European and American scholars conceive politeness as a set of communicative strategies which maximize the impact of an individual personality in a certain social context; yet, such a conception would be misleading in the observation, description and analysis of societies and cultures where politeness seems to be used, on the contrary, in order to minimize the impact of an individual personality in a certain social context. This opposition between personality and impersonality of politeness must not be considered as Manichean, but rather as running along a continuum which contains two polarities: on the one hand, cultures where societies are seen as environments in which individuals can affirm their personal aims; on the other hand, cultures where societies are seen as environments wherein individuals *cannot* affirm their personal aims. In the first case, politeness will be effective insofar as it increases the transparency of communication; in the second case, on the contrary, politeness will be effective insofar as it increases the opaqueness of communication (as is the case in small communities of Southern Italy or Iran).

It would be simplistic to try to understand the rationale of *cerimonie* or *ta'ârof* by adopting a semiotic model inspired by globalized communication, i.e. by an economic idea of effectiveness. Rather, politeness in social and cultural contexts where the individual is seen not as dominating its social environment, but rather as dominated by it, is better explained in comparison with another kind of semiosis: *gambling*. At each step of the interaction, participants mutually interpret their representamina, yet they know in advance that this interpretation may be false as well as true. This structural ambiguity, though, is not experienced as a limit, but frequently as a source of aesthetic pleasure, as in *cerimonie* or *ta'ârof* when individuals are gratified by their awareness of the theatrical, farcical nature of social interactions. What most “Eurocentric” scholars do not grasp is precisely this playfulness, the irony intrinsic to some situations of politeness, where the purpose of participants is to conceal personality more than to reveal it, where the usefulness of communication is replaced by the purposelessness of ritual.

Most existing analyses of *ta'ârof*, though from different methodological points of view, seem to reach similar conclusions (Beeman 1976; Hillman 1981; Betteridge 1985; Koutlaki 2002; Eslami-Rasekh 2005). For example, in an article devoted to face-keeping strategies in reaction to complaints, Zohreh Eslami-Rasekh points out that Iranian speakers are more sensitive

to contextual factors and vary their face-keeping strategies accordingly, whereas English speakers mostly use one apology strategy and intensify it based on contextual factors (Eslami-Rasekh 2004). He also suggests that “politeness theory, in its present form, is not enough to explain such differences, since they stem less from universal norms of politeness but more from culture specific values and attitudes (ibid.: 192).

I have tried here to demonstrate that linguistic politeness can be understood only if placed in the broader framework of a semiotics of politeness, one that is able to pinpoint relations between societies, cultures and “communicative styles”.

In this regard, semiotic research on specific politeness situations such as Japanese *wakimae* and Iranian *ta’ârof* can push scholars to reconsider the universality of semiotic models mostly formulated in Europe and Northern America, wherein the effectiveness of semiosis, signification and communication is generally conceived, consciously or unconsciously, by attributing a positive value to understanding. Inter-cultural comparison might reveal that such a conception is actually based on a particular idea of the relation between individuals and societies ultimately modeled on the economic concept of the market, i.e. a social structure where human beings freely interact in order to maximize their individual aims.

In a lucid ethnographic description of economic interactions in Marrakech, Elias Canetti points out that a “bazaar” is not a “market” (Canetti 1964). In a market, objects have specific prices, and communication is effective when it minimizes ambiguity about the relation between individuals, prices and objects. In a bazaar, on the contrary, objects do not have specific prices, since prices depend on the relation between individuals: there is one price for the tourist, one price for the local, one for a friend, etc. In this context, where social structure prevails on its members, communication is effective when it maximizes ambiguity about the relation between individuals, prices and objects. As a conclusion it can be argued that, while mainstream semiotics has mostly understood communication in terms of the disembodied interactions of the market, investigation of phenomena such as *cerimonie* or *ta’ârof* should encourage us to develop a deeper awareness of our cultural biases and to consider that, in some social and cultural contexts, communication might be better understood as a bazaar.

Semiotics and lexicography

A survey of cognitive approaches to pedagogical lexicography

1. Introduction

Semiotics is “concerned with everything that can be taken as a sign” (Eco 1976: 7). Semiotic signs can be represented in the form of words, phrases, sentences, images, sounds, gestures and objects. Lexicography, as the “art and craft” of compiling dictionaries (Laudau 2001: 1; Ooi 1998: 3), is represented by semiotic signs and their relationships.

Cognitive linguistics studies the linking of language with mind in the study of the brain and provides a dynamic perspective on language. Cognitive linguistics analyzes natural language as an instrument for organizing, processing, and conveying information. A cognitive approach to language, according to Langacker, can also be a “pragmatic approach, for cognition figures crucially in linguistic behavior, social interaction, and contextual understanding” (Langacker 1995). Recent developments in semantics, pragmatics and cognitive linguistics are widely used in lexicographical studies today (Pruvost 2004; Cowie 2004; Cock 2002; Thomas 1995; Stensen 1993). However, John Sinclair (1985: 81) claims that dictionary-making has to strive to “fit into the established lexicographic formats” or “fit into the whole conceptual background of lexicography.” At the same time, the discipline of lexicography strengthens linguistic theories, especially those concerning language use (Atkins 1996; Hartmann 1996). If the first aim of dictionary work is “to exhibit the actual variety of usage” (Murray 1888: x) and “capture meaning potentials rather than meaning” (Hanks 1994: 2), then the integration of cognitive approaches to lexicographic study is one of the most important methods in compiling dictionaries in order to cater to users’ needs. Cognitive linguistics offers “a number of advantages over some other linguistic frameworks, particularly in relation to the range

of language phenomena it can address and in relation to researchers' need to communicate their results" (Janda 2000). Pedagogical dictionaries, if designed to cater to users of a language, ought to suit to the users' patterns of thought; therefore, dictionary compilation should also include the study of patterns of conceptualization (cf. Coulson & Matlock 1995). Pedagogical lexicography is "linguistic in orientation, interdisciplinary in outlook and problem-solving in spirit" (Hartmann 2001: 33). However, according to Croft & Cruse (2004: 30), dictionaries normally "describe only the concept profile, or at best a very simplified version of the concept frame implicit in a concept profile". Therefore, in order to meet the user's need, lexicographers ought to take the learning and cognition process into consideration.

In light of these points, I propose to address the following questions: Do lexicographers pay attention to the cognition process for learners of a language? Can the users acquire enough information in dictionaries, and how does this information influence their learning and cognition processes? Are users satisfied with the information given by the dictionaries?

What are the user's own evaluations of such information as it might relate to learning and cognition? I shall address these questions and from the perspective of a Chinese learner.

2. Cognitive approaches to lexicography: Present and past

Cognitive linguistics, a subfield of linguistics, was developed in the 1970s. Although it is a relatively new field, it has developed dramatically during the last thirty years. Wallace Chafe, Charles Fillmore, George Lakoff, Ronald Langacker, and Leonard Talmy were the most influential linguists to focus centrally on cognitive principles and organization.

A cognitive approach to lexicography is developed from cognitive approaches to lexical semantics. Although usage information in learners' dictionaries is one of the major components in definitions, a systematic and standardized method in dealing with the usage of information still remains to be studied. The general claim is that the "pioneers" in the area of lexicography were reacting against an approach to linguistics which was strongly biased towards meaning in the abstract rather than meaning in use. Research on lexical semantics from the perspective of cognitive linguistics has traditionally "taken the position that lexical items, i.e., words,

constitute conceptual categories” (Croft & Cruse 2004: 109). The cognitive approaches to polysemy and metaphors in dictionaries are such cases in point.

Cognitive Exploration of Lexicography by YanChun Zhao (2003) was the first attempt to advocate cognitive approaches to lexicography in China. Zhao investigated how cognitive linguistics can be used in analyzing meaning, metaphors, morphology and grammar. However, his study is just a general introduction offering suggestive ideas for lexicography in China; it contains no detailed explanation of how and what kinds of cognitive approaches might be used. My own study of literature on lexicography (Saihong Li 2005) also showed a lack of consensus about appropriate approaches to pedagogical lexicography.

3. *Research design and methodology*

In investigating cognitive approaches to learners’ dictionaries and give advice on further research, I did three, small scale think-aloud experiments. These last are one of the most successful methods of observing how large groups of language learners actually employ dictionaries or glossaries. To get more reliable data about learning and cognition satisfaction from learner’s perspectives in regard to the information given in dictionaries, I designed 3 different tests, which were followed by evaluation questionnaires.

3.1. Participants

The participants in the study were 10 overseas Chinese scholars and 20 overseas students. Among the 20 overseas scholars, two are English teachers at a university in inland China, the rest all passed the EPT (English Proficiency Test); there were 10 PhD students among the overseas students and 10 MA students. Their ages ranged between 23 to 51 years old. Overseas scholars will study in Denmark from 10 months to one year. Overseas students had studied in Denmark more than a year. Thus, I can say that all the participants were advanced English learners. They had had at least eight years of English both at secondary schools and universities. All the participants in the study have completed the test.

3.2. Instruments

The dictionaries used in this preliminary study were the *Longman Dictionary of Contemporary English* (hereafter LDOCE), the *Oxford Advanced Learners' Dictionary of Current English* (hereafter OALD) and the *MACMILLAN English Dictionary for Advanced Learners* (hereafter MEDAL). These dictionaries are the three most popular learners' dictionaries in China, and they also represent the new developments in learners' dictionaries of the twentieth century.

3.3. Procedure

The participants were allotted 25 minutes for the test and 25 minutes to fill out the questionnaires. The 30 persons were divided into three groups. Each group was given a copy of one of the above-mentioned dictionaries, and each person was provided with a tape-recorder. Group1 was given OALD; Group2, LDOCE; and Group3, MEDAL. The tests were conducted three times, due to limited space and time. Each time 10 persons participated, and evaluation questionnaires were given out immediately after the tests.

4. *Data analysis and discussion*

4.1. Results of Test 1

The results of test 1 showed that 76% of the participants in Group1 with OALD had the right answers for the five questions; 72% of the participants with LDOCE answered correctly for those questions; and 78% of the participants got the right answers in group 3 with MACMILLAN. The percentage of correctness can be seen in Table 1.

	Question1	Question2	Question3	Question4	Question5	Total
Group1	80%	70%	100%	70%	60%	76%
Group2	40%	100%	100%	70%	50%	72%
Group3	70%	70%	100%	90%	60%	78%

Table 1. Rate of correctness for test 1.

The satisfaction of learning process and cognition by using the dictionary from the perspective of the ten participants for each group is shown in Chart 1.

Chart 1. Assessment of the learning process and cognition from the user's perspective.

The above chart shows that the participants were satisfied with the information given for some words in the dictionary and believe that that information is also useful for their learning process and cognition. Participants in group 1 found 24% of the information to be very clear and useful; 48% think it is fairly clear and useful; 18% believed the information unclear and not very useful; 4% found it to be very unclear and useless. I leave it to the reader to peruse Chart 1 in more detail.

The results indicate that there is much room for improvement in regard to providing more useful information, better suited to users' learning processes and cognition. Some participants argued that the respective dictionary simply did not provide enough information.

4.2. Results of test 2

Test 2 was designed mainly to 1) investigate how usage labels are provided in learner's dictionaries and 2) how such information influences the participants' learning process and cognition. Four out of ten words tested in OLAD have no usage labels or explanation about the use of words in proper pragmatic situations; the same holds for three out of ten in LDOCE, and four out of ten in MACMILLAN. Once again, the test showed that learner's dictionaries could use improvement. To put it another way: pedagogical lexicography has not made use of the best approaches to the cogni-

tive learning processes of the users. Chart 2 shows the degree of satisfaction among participants of test 2.

Chart 2. Degree of user-satisfaction with regard to learning process and recognition.

As indicated by Chart 2: the LDOCE received the best assessment in regard to usage of labels for learning and cognition. Overall, it is indicated that learner's dictionaries should provide more useful information and less linguistic and/or etymological meanings.

4.3. Results of test 3

Test 3 was designed to survey how cultural words are provided in learner's dictionaries and how this information influences the learning process and cognition. This test is very difficult for the participants. Some of them said they could understand the meaning of the words, but did not know for sure how to translate them into Chinese. The results are shown in Chart 3.

Chart 3. Degree of satisfaction with regard to cultural meanings.

Chart 3 shows that the LDOCE has the most satisfactory degree of cultural information as compared with the other two dictionaries.

5. *Conclusion*

In sum: the above study shows that the three learner's dictionaries have both strengths and weaknesses, proving up the truism that any dictionary will have "its own limited means ... therefore it is impossible to convey everything in it" (Hartmann 2003 III: 83). According to the 30 participants, all the dictionaries under consideration would be improved by providing more pragmatic, and less theoretical, meanings. Lexicographers must, at some point, realize that learner's dictionaries should incorporate linguistic meanings adapted to the readers' individual cognitive processes and cultural situation. Although mine is just a small scale study, with limited samples and number of participants, I hope this paper will be of help to formulators of future lexicographical work, especially learners' dictionaries.

Youzheng Li

Semiotics and ancient history

Two major areas of semiotic studies are the semantic structures of texts and the institutional mechanisms of textual formation. These are also related to the main interests of current historical theory. Historical discourse is notable for its semantic complexity, which requires elaborate clarification. Institutional formation of historical discourse is also very complicated and requires structural analysis. Like semiotics, historical theory is strongly interdisciplinary, tending to run contrary to the professional status quo of historical studies. Finally, the operative range of both semiotic theory and historical theory are related to the entire field of social and human sciences.

General semiotics has two main theoretical sources: the scientific/philosophical and the linguistic/literary. The present paper is meant to encourage renewed attention to a third source: historical theory. Unlike the two main theoretical modes, historical theory refers to both the intellectual and the social dimensions. If global semiotics literally means a cross-cultural one, the latter contains its non-western others in both the social and the historical dimensions. Non-western social and historical reality must broaden, deepen and multiply human knowledge of history. The globalization of semiotic studies requires an empirically and positively more homogeneous object and method.

Moreover, history consists of a series of dichotomies, such as process/structure, scientific/literary, past/future, disciplinary/interdisciplinary, western/eastern, practice/theory, recognition/action, meaning/referent, as well as faith/reason. History, then, provides a typical forum for profound epistemological and ethical reflection on human knowledge and future design in terms of hermeneutic and semiotic approaches.

1. Operative restrictions in single disciplines and the holistic ideal in interdisciplinary epistemology

Interdisciplinary and cross-cultural studies strive for a scientific holism that would be theoretically linked to all social and human sciences. General semiotics is accordingly related to the total range of academic scholarship. However, individual scientific projects are mostly arranged according to various, single disciplines.

Modern, holistic-leaning, general semiotics shares the same range of integrative developments as do modern social and human sciences, helping to promote semantic clarification and effective communication among the latter. The integrating tendency of these two academic practices reflects the need to promote all-round communication among various elements in academic, cultural, historical dimensions.

Historiography is highly interdisciplinary, typically a mix of classical and modern modes. As a traditional discipline, history has reaped the theoretical fruits of many modern social sciences, especially sociology, anthropology, archaeology and psychology. The post-war French structural stream in historiography has displayed the most ambition, particularly in the theoretical evolution of the *Annales* school over almost one century. As we know, it once tried to make the range of historiography equivalent to that of the entire social sciences; accordingly, history was ambitiously posited as a kind of scholarly totality for the future, the sum of all disciplines. The *Annales* school had reasons for expressing such an idealistic wish, feeling it to be an epistemological necessity in their historical practice. But we also know that the holistic claims of that school could not be sustained or justified. The fact that the *Annales* school selects their subject matter from the medieval European period indicates a self-contradiction in practice. As we know, ever since ancient times a “universal history” has been a common ideal of many traditional historians. That means the idea of total history should cover as many historical-geographic territories as possible. Moreover, the *Annales* school, in its downplaying of political history, imposes a serious self-limitation on their historical horizon. On the other hand, we should note that the ideal of total history of the *Annales* is especially characterized by its emphasis on methodological integration (interdisciplinary methodology). We may therefore say that the *Annales* school’s adventure is especially characterized by an epistemological and methodological holism,

which has had a substantial influence on the integrative development of human sciences. This tendency is further combined with French structuralism guided by a similar spirit but touching on much wider domains in culture and sciences. As a result, we see a double integration in the ideal of postwar historical theory or historical thought with respect to both methodology and subject matter. Since then “historical theory”, or the theoretical practice in historiography and historical thought, seemed to overlap all the social and human sciences. On the other hand, however, this scientific ideal can hardly be carried out actually. The reason is similar to what we said above about general semiotics. How can we really pursue a holistic project to include many subjects and methods from many disciplines?

Here we are faced with two different aspects in our epistemological reflection: desirability at the general theoretical level and possibility at the concrete practical level. As regards the range of subject matter, history has a reason to expand its conventional range, so as to include in practice the truly universal, namely, everything of spatial and temporal existence of mankind. Yet in fact, we can hardly carry out this integrative operation. Regarding methodological instruments, history has the right to be related with all relevant knowledge of social and human sciences in its projects. Both materials and tools applied for processing materials should operate within certain historiographical procedures formed in the existing disciplines. However, not only in history, but also in other interdisciplinary-directed academic practices, doubly integrative tactics can and to some extent must be applied in projects designed this way. Consequently, to overcome the contradiction involved in interdisciplinary practices, we should distinguish between strategic and tactical categories in present-day historical theory. At the ideal level this new and expanded historiography should share its operative range with all the social and human sciences; at the practical level it can only be carried out in quite relative terms. There may exist a reasonable intellectual gap between epistemological perspective and methodological design in historical theory. In the former, historical theory will share a similar holistic intellectual strategy with the humanities as well as with general semiotics, in order to explore the possible theoretical results; while at the practical level all actual scholarly projects must be arranged to work through tactical combinations of all kinds of knowledge and techniques. Nevertheless, the distinction between the theoretical ideal and the practical workability is due to a technical reason only, namely,

because we still lack sufficiently objective conditions to attain this scientific idealism.

The integrative ideal of contemporary historiography has been gradually shaped over the course of modern history. Only in the era of modernity could we reasonably begin to shape a conception of total history, owing to ever-advancing intellectual and methodological developments. On the other hand, there are obstacles to conceiving a total history for the twentieth century. In fact, so-called total history today, far from being a task for a single discipline, should cover all the different sections of modern society and culture. This new historical reality in the expanded sense is the concern of all professional historians. The modern historian, however, with a much richer source of documents and more advanced research techniques available today, can only be satisfied in writing a special history about his contemporary times. He can no longer write a truly universal history of his time. This contradiction in historiographical practice is also caused by the above-mentioned tension in historiographical theory. For example, a genuine, total history of the last century would amount to a quasi-encyclopedia about history, society and culture. How can we follow a traditional way to write such a total history? On the other hand, many present-day debates about historical theory are still restricted to the category of traditional historiographical works, regardless of various intellectual tensions prevailing in the total historical horizon of our times

2. Epistemological rationality and methodological possibility

In light of the above discussion we can see there is an operative inconsistency in contemporary historical-theoretical debates. Historiographical practice in the twentieth and twenty-first century is completely different from that in pre-modern times with respect both to the range of available materials and the level of research techniques. The research conditions of traditional and contemporary historiographies differ radically, hence so do the scholarly possibilities of both. So we cannot apply the same set of concepts to treat them, as professionals used to do. For earlier history, especially ancient history, we have only a limited number of written texts as proper objects; whereas for modern or contemporary history we have an almost unlimited supply of textual objects. In light of this divergence,

how can we deal coherently with concepts like truth, objectivity, representation, fiction, falsification and more? Whether pursuing causal analysis or axiological evaluation of historical events and situations, historians of modern and ancient times have very different capacities to performing their tasks; in fact, they belong to different categories of academic agents.

Again we confront the distinction between epistemological and methodological (strategic and tactical) levels. A historiographical epistemology based on present-day academic conditions makes contemporary historians more capable of dealing with historical problems – both ancient and modern – than were their former counterparts. Aside from postmodern, nihilistic rejections of historical truth, the objectivity of a historical event can be fixed precisely, at least in principle, by modern scientific and technical tools. For example, the same news item on a TV program offers limited flexibility for different reports made by different journalists from different angles, because there exists some shared external objectivity that can be positively checked. If the same cannot be said about the checking of historical events in the past, the reason is only technical in nature. But actual accessibility to a related truth depends on the accessible technology and on current political conditions. Nowadays, no so-called epistemological obstacle blocks our access to historical truth, as some extreme relativists would lead us to believe. Just the opposite: this basic distinction between historical knowledge of modern and ancient times presents a positive verification of historical theory; namely, “historical objectivity” in the epistemological sense may exist on the basis of modern human knowledge and social conditions. Of course, this positive statement can hardly be applied to present-day studies of traditional history. In short, we should deal with epistemological problems in light of present-day conditions of human knowledge, rather than in terms of the past historiographical works and documents.

3. Epistemological grades of conceptual precision and predictive efficiency in human knowledge

Among natural, social and human sciences, the rigorousness of related concepts and measures must be differently defined, although natural sciences provide the standard models for fixing conceptual precision in different scientific systems. Regarding historical theory the same thing can be said

about such basic concepts as observation, verification, truth, objectivity, prediction etc. We have already noted that historiography-theoretical concepts are still taken as empirically valid; the writing of history adopts a relatively less rigorous definition of the used scientific concepts. Strengthening our rational attitude toward applying historical science is also related to how to improve studies of traditional historiography. So-called historical truth, or the true picture of historical situations, depends strongly on the historian's intellectual operations. It is a pity that many modern historians mainly choose only traditional historical works, such as literary pieces or artistic remnants, for appreciation and enjoyment. But on the other hand, they also tend to confuse those classics with works finished in the modern period, on the basis of the seemingly same discipline of historiography, accordingly relaxing the scientific requirements for the both. By dealing with both traditional and modern historiography in the same way, historians are confused by their different operative procedures.

Therefore, we face a new task in historiography: how do we confront old documents with modern operative procedures, if the latter can hardly be used for the former in a directly positive way? Furthermore, a distinction should be made between modern historiography and traditional historical discourse. In general, there are two categories of historiography: the modern and the traditional. They have different operative systems with respect to their conceptual precision and predictive efficiency. After all, social and political practices for the present and the future are organized by means of empirical rationality. Without empirical rationality human beings could not longer exist normally. Semiotic knowledge, too, should be employed to strengthen the rational and intellectual potential of mankind. Without naively trusting in the logic of progress, we human beings should still cherish the same wishes for a better future as those people did in the Enlightenment era. Most historiographical work falls in this domain, hence especially the related ethical dimension in historical processes. The explicit historical operation and its implicit deep mechanism should be separated. Interaction between history and ethics also leads to a special emphasis on the historical causality between inner motive and external result.

4. The classification of historiography and the status of ancient history

Traditional historiography – prehistoric, ancient, modern – can be classified according to its respective chronological periods. The classification of historiography is regularly defined by presumably corresponding historical realities. Conventionally it is supposed that different modes of historiography represent their corresponding historical processes with respect to certain aspects. Although modern historical theory rejects this naïve view of representation, traditional historiography is still classified according to the various represented periods, even if the extent of related representation is far from being complete or satisfactory. From a historical-semiotic point of view, however, we maintain that historiography should be classified more in terms of the related “productive modes” or mechanisms of doing historiography than by chronological references. In fact, historiographical works are better defined by the ways they are made, i.e., by the means of collecting and processing documents. Both documents and their processing are made by intellectual and technical methods mastered by “historians” living in their periods. The point is that different periods or conditions provide different mechanisms for producing their historical discourses. Hence, the meaning of historical discourse is first defined by the meaning-producing mechanism that can set up a model for producing historiography; the related interpretation emerges accordingly. Of course it is not easy for us moderns to get access to production mechanisms of the past. First, the latter can hardly be traced back to their original situations, and second, modern people are not in a position to grasp the line of transmission of historical texts and related changes. This technically-fixed gap between contemporary readers and original writers creates a big obstacle to reaching the true situation of past production of historical texts. There is no easy way for modern historians to form their judgment of the genuineness of historical texts and the related historical truth. Therefore, so-called reconstruction of historical reality is almost impossible. Hence we reach two conclusions:

- We can hardly grasp so-called historical reality or historical truth, for the reasons given above.
- That difficulty is not epistemological but technical in nature.

In other words, we can appeal to two main reasons to relax our efforts to obtain historical truth, especially that about ancient history. First, the original conditions for producing and transmitting historical texts must have been too weak to allow past historians to attain this scientific level. Second, current scientific conditions provide us with much easier access to historical truth about modern history, the fact of which would indicate why we should relax our expectations when investigating the positive aspects of past and ancient history.

Now we have another reason to recognize that historiography is a mixture of the scientific and the literary: that is because most, if not all, ancient historical works are pseudo-literary works. Because of ancient text-producing conditions the epistemological problem of reference becomes less important and even less relevant with respect to ancient historical production. In ancient times, there could have been a distinction between legend and history in the mind of the reporters. Ancient historians did indeed aim to describe more what is true than what is fictive (stories); that's why story-telling developed from myth to history, as we see in ancient times. Ancient historians could collect historical documents (oral and written) from their direct and indirect experience as positive materials. We can thus assume that their historical snapshots include many true details.

On the whole, however, ancient conditions did not allow for sufficient representation of causal connections explaining historical events. As a result, many imaginative and fictive creations were added to the materials so as to form the pseudo-causal links necessary to establish any intelligible account. The essence of historical reality, or truth, lies in the qualified formation of its causal networks, rather than in the mere piling up of facts. These last, without reliable causal structures, have nothing to do with historical truth. For the essence of a story rests on its lines of causal logic rather than on the mere material of that logic. In the case of the narrative, the true origin of the used material becomes less relevant; how the author collected narrative details is not relevant to historical understanding. Whether from personal experience, from memory or imagination, how observations were collected and described doesn't matter, as long as the selected details function in an effectively semantic way in the narrative.

