative and I *voluntarily* decide to stand on ceremony; rather, the socio-cultural setting in which we are placed has already decided for us. As a consequence, a thorough understanding of politeness requires scholars not to sever verbal from other kinds of discourse that contribute to creating a situation of politeness. The relative and I interact through encyclopedias which do not include only verbal interpretants, but also interpretants activating the signification of degrees of kindred, distance between bodies, presence of these bodies in a certain space, postures, gestures and facial expressions, paralinguistic features, characteristics of the object exchanged between host and guest, social and cultural status of host and guest, and so on.

Given this semiotic setting of politeness, when the verbal exchange starts, its result will be paradoxical if politeness is understood as a way to maximize the affirmation of one’s personality in a social context. The relative offers a second piece of cake to me; at this point, I can interpret the offer in two opposite ways: A) the relative is standing on ceremony, the offer is fake; B) the relative is not standing on ceremony, the offer is true. If I refuse the offer, as the politeness setting requires me to do, the relative too will be able to interpret my refusal in two opposite ways: A) I am standing on ceremony; I am refusing but I actually want a piece of cake; or B) I am not standing on ceremony; I am refusing because I actually do not want a piece of cake.

Usually, when a refusal is reiterated, its expression is intensified. For instance, the refusal will be emphasized both verbally (repetitions: “I don’t want it, I don’t want it ...”; intensifications “I *really* don’t want it!”; argumentations “I am full”) and non-verbally (I change my tone of voice; I make gestures to reject the offer; I touch my stomach to express my fullness; I cover the plate with my hands; in Iranian *ta’arof* I even remove the piece of cake from my plate and put it back on its tray). However, this does not increase the intelligibility of *cerimonie* or *ta’arof*, since the emphasis of the refusal is commonly followed by a symmetrical emphasis of the offer, both verbally (repetitions: “take it, take it!”; intensifications: “*please* take it ...”; coaxings: “it is such a little piece ...”) and non-verbally (the relative’s tone of voice changes; his/her face expresses sadness at my refusal; in Iranian *ta’arof* the relative even takes a piece of cake and rapidly puts it in my plate). My last resort in order to communicate a refusal to my relative is a meta-communication about politeness itself. In Italian I would say “*senza complimenti*” (“without ceremonies”), while in Farsi I would say “*ta’arof nemikonam*” (“I am not doing *ta’arof*”). Nevertheless, even this move will not break the circle of offers and refusals, since this meta-communication about the fact that I am not doing any *ta’arof* can be interpreted by my relative as a subtle form of meta-*ta’arof*.

In sum: at no stage of these interactions can I be sure whether I am interpreting the relative’s offer correctly; conversely, at no stage of these interactions can the relative be sure whether my refusal is being interpreted correctly. The situation of politeness is such that ambiguity and potential misunderstanding are maximized during the entire interaction, so that both the relative’s offers and my refusals get entangled in a virtually unlimited chain.

Obviously, at some stage this chain will be interrupted: either I accept my relative’s offer or the relative accepts my refusal. Yet, even after an act halts the politeness exchange, there is no way to establish whether its conclusion was determined by a series of correct interpretations.

I would propose the hypothesis that the ambiguity, the lack of clear understanding, the potential misunderstanding which characterize semi-otic interactions such as *cerimonie* or, even more, *ta’arof*, ought not be considered as failed communication; on the contrary, these interactions are successful communication insofar as they *result* in this ambiguity, in this lack of understanding, in this potential misunderstanding.