"Effective" here can mean that the used material seems realistic, similar to what we see in real life. Realism in literary description is not logically related to the true process of its production, but rather to verisimilitude

as a storytelling artifice. For this empirically intelligible, real-like requirement in historiography, as we point out above, both objective observation and creative imagination can play an equal role in the persuasiveness the reading. Compared with the mythical text, the historical one is more realistic because its discourse reads more empirically intelligible, rather than because of its possibility of being verified.

The most essential part of historical narratives relates more to their organizing capacity to construct suitable or acceptable causality among events and details, without which piled-up details lose their empirically acceptable effects in textual reading. The causal network amounts to “the steel structure” of the story building; as such, it is the very essence of historical reality. In truth, ancient historical works should be taken as literary creations having certain quasi-realistic elements. Recognizing the historical picture from ancient historical works means to find the causal relationship among elements and events; historical descriptions refer to what is embodied in causal representation. But how can we moderns trust in the causal representations made by ancient people?

We may present a “statistical” or probable truth about the general profile of life in a given period or society. The historian seeks to record and describe historical truth according to his own standard; but, as we said above, because of technical restrictions in ancient history, he can hardly create an accurate picture, given the modest intellectual and technological state of his times. Indeed, we probably obtain a more accurate picture of the spirit and behaviors of an era through vivid stories created by a great fiction writer who desires to impart historical truth to his writing.

Traditional historical discourse functions essentially as the intellectual source for inspiration of mind and design of action. This important function, however, has been largely decreased since the scientific era. This is also the main reason why we should distinguish between the traditional and modern historiographies regarding their different functions.

*5. Ancient versus modern:
Reconsiderations for a new intellectual history*

The human capacity to know historical truth depends on both subjective and objective conditions. Therefore we infer that, from an epistemological point of view, ancient history is knowable on principle, but almost

unknowable in practice. This double conclusion leads us to ask, What is the meaning of ancient historiography for us today? No doubt, all historiography prior to modern times belongs to intellectual history, which varies in degree of mental and spiritual aspects. Yes, modern sociology and anthropology provide us with a lot of useful scientific models for dealing with historical subjects. On the other hand, the scattered and fragmented documents, as well as limited technology, narrows the range of effective observations made by ancient historians as to historical reality. Also, this kind of sociologically-directed study no longer has its object in clear view. Maybe this is one of the main reasons why the *Annales* school cannot effectively continue to pursue their research goals: they lack an actual sociological object of study. Nevertheless, sociology and anthropology help us to strengthen our investigations of historical backgrounds and conditions as the stages on which historical activities can be performed more or less fruitfully.

On the other hand, whether original historical discourse or modern investigations of the past, works of intellectual history are valuable in a broad sense, in as much as they are valid records of beliefs, faith, wishes, instincts, desires, knowledge and morality – that is to say, the subjective parts of mankind's life. Abandoning the quest for objective social and political truth about ancient and remote history, we can focus more intently on those so-called "subjective truths".

Unlike many previous intellectual and spiritual histories, ours is concerned with faith and attitude *as such*, apart from their causal relations with external factors. All sociological and anthropological models are used as ways to shape the modes of effective appearance of those mental tendencies only. Among all traditional historiography, the mode of ancient history, because of its special discursive construction, is even more important to our study of historical subjectivity than are the more primitive texts of myth and legend and the more-developed medieval historical discourse. It presents a medium grade of social representations that might prove more suitable for presenting the original and purest expression of subjective truth. Ancient historiography, rather than preceding mythical texts, expresses better the original mentality of historical races and individuals. This primitive, racial national mentality or historical faith has been transmitted to later generations as the main psychological and spiritual source of later historical developments. The identity of the original his-

torical mentality can help outline the spiritual aspect of its existence and development. The discourse of ancient history, which is less restricted than the earlier mythical-fictive type and by the later institutional-ideological kind, presents a more original expression of national beliefs and mental inclinations. In this light, the status of a historical social reality is in essence different from that of a historical mentality. The history of a national mental attitude has a relatively autonomous existence and continuity, in its engagement with other historical factors. It is hard to grasp exactly the reality of that social interaction because of insufficient knowledge of the latter; but we can grasp the reality of the mentality itself, as it appears in its interactions with increasingly more accessible social contexts in later historiography. Here we adopt a doubly directed operation for ancient historical discourse: avoidance of positive inquiry into socio-historical reality, and hermeneutically positive inquiry into the mental reality embodied in historical discourse. Social-causal reality calls for a description of external actions that is very difficult to realize in dealing with ancient historical discourse; by contrast, the basic mental reality can present itself directly by verbal expressions.

On the one hand, we can obtain important and reliable knowledge about ancient mentality *per se*; and on the other, we can get rid of misleading explanations based on faulty or unreliable documents about causal relations, which could present a misleading view of the historical mechanism determining ancient faiths. Thus, traditional faiths should be taken as coming from empirical sources that can be traced back historically from a positive method, as we attempt to do here. In other words, we can more positively trace back the primitive modes of human nature and instincts through studying those earlier historiographical narratives. To gain access to the truth of historical human nature, we should first relax our study of external, causal realities of ancient history, which can hardly be pursued positively today. We should lay more emphasis on the psychological and ethical truths embodied in the historical process. In both practices, semiotics will play an active role in constructing the anatomy of the complex semantic composition of historical discourse.

Historiography is essentially oriented to the future. Still, living in modern contexts we have to reorganize our historical experience. In doing so, we should first remember to keep a reasonable distance from traditional historical accounts that are largely based on unreliable observations

and broken causal analysis, which can hardly be used to guide our future projects. We should organize our historical knowledge more “horizontally”, that is, in terms of modern social and human sciences, rather than basing it on the traditional wisdom left by old historiography, which provides us with less reliable knowledge about historical objectivity.

Our new, positive Enlightenment will be embodied in three main intellectual systems that are organized holistically and mutually connected: general semiotics, historical theory, and social/human sciences. In brief, let us distinguish between history in the narrow or regular sense, and history in the broad sense. In our the three scientific endeavors just listed, semiotics plays a central organizing role in guiding and coordinating with the new historical knowledge. Historiographical epistemology is no longer the concern of historians only. Rather, it is a new territory for strategic operations shared among all our interdisciplinary projects.

Supplement: A theoretical sketch

- (1) HT (Historical theory) in a broad sense can designate theoretical thought about doing history. HT implies the following important aspects:
- 1. Total knowledge 1 (in its classical sense, namely that prior to modern sciences): stressing the wide *range of object*
 - 2. Total knowledge 2 (that since modern sciences): indicating both the *range of object* and the completeness of *methods* or theories, with the latter as more characteristic
 - 3. Combination of *theory (knowledge)* and *practice (action)*: learning of this synthetic nature involves human fortune and behavioral choices; hence *political history (past)* and political selection (*future*)
 - 4. HT shares the same range with *social-human sciences*; total knowledge or *total theory*
 - 5. HT’s emphasis will be more on present and future than on the past. Or HT₁ (*mental history-literary*) turns to the past while HT₂ (*historical science-scientific*, including political history) turns to present and future. The status of history and historiography will be changed or mixed with SHS.
 - HT as the triple combination of cognition (past), inspiration (present) and design (future)
- (2) SHS (social-human sciences): The HT problem leads to the SHS problem, involving the following aspects:

- HT depends on or is equivalent to SHS, with the result: $HT + SHS = \text{new HT} = \text{NHT}$
 - NHT leads to remodeling of present historical knowledge of the past, making the latter more empirically-scientifically organized
 - NHT or SHS leads to remodeling current historical knowledge of the present and the future, namely forming a new historical perspective: genuine total history about the present, which makes historical knowledge more empirical-positivist
 - NHT or SHS is conducive to the formation of new studies of political history (past, present and future); and new political history is related to the formation of political pragmatics for the future
- (3) GS (new general semiotics): GS will be more organically connected with NHT and SHS, resulting in new scientific human knowledge
- (4) HP (human practice): NHT will pay more attention to HP. HP needs more scientific methods of organization. Despite contemporary western theoretical elaborations, the obvious flaw of it rests on the structural gap between theory and practice. Many theories regarding human practice have proved to be irrelevant to the changing social, political and historical reality. Social and human sciences must be orientated to a more relevant recognition and explanation of social reality. Semiotics should organize its scholarship along the same lines.

Anna Löfström

A model of written miscommunication

This paper applies certain semiotic principles to a study of classical Japanese literature, with the production and reception of writing as the centre of attention. I will introduce two main theses, and then elaborate on a simple example.

1. Sign and movement

I define writing as relation of language and movement in (material) space. A written sign emerges in the movement between these two poles. To prevent any possible confusion of these two kinds of movement, I will from now on refer to movement in material space as *material text*. The hypothetical moment when a written sign becomes one with either of these poles renders the written sign dead. By “dead” I mean that the sign has no signifying power as writing, but only a latent possibility of signification. A written sign is alive only when it is on the move between these poles of death. What makes the sign alive by putting it on the move is a subject that encounters the sign, uses it, thus producing and re-producing it.

I have adopted my main idea for this model from Eero Tarasti’s writings on existential semiotics. Tarasti pays attention to the moment “before and after” a sign, introducing the concepts of *pre-sign*, *act-sign* and *post-sign* (Tarasti 2000: 33). A sign that seems to be crystallized or fixed, or when a “sign is the same as its concept” as Tarasti puts, is in fact only in a temporary state; most of the time signs are “in flux” (7). According to Tarasti, first, a subject has “in itself” an essence, which he actualizes or concretizes into an “act-sign”, followed by a “post-sign” interpretant. “After all, the sign itself proves to be a rather ephemeral entity lying between these two ‘transcendences’”, states Tarasti (33). This movement is carried out by the operations of negation and affirmation. So what actually happens in the course

of a sign's life cycle is the negation of a pre-sign in favour of an act-sign, and the negation of an act-sign while affirming the post-sign. (31)

What I would claim here is that a written sign is alive only when the acts of negation and affirmation are incomplete, and tension remains. A sign like this is always ambivalent, on the move towards something but still in touch with its former state. A living, written act-sign is the material text being written or read at the moment. There is a "dead moment" present in the possible life-cycle of a sign when it exists in the material, containing only the possibility to transcend the material and attain to transcendental ideas. The tension between linguistic and material on the one hand, and pre-sign or post-sign and act-sign, on the other, must be present for a sign to signify, that is, to be alive.

Roy Harris, in his book *Signs of Writing* (1995), claims that the underlying nature of all writing is not visual, but spatial (45). I want to go even further and claim that the underlying nature of writing is not only spatial organization, but *movement*, and in the case of an actualized material text, *organizing movement in space*. This means engaging in the writing-movement, be it "handwriting" motions in the air, leaving a graphic trace on a paper with a pencil or a brush, or hitting the keys of a keyboard. The act of writing that starts from emergence of a pre-sign sends the written sign into action. I call this movement the *downward movement*, which is aimed toward death in the material text. Observing the material text brings the written sign back to life, sending it towards death in language. This act of reading consists of *upward movement*.

So there is a break in the act-sign, as noted before. Before the act of writing there is a pre-sign which is negated in favour of the "bare objectness" of the material text. And after the act of reading, the material text is negated in favour of the post-sign. I will call these two *pre-written* and *post-read* signs. If the act-sign is not yet in process of being affirmed or is already fully negated, these signs are dead. What I think is essential to writing is the role of a subject in acts of writing a reading. A subject basically takes some linguistically comprehensible essence as his pre-(written-)sign and starts to reach towards the material, bringing a written sign to life. The written sign is now on the move downwards in his act of negating a pre-written sign and affirming an act-sign. But when the subject abandons the material text produced by his act of writing, by not writing or not reading it, the written sign dies.

In the event of reading, meaning is brought back to life. Grasping the organization of space through the senses (visual, haptic) and realizing or understanding it as meaningful revives the meaning. Movement is not just present here physically – say, in eye-movement, the movement of fingers on Braille-script and so on – but also in the reader’s active, cognitive reaching towards the meaning, i.e., the post-read sign. In this process, the sign is sent upward. When the act of reading is over, the material text is likely to be abandoned again, detached from the subject, and thus dead. The post-read sign has also lost its connection to the material and is drifting towards realms of meaning that transcend linguistic (and written) comprehension. On this side, too, the written sign is dead, since it has lost its connection to the material.

To conclude my point here: A written sign is alive only when it is moving, that is to say, when it is connected to a subject engaged in the act of writing or reading, when acts of negating or affirming the pre- act- and post-signs has started but is not wholly concluded, hence leaving the sign in a state of ambivalence. Thus, the “vitality” of a written sign is dependent on the tension between linguistic and material poles on the one hand, and on the other, the ambivalence resulting from the still-incomplete acts of negating and affirming the pre-, act-, and post-signs. The sign that is alive is able to signify (see Figure 1). Because the abandoning of the written sign, resulting in death, is in a central position here, “breaks” in the process of reading (what-is) written are bound to occur. A subject encountering a written sign left to die can only imagine what it might have been when it was alive, like a palaeontologist figuring out how dinosaurs were during their prime. So, some serious miscommunication is bound to happen.

2. Signifying functions in a written sign

But what is the written sign, that is alive with and within the subject, actually like? Is it divided in signifiers and signifieds? What kinds of signifying processes are central to it and how are they connected? Elaborating on this aspect will reflect my interest in Japanese writing, especially its earlier stages.

My first point here concerns signifiers and signifieds: in my view a written sign cannot be permanently divided into signifier signified (which is perhaps true of any sign). A written sign is a complex whole and its ele-

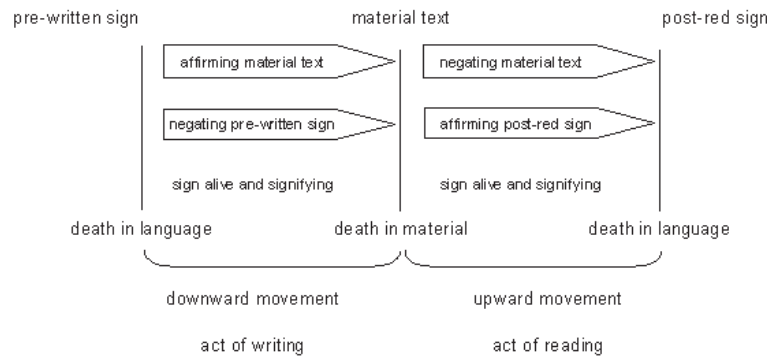

Figure 1. *Reading (what is) written.*

ments are bound together by the signifying tension. Whichever part of it is actualised first in *Dasein* will play the role of the signifier. The rest of the sign, the not-yet-existing signifying potential, is dragged along with it and by it, being affirmed or resisted by the subject. The affirmation of and resistance to the moving, living signifying element is always partial, contributing to the upward or downward movement of the sign. In this sense, my view of the written sign resembles what Julia Kristeva, in her *Sense and Nonsense of Revolt*, describes as the “thing-presentation/word-presentation heterogeneity” (1996: 33–34). I quote Kristeva:

For example, if I imagine the thing “train”, the sound level, visual level, tactile level, and so on of this representation constitute a complex, stratified set, which I will call a *layered* representation of the object or thing. ... The word “train” comprises not only its acoustic representation but also its reading-image, for “I” know how this word is spelled; the spelling of “train” is added to the sound “train.” “I” must also consider graphic representation, because “I” can write, and therefore the representation of my motivity comes into play.

Though her emphasis here is not on writing, Kristeva binds it closely to language. In a similar way the written sign can be seen as a layered complex composed of series of representations with no real clear division into a signified and a signifier.

My second point is about signifying functions. Let’s imagine that “I” was living in tenth-century Japan. What kinds of layers and levels would “I” imagine a written sign to have? There would be the “style” of the

graphic organization of a written sign: complex, simple, whole, simplified, cursive and so on. These would have a connection to more or less established writing-systems, which in use becomes something I call metasemiotic index. A writing-system used by officials gains a metasemiotic index referring to “officiality”; another, used by females writing their diaries, starts to signify “femininity” and “unofficiality”. There would also a precise, organizing movement employed in a single graph and accompanying the graphic trace. There would be elements that are pictorial or related to corporeality, transcending the language and the symbolical (rendered outside the symbolic order in the Kristevan sense) and thus transcending writing. There would be a sound, in itself and as part of a pronouncing-system (at least when referring to a Chinese character). There would be a word, as a part of spoken discourse, and in the case of *Kanji* (discussed below), there would be also a “meta-word” or a meta-linguistic function; a linguistic element or function not bound to a certain language (hence the possibility of pronouncing the same graph in Chinese and Japanese); and last, an ideographic connotation transcending concepts. (I by no means want to deny the latter, just to strip away the central position given them in typical western thinking.)

The main signifying functions are presented in Figure 2. In this figure the elements placed outside the triangle – defined as material, metasemiotic and linguistic – transcend writing. We can now see how the “metasemiotic” pole is dragging some of the elements (that is to say, signifying functions with meta-semiotic interest) aside from the line defined by the material and linguistic poles.

My third point is about resisting and affirming. While encountering the signifying functions at work or as potentials in a written sign, the reading or writing subject can resist them or affirm them. This is the contribution of the subject to the vitality of the written sign.

3. *An example: Encountering written sign in Tosa Nikki*

To conclude I will introduce and elaborate on an example taken from classical Japanese literature, namely, the famous first sentence from Kino Tsurayuki’s *Tosa nikki* from the tenth century. But before going into to the analysis I will summarize some general points about Japanese writing of the time, as these are central to the following discussion.

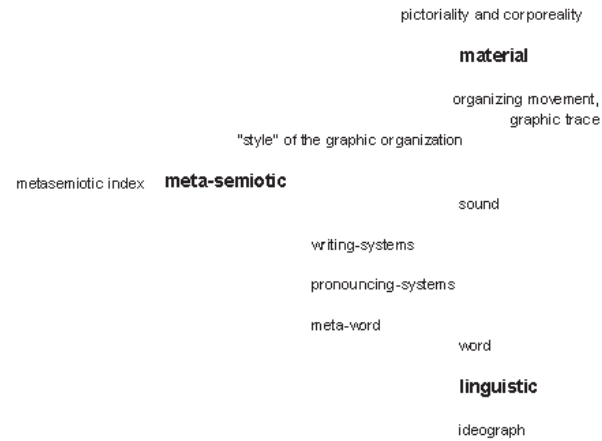

Figure 2. *The main signifying functions in classical Japanese writing.*

In classical Japanese culture there is a dichotomy between Chinese writing (writing with Chinese graphs, *Kanji*, in Chinese word-order) on the one side, and Japanese writing (a cursive simplification of *Kanji* used phonetically, the *kana* writing) on the other. This view has been challenged, for example by Thomas LaMarre (1994: 254–255), who renders the whole dichotomy as “stylistic”. The use of Chinese writing was during Tsurayuki’s time considered masculine, since learning Chinese was restricted to males.¹ Women would write their diaries in Japanese (*yamato kotoba*) using the *kana* writing, whereas official writings were done in Chinese. *Kanji*, due to its visual complexity and ideographic functions, could be classified as a kind of ideo-visual writing; *kana* would be conceived as less visual, leaning more towards recording to spoken language.² The diary recording Tsurayuki’s voyage is written from the perspective of a woman and thus in *kana* to facilitate discussion of feminine topics, to give the text a broader audience, and so forth. This explanation has been countered, however; for example, by claims that Tsurayuki’s intent was to create fictionality, or a space to discuss poetry in Japanese, or to create a revolutionary, gender-bending text (cf. Miyake 1996: 42).

I will set aside for now such traditional views on visual-male-official and phonetic-female-unofficial linger, and analyse the first sentence of *Tosa nikki* as a subject’s encounter with a written sign. And I will try to let

the fictional, writing subject resist and affirm the signifying functions she will encounter.

Tsurayuki writes: おともすなる日記といふものを、おむなもしてみんとてするなり。

I'm not a native speaker so I will not try to translate this into English, but will settle for citing a few translations. The first is by Helen Craigh McCullough: "I intend to see whether a woman can produce one of those diaries men are said to write" (1990: 73). The next one is from Earl Miner: "It is said that diaries are kept by men, but I shall see if a woman cannot also keep one" (1969: 57). And last, the version of William N. Porter, printed in full cursive as a kind of subtitle: "It is generally a man who writes what is called a Diary, but now a woman will see what she can do" (1981: 13). My own translation in Finnish goes like this: "Kun kuulemma miehetkin pitävät päiväkirjoja, katsotaanpa, voisiko myös nainen sellaisen kirjoittaa". Since all these translations have their pros and cons, I feel it is necessary to keep them all in mind.

Let's start with a simple overview. The writing subject states: "I am a woman. I am writing in Kana. I am writing in my mother tongue." The connection between the *Kana*-writing, Japanese language, and femininity is affirmed. The writing subject is actualising her idea in graphic movement producing a material text. The graphic qualities of *Kana*-writing are present. Also affirmed is the connection between the visual image of *Kana*-writing and the meta-semiotic index referring to femininity and unofficiality. "I will write a diary, as men do." The comparison between masculine and feminine is posited by the use of a particle も connecting the words おとこ, male, and おんな, female. The particle も binds two things of slightly uncertain nature together. Thus, a mild doubt is resisting the act of writing, resulting in ambivalence: "Men write diaries. I can do what men do. I can write a diary. I'm not sure ... do men write diaries? I am not sure ... can I write a diary?"

But from where does this uncertainty stem? The female writer states that she has not yet completed her act of writing, so the outcome that she is poised to see by herself is still uncertain. Literally, she states that she is intending to observe the outcome of this undertaking. So only the successful act of creating a material text, a *post-written* sign, can convince her of her capacity to write a diary. The writing subject is referring to a completed act of writing, thus implying that what she aims at is *not* that the text be

read, or in my terminology, what she aims at is not a living written sign but a sign of completed action that does not primarily work as a written sign *per se*. So the main focus is moved away from written signification, transcending it, probably in the direction of the meta-semiotic: “I, as a woman, was able to write.” This lack of interest in reading the written gets support from the final sentence: “After all, I suppose the best thing to do is to tear up these sheets at once” (McCullough); “It really is best that I should tear up these papers and end at once” (Miner); “Well, well, – this must be torn up at once” (Porter).

The 知る connected to male writing activity refers to something that is general knowledge of an uncertain nature, or as commonly translated, to hearsay (the Nihon Koten edition also supports this interpretation) as to the uncertain status of male diary-writing. This brings me to the last point I wish to make about this example: knowledge of diaries written by men in Chinese is (at least implicitly) modalized auditorily, as resistant to the visuality and un-auditorality of Chinese writing. At the same time, *Kana*-writing has strong visual presence, and an implicit reference to visual modality can be traced in the 見る connected to female writing activity, as discussed before. This implicit “seeing” is present in all four translation I have presented (“I intend to see”; “I shall see”; “will see”; “katsotaanpa”), and the auditory nature of information on male-writing is present in three of the four (my own included: “men are said to write”; “It is said that”; “kuulemma”). So, the writing subject is resisting the visuality of *Kanji* and at the same time affirming the auditivity of *Kanji* and the visual nature of *kana*. The only visible *Kanji* in the sentence are present in the spelling of the word 日記 (a diary), which in this sentence is attributed to male writers. So male diaries and their writing gain a small, yet existing visual presence, in a kind of citation and implied to be something uncertain, thus on the side of the presence of female writing.

Notes

1. Tomiko Yoda (2000), for one, challenges these views.
2. Conflicting views are presented by Thomas LaMarre and Marshall J. Unger. LaMarre (2000) questions the visual/auditory division of Japanese writing. For his part, Unger (1990) challenges the whole idea of “ideogram” and thus the exceptional importance often accorded the visuality of Chinese script.

On publicity and reflexive journalism

The socio-semiotic longitudinal analysis of media

1. Publicity

A continuous change of socio-political structure is going on in society, which we are able to follow and understand to a greater or lesser degree. This change of structure includes both more universal and more specific elements. The indicators of structure and structural change include *public texts* that are freely and widely distributed in large numbers. Structural changes can be observed, for example, through the *public text flow* – the structure and essence of texts that are emphasized during various periods and in different forms of communication (e.g., newspapers, TV).

I would argue that the most universal philosophical functions of public texts are unchangeable. Bühler (1934) and Jakobson (1960) determined the parts and functions of textual presentation. Lasswell (model 1948) theorized communication as a dynamic process, where every preceding situation affects the following one. Different communication models stress different aspects of system and process. One aim of process models has been to predict the behaviour of the participants in communication (Wii 1994: 19). This approach can be extended to public texts as well: on the basis of flows of texts, supported by media examples, one can determine the kinds of behaviour that are accepted and produced in a society (Lõhmus 2002).

In the field of journalism and media, the principle of the “public” is pertinent, since it seems to make a difference in distinguishing between important and unimportant topics. The importance of *publicity*, which is not a separate feature but a central property of media, continues to grow society – politics and culture are directly dependent on it in different

aspects. The *space of publicity* includes the whole or totality of possibilities. The understanding of *public values and principles* has been a subject of scientific research since Jürgen Habermas published his *Strukturwandel der Öffentlichkeit* in 1962 (in English, 1989). According to Habermas, there are different “spheres”, including the public spheres of culture and politics. During some periods, there has been a certain balance between different “public spheres” (for example, in Estonia during the transitional period 1987–1991); at other times, the political and cultural public spheres clash (e.g., in Estonia, 1970–1987).¹ Habermas’s concept is a valuable one for the analysis of media coverage.

Our longitudinal research has focused on the *principle of the public*, *value systems* and *agents* (heroes) in newspapers. This research is based on the understanding that public values may differ in countries of different historical backgrounds. Our approach is comparative in nature, since we are attempting to show differences between the evolution of Western and Eastern types of public. In doing so we can ask how the *public* has been cultivated, how it has been *covered* in media, and how it has been presented as *a construction for the public*.

One way to proceed is by analysing the structural changes in the ways society has been communicated. What are the main variables, or “cultural indicators”, that are used to characterize the “public”? What are the main topics of discussion? How are stereotypes clarified? What are the basic values presented? Etc. We attempt further to elaborate theories of the public sphere and public text by studying media texts as public practices on a longitudinal scale. It is important to stress that reference to the “public sphere” in terms of “public text values” (and vice versa) is a new approach in the social sciences. A typology of “indicators for public values” allows us to compare on an inter-cultural level the roles of media, media-presented value systems, as well as the agents and reflexiveness of media. In addition to linguistics and semiotics, it is also important to consider social practices, social capital, and “fields of practices”, as investigated by Pierre Bourdieu. Those are key questions at the level of the individual, of a society, and of an entire regional structural (EU). Communication between agencies at those levels influences meanings, resources and general processes.²

2. *Sociopolitical myths*

We may start by identifying the main elements of a social system and its media practices, then analyse the functions of these elements. I have used this method in my research on the Soviet political system and Soviet media practices (Lõhmus 2002: 64). But the structure of the model is universal, and may be applied more globally. Since media publicity as a vital domain symbolically features the whole system, I propose the following indicators/elements on three main levels: 1) *political sphere – sustenance of the political structure*: how that structure, its institutions and functions are defined and how dominant/collective ideas are conceptualised; 2) *the sphere of practices*, such as collective participation and other social, material and practical actions: the motivations and roles available to individuals for action in society; 3) *the personal sociocultural sphere*: how individuals and their identities are defined.

I have used this approach in my study of censored media texts. These provided empirical proof for the assumption that different transformations of texts, in the process of their being adapted to political norms, enable us to infer a typology of changes (Lõhmus 2002: 63–65). It was my conclusion that the background for the typology is that of the general societal-hierarchical structure.

3. *Expectations and reflexive journalism*

Previously, similar basic questions have seldom been jointly asked (see Schramm 1954; Gerbner 1969; Merrill 1977). Sketching the general picture is one of my main aims: an attempt to visualise the entirety of the systems behind these media issues and, through media practices, to describe the general, underlying logic of systems. The key-word for “reflexive journalism” is *expectations*. We should mention the fact that *publicity* and people’s *expectations* don’t necessarily match. *Expectation* is no longer a reflexive term but part of a socio-political construction. Expectations are the main field of struggle for meaning between different political constructions and the reflective culture. In public, and as publicity, something is put forward to justify *imaginary expectations* (officially defined as *general expectations*); at the same time, the real expectations of real people are either ignored or have not been considered at all. Thus, a situation may occur where public-

ity does not take expectations into consideration but, rather, misuses the readiness for expectations. This principle – *misusing public attention* – is the basis of advertising, politics, and ideologies. Through the construction of publicity – mental publicity – it is possible to mould the thinking and behaviour of people and to impose different habits and new expectations.

To understand the structural changes in publicity, both theoretically and in practical terms, it is necessary to observe public texts over a more or less extended period of time. This treatment attempts to give an integral view of “publicity” in a post-structural paradigm, that is to say, to remove academic discussion from its dominant, normative status. Research dealing with longer periods of time has been rare in Europe (see Becker et al. 2000). For example, in the framework of the international research project “The Formation of National Identities in Post-war Europe”, patterns of identity-construction were studied in seven European countries (see Luostarinen 1998). The project centered only on media analysis, however, hence producing an insufficient interpretation by the omission of many other sources.

4. *Model for longitudinal analysis*

Two lines of analysis serve as the basis of the present research: 1) First is the analysis of media over a relatively long period of time, which provides a general overview and indicators for understanding what has happened. 2) Second, analysis of already completed sociological research, which provides the context for media analysis. We have chosen to study Estonian journalism during the period 1940–2005.

A difficulty in coding the essence of a long time-period arises from the fact that changes in society take place quicker than do changes in media. Despite the widespread belief that journalism calls forth new situations and determines our understanding of them, we take the opposite view as our point of departure: we understand *journalism as a stable structure*. The stability (or stasis) of journalism’s main elements forms the background against which it is possible to study essential changes in sociocultural practices, in how they are presented, and in the essence and focus of texts that are spread throughout society: the sociocultural environment that reflects and/or shapes reality.

Quantitative methods make it possible to answer the question “What is the situation?” But such methods are limited when it comes to explaining the causal reasons of a phenomenon, that is to say, “*Why* is as situation as it is?” Using texts as objects of research requires answers to both questions. The text as a research object is qualitative, as it includes cultural meanings, signs and codes. Thus, a methodology is needed that will open these meanings; qualitative text analysis is inevitable. The research becomes richer by a comparison of different periods and different objects, and analysis of chronological moments can be conducted with textual materials as well as questionnaires. In our research, a distinction is made between main dailies and “yellow” newspapers, so as to reflect as wide a circle of opinions as possible. Thus the analysis should include texts that consider readers as a *public* as well as those that consider them as a *crowd*.

Our aim has been to gather an ordinary and typical sequence of common newspapers, a general treatment which includes few exceptions that would influence the overall view. Every fourth year, starting from 1941, was chosen for analysis, as well as the year 1940 (1941, 1945, 1949, 1953, 1957, 1961, 1965, 1969, 1973, 1977, 1981, 1985, 1989, 1991, 1993, 1997, 2001 and 2005). The interval is neither too short nor too long. Every decade is represented by two years, and some decades by three years. For complicated crossover times, we have also coded the in-between years. Thus, we have coded the year 1940 – when a fundamental change occurred (occupation) in the structure of Estonian society – as well as the year 1991 (from the period 1989–1993), when the Estonian Republic was officially restored. The analysis interval is somewhat biased, because the time-period was set so that it would contain years considered important by Estonian sociologists.

The choice of newspapers includes: 1) a national, centrist paper (*Rahva Hääl*); 2) a local-level but similarly centrist newspaper that had a more reflective-critical role, *Postimees* (previously *Edasi*); 3) an even more localized paper, featuring aspects of everyday life, *Tee kommunismile/ Sakala*; 4) a national newspaper for young people, *Eesti Päevaleht* (previously *Noorte Hääl*); 5) a “yellow” newspaper, *SLÕhtuleht*; 6) the Russian daily *Sovetskaja Estonija*, representative of the official direction on the local level; 7) *Sirp ja Vasar/Sirp*, a cultural newspaper, established in 1940, mainly for publicity purposes. Only the main issues of these newspapers were selected, with supplements omitted. Not all material prescribed by the *coding instruction* was dealt with; only that from the first workday of

the week (Tuesday issue) and the weekend issue (Saturday). As for other issues, we started from page 3 of the instruction – we analysed only the essence. The same was done in the case of the first and last issues of the year. For the issues for other days, scrutiny began with on the second part of the coding instruction (“Article: General characteristics”). The percentage of material left out of the analysis (% of the whole newspaper) was determined only for two issues (Tuesday and Saturday). The materials left out of the analysis were those with formal content; for example, short news items and notices, advertising, PR materials, obituaries, official notices, TV and radio programming, pictorial news, weather predictions, etc. In the case of these materials, we determined what percentage of the paper they constituted. Approximation was used in determining this proportion – the basis of calculation was a percentage division of the paper into number of pages (how large a percentage one page made up). If the material omitted from analysis consisted of notices and news, then those items’ headings, page numbers, columns, genres and sources were mentioned. The unit of analysis was the article: a written work with a heading and clearly determined beginning and ending. If the piece was accompanied by illustrating materials (picture captions, tables, figures etc.), these were considered part of the article.

In deciding about the inclusion or omission of articles, it was essential to have knowledge of the coding instructions. I would like to emphasize that the whole newspaper was read. If it didn’t include more than five articles that were suitable for coding (including all criteria needed), it was considered unwise to add another five articles to get 10. The golden rule of coding was: code only the things available, don’t invent anything. All the formal and essential characteristics mentioned in the coding instructions were coded in the article. From each issue, articles with the following genres and themes were coded: 1) the central article of the newspaper (the one considered most important by the issue itself, determined by position, emphasis, etc.); 2) editorials; 3) letters from readers; 4) opinion articles (including humour and satire, if they remarked on society); 5) articles on political direction and action; 6) cultural identity articles; 7) articles on social problems; 8) human-interest articles; 9) articles on society and publicity; 10) other articles dealing with how people had changed, the duty of people towards other people/society, the shaping of collective thinking or

the action of the state/system in favour of a person, and other complicated topics; 11) other articles.

5. *Coding principles*

1. For the coding of a newspaper the whole newspaper was to be read. In coding, it was not necessary to search for all the meanings that might be in the text; only those that were *evident* were coded. In the case of the essential categories, coding could be more interpretative, but had to lead back to the text.

2. We departed from the *minimum* programme; that is, from the guideline that only the most important items should be noted.

3. The use of *latent class analysis* (Lazarsfeld & Henry 1968) allowed us to determine more general meanings in the text. Assumptions didn't have to be expressed exactly according to the coding instruction, but they had to have the same idea. For example, take this quotation from an article: "On some questions the reader receives less information than he would like to receive [...] what the future of our city, our country would be like. But also some international events need explaining. [...] That there has been little discussion about these problems isn't necessarily due to a lack of interest on the part of readers" (Soontak, *Edasi* 27.12.1968). At the base of this passage, claim No. 209 is coded from the instruction: *People are interested in politics*.

4. *Choice of coders and validation of coding*. Coding was complicated because in many cases it dealt with meanings and interpretations beyond those specifically stated in a text. This set high requirements for the six women coders, five of whom were Estonian and one Russian (who coded the Russian issues only), all of which started their work simultaneously.

5. *Table of coding*. The table of coding included both formal and content parameters of the issues, which had been categorized structurally. Explanation of the processes and changes in various category-indicators made it possible to survey changes in the structure and essence of publicity and, through this, also the general changes in the meaning process (see Table 1).

LEVEL	CODED INDICATORS
1. ARTICLE: GENERAL FEATURES	o) Ordinal number of the article a) Edition b) Date..(e.g.: 01.10.90.) f) Placement of article. <i>Write the page/pages number/s on which the article is placed; if placed on two or more pages the article is indicated by both numbers, separated by a comma.</i> g) Importance, decided on by article's placement and length h) Location of article i) Emphasized elements of the article. j) Rubric of article, coded in accordance with the newspaper definition k) Title of article (write out) l) Characteristics of article's title m) Keywords of article n) Genre of article o) Formality of article (how official, relationship to individual) p) Emotionality of article q) Character of expression r) Subject of event s) Proceedings and functions of article t) Author of article t.1. Author's name and reference (write out in mode written in the text). t.2. Gender of the author t.3. Status of the author u) Used info sources u.1. - u.3. Personal info sources u.1.1. - u.3.1. Name and reference of the source u.0. Gender of the personal source u.1.2. - u.3.2. Status of the source u.1.3. u.3.3. Source's origin u.4. Impersonal sources u.5. Sources mentioned in the article are in harmony or in conflict v.1. Institutions and organisations mentioned in article v.1.1. Evaluation the author gives to institutions and organisations
2. CATEGORIES OF CONTEXT	A. ROOM B. TIME D: VALUES. <i>The list below shows the measure of the features and and how they are valued. If in the list there is no value presented in the text, it should be written below the suitable level. If it is possible to define the value only on an abstract level, only a common category will be indexed (level 1.1 – 5.5.). NB! The values are not arranged in a hierarchical way, but according to how they are presented in the text; they are indexed in each common category: D.0. In this list the predominant value in the article/or defined as the most essential is determined (write the code). D.1.1. - D.1.3. Mark those which are valued (write the code)</i>
3. THEME AND MESSAGE	E. FIELD OF THEMES E: 1.1. - E.3.1. Fields of themes E:1.2. - E.3.2. Problems/dangers/casualties named in the field of themes (write out which ones) E:1.3. - E.3.3. In this field, achievements and success/victories are named (write out which ones) E.4. If shown in the text, what is considered to be useful (write out) E.5. If shown in the text, what is considered to be unprofitable (write out) F. CHANGES F.1. Is any ideal, hope or wish named in the article? F.2. In the article is there any mention that the situation has changed in comparison with earlier times? F.3. What changes have been mentioned in the article (the estimation of changes)? F.4. Is it stated in the article that the present situation must change? F.5. In the article, are there any suggestions on how the situation should change? F.6. What is presented in the article as progress, something worth achieving? (write out) G.1. Necessity of article for publicity at present moment (this is coded according to the coder's self-knowledge) G.2. Article's resonance and common interest in publicity at present moment (a coder estimates it according to self-knowledge) H. The size of the report is determined I. It is marked on the basis of whom to believe in the report.
4. NARRATIVE	A) Argument(s) presentation, balance and extension of argumentation B) Intertextuality of article – does the article point to earlier published reports? C) Article's symbolic context D. CAST-Characters D. Number of essential characters in article D.0. Me-character D.1. - D.3. Name and reference of acting person. D.1.0. Gender of character D.1.2. - D.3.2. Status of character D.1.3. - D.3.3. Origin of character, if it is clearly in the text or if it's inferred D.1.5. - D.3.5. Estimation given to the character by the author D.1.6. - D.3.6. The main indication of the character (write out) E. Groups. F) Kind of application to reader G) Roles given to reader H) Essential quotation if present in the text .I) Commentary on the text (show double-entendres if present in the text)
5. LCA	1. Publicity and its subjects 2. Political publicity and history 3. The Culture 4. Social structure and state's role 5. The individual and the society 6. Public media 7. Power 8. Individual <i>THEMES ANALYSING PUBLICITY DISCUSSIONS Arguments expressed in the text!</i>

Table 1. Table of coding: List of variables (Lõhmus & Kõuts-Klemm 2005).

6. Conclusion – Towards an analysis of the global media sphere

In conclusion, we created a typology of main indicators that could be used to describe changes in the public sphere. Applying these indicators to the content analysis of media, we described changes in the public sphere during different political regimes. Although the present database allows us to point out the most influential cultural indicators, it is important to

clarify whether they are unique or can also be applied in similar circumstances in different cultures. The *typology of cultural indicators* is universal in nature; it allows us to compare the role of media in creating the public sphere in different cultures. Second, we focused on the question of whether the reflectivity of media can be measured (for instance, via frequency of topics or intensity of attention paid to certain areas of life). Third, we questioned how the “public” is construed in mass media. Fourth, the fundamental aim of our project was to analyse the “public” as a representation of *collective reflectivity* and/or as a *construction*.

We focused on policies towards media as a sphere of interpretation in the twentieth century, the construction of social reality in different media cultures, and the comparative mapping of topics that represent the public in different countries (topics such as the economy, history, power, social stratification, journalism, “high” culture, popular culture). It is believed that the results of our efforts, based on practical-data analysis, will produce a new theoretical and critical/practical approach to the study of the mass-mediated public. The database will also be used for student projects that concentrate on several aspects of the evolution of the Estonian public sphere, as well as for international comparison.

Notes

1. Estonia was restored as an independent state in 1991. At the end of the 80s and the beginning of the 90s, Estonian media suddenly enjoyed a high level of autonomy. It was freed from externally defined functions set by a totalitarian regime and became regulated by the rules of the media themselves. The comparison of different media practices – totalitarian, autonomous, and liberal – could provide valuable material for future studies. Self-reflexive media with an active organisational role in social processes are in themselves something extraordinary.
2. On the other hand, there is an important question about the *reception* of texts and the *expectations* regarding public texts; on this matter, see Lõhmus 2007.
3. This article is part of a scientific project entitled “The Role of Media in Creating the Public Sphere of Estonia and the ‘Public’ in Estonian Media: 1954–2005” (ETF5854).

Mobile communication: The misunderstood user

1. Introduction

In recent decades the digital revolution has reshaped habits and processes born with the Industrial Revolution, leading to the establishment of an advanced service-based society. Information and communication technologies (ICT), in particular the Internet and mobile phones, have become essential tools of everyday life and represent the enablers of a human-centric Information Society, in which citizens can actively participate through their communication capabilities (Viherä 1999). At the same time, ICT is also the engine of the global economy based on the paradigm of continuous economic growth, which favors a concept of user-consumer rather than citizen. Understanding the needs, wishes and orientation of users should be the starting point for the development of future technologies and Information Society policies. Human-computer interaction (HCI) and user psychology (Saariluoma 2004) represent suitable frameworks for the investigation of user behavior. Scientific knowledge and theories should be applied to create a convergence of perspectives on the identity and role of users, overcoming the current conflicting views of the main stakeholders. Through cooperation, human-centered strategies reconciling economic and social development could be outlined and implemented. In order to understand the current situation, knowledge is needed about users' needs and practices connected to the adoption of converging technologies. Important insight comes from the analysis of newspaper stories, which mirror the social consequences of political decisions and the market strategies of enterprises; in addition, they also reveal interesting initiatives suggested by citizens and negative social trends which should not be ignored. This article consists of two parts: in the following section,

we present data and methods of our analysis. Next, we illustrate and compare the main results, discussing their relevance for the development of the Information Society.

2. Data and methods

We investigated what kind of stories appear in newspapers about mobile communication and how users are described by journalists. Since the cultural dimension plays an important role, we decided to collect data from the online versions of “La Repubblica” and “Helsingin Sanomat”, the most popular newspapers in Italy and Finland. These two countries have different cultural backgrounds, but both are European Union members. We browsed the online archives of the newspapers searching for articles in which mobile communication had a central role. Due to the blurring boundary between the telephone, television, Internet and radio, we have often considered relevant such stories where mobile communication was implied though not explicitly quoted. Our search was restricted to a period of four months (September-December 2006). The huge number of articles was reduced to a subset by filtering the archive with a set of keywords connected to our search. In this way, we obtained 83 articles, 18 from the Finnish newspaper and the remaining ones from the Italian paper. In our investigation, we tried to identify the users described in the story, classifying them according to the role they played in the article (car driver, student, worker, consumer, etc.). The resulting categories are partially overlapping, and in some stories more actors were identified. In the analysis, we also tried to uncover the goal or task of the user, by interpreting the journalist’s point of view. The original versions of the articles were written in Italian and Finnish, hence the English text fragments reported here are free translations from the original texts done by the authors of this article.

3. Results

3.1. Mobile users as described by the Italian media

In the Italian corpus there were 10 main categories of users involved in stories of mobile communication (Fig. 1). Originally, there were more groups, but some have been aggregated; for instance, “mobile industry”

includes stories about telecom operators' strategies, phone manufacturers' new releases and other companies entering the mobile market. Similarly, the "consumers" category includes stories of different type of users, such as players of mobile games (6%).

Being creative innovators and early adopters of new technologies, the employment of mobile services by the young can indicate positive or negative trends, which should be carefully taken into account by both policy makers and enterprises. Stories about students represent 16% of the whole corpus; out of ten articles, nine highlight a negative use of mobile phones in schools and only one shows a positive example of cooperation between universities and the private sector to boost innovation. The following fragments illustrate the common practice of filming scenes of violence or sexual abuse during school hours using mobile cameras.

Figure 1. User categories in the Italian corpus.

[1] "Every student had a well defined role. The first one was kicking his schoolmate, the second writing Nazi-symbols on the blackboard, and finally, the third recording the scene with a mobile phone. The clip was some months later uploaded on the Internet." (16.11.2006)

[2] "Using video-phones (students) filmed violence on a 13-year old girl and sent the images to their friends, celebrating their bullying." (17.11.2006)

[3] "Five schoolmates were raping her in a park. A sixth person arrived during the violence, took out his mobile phone and filmed the scene." (18.12.2006)

Related articles discuss opinions of school directors, families and politicians about the need to increase control or ban mobile phones from schools.

[4] “*A thirteen-year-old student sharing indecent images or videos of other schoolmates is not capable of realizing what kind of problems his mistake can cause in the future, for instance, difficulties in career development or trouble in personal life.*” (12.12.2006)

Happily, students were also mentioned for their contribution as young innovators in the field of information and communication technology. Every year, the Nokia University Program gives awards for the best student project:

[5] “*Three students of the University of Pescara invented the holographic mobile phone, which is capable of displaying images, presentations and videos in 3D. [...] Their project could be commercially developed in a few years.*” (1.11.2006)

When the public and the private sector cooperate in a similar manner with citizens, advances can be made in the development of the Information Society. Unfortunately, most companies, and especially telecom operators, seem to be interested only in the average revenue per user (ARPU). Articles about the mobile industry represent 19% of the whole corpus, and 9% of them are about accusations of illegal operations committed by Italian operators, namely Vodafone and Tim. So far, the fight between mobile operators has had no winners. There is no doubt that the end-users are the real losers, as companies try to gain market shares through massive advertisement campaigns rather than developing and launching innovative services. In 5% of the stories, end-users are described as malicious hackers or crackers trying to take advantage of system security holes for gaining individual benefits. However, there are also stories about citizens’ initiatives seeking public good. For instance, mobile users had to pay a special tax each time they recharged their credit. In April 2007 the “re-charge tax” ceased to exist thanks to a political decision. However, the initiative for abolishing this tax, in use only in Italy, is due to Andrea D’Ambra, a student who set up a web-site, gathered almost 1 million signatures, and sent them to the European Commission. This result shows that self-organized individuals can and should have an impact on the development of the

Information Society. The significance of users has been acknowledged by American media, which often reports creative uses of ICT, in particular concerning the activity of bloggers and the Web2.0 phenomenon. For this reason, *Time* magazine has elected the ICT user as “person of the year 2006”. According to *Time* editorialist Lev Grossman, this is “an opportunity to build a new kind of international understanding, not politician to politician, great man to great man, but citizen to citizen, person to person” (Grossman 2006). Italian media have not ignored this important trend: 8% of the articles were about blogs and other Web2.0 technologies, while 13% were about citizens. In this context, the economic impact of grassroots innovations was often mentioned, but there were also many ordinary stories of disparity, with unskilled users presented as victims of the modern society.

[6] “*User-generated content will offer new opportunities to the economy and to the media, and will increase participation of individuals in public life. [...] The Web3 congress has confirmed the interest of enterprises for the Web 2.0, in which technology supports the active contribution of the user.*” (14.12.2006)

[7] “*A thirty-year-old person will have to pay a bill of 50 thousand for three movies downloaded online through a mobile connection. The user was connected for hours to the Internet, certain of having purchased a flat-rate contract with his mobile operator. On the contrary, the contract allowed 600 megabytes of monthly traffic at the fixed cost of 35 euros. Every extra downloaded kilobyte would be charged 0,2 cents.*” (19.12.2006)

3.2. Mobile users’ attitudes and practices in the Finnish media

In the Finnish corpus, there were 5 main categories of users involved in 18 different stories about mobile communication (see Fig. 2).

Most stories (26%) described mobile users as clients, customers or consumers, suggesting that individuals are considered only as a source of income. This type of thinking reflects a superficial view of users, who are also depicted as a large and homogeneous group of individuals, without different needs, wishes, capabilities or other distinctive features. This orientation towards a “faceless” user was found in 39% of the sample articles, which aggregate two categories: consumers and special groups, the last

Figure 2. User categories in the Finnish corpus.

including people who cannot communicate in the Finnish language, such as immigrants and some of the disabled. In 11 articles (61%) the journalists clearly describe the positive or negative user attitude and behavior towards mobile technologies.

[8] “*Finns have received fake bills via SMS. [...] Tricksters have sent fake bills to mobile phone users.*” (5.9.2007)

[9] “*The mobile phone is harmless – or is it? [...] Consumers are worried about the radiation emitted by mobile phones. [...] Studies don’t show any evidence that radiation could be harmful, but worried consumers are advised to use hands-free sets.*” (1.11.2006)

The selected fragments clearly show how users are presented either as victims or as guilty of dubious actions. For example, in the case of SMS loans, people are seen as unable to make their own decisions. Similarly, in the fraud concerning fake bills, users are described as easy to cheat. In contrast, mobile users who are concerned of radiation are advised to use hands-free systems, although studies are quite reassuring as to the safety of mobile phones. All in all, users are described in a rather negative, patronizing manner, being judged incompetent to make reasonable decisions.

[10] “*An online video shows a guard hitting a man lying on the ground. An outsider recorded the video in secret by mobile phone and uploaded it to the Internet, and it clearly showed maltreatment. Police used it as evidence.*” (15.11.2006)

People are still unaware of their rights or what is considered as suitable behavior. In this case, the video clip helped in the investigation of the case. But that does not justify the secret recording and uploading of the video to the Internet. There is an urgent need for clear rules about video recording in public places and showing them online. The story does not tell if the person who recorded the video received any punishment for having shared the clip online without any permission.

[11] “*Consuming service betrays background of products. [...] Ecological and ethical consuming is difficult. [...] A new service is under development to help selected consumers. [...] Upon request, detailed product information could be displayed on the cell phone.*” (20.9.2006)

In the last example, a new mobile service has been developed for consumers who want to verify the origin of products they are going to purchase; in particular, users are concerned about ecological and ethical product information. Volunteers collect information in public databases, so knowledge can be shared and spread via word of mouth. This is a good example of how technology can support social innovations and create a sustainable society, in which users can self-organize, thus playing an active role in content creation and promotion.

4. Discussion and final remarks

Our investigation shows that we are already experiencing the social consequences of digital convergence, which will become even more evident in the years ahead. As Marrone (2004: 198–201) showed in his socio-semiotic investigation of meaning and practices of mobile users in Italy, the mobile phone has a dual nature, positive in some cases and negative in others, which reflects the nature of the owner. This multiplicity, which is common to every technological innovation, leads to analogies between the mobile phone and the handgun. Both are small, portable, and to be hidden in the pocket. In addition, they both bring a sense of power and security to the user. In order not to use them wrongly, caution and responsibility are required. Like portable multimedia computers, modern mobile devices offer the user a wide choice of functions, and these will be even more various when ubiquitous technologies become available. The increasing complexity of understanding the interplay between ICT, users and society

make decision-making a real challenge. The goal of increasing the quality of life and social cohesion implies the finding of proper solutions to major challenges, which are human rather than technical.

Our analysis opens only a small window to the problem, but hopefully reveals some interesting ongoing trends. All in all, there are no major differences between Italian and Finnish stories, although media interest and type of articles are influenced by cultural background and journalistic tradition. Concerning the way users are conceptualized by enterprises, both Italian and Finnish stories of mobile communication agree on the idea of “faceless” users, valued only for their ARPU. In addition, because of marketing strategies and the digital divide, some users either cannot participate in the Information Society or become victims of services that should improve their lives. Our analysis has also shown the drawbacks to conceptualizing the user in a simple way. Moreover, the utilization of mobile cameras in Italian schools shows the need for technologies to provide freedom, but also a degree of control. Strategies should not be too strict or centralized, because that might prevent grassroots innovation and open circulation of ideas. So far, enterprises and institutions have adopted two different user conceptualizations: the former derives its models from marketing, and labels users mainly according to their consumer habits; the latter emphasize education, current issues, and preferences of the citizens. A unified view of the user is needed as a starting point for a convergence of policies; in this context, social capital theory (Portes 1998:1–24) could present a suitable framework, since it suggests that economic growth might arise from investment in strategies focusing on people and their social interactions. Because mobile communication is inherently social, our future research will investigate suitable design methodologies for mobile and other services aiming at reconciling social and economic development.

Pentti Määttänen

Secondness and the limits of conventionality

Linguistic meanings are conventional. A string of letters can, in principle, mean anything. In practice, however, we cannot change linguistic meanings arbitrarily. We must accommodate our linguistic behaviour to prevailing practices, to certain conditions of using language. The question is what these conditions actually are.

The answer to this question depends on the concept of meaning. If the source of all meanings is language, the only limits of conventionality seem to be cultural traditions and historically formed discursive practices.

In Peircean semiotics, however, the notion of meaning is wider. Peirce writes that “what a thing means is simply what habits it involves” (*CP* 5.400).¹ Elsewhere he writes that “the meaning of any sign for anybody consists in the way he reacts to the sign” (*CP* 8.315). In other words, meanings simply are our habitual reactions to different sign-vehicles.

There are different sorts of habitual reactions. In classical pragmatism the emphasis is on non-discursive reactions. In semiotic terms this becomes apparent in Peirce’s notion of interpretant. It is often pointed out that the chain of interpretation may be endless, at least in principle if not in practice. Sign-vehicles are interpreted with interpretants. These interpretants may be new sign-vehicles which are interpreted with further interpretants and so on.

Peirce has, however, a special kind of interpretant, the final logical interpretant, which is a habit of action. “The deliberately formed, self-analyzing habit – self-analyzing because formed by the aid of analysis of the exercises that nourished it – is the living definition, the veritable and final logical interpretant” (*CP* 5.591; see also, 5.494). So the chain of interpretation is not necessarily endless. It may end in a habit of action, and a habit of action is realized in actual action. We act upon our interpretation, that is, we act according to a habit.

The perceived world is ultimately interpreted with our various habits and practices that take place in the same world. The mediating interpretative chain may be long, twisting, and multilayered. Many strands of this chain are not supposed to have much to do with our concrete practices. But this is not our concern here. We are dealing with meanings of non-linguistic sign-vehicles. From the viewpoint of Peirce's wide notion of meaning, ordinary objects of perception like trees, tables and buildings are meaningful entities in their own right, and these non-linguistic meanings exist as the habitual practices that are related to these objects.

When interpretation gets down to final logical interpretants, to habits of action, the perceived objects may be also objects of action. It is important to note that in Peirce's pragmatism action is not just something that follows from experience and deliberation. His concept of experience is wider (*CP* 1.336). Mere sense experience is not enough. The world is also experienced through action, where the dyadic resistance of Secondness has an effect on habit formation, that is, on the formation of beliefs and interpretations of the world. Generally speaking, the perceived world is also the world in which we act, the world of objects of action. This can be analysed with the following semiotic triangle (Määttänen 1993: 42).

Figure 1. The semiotic triangle.

In Figure 1, **S** stands for sign-vehicle, **O** for object and **I** for interpretant. The triangle illustrates the fact that for Peirce signs are three-place relations; they belong to the category of Thirdness. This also holds for non-linguistic meanings. The three-place relation, illustrated by the triangle, consists of two-place or dyadic relations. This denotes, among other

things, that in non-linguistic bodily practices we meet the resistance of hard facts. This resistance belongs to the category of Secondness.

Dyadic resistance limits the conventionality of non-linguistic meanings. This is pointed out by Horst Ruthrof, who distinguishes between base constraints and constraints imposed by community. Base constraints are necessary conclusions drawn from situations where signification systematically fails quite independently of the discursive practices of the linguistic community. For example, one cannot act consistently on the basis of the idea that people can drink quicksilver and stay alive (Ruthrof 1997: 24).

The Peircean approach allows for a more specific analysis. The meaning of a hammer differs from the meaning of a pen, and this difference in meaning is precisely the difference in the ways of using these objects. And this difference is based on the physical properties of these sign-vehicles. There are things we can do with a hammer but not with a pen, and vice-versa. In other words, the physical properties of non-linguistic sign-vehicles typically restrict the possible habits that can be related to them and, by the same token, the possible meanings of those sign-vehicles. The signifying processes are modified by the physical properties of these sign-vehicles or, to be more exact, by the dyadic resistance we meet in dealing with these sign-vehicles. This is slightly more sophisticated than in Ruthrof's example, where erroneous signification simply ends abruptly if realized as actual action.

The basic difference between Ruthrof's approach and the Peircean one concerns the way in which the non-linguistic base constraints (to use Ruthrof's term) may affect signification. Ruthrof speaks about situations where signification systematically fails, where one cannot act according to a text, and where it is better to modify the interpretation of perceptions (Ruthrof 1997: 24). The terminology suggests that signification is linguistic, based on text. What is missing in Ruthrof is an explicit account of how non-linguistic sign-vehicles could be meaningful in their own right, independently of linguistic meanings.

A similar example is Umberto Eco's way of speaking about prelinguistic meanings as common dispositions of signification which have an effect when we step into language (Eco 1999: 144). Independent lines of resistance give some limits to discourse (*ibid.*: 50), but the dynamical object that makes us create sign-vehicles will always remain a thing-in-itself (14).

In Peirce's view the dyadic resistance of hard facts is experienced through actual action. This resistance does not have the status of a Kantian thing-in-itself that cannot be experienced. The resistance is experienced as objective conditions of action to which action must be accommodated if it is to be successful. In other words, resistance shapes the habits of action; that is, it shapes the meanings associated with objects of habitual action.

In sum, every object of perception functions as a sign-vehicle provided some habits are associated with it. The shaping of meaning by virtue of dyadic resistance depends on the nature of the sign-vehicle; the latter's physical character restricts the habits (meanings) that can be associated with it. The meaning of linguistic sign-vehicles can be analysed along similar lines. The usage of things like words, tools and instruments surely belongs to the habits that they involve.

Ludwig Wittgenstein's famous theory, according to which meaning is use, is therefore closely related to Peirce's thinking. However, Wittgenstein's definition of meaning is often interpreted as applying only to linguistic expressions, and his examples of using tools and instruments are only an analogy from this point of view (Wittgenstein 1953, I: sec. 11, 14). Wittgenstein's notion of language-game can be interpreted, crudely speaking, in two ways. It is possible to maintain that language-games contain only linguistic moves and that the relation between language and world is no longer an issue. Linguistic expressions have relations to other linguistic expressions, and that is all there is to it. Another line of interpretation stresses, however, that the use of linguistic expressions takes place in the context of non-linguistic practices; that there are also non-linguistic moves in language-games. This is how Wittgenstein puts it: "I shall also call the whole, consisting of language and the actions into which it is woven, the 'language-game'" (Wittgenstein 1953, I: sec. 7).

This latter interpretation fits well in with Peirce's definition, which is certainly more than an analogy. Tools and instruments are sign-vehicles, and their meanings are the habitual ways of using these instruments. As already pointed out, this notion of meaning can be pushed further to entail that objects of perception in general are meaningful entities which are ultimately interpreted in terms of habits of action, although we don't "use" all these objects in the same sense as we use tools and words. The crucial difference between linguistic and non-linguistic sign-vehicles boils down to the fact that the physical properties of letters and words are required

only for the possibility of distinguishing between letters and words. It is enough to see the difference between them. These physical properties do not restrict the meanings (uses) of them. But in the case of non-linguistic sign-vehicles the habits of using them are shaped by objective properties of the sign-vehicles and by agents as biological organisms. In other words, the dyadic conditions of this interaction, namely brute force and hard facts, muscular effort and resistance, shape the meanings that can be associated with non-linguistic sign-vehicles; but this is not the case with language.

If we are to be consistent, however, linguistic meanings are not independent of non-linguistic ones. Non-linguistic meanings are not conventional in the same sense as linguistic meanings can be, in principle. Thus even if it is possible to have meaningful thoughts independently of non-linguistic meanings, it is not possible to act upon those thoughts if they are not consistent with the non-linguistic meanings. In this sense, the conventionality of linguistic meanings is restricted by the same dyadic constraints as non-linguistic meanings. The constraints set up by the physical environment can, of course, be changed with the help of tools and machines. It is possible, then, to change the objective conditions of action in many ways, but this does not remove the fact that dyadic resistance is always involved in concrete interaction with the environment. Hard facts cannot be avoided. The dyadic resistance of Secondness also restricts linguistic meanings.

Linguistic and non-linguistic meanings form a multilayered system in which linguistic meanings are based on non-linguistic meanings – not the other way round. Of course, natural language is a powerful tool for writing poems and fairy tales, not to mention science fiction. But if the purpose is to discuss the relation between world and language, then linguistic meanings must be adapted to non-linguistic ones. The semantic relations from language to the physical world proceed through non-linguistic, meaningful practices.

Linguistic meanings are based on non-linguistic hard facts, but it is still possible to maintain that the experienced world is inevitably interpreted and meaningful. From the viewpoint of Peirce's wider notion of meaning, this does not entail that language carves up the world into meaningful objects of experience. The basic vehicles of interpretation and signification are given already by our corporeal interaction with the natural environment.

The basic requirement of non-linguistic signification is our embodied existence as living biological organisms. The categorization of the world into middle-sized everyday objects is given by this precondition of signification, and this categorization is an *interpreted* categorization by virtue of non-linguistic meanings; that is, by virtue of habits of action related to these everyday objects.

Linguistic signification is based on non-linguistic meanings, and they, in turn, are based on our embodied existence as living organisms. There is not much evidence for disembodied signification. Conscious human beings tend to be living bodies. Proponents of hard naturalism sometimes refer to the fact that categorization of the physical world is studied by the science of physics, which has not yet resolved the problem of the ultimate structure of matter (see Määttänen 2006). However, the distinction between liquids, solids and gases has not ceased to be a scientific distinction, and such a distinction will continue to be made in the foreseeable future. Indeed, it is hard to imagine what sort of scientist (after investigations that are equally hard to imagine) would try to convince us that this distinction is unscientific, outdated and abolished. The same fate would concern the existence of the hypothetical scientist as a human being.

Cartesian arguments in favour of disembodied consciousness will not do, either. It is a fact that one can doubt the existence of one's body, but one cannot doubt the doubt. However, mere doubt does not really annihilate the body. The conceptual difference between doubting the body and doubting the doubt does not imply an ontological difference between *cogito* and body. The problem is the same as in hard naturalism. There is not much evidence for the existence of *cogito* without a body, but, unfortunately, there is an enormous amount of evidence for the existence of bodies without *cogito*. The positive conclusion is that our embodied existence as living organisms is a permanent condition and a prerequisite of cognition based on meanings, linguistic or non-linguistic.

Juan Magariños de Morentin

Los bordes de la semiótica

La pregunta central que construye al temática de nuestra Mesa Redonda puede formularse en los siguientes términos: ¿En qué tiene que cambiar la semiótica, para seguir siendo (¿o para llegar a ser, de una vez por todas?) un instrumento eficaz para explicar la producción, interpretación y transformación del significado de los fenómenos sociales?

Como un comienzo de respuesta posible, me animaría a decir que la semiótica, si pretende llegar a explicarlos, antes que referirse al resultado logrado y al concepto construido, tiene que acompañar, sistematizar o incluso promover la dinámica de los concretos procedimientos según los cuales, en determinado momento de determinada sociedad, se considera que se producen, se interpretan y se transforman los significados que, en ese momento de esa sociedad, se atribuyen a los múltiples, diversos y dispersos fenómenos que constituyen el universo de lo social. O sea, habría que explicar el proceso de su producción para poder llegar a comprender el valor semántico diferencial del resultado; lo que implica admitir al significado como un resultado históricamente situado y no como una sustancia esencial y universal.

Según esto, la primera tarea de la semiótica, desde el punto de vista lógico, consiste en explicar, no ya el significado de los fenómenos sociales, sino, antes que nada, el proceso de *producción, interpretación y transformación* de tal o de tales significados. O sea, la semiótica tiene que poder explicar, siempre en el sistema de la racionalidad vigente en determinado momento de determinada sociedad, cómo se producen, se interpretan y se transforman, en ese momento y lugar, los significados, para, así, poder llegar a explicar adecuadamente (o sea: según la racionalidad del momento histórico y de la comunidad en el que formula sus enunciados y dando cuenta eficaz del fenómeno que está en condiciones cognitivas de percibir) por qué a determinados fenómenos se los percibe como portadores de determinados significados posibles.

Así que, por el momento, voy a irme refiriendo, preferentemente, a las condiciones de *producción, interpretación y transformación* del o de los significados, antes que a las características específicas constitutivas del *valor* del o de los significados de algún determinado fenómeno social, en su correspondiente sistema semántico.

También propongo, a la reflexión conjunta con el lector, considerar si corresponderá (como lo pretendo) establecer que, de estas tres condiciones, la fundamental es la de *transformación*. Porque el significado que, en determinado momento de determinada sociedad, permite percibir la existencia de un determinado fenómeno, *es un estado de tránsito*, que se hizo posible por haber existido un antes, desde el cual el significado que en él tenía ese fenómeno, contenía también, en sus bordes, la posibilidad de que se formulara el que tiene ahora. Constatación de una inaprensible actualidad, porque apenas comprendida y, en cuanto tal, percibida, ya se desborda hacia un después que, parafraseando la cita que Foucault hace de Althusser (1969: 12), revelará a este presente, cuando ya sea pasado en el futuro inmediato, como ideológico, ya que ese futuro consistirá tan sólo en la posibilidad de formulación de significaciones diferentes, dialécticamente superadoras, que harán ver otros fenómenos, en el mismo espacio donde está el que se percibe en el presente, el cual también así lo había hecho con los que se percibían en su pasado.

Éste es el sentido de *la interacción constructiva* a la que me refería antes y en función de la cual consideraba que, en el borde de los pensamientos posibles en un determinado momento, están, todavía *borrosos*, los nuevos pensamientos que requerirán de las nuevas formas semióticas que sonaban, todavía, como *furia* expresiva en el borde de las semiosis disponibles en este momento, al que, en lo fugaz de su transición, consideramos presente, de modo que esas nuevas semiosis permitan percibir, en un mundo futuro, fenómenos a cuya existencia no accede nuestro conocimiento presente, por encontrarse todavía en el borde *entrópico* de lo indiferenciable. En definitiva, sólo digo algo tan viejo como que el objeto de conocimiento de la semiótica consiste en explicar la transformación histórica del significado, entendiéndose aquí historia como la emergencia *del cambio*. La cuestión es asumir su dinámica, su racionalidad (actual y transitoria) y construir los modos fugaces de explicarlo.

He centrado la problemática de la semiótica en la exploración explicativa de las condiciones de producción, interpretación y transformación de

los significados, tal como estos existen en un momento determinado de un grupo social determinado y reclamaba, para la transformación, la calidad de ser fundamental respecto de las otras dos condiciones. La transformación construye la historia y, a su vez, la historia es una característica constitutiva del ser humano: no hay hombre/mujer si no es como una transitoria función entre lo que fue y lo que será, nunca detenida en el presente de algún ser definitivo, hasta que llega su muerte y, aún entonces, sometido a la historia de las interpretaciones que de ese ser continúen haciéndose.

Pero ahora, lo que propongo a los lectores es que me acompañen en la exploración de la interpretación, en cuanto trabajo necesario para la producción de la transformación. Una *interpretación transformadora* habrá de consistir en la producción de otro significado derivado del anterior, que ya no será el mismo, y, por tanto, en otra posibilidad de percepción del anterior fenómeno social, que ya no será el mismo. Si la transformación, como he tratado de plantear, se proyecta en una *dialéctica cronológica*, la interpretación, como espero que lleguemos a ver, se proyecta en una *dialéctica mental* (e incluso cerebral, o sea, neurológica, así como también situada (Suchman 1987). De este modo, propongo ubicarnos en un borde del concepto de interpretación, para explorar su comportamiento dinámico o sea transformador. En este sentido, considero que existen dos direcciones, relativamente autónomas, de investigación semiótica.

Por una parte, un nuevo, cronológicamente, estímulo perceptual (por ejemplo, algo visto o tocado u oído, etc., en determinado momento, en el mundo) solicita, en la memoria asociativa, la posible identificación de un atractor, en cuanto residuo de la significación identificadora de otra percepción ya histórica, que, ahora, se propone como interpretación de ese nuevo estímulo; o sea, se propone a tal significación histórica como la significación atribuible a la configuración existencial que se está percibiendo.

Por otra parte, en un recorrido inverso al anterior, la actualización, en la memoria asociativa, de la significación de una percepción histórica, permite, en el órgano sensorial afín a la significación de esa percepción, la recuperación actualizada de determinados estímulos sensoriales históricos (en su estado coyuntural de transformación) que originan, en el órgano sensorial involucrado, una configuración imaginaria.

La primera situación es aquella en la cual se percibe algo y, además, se sabe qué es lo que se percibe; en un sentido semejante, Peirce diferencia entre el “perceptum” en cuanto sensorialmente activador pero sin inter-

pretación que lo identifique y el “juicio perceptual”; por ejemplo en CP 7.630, siendo esta primera situación ya el caso del juicio perceptual. Esta capacidad de identificación de algo en el mundo depende de los resultados que aporte la comparación de la imagen sensorial registrada (visual, táctil, olfativa, etc.) con el atractor o registro mnemónico, o sea, con las imágenes sensoriales anteriormente registradas y almacenadas en la memoria y en función de las cuales la interpreta de alguna de estas tres maneras: (1) o coincide totalmente: vuelve a verse lo ya visto; (2) o se ve a lo que se ve como una modificación de algo ya visto; (3) o no hay registro que coincida en parte alguna con lo que estaría propuesto a la percepción; imposibilidad, esta última, de saber que se está viendo (no ya qué sea lo que se ve, sino que se anula la posibilidad de ver lo que se está viendo, ya que ver es identificar e identificar es reconocer). El proceso de *conocer*, en este sentido, consiste en la posibilidad (o en ser capaz) de percibir lo diferente, mientras que el proceso de *reconocer* consiste en reconducir lo diferente propuesto a la percepción a lo ya conocido, lo cual es desconocer lo que de nuevo tiene lo percibido (y algo recupero en esto de la reflexión del althusseriano filósofo argentino Saúl Kars [1971]). En el caso (1), la interpretación de lo percibido duplica lo ya conocido (lo reconoce sin incrementar el conocimiento). En el caso (2), la interpretación de lo percibido expande lo ya conocido (permite conocer a lo que se percibe como una posibilidad antes desconocida, por inaccesible, en el registro de la memoria asociativa; lo que implica expandirlo hasta llegar a sus bordes). En el caso (3), no hay posibilidad de conocer lo que se percibe, salvo (a) a costa de negar la existencia de lo percibido o (b) a costa de producir una ruptura que reestructure la memoria asociativa según reglas y relaciones diferentes a las que hasta entonces estaban disponibles, lo que implica producirlas a partir de los bordes de aquellas previamente disponibles; ruptura necesaria para generar una nueva forma de conocer, en la que tenga cabida la interpretación de lo percibido como un nuevo conocimiento (o sea, ya bien (a) se niega la percepción, ya bien (b) se niega el sistema con el que se la pretendía interpretar; lo que implica la presencia de un nuevo sistema como sucesor del precedente).

La segunda situación es *aquella en la cual alguien imagina algo*. La capacidad de imaginar depende de la posibilidad de actualizar recuerdos de efectivas percepciones sensoriales precedentes. Se mezclan, se transforman para construir un imaginario posible, pero en definitiva su materia prima

(mnemónica) preexiste. Con esto se rechaza el tradicional argumento de Z. W. Pylyshyn (1973), cuando niega la existencia de imágenes mentales (sustituyéndolas por secuencias proposicionales) por considerar absurda la presencia, en el cerebro, de una “pantalla” a la que alguien esté contemplando desde su asiento. Ironías y metáforas al margen, considero que las terminales sensoriales (retina, papilas gustativas, tímpano, etc.) son no sólo el receptáculo (la “pantalla”) que registra y transfiere, a las localizaciones específicas del cerebro, la entrada de los estímulos sensoriales externos (percibir), sino también la “pantalla” sobre la cual, desde la memoria asociativa, en una segunda función de estimulación, se proyectan las huellas perceptuales de estímulos sensoriales históricos ya internalizados (imaginar), las que son “contempladas” (como en un rebote) por la misma memoria asociativa, en su primera función de reconocimiento.

Tanto al percibir una entidad del entorno, como al imaginarla, nos ubicamos en el borde, en el primer caso del conjunto disponible de las variaciones efectiva e históricamente percibidas, para poder percibir lo diferente en lo efectivamente existente (percibo a partir de lo que conozco), y en el segundo también en el borde del mismo conjunto disponible de las variaciones efectiva e históricamente percibidas, para reproducir, en el órgano sensorial correspondiente, las huellas dejadas en el registro neuronal por percepciones anteriores (imagino a partir de lo que he percibido). Todos los órganos sensoriales son “de ida y vuelta”: proyectan en el mundo lo que pueden identificar por correlación y contraste entre lo efectivamente percibido y la información registrada en la memoria asociativa; y proyectan sobre el órgano sensorial (sin necesidad de percepción efectiva) configuraciones perceptuales (imaginería), por activación cerebral de la información registrada en la memoria asociativa.

La realización de esta doble tarea de registro: percibir/proyectar (lo que ya no es lo percibido) y doble tarea de estimulación: proyectar/imaginar (lo que ya no es lo proyectado) es la que encuadra las posibilidades transformadoras de la operación de interpretación. Sobre ella, tras atender a la producción enunciativa de las semiosis socialmente vigentes/posibles en una determinada sociedad y en un momento histórico determinado de esa sociedad, volveré más adelante, para, en definitiva, tratar de identificar y describir las operaciones semióticas, que desde los bordes de la semiótica histórica, permitan explicar, en su dialéctica cronológica, mental-cerebral

y enunciativa, el proceso de la producción dinámica de la significación de los fenómenos sociales.

Y éste sería el *borde de la semiótica*: a partir del campo propio, construido con la explicación del significado de los fenómenos sociales (su estado vigente de representación/interpretación) se alcanzan sus bordes, como delimitación originada a partir del límite a la vigencia de las operaciones de producción, interpretación y transformación, en el campo propio, de las significaciones disponibles.

En diversas oportunidades he hecho alusión al mito adánico como metáfora de la primera producción semiótica (en nuestra cultura occidental) y, con ella, primera proyección, desde la estructura conceptual del ser humano (ver Ray Jackendoff 1983: 135–159), de la existencia ontológica de las entidades del mundo: “... y Yahveh Dios formó del suelo todos los animales del campo y todas las aves del cielo y los llevó ante el hombre para ver cómo los llamaba, y para que cada viviente tuviera el nombre que el hombre le diera. El hombre puso nombres a todos los ganados, a las aves del cielo y a todos los animales del campo ...” (Génesis 1, 19–20). Dejo para otra oportunidad el tema del fracaso de esta primera tarea semiótica, con la que Dios pretendía que el hombre dejara de estar solo; lo que se revirtió cuando el hombre se encontró con lo que Dios, en un segundo intento, le había preparado especialmente y completó aquella primera producción semiótica nombrando a esa nueva presencia: “entonces éste [el hombre] exclamó: ‘... ésta será llamada mujer [varona] porque del varón ha sido tomada’”; con lo que, además, se instaura al varón como punto de referencia en nuestra historia (occidental). Lo que propongo a la reflexión es esta muestra de la eficacia de la producción semiótica (en este caso, del discurso): todas las aves del cielo y todos los animales del campo adquieren existencia ontológica al ser nombrados por el hombre, y lo mismo ocurre, en este relato, con la mujer. Antes de que el hombre los hubiera nombrado, en virtud de haber sido nombrados por Dios, todos tenían existencia óptica, pero la posibilidad de identificarlos, o sea, de atribuirles significado y sentido en función de la identidad diferencial de cada uno, sólo se da a partir de que el hombre les hubo atribuido un nombre. Hay, en esta metáfora, una cómoda situación inicial: nada tenía nombre y ningún nombre había sido usado previamente. La semiótica (discurso verbal, en este caso) no tenía historia y, por eso mismo, el mundo tampoco; hasta que, mediante la generación de un femenino, se transforma la semiosis, lo que hace posible la identifi-

cación de una nueva presencia, que se diferencia de las preexistentes dando lugar al primer cambio y con él a la historia.

Pero, al pasar de la sorpresa retórica a la pretensión explicativa, se enfrenta una situación diferente. El mundo que percibe (reconoce/conoce) el ser humano consiste en un conjunto de entidades, que resulta determinado, a cada momento de su historia, por las posibilidades enunciativas (reproducción/producción) verbales, visuales, táctiles, etc. proporcionadas por el conjunto de semiosis de las que dispone en ese mismo momento de su historia.

Si reproduce lo que antes ya podía enunciar, reconoce lo que podía percibir y tal como ya antes podía percibirlo; si produce nuevas formas enunciativas que antes no podía enunciar, conoce lo que no podía percibir y como antes no podía percibirlo. Hay una correlación fuerte entre lo enunciable y lo percible. Y este orden sería también ineludible e inalterable: tengo que poder enunciar para poder percibir y no a la inversa. No es la nueva percepción la que produce la necesidad de una nueva enunciación (aunque ello resulte contraintuitivo); para estar en condiciones de percibir algo diferente, el hombre tiene que saber que lo puede percibir; de lo contrario, lo negará como percepción, negándose a percibirlo. Inversión de otra metáfora religiosa clásica: la que relaciona a Santo Tomás con el Cristo resucitado; no se trata de que si lo viera lo creería, sino que deberá creer para poder ver.

Si está dispuesto a modificar la estructura de su conocimiento, por intuir que puede nombrar otras entidades a cuya percepción no accede, es que ya se situó en el borde de sus posibilidades semióticas y, será en función de los contenidos y relaciones de transformación enunciativa que pueda proporcionarle ese borde como aceptará modificar su estructura cognitiva para poder ver lo que supone que está dejando de ver. De alguna manera, esto implica una teoría de la creación, que es en lo que consiste la interpretación transformadora.

Entonces, podríamos ir dejando el campo de la epistemología semiótica (pese a todo lo que queda por establecer y explicar) e irnos introduciendo en el de una metodología semiótica. En función de lo vengo diciendo, tenemos dos accesos posibles a la problemática metodológica, según que dirijamos nuestra investigación al momento previo o al momento posterior respecto del momento en el que se produce el cambio.

(1) En el momento previo, si me interesa proponer (crear, producir) una enunciación semiótica (en cuanto signo) que transforme una determinada percepción semiótica (en cuanto objeto semiótico): ¿Cómo puedo conocer y utilizar las nuevas características que habrá de tener la nueva semiótica? ¿Cómo identificar los contenidos y las relaciones que constituyen los bordes de la semiótica actual para, desde allí, descubrir los contenidos y las relaciones que constituyen el núcleo de la nueva semiótica, que todavía no existe? ¿O todo lo que haga continuará siendo, tan sólo, una duplicación o una expansión de la actual?

(2) En el momento posterior, si me interesa explicar de dónde proviene una determinada enunciación semiótica (en cuanto signo) a la que atribuyo la eficacia de haber transformado determinada percepción semiótica (en cuanto objeto semiótico): ¿Cómo puedo identificar las características y la forma de utilización de la semiótica de donde proviene la enunciación semiótica en estudio? ¿Cómo identificar los contenidos y las relaciones que constituyen el núcleo de la semiótica actual para, desde allí, descubrir los contenidos y las relaciones que constituyeron los bordes de la semiótica precedente de la que provino la nueva enunciación? ¿O la enunciación semiótica en estudio resulta ser, tan sólo, una duplicación o una expansión de la precedente?

Figures rhétoriques: Obstacle ou facilitation de la communication ?

Introduction

L'objet du troisième livre de la *Rhétorique* (*Περί Λέξεως*) d'Aristote est destiné à l'étude des mots, des jeux de langage et des formes particulières qu'un orateur utilise dans un discours persuasif. Les *enthymèmes*, les *lieux*, les *métaphores* font partie du vocabulaire spécialisé d'Aristote et se décrivent comme des codes ou des signes d'une valeur esthétique et sémantique. Ce sont des formes d'expression facilement reconnaissables et d'une efficacité donnée, lorsqu'il s'agit des schémas répétés dans la majorité des discours.

Il est évident que la structure et la forme de l'argumentation ne peuvent que suivre les courants intellectuels et culturels de chaque époque. Les *enthymèmes*, les *lieux communs* et les *exemples* évoqués appartiennent à la connaissance encyclopédique de l'auditoire. Les *métaphores* et les autres figures rhétoriques, comme les *anaphores*, les *prolepses*, les *hyperboles* doivent être formulées conformément aux schémas conceptuels de la société ; si non, ils n'atteignent pas leur objectif (*Rhétorique*: 1404b 11–20).

Par schémas conceptuels s'entendent les modalités d'interprétation des significations dans une certaine société et pendant une certaine époque. Bien que l'interprétation d'un énoncé soit une affaire plutôt personnelle, il y a des normes collectives qui indiquent grosso modo les limites des sens littéraux et l'obligation de l'interpréter métaphoriquement. Cependant, dans le même passage de la *Rhétorique* le philosophe, après avoir averti les auteurs que les schémas originaux (*ξενικά*, étrangers) introduits dans le discours, peuvent ne pas être compréhensibles et, par conséquent, éloigner les auditeurs, propose aux rhéteurs l'utilisation des schémas métaphoriques.

Une métaphore bien amenée élève le niveau esthétique du discours et surprend agréablement le récepteur en élargissant le cadre cognitif de la communication. La question qui se pose alors dès l'analyse préscientifique du discours dans l'Antiquité jusqu'à l'analyse sémiotique de toute espèce de discours est si les figures rhétoriques constituent effectivement un facteur qui facilite la communication ou un obstacle qui crée un terrain favorable pour des malentendus.

1. *Les cadres théoriques*

1.1. Aristote et Perelman

La génération et l'interprétation de la métaphore sont un exemple de l'interaction entre les interlocuteurs pendant la communication. Le degré d'intégration de la signification de la métaphore par le récepteur, en tant que figure qui se réfère à une autre situation – transport de sens et de propriétés –, indique le degré de sa participation mentale et sentimentale aux événements décrits. Si le récepteur est en position d'interpréter correctement une métaphore et saisir le nouveau sens attribué aux mots, il est en position de concevoir l'énoncé comme un ensemble. La vertu à propos de l'utilisation de la métaphore réside en trouver la similarité ou l'analogie entre deux choses ou deux situations et départager seulement les propriétés qui rendent cette analogie légitime et par conséquent acceptable (*Poétique*: 1458a 25–31 et 1459a 4–8 ; *Rhétorique*: 1405a 9–13). La théorie, sur laquelle Aristote fonde ses observations sur le style, se récapitule dans le fait incontestable que le discours, en dehors de son attribut cognitif, en tant qu'énonciation d'une connaissance de caractère informatif, provoque chez le destinataire une modification de son état sentimental. En termes de rhétorique, le discours fonctionne en tant qu'un acte d'énonciation à la fois comme porteur d'un cadre de connaissances et comme le stimulus qui place les auditeurs dans une situation émotionnelle. L'information et la passion sont incontestablement deux logiques du discours chez Aristote.

Selon Perelman il y a une certaine correspondance entre le niveau de l'orateur et ce des auditeurs (1958: 20). La parole doit être ajustée aux besoins, intérêts et connaissances du public; autrement, le rhéteur développera une argumentation inaccessible et peu intéressante, alors moins convaincante. À chaque ensemble social, correspond un mode différent

d'expression. Hors des intentions qui déterminent l'argumentation sur un sujet quelconque, il existe toujours l'interaction de l'orateur avec son audience, qui doit être adaptée aux particularités des destinataires pour que l'approche préalable soit achevée. C'est une thèse déjà exprimée chez Aristote où le philosophe a fait allusion aux formes propres à certains groupes sociaux.

1.2. Les fonctionnements du langage chez Austin

Pour qu'une communication soit réussie, il doit y avoir un minimum des présuppositions: une langue commune et en plus un usage de cette langue par le locuteur, compréhensible pour son audience. Austin parle des trois fonctionnements du langage: la locution qui se réfère à l'action de parler, l'illocution qui se réfère à la manière avec laquelle s'utilise un idiome et la perlocution qui se réfère aux conséquences psychologiques que l'utilisation du langage entraîne pour les auditeurs (1976: 119). En apparence, ce qui est important quant à l'acte de communication est la perlocution, parce que ce fonctionnement du langage dévoile ce que le locuteur veut susciter chez le destinataire, le comportement qu'il veut provoquer. Nonobstant, comme les intentions d'un locuteur ne sont pas toujours évidentes et comme les moyens qu'il utilise pour atteindre ses objectifs ne sont pas toujours efficaces et parfois échouent, ce qui vraiment conditionne les résultats de la communication est le fonctionnement illocutoire du langage, ce que le locuteur inévitablement exprime (incitation, conseil, interdiction, invective, désapprobation). Dans ce point, on peut évoquer l'approche d'Eco sur l'interprétation des signes selon le comportement qu'ils introduisent chez le récepteur et sur la classification des intentions qui créent le champ des suggestions dans la communication (auctoris, operis et lectoris). Dans ce cas, le fonctionnement illocutoire, qui est fondamentale pour la détermination des conséquences du discours, dépend primordialement de l'intentio operis et en second lieu des autres intentions.

1.3. Intentions et thymique

Comme on a déjà remarqué, Aristote présente dans la *Rhétorique* la clarté de l'énoncé en tant que condition essentielle pour que le rhéteur arrive à persuader son auditoire. Eco, bien qu'il ait, lui aussi, parlé d'un lectorat

concret, lequel va «consommer» son œuvre et par conséquence conditionne sa génération, a exploré la question de l'ouverture de l'œuvre sous les perspectives à la fois d'un message qui transmet une information et d'une création esthétique. La différence entre les deux penseurs se trouve dans l'objet cognitif qu'ils explorent: Aristote étudie le discours (argumentatif), tandis qu'Eco étudie le texte (littéraire).

Fontanille dans la *Sémiotique et littérature* (1999: 16) explique pourquoi il est nécessaire de distinguer méthodologiquement le discours du texte. Le discours présente une cohérence sémantique qui se fonde sur l'unidimensionnalité de l'énoncé. Il a un objectif concret, et, pour qu'il soit atteint, toute ambivalence est exclue. Tout au contraire, le texte, en admettant des significations diverses selon le contexte sémantique, présente une pluridimensionnalité qui lui permet d'encadrer l'aspect sémantique d'un certain discours. La signification d'une phrase ne peut pas être l'addition de la signification des mots qui la composent. Par conséquent, la signification d'un discours ne peut pas être l'ensemble de la signification de ses parties. L'univocité du discours est assurée par le fait que son interprétation finale ne s'effectue pas en examinant chaque partie indépendamment de l'autre, mais comme un ensemble organiquement lié.

Chez Fontanille, la signification et l'objectif du discours constituent un principe conformément auquel se forment les logiques du discours: l'action, qui se base sur la production de simulacres, la passion qui est le résultat de l'évocation d'un événement dans l'espace-temps du discours et la cognition qui est la connaissance du monde cognitif du discours, produit de l'entendement des récepteurs (1998: 256–257). Il partage alors la triple fonction du discours comme elle est proposée par Aristote: présenter une action (imitation de la réalité, mimésis, enthymème), susciter l'état sentimental du spectateur (terreur, pitié, psychologie de l'auditoire du discours argumentatif) et transmettre une connaissance ou un mode de pensée (dialectique et argumentation).

Le style selon la pensée de Greimas et de Fontanille est un passage à la signification de l'énoncé, qui en termes de génération du message peut assumer la configuration de la forme du contenu et de la forme de l'expression. La question du style est étroitement liée à la théorie des passions. La passion se manifeste en tant qu'un produit d'un idiolecte ou d'un sociolecte. Autrement dit, l'auteur emploie les schémas qui, quoiqu'ils soient une partie de l'ensemble des schémas que l'époque et les circonstances de

la communication proposent, créent un style personnel, qui à la fois le distingue des autres auteurs et se révèle convenable pour servir son idéologie. Pour cette raison, les schémas narratifs utilisés pendant la communication littéraire, rhétorique ou quotidienne, sont un choix parmi les possibilités que langue courante et/ou tradition offrent. L'esthétique est un agent qui provoque des sentiments positifs ou négatifs chez le spectateur, mais il n'est pas le seul: Aristote a traité la distinction entre le fait esthétique, en tant que produit de la forme, et les émotions suscitées par le contenu d'un énoncé. Cependant, il y a toujours le cas – et Aristote le connaît bien – où un schéma ou une figure à la fois orientent vers un cadre cognitif et contribuent au résultat esthétique, comme la métaphore, qui introduit une analogie, ou l'intrigue, qui véhicule la succession des événements.

Néanmoins le principe qui détermine la signification du discours est son instance. D'une part, l'émetteur construit le message en tenant en considération les logiques du discours: pratique, cognitive et émotionnelle. Il utilise certains signifiants qui vont à la fois fournir au destinataire un réseau de connaissances, qui admettent des significations selon son intention, et susciter son monde sentimental. D'autre part, le destinataire, selon les logiques du discours qu'il rencontre, va attribuer les significations qui lui semblent propres. La passion est alors le résultat d'une synthèse entre la tentative réussie de l'émetteur de suggérer un état émotionnel et la réponse du destinataire qui, après avoir conçu ou construit la signification de l'énoncé, commence à manifester des sentiments. Fontanille affirme que les systèmes philosophiques (celui d'Aristote parmi eux) qui ont traité la passion, sont ancrés dans une certaine époque et culture et pour cette raison, ils ne conservent pas leur valeur analytique hors des cadres spatio-temporels spéciaux (1988: 211).

2. *La métaphore*

Aristote insiste sur le fait que la métaphore nous transmet une information: quand on dit que «Achille fonce sur l'ennemi comme le lion bondit sur sa proie», on apprend que le héros est un grand et vaillant guerrier. En fait, il s'agit du transport de deux propriétés du lion (puissance et vaillance) au héros homérique et non de l'ensemble des propriétés. Selon Peirce, ce transport de propriétés présuppose une abduction. C'est donc la découverte d'une proportion entre les deux termes de la métaphore

sans laquelle le schéma serait inacceptable. Aristote considère que ce processus est l'usage des éléments que la langue préexistante offre pour créer une nouvelle, expression dont les règles se posent conformément à l'interprétation de la métaphore. Sur ce point se focalise la fonction didactique et informative de la métaphore: la proportion entre deux choses à la fois dévoile une certaine propriété ou une certaine fonction d'elles et enseigne un mode de penser.

Par conséquent, la métaphore peut être vue comme une méthodologie d'observer le monde: la découverte d'une proportion entre deux choses ou deux êtres vivants est une approche qui permet des corrélations sur la substance et les propriétés des choses. Cependant, il s'agit des proportions qui ne sont pas toujours visibles ou compréhensibles. Ce cas est commenté par Eco qui se réfère de nouveau à Aristote. Une proportion qui s'exprime dans un énoncé métaphorique doit être soit la répétition ou la reformulation d'une proportion déjà communément acceptée, soit très bien posée, de façon à être si évidente que personne ne puisse la récuser (2001: 160).

La métaphore présuppose donc une fonction cognitive depuis que l'analogie résulte de la connaissance profonde de la nature et des propriétés des choses. Fontanille explique pourquoi la mise en valeur de la médiation du domaine sensori-moteur pour analyser la fonction cognitive, permet à l'homme la construction des métaphores. Il utilise l'exemple de l'humeur (bonne et mauvaise) en mettant en évidence ses aléas renvoyant à une structure spatiale (en haut et en bas) (1999: 8). Eu égard à la structure de la pensée humaine une telle proposition est légitime, lorsque cette métaphore est bien reconnaissable et habituelle dans plus qu'une ambiance culturelle (par exemple en France et en Grèce).

Selon Eco, comme la métaphore ne se réfère pas à un monde fictif, ni au monde réel, elle reflète la conception personnelle de l'auteur sur les phénomènes (1992: 161–165). L'interprétation de la métaphore propose au lecteur une image différente du monde, qui représente les expériences intérieures et le système cognitif de l'émetteur. D'autre part, il est possible qu'un récepteur conçoive un énoncé comme une métaphore, sans que l'auteur ait l'intention d'y attribuer une signification métaphorique. Le niveau encyclopédique du destinataire joue un rôle primordial dans la réussite de l'analogie constatée. Une dernière observation qu'Aristote cite sur la fonction de la métaphore, est le fait que l'usage d'une chose à la place d'une autre a comme conséquence la négligence de propriétés du terme comparé

(2001: 154). Le créateur d'une métaphore doit toujours prendre en considération le fait que le transfert ne peut pas concerner l'ensemble des propriétés. Dans l'exemple d'Achille il est légitime de penser que le poète fait allusion à la puissance et à la vaillance. Il est hors de question d'envisager une interprétation qui se base sur le rôle du lion dans le royaume des animaux. Achille est sans doute le meilleur guerrier des Achaïens. Mais, il ne peut en aucun cas avoir dans la guerre le rôle du roi. Il est à Agamemnon.

L'évocation d'un exemple de la recherche sémiotique va éclairer l'emploi pertinent de la proportion qui conduit à la réussite de la communication. Fontanille analyse le vers des *Feuillets d'Hypnos* de René Char "Connaissance ineffable du diamant désespéré (la vie)". L'usage d'un mot qui dénote un être vivant (désespéré) pour qualifier un mot qui ne le dénote pas (diamant), crée dans un premier temps une difficulté dans l'interprétation. Cependant le mot "vie" fonctionne comme un métalangage qui explique la signification de l'énoncé. La vie établit une proportion entre le diamant et le désespoir, lorsqu'elle est précieuse et peut être désespéré (1999: 177).

Conclusion

En conclusion, Eco reconnaît ce qui, depuis Aristote, est évident dans les discours oratoires: l'utilisation d'expressions d'une efficacité persuasive déjà vérifiée, ne renforce pas seulement la vigueur argumentative du discours, mais elle influence l'émotion de l'auditeur, fait qui le rend plus réceptif aux thèses du rhéteur. Ces "formules" sont des codes acquis et augmentent la valeur esthétique du message et, par conséquent, influent sur le thymique du récepteur. Une espèce de formules sont les preuves extra-techniques, selon la terminologie aristotélicienne, lesquelles se basent sur les principes méthodologiques du signe (1972: 160–161). Ces preuves représentent une image absente qui désigne les proportions que l'auteur veut mettre en œuvre pour décrire une situation, une idée ou un objet présent. Il s'agit alors des signes qui, transmettant le cadre d'information que l'auteur veut émettre, canalisent un réseau de passions, qui consolide ou, selon le cas, bouleverse l'état émotionnel du destinataire.

Finalement, un dernier exemple du rôle capital des figures dans la communication est leur application dans les textes visuels. La classification des figures rhétoriques en tant que tropes possibles d'expression faite par

Aristote peut également être appliquée dans le cas des codes visuels (cas de transposition des concepts). Eco parle de cette potentialité par rapport à l'analyse de la publicité iconique. Il se réfère aux figures, aux exemples et aux arguments de la rhétorique classique en tant que répertoires de techniques de l'expression verbale correspondants aux répertoires de l'expression visuelle (1972: 236). Une illustration de cette observation d'Eco se donne à propos de *topoi* verbaux et visuels: comme selon lui le processus de la codification des messages esthétiques et des cadres cognitifs n'est pas différent, il est légitime de traiter les iconogrammes en tant que signes qui connotent un champ topique.

Fatal misunderstanding in Timo K. Mukka's short story *Tabu*

1. Tabu: Parody of the Holy Family

This article concerns Timo K. Mukka's large short story or short novel, *Tabu* (published in 1965), which is a parodic tale of the Bible's holy family.¹ This text is based on my dissertation, which concerns problems of Timo K. Mukka's prose mainly in the light of Mikhail Bakhtin's theory of the novel.

Mukka's *Tabu* has been translated into French, Polish, Estonian and Hebrew, and a movie version of it exists in Poland. The story is about a 12-year old girl, Milka, who lives with her widowed mother in the countryside of Lapland. The story time is in the 1920s and discourse time in the 40s. Their peaceful everyday life changes for good when the mother starts a relationship with an unstable wanderer, Ojanen, who is also called Kristus-Perkele (Christ-Devil). The dramatic turn in the story happens when the mother finds out that Ojanen is also having a sexual relationship with Milka. The mother notices that her daughter is pregnant and realizes who the father of the unborn child is, although Milka denies having a sexual relationship with anybody. Ojanen leaves the village and young Milka gives herself as a wife to the old parish clerk, Malmström, who has earlier proposed to the mother. The parodic holy family is formed.

I will study the themes of the story in the light of Sigmund Freud's (1913) thoughts about taboo and totemism. My focus is on the taboo of incest (clearly the theme of pedophilia is present also). The ambivalence of Milka's feelings, the love-hate relationship with Ojanen who suddenly disappears, is very interesting in the light of Freud's thoughts of repression, neurotic denial and defence mechanisms. Also the mother and daughter

relationship, which turns unnatural and causes the madness of these both women, is important to the interpretation of the story. Some objects and spaces in the story are clearly those of totemism, as kinds of chronotopical and mythical elements of secrecy, as well as a parody of the Immaculate Conception. The story is told twenty years later, from Milka's point of view. She is now a bitter and odd woman, who hates her God (who clearly is Kirstus-Perkele).

In the story one can identify many genres. The most important genre change is between ballad-like archaism and romantic prose-poem style, this last appearing in sublime, sometimes even grotesque expressions. This tension between ballad and naturalistic prose, sublime and grotesque, characterizes the discourse of genres and personages in the story.

2. Genre change

The most important structural element in Mukka's prose production is that of genre change. In Mukka's prose one finds realistic expression, ballad form and lyricism, a naturalistic way of emphasizing certain shocking elements in the story, letters, and even autobiographic material (he quotes from his other texts), parody, newspaper style, stylistic borrowings from other writers, and more.

As Mikhail Bakhtin has observed, novelistic form embraces all the other forms of literature inside itself, and Mukka's prose is in many ways a living example of this. For Bakhtin one of the most important characteristic features of novelistic form is genre memory. The novelistic form of literature (prose form) has absorbed different genres from the history of literature, in this way developing into new and vivid literary form. In this way, too, the novel is inherently a form of parody, since it absorbs other genres into itself (Morson & Emerson 1990: 93).

In Mukka's prose, genre changing allows for the expression of different points of view, which in turn make it possible to show the chronotopical situations in the story. In those situations the problems and dilemmas of the characters (usually the main character, "the abject hero") can be shown in a multi-stylistic, dialogical way.

According to Bakhtin, chronotopes in literature have a very important, even determining role in the plot of the novel, by capturing especially

important places and moments in the characters' lives – those peculiar moments where time slows down and the plot thickens. As Bakhtin says:

[Chronotopes] are the organizing centres for the fundamental narrative events of the novel. The chronotope is the place where the knots of narrative are tied and untied. ... Time becomes, in effect, palpable and visible; the chronotope makes narrative events concrete, makes them take on flesh, causes blood to flow in their veins. ... It is precisely the chronotope that provides the ground essential for the showing worth, the representativity of events. ...

The chronotopes ... provide the basis for distinguishing generic types; they lie at the heart of specific varieties of the novel genre, formed and developed over the course of many centuries.... (Bakhtin 1990b: 250–251)

How this plot-thickening place and slower than usual time (of life) are created and shown, how the chronotope is expressed stylistically – all this depends on the genre. Ballad tells the story differently than naturalistic genre does. And when these two are mixed together, the effect can be quite powerful, as I will show later on.

In *Tabu* the most important chronotopes are those which Bakhtin calls “threshold situations”, those special moments which change the main character's life and propel the story forward. In *Tabu* these chronotopes of transition are represented in situations of seduction and marriage proposals. Perhaps the most important threshold is the so-called “moment of truth”; in this case, it is when the mother comes to understand that her daughter is pregnant, thus discovering the truth about the relationship between Milka and Kristus-Perkele. This fatal misunderstanding leads to deep and life-changing events. A little later I will show how the style of communication changes between mother and daughter after this crucial moment.

It is also important to notice the spaces or settings of these chronotopical thresholds. In *Tabu* these are an open hay field and a barn (these places are often repeated in Mukka's prose in general). Another such space is inside the house, a secure place, away from wild nature, and the place where offers of matrimony are made.

The old parish clerk first proposes to the mother in the old main room of the farmhouse, but the mother refused, waiting instead for the proposal of her lover, Kristus-Perkele. Later, another proposal occurs, in another room, this time with the world turned upside down. After Kristus-Perkele

has betrayed and left both women, Milka makes proposes to the old parish clerk, and they spend their wedding night in the new room, made by Kristus-Perkele, who has changed the lives of both women. This irony is important, because in it we can hear the sound of muffled laughter, such as that provoked by parody (cf. Bernstein 1989, 1992), where old values are made to appear in a new light. In this story, what was once considered upside down has now become reality: the parodical “Holy Family” is formed in the room made by Christ-Devil. In quite a cruel way the reader is shown both the madness of this situation and of the world. We can hear laughter behind it all, but perhaps of nervousness rather than good humour.

3. *Incest: Mukka’s story and Freud’s Totem and Tabu*

The revelation of the importance of incest in neurosis has met with universal scepticism by adults and so called normal people (cf. Freud 2003: 20). But it is important to notice how much the theme of incest has interested creative writers and artists (e.g., novelist William Faulkner). There are countless variations of the theme in art, and Mukka’s story is one of them. While I am giving an interpretation from Mukka’s story, I am also opening up Freud’s ideas about totemism and taboo:

Tabu is a story about two women, but at the same time is a very masculine story. It tells of the effect of masculine power over these two women, how the power of the false God of sexuality destroys peaceful living, and ruptures the natural mother and daughter relationship. When By “masculine power” I mean (in the Freudian light again) that these two women live under the same totem. If village women had to live their lives as a wife, daughter and widow, those roles are always somehow related to a man, usually a husband or father. The relationship between Milka and her mother is broken by Kristus-Perkele. As the lover of the mother, he is forbidden to be the lover of the daughter as well. In this system of totemism, that kind of relationship is against the law of exogamy. As Freud says: The worst way to break the totem, is to have a sexual relationship with all the women who belong under the totem.

Kristus-Perkele’s presence in the village is in itself ambivalent. On the one hand, he is truly like a god, in that he rules over the lives of both women; on the other hand, he is not a member of the tribe, but an outsider. He exercises marital rights with both women, but does not take on

the tribal responsibilities for doing so. He is above and outside of everything, and at the same time he is deep inside these two women's minds. The taboo of incest has been transgressed when Kirstus-Perkele's relationship with Milka becomes more or less like a father-daughter relationship.

From the perspective of totem denial, the scene just described is like an upside down situation. As Freud says, amongst so-called primitive tribes (although the people in Mukka's story aren't "primitive" in the Freudian sense) totem denial goes against the incestuous desires of son and brother. In Mukka's novel the daughter has these desires for an older man. In practice young Milka seduces Ojanen, who first tries to prevent a sexual situation from developing. There can be room for a negative Oedipus complex as well (see Silverman 1988: 118–126).

According to Freud (again amongst primitive tribes) the punishment for breaking this taboo of totemism is death, but in Mukka's story it is the madness of these both women and the death of a living relationship with God. This is shown most powerfully in the story by the change of style and meaning of Milka's prayers (the genre of praying is in Mukka's prose in generally important).

It is also very interesting in the light of Mukka's story what Freud says about the ambivalent relationship between son-in-law and mother-in-law. The taboo is very strong against a relationship between these two "in law" relatives. And because of the deep, collectively subconscious denial of tender feelings to the son-in-law, hostile feelings rise to the surface in the mind of the mother-in-law. In Mukka's story this relationship, too, has been turned upside down, even twice. First the mother has two suitors, but suddenly both of them find themselves in the position of sons-in-law; the older one properly so (through marriage), and the younger and dearest one, as father of her daughter's baby. In this story Mukka thus shows clearly why it is so important to follow the law of exogamy.

In this connection it is very interesting to read what Freud says about the mother-in-law's sadistic relationship against the son-in-law, which seems to come directly from Mukka's story, as if Freud were talking about Milka's mother (I quote Freud):

A woman whose psycho-sexual needs should find satisfaction in her marriage and her family life is often threatened with the danger of being left unsatisfied, because her marriage relation has come to a premature end

because of the uneventfulness of her emotional life. A mother, as she grows older, saves herself from this by putting herself in the children's place by identifying herself with them; and this she does by making their emotional experiences her own. – A mother's sympathetic identification with her daughter can easily go so far that she herself falls in love with the same man her daughter loves; and in glaring instances this may lead to severe forms of neurotic illness as a result of her violent mental struggles against this emotional situation. (Freud 2003: 17–18)

As we remember, Milka's mother was widowed years ago, and she is in love with Kristus-Perkele, the same man her daughter loves. It is difficult to say which one felt love first; maybe it happened at the same time. But it is clear that after these events the mother became enraged. The fatal misunderstanding is perhaps at the same time the fatal sameness, the crazy-making, parallel identity of mother and daughter.

3.1 Holy dread

First a few more words about the ambivalent nature of the concept of taboo. Even the word "taboo" has two meanings: it means "holy" and "untouched" in that holiness; and it also means dangerous, dreadful (*unheimlich*), impure and forbidden. The first meaning binds it in my literary example to the unity of the sublime (and on the generic level, to ballad form and lyrical style). The second meaning joins it to the grotesque (and on the generic level, to naturalistic expression and style). To find these connections is of course important in the study of genre change and genre memory of the story.

There is yet another concept, which is the combination of the holy and the dreadful, namely, *holy dread*. It is something you can't reach, which is not in your hands or under your will. You can't control it and that is why it is covered by denials and forbidden. When Milka and her mother became like objects of holy dread by breaking the taboo, they have to solve their crime. This solving is endless, because the two women have taboo nature themselves. But the fact is "that the violation of a taboo can be atoned for by a renunciation shows that renunciation lies at the basis of obedience to taboo" (Freud 2003: 41). These women have, in the deepest way, the holy dread against themselves and their unbearable and irresolvable situation.

The ambivalence of their situation is total, and it is also strongly both sublime and grotesque.

3.2 The wooden ball

In the story is one particularly interesting object, the interpretation of which deepens both the chronotopical point of view and the object of taboo. After their first love-making, Kristus-Pekele gives Milka a silver coin, which is a treasure for the girl. Just before the man leaves the village and both women, he makes a hollow wooden ball for Milka, and inside it he puts this silver coin. Only Milka knows the hidden truth of the wooden ball.

In the light of Freud's theory, these kinds of symbols of the taboo are common in primitive cultures. The ball is a symbol of the world. Inside of it is a coin, which is like one of those thirty silver coins the Jewish leaders paid Judas for betraying Jesus. It is a coin of betrayal, payment for the virginity and pure mind of the young girl. Inside the ball it is also like the embryo Milka is carrying. The ball is the world and the womb. Both round spaces keeps their secrets inside for those who do not want to see the truth. The daughter knows what is inside the ball, but at that point the (already crazy) mother does not understand. Rarely speaking to Milka any more, she sits on a rocking chair and turns the ball in her hands, saying to herself:

... what might be inside... here? It rings nicely. He knows. He has put the secret inside. Let anybody try to find out the truth. Miraculous is his dispensation. Nobody knows what inside – is it even necessary? The punishment will follow from... curiosity. Miraculous are his works... The ways of God are inscrutable. (Mukka 1966:106, translation mine)

The mother is also clearly speaking to God and to Kristus-Perkele, who is like God for both women.

The wooden ball is clearly a symbol of the forbidden, in some way even incestuous relationship, as well as the pregnancy. Both mother and daughter have something bad to hide. Like Freud says: "The source of taboo is attributed to a peculiar magical power which is inherent in persons and spirits and can be conveyed by them through the medium of inanimate object" (Freud 2003: 24). The power of the taboo has migrated from Kris-

tus-Perkele to Milka through this magical wooden ball. The carrier of the taboo is forbidden, a scared and envied person, who becomes as a taboo to him- or herself. Milka becomes a taboo person and the wooden ball symbolizes this change. On one side is veneration, on the other, horror, just as a taboo person is two-sided.

*4. The story of denial and speechlessness –
The discourse of madness*

As mentioned before, in this crucial threshold situation in the sauna, at this moment when mother understands the wholeness of the deception, the discourse between mother and daughter changes: the way of speaking, the expressions of tenderness, the whole communicative system.

It is also important to notice that the deepest misunderstanding happens when the mother doesn't realize that her child has grown up (the mother has underestimated her daughter's sexual maturity), and now it should be the time to change the discourse. At first the mother has no code for talking to her child in the proper way, in the way that she could protect the girl. Sexuality is a taboo for the mother, too; even she has no verbal instruments to deal with the subject of sexuality. So Milka is "tabula rasa" in the field of sexuality: on the tabula is not even one word of warning, no alert to what will be. And when the worst thing happens, these two women find no way to speak to each other, because their situation has changed in such a strange and unnatural way.

How does this happen in the story? In the chronotopical situation in the sauna, denial comes between the mother and the daughter. Because the mother has never provided insight into adult living, Milka has no correct words for explaining the situation. What she has is a very strong feeling of sin, which she is denying: Milka denies being with anybody (maybe at first she doesn't even understand how she got pregnant), so her pregnancy becomes sinless, like the biblical "immaculate conception". In this denial, she refuses to see the truth.

Not only is this denial a corruption of the biblical story, but there is also transference in it. Freud says: "The ease with which the prohibition can be transferred and extended reflects a process which falls in with the unconscious desire and is greatly facilitated by the psychological conditions that prevail in the unconscious. The instinctual desire is constantly

sifting in order to escape from the *impasse* and endeavours to find substitutes – substitute objects and substitute acts – in place of the prohibited ones” (Freud 2003: 35). That is precisely what happens to Milka: she keeps living in the unresolved situation, with her psychic fixation, which is a consequence of the constant changing of overwhelming desire and the denial of this desire. Very strong ambivalence rules Milka’s life.

Milka is transferred from her mother’s arms to Kristus-Perkele’s arms; hence she doesn’t have time to grow up and become familiar with her adult body. What happens, as Luce Irigaray says: “She regresses to the level of need” (Irigaray 1993: 126–127). After Kristus-Perkele has disappeared, and Milka can’t offer her body to her lover, she gives herself as payment for the work of a young village boy, Auno, and finally offers herself as a wife for the old man to compensate her sin. Thus, when Kristus-Perkele gives Milka the wooden ball, it is also like the biblical fruit of sexual knowledge (sin). Masculine power takes over in the symbiotic female house, in the world of mother and daughter. Suddenly the two women become competitors, when the masculine will and desire starts to define their female being. The originally harmonious life of these two women falls under patriarchal power and definition, and the monster of sin starts to grow.

5. Conclusion

Because the narrator is always Milka, and she is telling from the point of view of the young girl, the style of narration is naïve and a bit infantile. The style is romantic, distant, proud, archaic (very old fashioned), and there is at the same time something hidden and something naively open about it – the style of a lyrical ballad. The prayers (clearly the sign of obsessive neuroses), which Milka repeats and which really are denials of God, constitute Milka’s silent revenge on Kristus-Perkele for leaving her. And the meaning of what she tells through the story is quite terrible and horrifying, very naturalistic. Again: the sublime and the grotesque are unified in this very special way of story telling, which underlines Milka’s demoralization and fall into madness.

In the story are certain very characteristic features of naturalistic style; one of them is inevitably the erotic and bodily openness. It is possible to think that Milka’s story is in many ways a typical naturalistic novel (or short story) of inner individual development, like a modern *Bildungsro-*

man. Yet here, too, the meaning is again turned upside down, because it is a story of collapse, of individual catastrophe. Milka's growth, as a human being and as a woman, stops; she turns to madness. And cruel and ironical is that the same negative development happens also to Milka's mother; their destinies become parallel.

Maybe because of the genre variation and stylistic ambivalence *Tabu* is one of the most confusing and interesting of Mukka's stories. The dialogue between genres works effectively. As Freud says on the first page of *Totem and Taboo*, "In the beginning was the deed." The same may be said of Mukka's *Tabu*: The deed is foremost, and it is expressed in the most interesting and vivid way.

Note

1. Timo K. Mukka (who was also a painter) began writing at a young age (around 12 years old), and he also died very young (29 years old). Within ten years he created his entire literary production, which includes 17 short stories, a collection of poems, and 5 novels.

A war of symbols in the political arena

The Mexican post-electoral campaign of 2006

1. Introduction'

Politics is by definition a sphere of action and decision. Politicians are supposedly hired only to execute, to the best of their ability, the will of those they represent. It is quite remarkable, then, to note the intensive use of symbols in various areas of government. One would expect government representatives to be more interested in establishing and guarding citizens' well being – as *object* – rather than in using *signs* (crudely put in Peircean terms). Yet, politicians seem to aim more at producing propagandistic effects than social effects.

As you may know, in 2006 Mexico endured the most hotly debated electoral competition in its history. The winner of the election was decided by a scarce margin of 0.5% of the votes cast. This narrow difference made the post-electoral campaign all the more intense, and the Federal Electoral Tribunal had to decide who was to become president. In these circumstances, the (initially) most popular and almost certain winner of the elections during previous years, then Mexico City's mayor, Andrés Manuel López Obrador, deployed a more forceful post-electoral campaign than any of those during his six years in office. His objective in the post-electoral crisis of 2006, was to press the Tribunal to decide in his favor. This he did by taking over the main Avenue and major streets to the Central Square, the Zócalo, for forty five days. And here begins the case I address in this paper: the intensive deployment of symbols, used for legitimation purposes, during this post-electoral presidential campaign, from July 30 to December 1, 2006.

I analyze this symbolic maneuver according to a model presented 13 years ago, at the 5th International IASS Congress at Berkeley University, which proved to be quite enlightening when applied later to various other contexts.² I then proposed the possibility of addressing semiosis in terms of two different orders: (1) the *signic order* produces signifying effects by (strictly Saussurean) oppositions and differences to produce; (2) the *symbolic order* functions through charges of time, energy and material accumulated to produce significant effects. The signic was understood in a sense akin to Peirce's symbol; the symbolic resembles Peircean indexes, in that both assume an existential, motivated link or material contiguity with the object.³ This distinction between signification and significance was of course proposed by Charles Morris (1964).

The symbolic order, of which I speak today, differs from the signic precisely because it is based on a metaphorical projection (in Lakoff and Johnson's 1980 sense) taken from economy as source and targeted at producing meaning. The association between semiosis and economy comes up in the thought of various authors, from Marx to Saussure and onward, when speaking of value, and particularly in Jean Joseph Goux's (1990) work on symbolic economies. Yet, it was Ferruccio Rossi-Landi (1968) who specifically addressed and understood language and economy jointly through the concepts of "linguistic work" and "linguistic market".

Allow me to refine the idea: signs *signify* by relations of oppositions and differentiations in their position within a code, a paradigm and a syntagm; whereas symbols are *meaningful* in proportion to the storages of time, material and energy (affective, labor-oriented) associated with them. These storages that make symbols significant depend on at least six parameters: time, space, sound, verbal, corporeal and physical objects, all operating jointly in the production of what is significant to a particular interpreter.

2. *Symbolism in time*

The two main contenders during this campaign were the conservative candidate, Felipe Calderón, from the PAN party with affinities to Christian Democracy, and the populist Andrés López Obrador from the PRD, a derivation of the PRI, the political origin of most of its leaders. The two candidates deployed totally different strategies in the symbolic use of time and

space. After Election Day (July 2, 2006) López Obrador chose all dates with historical or political value on which to make his political moves, and hence capitalize on their storages of time and emotional weight. He and his party thus picked the following:

- September 1: Presidential Speech at Congress, to block the Congress Tribune.
- September 15: anniversary of Hidalgo's call for independence, to impede the presidential ritual at the main city square (Zócalo).
- September 16: Independence Day, for his self-proclamation as "legitimate president" in front of the people gathered at the Zócalo.
- November 20: Anniversary of the Mexican Revolution, for his swearing-in ceremony as "legitimate president".
- December 1: the newly elected president's avowal ceremony, used for blocking the Congress Tribune.
- March 21: Anniversary of Benito Juárez's birth, used for his political convention and show of power to the million or more gathered at the city square.

On his part, the newly elected Felipe Calderón was, by law, to become president automatically on 1 December 2006. By the signic order, no additional step was required. He nonetheless deployed an equally symbolic stratagem. At midnight, between November 30th and December 1st, national television aired a ceremony staging Calderón as president of Mexico. This strategy was taken because Congress was controlled by the opposing party and it was doubtful whether he would be able to perform the full customary ritual the next day at the podium. This *ad hoc* invented ceremony was literally out of place, but inside time.

3. *Symbolism in space*

All acts performed by Obrador took place at the main square of the country, the Zócalo, whose symbolism dates back to Aztec times, with the mythical foundation of Tenochtitlan, now Mexico City. During his campaign, great importance was given to his declarations and aspirations that he would make his residence at the National Palace, as a century before the Mexican hero Benito Juárez did, a place where no president has resided for about fifty years. The National Palace is a highly charged, symbolical site (cf. Mandoki 1998), as it was home to Moctezuma, the last Aztec emperor,

and to Hernán Cortés, the Conquistador. We see here the charge or storage of time and affective energy associated with it from historical facts; in addition, there is the symbolic charge of the material itself, since it was probably built, at least in its foundations, from the very stones stolen from Aztec pyramids and temples. As I have argued elsewhere (Mandoki 2004), the place endows power to the occupant.

Other symbolic uses of space were blocked for 48 days by Obrador's people, who were camping in the streets: Paseo de la Reforma, calle Madero, and Avenida Juárez, these being the greatest names in the official history of Mexico. During his tenure as mayor, Obrador invested important resources in twice redecorating the symbolically charged Paseo de la Reforma. It was first constructed in 1860 at the initiative of the Mexican emperor Maximilian of Habsburg, who called it the "Avenue of the Empress" in honor of his wife Carlota; it was renamed Reforma in honor of Juárez, the anti-Maximilian protagonist and elected president of Mexico, a Zapotec Indian who fought the conservatives' imperialist dreams.

The symbolic chiefly functions by connotation (the signic by denotation), hence the taking of these streets worked semiosically as if these great historical figures voluntarily joined López Obrador's movement, while for others it seemed as if they were kidnapped by it. As for the other presidential candidate, Calderón, the symbolism of space required the deputies of his party to sleep for three consecutive nights at the Congress hall, so as to secure the podium for the President's swearing in, since López Obrador's party had declared it would do everything to thwart it.

4. *The symbolism of words*

What was peculiar in this campaign was precisely the replacement of the signic order by the symbolic, and thus a symbolic use of words. López Obrador declared the elections "a fraud", called Calderón a "spurious president" (notice the onomatopoeic and corporeal effects of the term), and referred to himself as the "legitimate president". He utilized the word "legitimate" to oppose, by a strict Saussurean mechanism, the "legal" (which, *ipso facto*, would mean illegitimate), yelling "to hell with your institutions!"

In politics, some take the word "symbolic" to mean "harmless". For example, the governor of Michoacán declared, with respect to Lopez Obrador's self-proclamation as legitimate president: "It is symbolic, I see

no seriousness in it". Yet, not only were words replaced here, but also numbers. The fact that he lost the election by almost 240 thousand votes was replaced by a discursive construct of "the people" (*el pueblo*), symbolized by the throngs of gatherers at the Zócalo. Additional symbolic work was performed by attempts to stigmatize this number as irrelevant by the affixing to it the word "fraud".

5. *The symbolism of sound*

Who shouts louder became the favorite game played by then president Vicente Fox and López Obrador during the week that preceded the symbolic ceremony of Independence Day. The ceremony traditionally consists simply in the tolling of the bell at the Presidential Palace, flagwaving, and shouts of "Long live the heroes that gave us the fatherland!", "Long live Hidalgo, the father of the country!", "Long live Mexico! Viva Mexico, Viva México!" This ritual is simultaneously repeated by governors and municipal presidents throughout the whole country, but the main site and symbolic center of this ritual is the Zócalo.

As a newspaper reported, both López Obrador and Fox attempted to perform the ritual scream at the same time and at the same place, the Zócalo, where a fierce battle ensued over whose scream would sound loudest. This tantrum in fact *symbolized* the six-year period of these two politicians' office: rather than focusing on the serious problems of a country with more than half of its population below the poverty line, these two exhibitionist politicians used each other to play agonistic games of declarations. Fox diminished his position by responding to a lower status of politician, while López Obrador erred in attacking Fox, since in Mexico reelection is unlawful and Fox was no competition at all to his presidential ambitions, thus underestimating the real opposition candidate.

6. *Symbolism of bodies*

During his pre-campaign López Obrador exhibited, in Bourdieu's terms, huge *social capital* ("the people", namely millions of sympathizers, especially among older people), greater *political capital* (80% during his pre-campaign), and an enormous *economic capital* (vast government resources for the administration of Mexico City, this time not stolen and hidden

for functionaries' private benefit, but exhibited for the mayor's public and electoral image). López Obrador's chief advantage over his opponent was deployed by the corporeal exhibition of his followers, namely, their physical, bodily presence (not only in the ballots, in which they counted by the signic order and became simply numbers) at street gatherings, by setting up camp, by blocking avenues, and other mass assemblies.

Calderón would never have obtained such sacrifice from his supporters; these last are generally more well off economically, and would never have slept for a month and a half in the streets on his behalf. On the symbolic axis, this total mass of bodies that, in López Obrador's boasting words were "enduring cold hail, shaking and freezing", whether a million people or thousands, eloquently expressed by corpo-real symbolism López Obrador's real material support, some of it genuine, other negotiated by crooked deals.

A plan was designed to take the site by surprise and make Calderón appear, in Houdiniesque style, at the Congress Tribune from behind the monumental flag, at the very last minute, and to perform the swearing-in ritual. This also entailed a corporeal symbolism: the president presiding the presidium.

7. Symbolism of objects

On national television, flanked by the army during the ad hoc ceremony at midnight of December 1st, Mr. Vicente Fox was shown removing his Presidential band and giving it to a soldier. When the ex-president came into sight the next day during Calderón's Houdini-like appearance at the Congress, a funny mistake in continuity occurred: he was clumsily carrying the ribbon again, then took it off out of camera range, carried it as if it were a Ming porcelain jar to the Congress, and tried to put it on Calderón's chest; but moving rapidly, the president of the Congress did the job. Quite aware of the symbolism, and despite the fact that ex-president Fox had also received the band from his predecessor, Calderón preferred to avoid it, as if accepting it would be symbolically infected by Fox's relatively meek intervention.

This type of symbolic object – a red, white and green, silky fabric with a golden eagle embroidered in the middle – was well suited for López Obrador, and conferred by another symbolic figure in Mexican politics, Rosario

Ibarra de Piedra, the bereaved mother of one of the many victims of the dirty war that went on during Diaz Ordaz and Echeverría's regimes.

Four objects had particular relevance in this ceremony that depended wholly on symbols: the presidential band, the national emblem (an older version recycled for López Obrador's ceremony), a podium, and the supposed "presidential chair", this last another curious myth, as if there really existed "a" particular chair for the president to sit on, one exclusively designed to make López Obrador appear "presidential" one the day of his self-proclamation as such.

8. Conclusions

We can conclude that symbols are relatively more flexible than signs. For that reason López Obrador used them to *replace* the following: (1) forty million voters of the 2006 election by the few thousands present in his "democratic national convention"; (2) more than 78 % of the Mexicans who did not vote for him, by the bodily presence of his followers⁴ (41% abstention, with more than 37% going to other candidates); (3) the Supreme Tribunal's decision by his self-proclaimed "legitimate presidency"; (4) the Political Constitution of Mexico by an interpretation of one of its Article of context; (5) evidence and rational arguments at the Congress, by deputies' physical brawls at the podium.

The formula by which to replace signs with symbols is quite simple: conflate the legal and the legitimate (this also reflects the symbiotic relation between the two orders), making the illegal appear legitimate by associations of the symbolic order. Illegality would disappear under the weight of symbolism and magically be transformed into a new signic construct.⁵

Notes

1. This paper is a translation of part of my recently published book (2007b: 86–90).
2. See Mandoki 1997; I then called "semiotic" what I now term "signic". See also, Mandoki 2007a.
3. Saussure's conception of symbols was quite vague, somewhat similar to Peirce's icons.

4. 55, 557,012 votes and non-votes out of a nominal list of 71,374,373 is to 100% what 55, 557,012 is to 77.83%. http://www.ife.org.mx/documentos/Estadisticas2006/presidentet/gra_nac.html
5. In the case of the “Democratic National Convention”, the signic was replaced by the symbolic. See Mandoki 1999, for more regarding this tactic of “convenient” and systematic substitutions; such as the substitution of religion by the instrumentalization of art, replacing art with propaganda, and propaganda with indoctrination, culture with monumentalism, etc.. These tactics of substitutions are symptomatic of authoritarian tendencies.

Culturomes and negentropic processes

Following Schrödinger from a biosemiotic perspective

Once upon a time, sometime during mid-fourth century B.C.E., as Aristotle strolled in his garden “through the worlds of animals and men”, he was wondering whether a certain continuity might exist within the animal species. Two millennia later, this observation reappeared in Darwin and Wallace’s natural evolution theory, followed by a century in von Uexküll’s cross-species *Umwelten* and Sebeok’s firmness about a semiotic continuum. This continuity, however, does not seem to be linear, since the variety of existing species has changed in discreet jumps and mutations through evolutionary drifting. We now know that creatures do not emerge once and for all, complete and whole, like a Minerva out of Zeus’s head or Adam’s animals in the Garden of Eden. We have learned that there is a gradual assemblage from the simple to the complex, from carbon chains to amino acids amalgamated by peptide connections to form proteins that would allow the construction of a cell’s structure assimilated to multi-cellular tissues, multi-tissue organs, multi-organelle organisms and multi-organismal biomes that constitute the biosphere, materializing, to use Lovelock’s term, in our great Gaia.

Please allow me to designate, for symmetry and brevity’s sake, the other side of this process – namely, the inert, physical world – with the term “plerome” (following Bateson 2000: 26–31), for its resonances with “biome”. The new scientific cosmology points to the idea that the world began at a Big Bang explosion in the plerome, generating space-time through the expansion of matter-energy, even if we do not know whether this spreading out will eventually implode and contract or whether there were previous Big Bangs (or tiny bings). Ruling the plerome as one of its fundamental

principles is the Second Law of Thermodynamics, implying that matter and energy tend towards macroscopic homogenization and microscopic disorder. This process, known as “entropy”, could also be interpreted as the law of universal irreversibility.

At another level, that of live systems, or biosphere (we’ll call them “biomes”, which by *Webster’s Dictionary* means “major ecological community types, as tropical rain forest, grassland, or desert”) there seems to be an equally vigorous, but opposite tendency towards self-organization or “autopoiesis” (cf. Maturana and Varela 1992), marking a clear directionality to diversification, macroscopic heterogeneity and the production of order. What appears to occur here is, in Schrödinger’s term, *negentropy* or negative entropy in evolutionary processes. The materials for biomes basically come from the plerome: energy and matter, muons and leptons, oxygen, hydrogen, nitrogen atoms, carbon molecules and so on. The question that compellingly arises is, How can a general law in physics be so radically contradicted in live systems, since these all (supposedly) emerge from the same components of the physical substrate?

Swenson (1999) proposes an explanation to this discrepancy when arguing that live systems are, in effect, the most efficient trajectories for the dissipation of energy in agreement with this Second Law, thus justifying continuity between biome and plerome. The story, however, does not end here; live systems tend to create further order at “third order units”, namely, social organizations (in Varela and Maturana’s 1992 terms, “collective conglomerations” as among termites, ants, bees or human groups). I will denote this level as “culturomes”, to denote local forms of culture socially integrated into specific biomes. How does this third order stand in relation to entropy?

PLEROME	BIOME	CULTUROME
<i>Res extensa</i>	<i>Res significans</i>	<i>res cogitans</i>
Information (qubits?)	signification (DNA?)	Conceptualization (logic?)

Table 1. Plerome, biome, and culturome.

Following Bataille’s (1987) idea that excess tends to destroy itself or attack the organism when not dissipated and wasted, one could assume that perhaps some kind of entropic process is at work in rituals like the potlatch or *mayordomía* and other forms of ceremonial dissipation, which

could suggest some continuity in the entropy law through these collectivities. What is a constant and an absolutely defining feature of a culturome is that it is a procedure for ordering the world and the relations within a group, an order which depends on conventions, negotiations, habits, and common codes. Thus a culturome is basically a negentropic process generating finer and finer distinctions and differentiations (even among ants or bees, which practice a division of space and labor within their community).

If laws of randomness in the *pleroma* tend to disorder, entropy and dissipation of energy, the new creatures emerging everyday in the biome (in addition to novel forms of flora and fauna hybrids, virus mutations, prions) point in the opposite direction, i.e., toward order, evolution, natural selection, heredity, intentionality, and diversification, in short : negentropy. While disorder needs no explanation – we see it as the natural tendency of everything – the opposite tendency certainly requires it. Jakob von Uexküll conceived the idea of a master plan to explain the order of nature. Bateson (1972, 1991) proposed the concept of “the sacred”, the “spirit” or “ecological mind” in live systems, believing evolution to be a mental process. From the point of view here taken, “the sacred” could be defined in a secular sense, as nothing other than semiotic networks passing from one system to another, from one scale or level to another, since any order depends on some kind of code. Situated exactly between Descartes’s *res extensa* of inert matter or plerome and *res cogitans* of human mental processes at the culturome, something is at work, namely semiosis, or Peirce’s (1977) “perfusion of signs”, which we could properly call *res significans*. Evolution depends on this semiotic *res significans* beginning with the detection and absorption of what is significant to the organism at the basic protozoic level of the plasmodium, as solar energy, nutrients and water by plants and of food by animals, fungi and bacteria. *Res significans* is woven by each and every creature through continuous processes of action-perception (Uexküll’s 1982 functional circles between perceptor and effector) at all the levels for only 4 billion years on earth.

One could suppose that such processual continuity is rhizomatic, reticular, and multidimensional, in a similar manner to synaptic connections in the brain operating by intermittent jumps and contacts or flows of information. This makes us wonder about the action of semiosis through which deviations, regressions, iterations, saturations, thickenings and weaken-

ing unpredictably occur, increasing or decreasing the density in clusters of meaning. These semiotic rhizomes emerge in several directions and have different weights (in Edelman's 1992 sense) related to food, danger or mating, activities that are crucial to the survival of the organism.

The "master plan" to which von Uexküll referred (something like a code that could explain the wonderful patterns of order found in the lifestyle and development of several organisms for their survival) raises the question of its determinist consequences. The point here is that Uexküllian *Umwelten* or Batesonian "ecological minds" or Lotmanian "semiospheres" all involve processes that necessarily depend on the plerome which appears to build up, in our world, towards biomes developing into culturomes. This question was partly addressed by Kalevi Kull (1998) from a Lotmanian perspective a decade ago, in regard to the semiosphere as the system of all interconnected *Umwelten* which, according to Rothchild's third biosemiotic law of domination (cited by Kull 1999), does not seem to follow a pre-established pattern in this process. Semiotic activity is open, flexible and able to face novelty; but due to the law of continuity and repetition, order settles down with each act.

Self-similarity and iteration in semiotic action could help us understand how this sense of order arises, probably according to Peirce's idea of habit as a process of sedimentation. Interestingly, Schrödinger envisages the emergence of consciousness on the opposite end, not as a result of order and habit, but of novelty. Consequently, one might conceive consciousness as feeding on disorder to create order at the level of the culturome.

Related to repetition is *replication*, a repetition that doesn't circle but spiral, changing the result in reproduction. The more complex the organism in which repetition takes place, the more novel the replication appears to be, bringing about a new creature in many aspects similar to, but different from, its begetters. The plerome, on the other hand, does not replicate, nor diversify (or does it?), but perhaps only fissions or fuses. Replication may thus be the basic negentropic mechanism at work in biomes and culturomes, because every product is new and limited, tending to reproduce itself and create further differences (an idea found in *Selfish Gene*, 1976). In the biome, *replication* is biological procreation, while in the culturome it takes the form of schooling, propaganda, indoctrination, proselytism, rhetoric, and the like, all mechanisms to replicate ideas and cultural practices by two opposite mechanisms: entropic desire for homogenization

(everyone should think the same) and negentropic differentiation of a group by its opposition to the “others”.

Moreover, life, like snails, always leaves traces: a book, a worm’s path within a pea, a symphony, a spiderweb, a cocoon, an egg, a pyramid. The index, the most material of all signs, seems to be at the very roots of evolution. This fact forces us to consider if, in effect as Sebeok affirmed (1963, 1996: 22) and Peirce implied, semiosis only happens in live beings from the cell on, at the biome level, or could exist in the plerome as well. The plerome also leaves traces: the Hubble telescope detected traces of the Big Bang, as black holes are traces of dead stars. Are we the only interpreters of these phenomena? Further questions arise which are at the core of biosemiotic approaches: Are DNA molecules purely mechanical assemblage processes or are they interpretants? What about antibodies in relation to antigens? Being live creatures or second order units (pluricellular individuals), do we undergo an ontogenetic big bang from our cygotal conception, all flowing towards dissipation at death in strict accordance with the law of entropy? Ashes to ashes ... but where exactly does semiosis begin?

If, for Gregory Bateson, information “is a difference that makes a difference”, for contemporary physicists information appears to relate to the condition of matter-energy, for example, the spin of an electron. For Lloyd and Ng (2004: 31), “each elementary electron, photon and other particles store bits of data, and whenever such two particles interact, those bits are transformed. The physical existence and the content of information are inextricably linked.” They claim that a physical system can be explained using a finite number of bits in which each particle of the system acts like the logical door of a computer. When the particles interact, a change of spin or axis can be caused. The Cartesian syntagm for *res extensa* would now be enunciated as *computo ergo sum*, understanding the universe as a great cuneiform tablet: wherever there is matter, we can find information (perhaps finally the total information needed to make Newton’s mechanical system exact). So now in addition to *meaning* (when a signifying agent or interpretant triggers a semiotic process) at the organismic cellular level of a paramecium’s membrane or ants’ chemical communication, there is also *information* not only in the brain’s chemio-electro-synaptic connections and molecular DNA codes or antibodies’ recognition of antigens, but perhaps also at the atomic scale. Therefore we may well go from qubits,

bits, bytes, molecular DNA codes, signals, signs, syntagms, paradigms, *Umwelten*, semiospheres and epistemes.

Every cultural process begins by an act of distinction, separating, as God did, day from night, light from darkness, macrocosm from microcosm, quarks from muons, always cutting through the “mass of thought” with sharper signifier/signified differentiations. Culturomes are thus constructed by these cuts or distinctions which constitute the very bricks with which human organisms construct culture, namely, the edifice that carries out autopoietic processes as third-order units: we and them, sacred and profane, nature and culture, body and mind, good and evil. Mental distinctions appear to be a law in both phylogenetic and ontogenetic developments through semiotic disambiguation generating, at an exponential speed, new terms and colonizing new cognitive fields. New artifacts, brands, names, ideas, pictures, gadgets, scientific fields and concepts are exploding in this negentropic cultural big bang. Can we apply Swenson’s conjecture here as well, and say that culture is an efficient energy dissipation device in agreement with the Second Law? Or are we producing culture to slow down organic replication (procreation) by sublimation, as Freud would say, and thus also the entropic? Could it be that this incessant and accelerated cultural production ultimately tends to dissipation and disorder in some sort of cultural entropy by informational noise and saturation, when difference will no longer make any difference? What disorder do cultural organisms or third-order units export to the environment? Are culturomes enabling the return of entropy with a vengeance as in nuclear pollution buried in the Mexico-USA borders or cell phones’ toxic waste, which, unless exported to the moon, will eventually contaminate everything surrounding it?

For Schrödinger (2001: 71), “What an organism feeds upon is negative entropy”. Negative entropy or negentropy is, for this Nobel prize physicist, the key element in metabolism, rather than the common held view of energy absorption and exchange of materials within the environment. In other words, as live creatures we crave for order and absorb it while expelling disorder. We are not nourished by proteinic materials so much as from their organization. Is this also the case of collective organisms? Does flora create vegetative order (sugar, oils, and vitamins) from the plerome, as fauna creates animal order (proteins, fats) from the flora and other fauna, while we create culturomic order from the former? Does this neural

order of the third level (Edelman's [1992] "neural maps") equate perhaps to Semon's *mnemes* or Dawkins' (2006: 189–2001) *memes*?

Not only a matter of scale, this problem implies as well the very texture with which culturomes, semiospheres, *Umwelten*, mnemes, percepts and signs are assembled, perhaps in a similar manner to electrons, carbon chains, amino acids, proteins, tissues, muscles and so on. The increasing complexity of these three levels seems to imply that each one keeps the structure of the previous but adds further order in an apparently irreversible process: biomes retain pleromatic elements (such as atomic order) but add further order (from molecular order on, more stable than atomic randomness), as culturomes keep part of pleromatic and biomatic orders but are irreducible to them. The human body turns to ashes; its biomatic properties dissipate at death, obeying entropy; but it nevertheless manages to bequeath the order it created and learned to newer generations by a cumulative cultural heritage. I have presented you more questions than answers, hoping to find some help in figuring these problems out.

Russ Manitt

At the crossroads of significance and insignificance

***Winterreise*, meaning and alienation**

1. Introduction

Given that Wilhelm Müller's poem-cycle *Die Winterreise* is presumably about an alienated wanderer, the question remains whether Schubert's music to these poems is independently able to express alienation, or to convey meaning of any kind. In these so-called postmodern times, where musical hermeneutics is, at best, suspect, and where, at worst, there is no longer any hope for common agreement, my choice to examine the possibility of a *shared* musical understanding of alienation is anything but a methodological error.

First, I will give a very brief history (up to Hegel) of the word *alienation*, a word that, as a result of its semantic overload, the late philosopher Paul Ricoeur describes as "ill" and that, as such, needs a little spring cleaning. I will be following Ricoeur's typically erudite encyclopedic article for the purpose (Ricoeur 2000: 47–60). Second, I will mention several passages in the poems of *Die Winterreise* that resonate with the different aspects of philosophical alienation. Third, I will discuss the signifying potential of the music itself with regards to the alienated experience of the modern individual.

2. Alienation

A genealogy of *alienation* starts with the Latin origins of the word. *Alienatio* refers to business and collection, whereby one relinquishes one's right to a property. Hobbes expands this meaning of *alienatio* to the renunciation of one's liberty (*I give up my right...*) which is made in favor of a non-contracting third party, i.e. the sovereign. Rousseau argues that this renun-

ciation is made for the good of all. In this sense, his concept of *aliénation* becomes a founding act of the political body and, by doing so, moves from a juridical to a political realm, a move which Hegel will later refuse.

Appropriation, according to Hegel, is only legitimized by an *exterior* will. The State – which is founded on the assembly of people sharing a common language, common customs and traditions – cannot, according to Hegel, rest on contractual relationships. A contract, in fact, pits wills against each other. In addition, Hegel remarks that the act of cession not only alienates the subject from the surrendered object, but, especially, alienates oneself from one's arbitrary *will* over that object.

Two different words are used by the philosopher of *The Phenomenology of Spirit* when discussing alienation: *Veräußerung* and *Entfremdung*. *Veräußerung* suggests exteriorization. This specific type of alienation, through its association with Gnosticism, conceptually bridges the gap between the absolute One and the contingent Other. It ensures “a passage from the immediate to the mediate, it introduces confusion into what is indivisible, paving the way for contradictions to be surpassed” (Ricoeur 2000: 55, my translation). In other words, it is the necessary evil on the road to reconciliation.

Entfremdung, Hegel's second term, emphasizes the estrangement that comes with alienation. It is the rift with *oneself*, a feature of Hegel's unhappy consciousness. With *Entfremdung*, the individual mind faces God, or the absolute Other, in front of whom the individual is reduced to *almost* nothing. In this case, there is no reconciliation.

3. *Alienation and Winterreise*

Wilhelm Müller wrote his cycle of twenty-four poems, *Die Winterreise*, in 1822. The plot of the cycle, known to most, is simple enough. A young man, suffering from a failed relationship, leaves his home, renouncing his work, his city, and God, seeking answers, seeking death, and finding neither. However, one *could* wax psychoanalytical and question whether or not this disastrous love affair is the cause or the *consequence* of the wanderer's oddities. *Strangeness* is, in fact, the problem. The first lines of the very first poem tell us as much: “Fremd bin ich eingezogen/ Fremd zieh ich wieder aus” (“A stranger I arrived, A stranger I depart again”). By the second half of the cycle, the journey itself takes precedence. The *idée fixe* is

displaced from his beloved to himself. “I have done no wrong that I should shun mankind. What senseless craving drives me into the wilderness?”, he asks in “Der Wegweiser”. The answer is in a preceding song. While he roams the streets at night (in “Im Dorfe”), he remarks, as the villagers sleep: “They dream of much that they have not, find refreshment in good and bad things. And tomorrow all is vanished”. At last, the journeyman finds solace in the organ-grinder, however one may interpret this figure. In short, the wanderer of the *Winterreise* seems to be caught up in a particularly Hegelian sort of alienation. (Whether in the sense of *Veräusserung* or *Entfremdung* is another matter.)

It is equally worth mentioning the authoritative and extremely bureaucratic regime in which Schubert lived, a reality that was doubtless alienating for many reasons. At the very least, it produced a dissonance. David Gramit notes: “... by becoming government officials, teachers at state-supported institutions, and the like, ... most of Schubert’s friends also were or eventually became part of the same repressive apparatus whose incursions they resented” (Gramit 1997: 69). While the practice of the arts was at times refractory, self-cultivation was highly regarded. But cultivation also provided some respite from Austria’s oppressive and alienating bureaucracy: the escape into an inner artistic world was the only way out. But the question remains: How was this done *musically*? Rosen, in a discussion about Schubert’s three-key expositions, suggests the following:

Both the half-step shift and the harmonic field and the technique of using the space outlined by the motif as basic rather than its interior shape, work toward the same end: they diffuse the urgent rhythmic impetus implied by motivic or harmonic structure and turn the *music inward into more intense but less focused effects of contemplation* (Rosen 1997: 97, my italics).

Christina Muxfeldt echoes Rosen’s comments by remarking that Schubert’s skillful modulations and the “plodding steps of the poet-wanderer” both participate in the “representation of an inner experience” (Muxfeldt 1997: 125–131). Susan Youens, in her book *Winterreise: Retracing a Winter’s Journey*, also talks of this same plodding “journeying figure” (that permits structural cohesiveness and signifies the journey’s inexorable impetus). Youens equally observes the presence of other topoi that signal “a change of place *within the wanderer’s mind*” (Youens 1991: 83–95).

Although these interpretations may ring true to some, they are far from being indisputable. Youens herself disavows any claims to objectivity in the preface to her book. But objective or not, the evocation of an inner space certainly seems, for all authors, to be the key to understanding the *Winterreise* and Schubert in general. Is this a universal truth of Schubert's music? Or a topos of Schubert scholarship?

4. *Winterreise and Analysis*

I am neither adverse to analysis nor am I unfavorable to interpretations that may come from analysis or, for that matter, from any other form of *criticism*. However, I do perceive at least two pitfalls in the search for musical meaning. First, many analysts bent on revealing *what* a piece of music means – or even, to borrow Kofi Agawu's phrase – *how* the music means, seem to hope for a much too univocal equivalence between signifier and signified. Walter Everett's position in his 1990 article on "Grief in *Winterreise*" is one example: "My aim in the following pages is to show that ... the decoration of the fifth scale degree with its semitone upper neighbour note, is Schubert's principal means of portraying the wanderer's grief." (Everett 1990: 157) Two interpretative constraints raise some suspicion here. First, the wanderer's grief is, according to Everett, a consequence of his estrangement from his beloved. While this is certainly true to some degree, I believe the problem is much more deeply rooted, as expressed by my earlier comment on the cycle's first line. The wanderer's feeling of alienation *predates* any problems in his relationship, and may have in fact contributed to them. Second, although Everett's able analysis aptly demonstrates the pervasiveness of the figure, the figure's signifying authority remains dubious. One feels the impulse for a strong conclusion. The example – although infinitely less complex – of the descending minor third of a doorbell signifying a visitor's arrival comes to mind. In Everett's case, this exhibits grief over a lost love (Ex. 1). Everett's assertion that the semitonal figure is the "principal means" of portraying meaning, thus implying that there *are* others, does little to alleviate the impression that the author is envious of the certainty scientific proof claims to offer.

This brings me to the second pitfall. It seems to me that, instead of allowing for a multiplicity of interpretations, many analysts and critics debate over issues that may, ultimately, not hold that much significance.

Example 1. Everett's Schenkerian analysis, beginning of "Einsamkeit", from Winterreise.

Often, it is the debate itself which is most revealing. One thinks, for example, of the often discussed Lied "Auf dem Flusse" by no less eminent musicologists such as David Lewin, Anthony Newcomb and Richard Kramer, without even mentioning Schenker's famous analysis of the song. That said, it seems fairly obvious that the hottest point of contention involves the presence of the G# bass in measure 11 (Ex. 2) at the contested modulation to D# minor and, *in extensia*, to the G# minor episode of measures 48ff (Ex. 3).

Example 2. Schubert, "Auf dem Flusse", mm. 8-13.

Lewin (1982: 47-59) considers the G# of m. 11 as simultaneously related to the "optimistic" future E major (mm. 23ff) and the "pessimistic" E minor tonalities. The resulting ambivalence suggests, in his view, that the wanderer is in fact asking an honest question: "Is there any capacity for flowing torrential warmth left under the frozen exterior of the heart?" There exists, in fact, ample evidence elsewhere in the poems of the cycle to

suggest that the wanderer is genuinely concerned that once the pain (or numbness) subsides he will have lost his beloved for good.

Newcomb (1986: 153–174) takes a more straightforward approach and considers the tensions between G# minor and E minor more locally and as signifying, thereby, the frustrated passions of our dearly despondent devotee. And Newcomb also makes a good case.

Finally, Kramer (1994: 153–159), like Lewin, perceives a contradiction in the use of the G# at m. 11. However, for Kramer, the problematic G# creates a “dissonant ambivalence” between E minor and D# minor which, says Kramer, allows the music to go beyond simple image making. In fact, this gambit, what Kramer calls a “chill motion”, is “universally admired as the musical mimesis of an inner psychological stirring” (1994: 153). The “chill motion” is a half-step shift – which, of course, recalls previous commentaries about Schubert’s psychology.

er - kennst du — nun dein Bild? Ob's un - ter dei - ne

49 Rin - de wohl auch so rei - Bend schwilt ?

Example 3. Schubert, “Auf dem Flusse”, mm. 44–51.

So who is right? (I cannot help wondering if my question is undecided, rhetorically frustrated, or the result of some deep psychological stirring). The honest – and perhaps expected – answer is : everyone. It is my contention that these interpretations, and the analyses upon which

they are founded, all have their merits and although, as the authors themselves admit, they prove nothing, they succeed at least in persuading...to a degree. Of course, it is this ... to a degree ... that remains disturbing. Why? Because, as Carolyn Abbate remarks,

[m]usical gestures are understood as signifiers when we consult intention, or reconstructed historical and cultural surroundings, or our own individual and accidental associations, or the emotional dictionaries set up by operas and movies, or caprice and fantasy, and they mean anything one person wishes, or nothing at all. (Abbate 2005: 357)

If music does not have *one*, but two, or six, or six *billion* meanings, then it runs the risk of becoming meaningless. At the very least – and I am borrowing here from Ricoeur’s comment on the semantically overloaded term “alienation” – a semantically overloaded music runs perhaps the risk, too, of becoming “ill”. But it is difficult to maintain Abbate’s point of view, which argues that it is the free, live performance that really matters. Whether that is true or not makes little difference: people attribute meaning to music everyday. It is also difficult, of course, to maintain the view that music means only one thing, like a message awaiting the breaking code.

So, if there is more than one possible interpretation of “Auf dem Flusse” and less than an infinity of possibilities, how many are there? Are there limits to the interpretations we give? Suppose I admit that one of the things that limits these interpretations, the work itself (whatever that may be), is also the very thing that challenges them and is challenged *by* them. I would contend that what Schubert succeeds in doing, even today, by flirting ever so closely with the *limits of conventional modes of musical discourse*, is to actually make us experience – critically – the same questions with which his wanderer struggles. As such, I would agree with Richard Kramer who states that “eccentricity that cannot be understood to be grounded in some coherent language is without expressive meaning” (Kramer 1994: 15). Precisely *because* it is grounded, Schubert’s music allows for ungroundedness. But would this mean that all “eccentric” musical moments – or, as with the case of “Auf dem Flusse”, all tonally ambiguous moments – are expressive of alienation?

In a way, yes. Because they invite us to perceive critically. They *provoke* a dialectic, they *encourage* exteriorization. (Plus, as we saw with Hegel’s *Veräußerung*, not all types of alienation need even be left divided.) And,

in a way, no. Because, as we observed during the conference, tonal ambiguity can also signify angels, humour, and so on. So my attempt to subsume Lewin's, Newcomb's and Kramer's interpretations into a synthetic gesture of *tonal ambiguity* as a strong signifier of alienation is a failure, for much the same reason Everett's attempt to subsume all semitonal figurations into a signifying gesture of grief was a failure. The failure, as it is, was determined from the outset. The assumption was wrong: this is not a case that can be closed. However, in recognizing that failure, one can finally start to hope for success. One can hope to find, if not a *clear* understanding, a *shared* understanding.

In fact, as Lydia Goehr's article on form and exile makes clear, "the real failure of philosophical form wouldn't necessarily be one that left a space for an unresolved ending, but one precisely that did not leave such a space" (Goehr 2005: 336). The same could be said about music and its meaning. Does this unresolvedness, then, permit a countless number of possible interpretations? Not exactly. The number of interpretations may be immeasurable, but it is not infinite. But, if there is no common topos, how can we find our way home? How can we hope to achieve something resembling a *shared* musical understanding if, because of this openness, we are condemned to live in interpretive exile? Because exile is *not* isolation. Because a "perpetually exiled state [...] is precisely the way not to isolate the subject from society, but, rather, to maintain its dialectical play with it" (ibid.: 335). To put it in terms of this conference: communication does not end with misunderstanding but relies on it to exist. It is the intersubjectivity of this communication, finally, that imposes the limits on interpretation while, at the same time, allowing for its freedom. Interpretations are never impervious to judgment. An individual's eccentricities are always subject to be measured up to the norm. The norm is always subject to be contested by the individual.

This game, itself, is our common ground. How meaningful it is depends largely on how we engage it.

Dario Martinelli

Notes on the theoretical program of biosemiotics; or, “What exactly am I doing here?”

It is no mystery that the theoretical foundations of biosemiotics have been exposed to a significant amount of criticism, from both semiotic insiders and outsiders (typically from other biological sciences). Although it is true that part of such criticism is due to a die-hard conservative scepticism within academic environments, and after all, as the proverb says, “many enemies bring much honour”, it is also true that a number of those remarks are really worthwhile to take into account.

Being in the peculiar and ambivalent position of a) often having to explain (when not defend) my own zoosemiotic research to entire squads of sceptical (or simply inquisitive) colleagues, and b) having myself been pretty critical towards biosemiotics in more than one occasion (with an emotional participation that denotes most of all care and affection), I feel it is in my own interests to reflect upon the issue. As the title of the congress this paper is written for is “Understanding and misunderstanding”, I shall humbly illustrate a few points about biosemiotics I think I understood and others I fear I misunderstood.

Point number one: Consider an essay collection of, say, 20 articles, or a symposium of 20 papers. How many articles/papers out of 20 you think you should be interested in, in order to buy the book or participate to the congress? And how many you should have some competence about, in order to contribute to that book, or present a paper to that congress?

Let us go by degrees. Let us say I am a comics artist, and I am hoping to become the next Charles Schultz. To a strict degree, I am of course interested in articles or papers like “Stylistical traits and evolution in *Peanuts*,

from the origins to nowadays”, or “The role of Charlie Brown in the depiction of American Society”. To a slightly larger degree, also essays on Stan Lee or Walt Disney are very fine. And, of course, I would not mind learning something about media, satire, newspapers. I should be happy also with something about drawing in general. Maybe painting too. Sculpture? Probably not. Architecture? Not really. Interior design? Good grief!

So, would I buy a book with 5 articles about LeCorbusier, 6 about ceramics decoration, 4 about Baroque churches, 3 about French impressionism, and 2 about Superman? Probably not. Still, this is my status as zoosemiotician, inside the biosemiotic circle.

My interests include the human-animal semiotic relationship, the concept of “animal”, animal aesthetics, play behaviour, deceiving behaviour, several ethical and methodological issues, the cultural representation of the animal, interspecific communication, the concept of language, and of course zoomusicology. Also, give me anything that pertains to animal signalling behaviour or the way we humans semiotically interact with them, and I am happy. It does not look a restricted range of interests to me. We count some 1,250,000 animal species on this planet, and they *all* do many interesting things with signs. Yet, in those occasions where I attended biosemiotic congresses, symposia or sessions, I could consider myself lucky if one, sometimes two, scholars would speak of any of those topics.

My colleagues send me articles to review, and they are called things like *The Physics and Metaphysics of Biosemiotics*; *Biosemiotics as a Mode of Thermodynamics in Second Person Description*; *Beyond Bioinformatics: Can Similarity Be Measured in the Digital World?* What am I supposed to know about these things?

Make no mistake, I have profound and absolute respect for these topics, and even more for the people that deal with them. I do not know what they talk about, but I am sure it all makes sense. My problem is different. I wonder: am I the only one who feels so lost in this huge galaxy of topics? Biosemiotics seems to deal with all kinds of things, and all sizes: from the infinitely small (DNA, for one) to the infinitely big (the Cosmos). And all that stays in the middle: cells, molecules, plants, animals, ecosystems, light, virtuality, you name it. It is all possible. Why? Probably because *Bios* is a Greek word for *life*. And, *Six Feet Under* TV series excluded, is there anything we can talk that is not about *life*? In taxonomy, before reaching Life, you need 9 steps: Species, Genus, Family, Order, Class, Phylum, Kingdom,

Domain, and finally Life. Human being, the subject of most semioticians, is just a species, i.e., the first step.

That makes me think: What is exactly biosemiotics? Is there such a thing like *one* biosemiotics? After all, Sebeok anticipated it, there is cytosemiotics, phytosemiotics, zoosemiotics, micosemiotics, endosemiotics; and let me add chosmosemiotics. Etcetera. Do we seriously think that talking about mushrooms has to happen in the same context where the next paper is about subjectivity, the one after that is about vervet monkeys, and the previous was about the origins of the universe? Why not a paper on Paul McCartney, then? He is alive, he is vegetarian and he wrote “Blackbird”.

It is very hard to find anything that is *not* life, but it is exactly when something is about everything that it becomes about nothing. Are all these topics belonging to the same discipline? If yes, what is the advantage? Having more people in a conference (if that is really the case, because I do not see why a specialist on any biological topic should find so attractive a place where hardly anybody speaks about his/her things)? And what are the costs? Is it healthy for a discipline to be so generic? How can I give helpful feedback to my mushroom colleague? And how can s/he be helpful for my whale songs? Of course, there will anyway be interesting discussions: but how deep, how precise and how precious, that is a bit tricky.

If I can humbly propose a challenge for the near future of biosemiotics, that is to decide whether we want this label to be an umbrella term, and then everybody is welcome, former Beatles included, or a discipline with a strong – and strong often means limited – paradigm. If we are for the latter option, and I believe we are, judging from the theoretical efforts of those I consider the main scholars in the field, then we need to trace a path that goes towards choice, distinction, and specialisation. This, I believe, is what distinguishes a scientific community from a crowd of scholars.

Also, such an action is called for because, and this is probably my main fear (or misunderstanding), I have the feeling that more often than not biosemiotics is experiencing something similar to a metaphysical drift, or – to put it mildly – an empirical support to the interpretation of given life processes does not always seem to be a priority. I shall not go into details here, because that would require examples that some colleague or friend might easily consider offensive, and there is no whatsoever intention here to do so. I trust anyway that most colleagues know what I am talking

about, and – if yes – I humbly invite all of us to put this picture in relation with the not amazingly positive reputation that biosemiotics has in other scientific fields.

But let us not underrate the McCartney issue. So, all of us know perfectly that a paper on a pop-rock singer-songwriter would hardly be accepted at the Gatherings, or in similar contexts. Now, the ex-Beatle and the vast variety of topics I just mentioned are two sides of the same problem. The problem is that when biosemiotics looks at its left, it sees no limits whatsoever, while, when it looks right, it sees the Pillars of Hercules (or the other way round, if you are not politically satisfied of this arrangement). Biosemiotics sees its analytical potentials as unlimited, but only (if only is the word) when it does not interfere with the untouchable dualism Nature-Culture: Nature allowed, Culture not. Culture is not a living process, apparently. It has no biological basis, and has no part in detecting the meaning of life. Yet, it would not be so difficult to prove otherwise. Both rhetorically and scientifically. Not to mention that scholars that like so much Peirce should be anxious to support the notion of synechism. But, thankfully, at least human culture was left out. Now, that seems to me not the result of a pondered scientific decision, but more an ideological one. In an environment, the semiotic one, dominated by scholars that deal with human matters, biosemiotics came to cover just everything that is not human. Which, evidently, is a definition by negation, rather than by affirmation. Take humans out, and what remains is biosemiotic. But, I am afraid, this is not the kind of specialisation I was hoping for. Because if we accept once again, although in disguised form, and pretending we are doing something else, the Cartesian dualism, then I find it hard to identify myself with this community. Let alone how against this I am ideologically, the thing is that I see most of my academic interests falling into the category of cultural processes. Or where else should I reasonably include such topics as zoomusicology, the human-animal relationship or the notion of language?

Given the nature of this paper, I cannot avoid referring also to Prof. Kristian Bankov and his famous notion of “Bankov’s Razor”. Although controversial in many aspects, that notion had for me the great merit of shaking the coconut tree of biosemiotics, forcing me, for one, to seriously reflect upon the scientific role of biosemiotics, its weaknesses and its strengths. There has been quite a hype around the razor in the last 2 or 3 years, within

the semiotic circle, or – better – within *our* semiotic circle, i.e., the circle of those semioticians that move around the same area of knowledge exchange. *Our* circle is the circle that meets often here in Finland, particularly in Imatra, and then in Tartu, in Copenhagen and in other European places in the occasion of the Gatherings or similar meetings.

In one of the main points of his argument, Bankov notes that a certain “scientific humility” that he expects from biosemiotics is, I quote, “not present in the majority of biosemiotic papers I have read” (Bankov 2005: this article, presented during the 2004 ISI congress in Imatra, is forthcoming as a publication, therefore I cannot provide page numbers for my quotations, that come directly from the unpublished manuscript that Kristian kindly handed me). Here I have to agree, although, probably, for reasons that are not necessarily the ones indicated by Bankov. He says: “Biosemiotics is totally dependent not only on the existing data, achieved within certain sciences. It is entirely dependent on the very scientific worldview, on its articulations and categorizations of the surrounding world, on the biological terminology, on the theory of evolution and the like. Biosemiotics would be nothing without them, whereas they, the conventional disciplines, have existed, exist and will exist totally unaware of biosemiotics” (*ibid.*).

Although there is a certain form of dependence, in the way above described, I really do not see it as an exclusive problem of biosemiotics at all. *All* disciplines depend in some form from those that came before them and dealt with the same issues. Did not musical semiotics depend on musicology and music theory? Did not classical semiology depend on linguistics? Of course they did, except that, exactly like biosemiotics, they were able to develop an identity of their own, autonomous enough to enable us to consider them “something else”. I may agree with Bankov that the autonomy of semiology from linguistics, when it comes to specific analysis, is somewhat superior to that of biosemiotics from biology. But then again, semiology is older. Give biosemiotics some time.

More importantly, however, Bankov’s statement seems to ignore that biosemiotics *did* propose a consistent number of novel theories and methodologies, maybe even too many, and these have just nothing to do with those “other” sciences, starting from the principle itself that animates the entire biosemiotic idea, i.e., identifying the biosphere with the semiosphere, with all the thousands consequences and the shift of mentality

implied. And that, like it or not, is something that biologists never even thought of. I shall also, and proudly, bring my own zoosemiotic research as an example of a genuinely semiotic study that needs, is enriched and characterised by the use of semiotic tools. A configuration of aesthetic phenomena, the way I constructed it in my writings (see Martinelli 2004, for instance), would never have been the way it is now without the application of the Jakobson model on communication, the Peircean notion of firstness-secondness-thirdness, and Eco's reflections on the ambiguous and multi-layered nature of the aesthetic codes. Anybody, semiotician or not, who went even superficially through my writings can notice that. So, if the razor has to shave somebody on that point, that is certainly not me. But, really, I could say the same for a lot of other colleagues whose work I am familiar with.

Another cup of tea is to browse through all these innovations provided by biosemiotics, and put in a separate box 1) those that are probably not necessary, as they reformulate with different terminology what has already been known for a while; and 2) those that risk exposing biosemiotics to an excessive amount of criticism, given their purely speculative basis, which sounds a bit out of tune in a discipline that after all aims more to improve biology than philosophy. I am not very worried about the first point, as it is a sport practiced in nearly all fields of research, but, as I expressed already, I am deeply concerned about the second one.

Having said that, I still see Bankov's concern as legitimate to a certain extent. I still see this lack of humility as something worthwhile to discuss, being in fact one of the aspects that puzzles me the most about the current state of biosemiotics. I must say that, yes, a certain arrogance has indeed been displayed in quite a few occasions, when it comes to both the foundations of the discipline, and its theoretical – so to say – heritage. The above-mentioned metaphysical drift is already something that speaks for itself, but let us see other instances.

Firstly, we have the so-frequently experienced presumption of many biosemioticians to have finally discovered the ultimate answer to all problems. You can see them, happy and proud, reminding you how the biosemiotic revolution has turned the obsolete knowledge upside down, for better and for good. I am sure the biosemiotician colleague who is reading this article will understand what I mean here, and if s/he does not it means s/he is one of them. The thing is, I also secretly think that biosemiotics

offers a more consistent view of natural phenomena, I also stand for a semi-otic interpretation of them. *But*, we do not have the reputation to say that openly, this reputation being completely to be achieved. And in fact, even if we did have it, I would still find such an attitude unpleasant. We all agree that biosemiotics has to face prejudices, incomprehension, conservative and reactionary feedback. But I really would not subscribe on boldness as an appropriate response.

Another example of this arrogance lies on the luckily-just-occasional tendency of refusing, or at least underrating, the contributions to semi-otics provided by those semioticians that were never BIOsemioticians, or that anyway refer to completely different fields of inquiry (provided that there is such a thing: see above). The obvious instance is the strong stand in favour of the Peircean sign paradigm, to the detriment of the Saussurean or the Greimassian one (and, make no mistake, I am also for number three in defining sign and semiosis). Yet, I would not mind witnessing a kinder response to those that dare presenting papers that are not necessarily Peircean. Never mind the wasted occasion for confrontation, at least let us not label those papers as “a step backwards in scientific research”, as occurred few years ago in Imatra during a biosemiotic session. And, to say it all, a few remarks should be made also about Peircean approaches *in se*. However, I shall keep them for another occasion, except perhaps a few hints here and there.

Anyway, from time to time, this rejection for extra-biosemiotic approaches may become a momentary lack of memory. A couple of years ago, I was asked to review an article on Modeling Systems, written by a very famous semiotician. The article certainly provided a comprehensive account of the state of the art of the theory on Modeling Systems, very efficiently summarising the main issues related to the concept. I was naturally in favour of its publication.

However, one aspect I found surprisingly approximate, and that was the total – and I mean total – lack of mention to the enormous contribution that Tartu-Moscow semiotic school in general, and Yuri Lotman in particular, gave to the concept. To maintain, as the author of the article did, that, quotation, “modeling systems theory *blossomed* forth as a comprehensive theoretical and methodological framework *only* in the pivotal work of Thomas A. Sebeok” was a complete neglect to the contribution of Tartu-Moscow school, which is even more ironic when we think that

Sebeok himself repeatedly expressed his debt to Yuri Lotman on this account. Is this the Orwellian case of “all semioticians are equal, but some (i.e., biosemioticians) are more equal than others”?

Two more questions are left to discuss, in relation to Bankov’s Razor: one is, Does biosemiotics have an ethical paradigm?, and the other is, How to react to accusations of anthropomorphism and reductionism? Now, these are topics that I discussed at length in a few of my writings (most extensively in Martinelli 2007: 154–216, and 275–288). But there is a difference. My arguments on anthropomorphism and reductionism were already articulated in form of response to a number of critical remarks moved against bio- and zoosemiotics. The fact itself that in that book I formulated a notion called Martinelli’s canon, suggests already an, at times ironic, awareness of both the Morgan’s canon and the Bankov’s razor. As I do not feel I have anything to add to those reflections, at the moment, I shall kindly invite the readers interested in my views on the subject to browse the pages of the mentioned monograph.

On the contrary, my views on the ethical paradigm of biosemiotics have always been formulated *a priori*, as part of the construction of my own theoretical program, and not as the result of a need to fight back anybody’s remarks. Prof. Bankov, once again, was able to summarise these remarks with very efficient rhetoric (and I mean rhetoric in the noblest sense of the term). There is no room for discussing all the several implications of Kristian’s argument, so I shall here limit myself to the most evident one, not before reassuring that I will discuss at length *all* of them in a forthcoming article for the Journal of Biosemiotics (in 2008). Here is an important quotation from Bankov’s article:

When biosemiotics introduces in the scientific agenda ideas helping the better understanding of the interaction among living beings, this is not only praiseworthy in itself, but it also contributes a lot the interdisciplinary prestige of semiotics. ... What I find wrong in the whole enterprise is the claim that to be more conscious in that way we need to overcome anthropocentrism. (Bankov 2005)

Here, Bankov proceeds by quoting my own words:

Finally, to study other animals from the perspective of human sciences is the result of a very clear historical course in the human evolution, i.e. – borrowing the expression from Johann Galtung – enlarging the centre and

including more and more periphery. Who are WE? Nowadays, “we” corresponds to a larger number of individuals than just one century ago. “We” also means Australian aborigines, African pygmies, people with mental deficits, women, etc. A long time ago, “we” corresponded to a very limited amount of beings. In years to come, “we” will also cover other animals, and this future has already begun, if we, for instance, think about New Zealand and the so called Animal Welfare Act, which ascribes to Great Apes (chimpanzees, gorillas, bonobos, etc.) the same basic rights to life as human beings enjoy. (Ibid., originally in Martinelli 2003: 2).

Bankov then comments:

It is the typical, politically correct program, which any responsible person, me included, would subscribe. But for the hundredth time the undervaluation of the burden of our human condition makes the promises unsustainable by the premises. What about the marriages? First THEY, the potential candidates for marriage, were limited by their social state, by the class, the noble origins, and the like. Then THEY became larger group, overcoming at the end even the racial differences. Then THEY started to include even human animals from the same gender. What is the next step? Should we start to share the mutual right with non human animals to marry each other? Although some undeniable advantages of marrying a cow, there will be a constitutional blackout when the “marriage right” rumor start to spread in the phytosphere. Or we should decide to exclude the plants from the party? More generally, what about the fundamental right of not being eaten? Who will have to enjoy this right and who should not? How could living Nature work with prohibitions within its nutritional chains? Sure, “anyone who places himself out of Nature will feel out of place”. But anyone who places Nature inside culture, thinking that he won anthropocentrism, it’s an underestimation of its complexity! (*ibid.*)

It was in the news sometimes in June 2006 that an Indian woman named Bimbala Das had married a cobra snake, in a small village called Atala. She claimed she was able to communicate with the snake on a very spiritual level, and the entire village took the event as a sign of good fortune. No less than 2000 people witnessed the ceremony, celebrated with a Hindu ritual, except that the groom did not show up, possibly foreseeing the decrease of passion that many experience in married life. Now, how did I react to the news? Did I see my biocentric hopes finally achieved? Of course not: I first laughed heartily, and then I simply took the event for what it is: something that has nothing to do with the ethical program

I am talking about. Moreover, the entire issue is heavily connoted from a religious point of view, a particular that makes it not only different, but nearly opposed in principle to my own, explicitly and proudly secular, ethical suggestions.

To maintain that the basic right of life equals the right of two persons to get married if they wish is as appropriate as equaling the brain of Leonardo da Vinci to that of Silvio Berlusconi. Marriage, as an institution and as an event, *is* a cultural, human, species-specific event. Bringing to an extra-human level something that happens only among humans is of course silly. If anybody sees a way to communicate, discuss, demand, validate and invalidate the notion of marriage with/to other animals, and sees also a reason why on earth would we need that, then please tell me.

However, the right of not being exercised violence and not being violated the basic right to life, *is not*, by all means, a human exclusive. The construction of this right, at legal level (never mind the ethical one), occurs once we acquire the knowledge that a given individual receives pain and damage by such violations. Not only. It applies only when we are not sure that this would be the case (which is why, to mention a couple of examples, euthanasia is illegal, and a pregnant woman cannot be incarcerated). By now, we have decades of knowledge and research that reassure us, with no doubt whatsoever, that non-human animals fall into the category of those who receive pain and damage by the violation of their safety.

Therefore, the argument of those, like myself, who maintain that – to certain extents – anthropocentrism *can* be overcome, applies only (again, if “only” is the word) to those areas of ethics where a *clear continuity* between the human being and the other animal species can be detected. Nobody will ever see me collecting signatures to, say, grant unemployment benefits to all those animals that do not have a job. But if you see a spectacled, slightly overweight Italian demonstrating in favour of an improvement of the Directive 86/609/EEC (the one about animal experimentation), there are good chances that might be me. I hope the difference is clear.

The *dynamic spatiality* of understanding and misunderstanding

This paper outlines an evolutionary hypothesis about understanding and misunderstanding at a linguistic level as a basis for a more objective analysis of the meaning expressed by language. The study is introduced by a short outline of the scientific background (1). The specific topic of the hypothesis (2) deals with the “endo- and exospatial schemes” concerning the “dynamic spatiality” of understanding and misunderstanding at a linguistic level. An exemplification of the hypothesis (3) is given by an analysis and interpretation of the meaning of two pieces by Shakespeare: his Sonnet LXXIII and King Lear’s famous monologue (*King Lear*, Act V, Scene III). The paper ends with a short conclusion (4).

1. Scientific background

The broad scientific background of the hypothesis outlined in this paper is given by evolution and semiotics. Obviously, evolutionary and semiotic backgrounds do not eliminate historical points of reference in which humans have been living since the beginning of their history. On the contrary, evolution and semiotics set the historical level within larger horizons and provide it with deeper roots, which can avoid more misunderstandings in the comprehension of events in general and of sophisticated abstract symbols in particular. In the scientific evolutionary background, semiotics takes a central position for the hypothesis at issue, particularly American semiotics. Evolutionary semiotics appears as a most appropriate link between the history and prehistory of meaning, specifically at a linguistic level. As a historical phenomenon, language arises more or less suddenly, like a mushroom without roots, often as a divine gift to humans, whereas

language, within the evolutionary and semiotic frame, exhibits connections with all preceding sign systems, from biosemiosis to anthroposemiosis, including the most sophisticated evolutionary semioses of language.

Neurophysiology and neuroscience also belong to the scientific background of this paper, especially studies about the nature of space processing, of unconscious and conscious intentionality and comprehension of reality (Rizzolatti 2006; Lacquaniti 2007). In the light of more recent studies, space processing does not arise as a simple sensorial or executive phenomenon, but arises as a coordinated act endowed with unconscious motivation and intention. In other words, motivation and intention are not produced somewhere in the brain separately from motion, as believed until recently, but are consciously and, above all, unconsciously intrinsic to motion or motor acts themselves, i.e., to the production of consistent space configurations.

2. *The hypothesis*

At the core of the present hypothesis about understanding and misunderstanding at a linguistic level there is at the primal shaping of meaning a kind of space processing. Space processing obviously started with life itself, not only with the presence of reptiles on Earth or with the right hemisphere of the brain. As the youngest born into the evolutionary and semiotic world, language cannot disown its ancestors, among which the spatial system and the chemical channel stand in the foreground. Language does not replace spatial processing, nor can it exist separately from it; language only comes after those, and it always carries with itself the spatial unconscious and conscious configurations of which it is the most articulated expression (Mascialino 1997).

Let us now come more specifically to the technical terms of hypothesis. The concept of “spatiality” refers to the whole set of spatial configurations unconsciously and consciously processed by the different motor areas of the brain. The attribute of “dynamic” refers on the one hand to the nature of experience, which is essentially connoted by motion and actions, and on the other hand to the nature of every different motor brain area, which in parallel processes and re-processes each sensation and perception, each motor act, each experience, by continually producing spatial schemes for adaptation to life. The eyes themselves are continually moving and produc-

ing different space configurations even when they are seemingly fixed on a motionless object.

The concept of *endospacial scheme* concerns both activities reduced to the goal-directed motions laying at the basis of the actions expressed by verbs, as well as global spatial configurations of objects with approximated contours. The concept of *exospacial scheme* concerns both actions expressed by verbs and provided with all related objects, as well as detailed spatial configurations of objects with precise contours. As for the organ of sight, for instance, the endo- and exospacial schemes at issue match with the images built at low and high frequencies, respectively. With the term *endoplot* is intended the whole set of motions carried out by a body of linguistic expressions; the *exoplot* is intended as the whole set of verbal actions carried out by a body of linguistic expressions.

Dynamic spatiality with its endo- and exospacial schemes reflects in languages. Since these are the most recent sign systems produced by the human neuronal network, they necessarily root upon the preceding, non-speaking, significant, and essentially spatial sign systems, which cannot avoid being reflected in words and syntax (Mascialino 2006) as both deep and superficial structures of experience.

Since unconscious brain processing precedes the conscious process by at least half a second, the reconstruction and consideration of endo- and exospacial configurations implicitly carried out by words and syntax help to the identify unconscious and deep meaning. This is important, because conscious and superficial meanings base themselves on the unconscious meaning. Therefore, if the spatial schemes in which the skeleton and the dress of events are identified, a more objective understanding of the world is achieved, as well as a more objective understanding of misunderstanding. The present hypothesis about spatial schemes provides language analysis and also psychoanalysis with an objective spatial frame or grid by which to avoid most misunderstanding, which arises due to subjectivity in processes of understanding and producing experience.

3. *Examples*

To exemplify the understanding and misunderstanding of meaning according to the above spatial evolutionary hypothesis, we turn to an analysis and interpretation of two well-known pieces of literature: (1) Shakespeare's

Sonnet LXXIII, *That time of year thou mayst in me behold*, and specifically the image in the last verse: “To love that well which thou must leave ere long”; (2) the king’s monologue/dialogue (*King Lear*, Act V, Scene III), specifically the image “... and we’ll wear out/In a wall’d prison” (lines 11–12). Both pieces will be analysed through the identification of their dynamic spatiality, and the resulting novel interpretations will be compared with current, traditional ones as to meaning and coherence. An analysis and interpretation of every detail of the whole sonnet and monologue on the basis of the dynamic spatiality may be found in two past studies (Mascialino 2002).

Let us start with Sonnet LXXIII, the whole text of which follows in order to contextualize the image to be analyzed (my italics):

That time of year thou mayst in me behold,
 When yellow leaves, or none, or few, do hang
 Upon those boughs which shake against the cold,
 Bare ruin’d choirs, where late the sweet birds sang.
 In me thou seest the twilight of such day,
 As after sunset fadeth in the west,
 Which by and by black night doth take away,
 Death’s second self, that seals up all in rest.
 In me thou seest the glowing of such fire,
 That on the ashes of his youth doth lie,
 As the death-bed whereon it must expire,
 Consum’d with that which it was nourish’d by.
 This thou perceiv’st, which makes thy love more strong,
To love that well which thou must leave ere long.

The image chosen for exemplification is contained in the last verse and emphasized in italics. Traditional interpretations and translations, not based on the dynamic-spatiality view, see a protagonist who is about to die, speaking to a beloved person, this last most probably a young man (for detailed explanation, see Mascialino 2002). The protagonist asks the beloved to love him well, i.e., to love him as strongly and as well as possible because he, the protagonist, is near death and will be soon gone forever. In other words, current interpretations describe an ill, no longer young protagonist who is going to leave the Earth forever, and a beloved young person who will remain on Earth alone following the protagonist’s death. But this interpretation does not stand the falsification brought by appli-

cation of the spatial schemes of our hypothesis: the protagonist is in the same situation as that of the beloved; i.e., the protagonist, being close to death, should love his sweetheart because he will soon be leaving. We must therefore ask, Why does the protagonist want his sweetheart to love him, but does not ask the same of himself, i.e., to reciprocate in such love? Current interpretations do not answer this question, and they misunderstand the image in at least two aspects which are relevant to understanding the meaning.

The first misunderstanding concerns the relative pronouns, “that-which”. According to the dynamic-spatiality view, both pronouns used together can be spatially connected with things or abstract concepts, but not to persons; i.e., they have no spatial matching with persons, just things. Consequently, the protagonist cannot directly refer them to himself or to another person, either concretely or metaphorically, but can only refer them to some object or to some abstract concept. Therefore, if we follow the spatial channel, specifically the exospatial schemes, the pronouns can only refer to events described in three stanzas: (1) the hanging down of the leaves, or the lack of life in the leaves, and more indirectly in the protagonist, since he is metaphorically compared to this event; (2) the setting or disappearing of the sun, and of the protagonist metaphorically compared with that event; (3) the flame going out on its “death-bed”, or the dying of the flame and the protagonist metaphorically compared to the event. It would be scandalous for the young protagonist to abandon that which is indicated by the correlation “that-which”, the request of love by the older and ill protagonist. And things do not go this way in the sonnet. Let us see more in detail.

The spatiality of the three stanzas, respectively, concerns leaves which are hanging down, a sun which is going down, and a flame which is going down; i.e., there are three motions downwards and three phenomena happening in three different and precise locations. If we consider the spatiality of the three quatrains and that of the last hemistich, particularly the endospatial schemes (schemes of the motions), we perceive a jump. It is as though there were two different conceptual and emotional landscapes with no conscious or unconscious connection with each other. In other words, the spatiality intrinsic to the verb “to love” and to the adverb “well” in the last verse do not have any connection in the context with natural phenomena nor with motions downwards or in whatever direction. But since we know that one of the central mechanisms of the brain is given

by the unconscious association system, we must take into consideration that there should be a coherent, parallel or opposite, connection of the last two verses with the preceding, downwards spatiality. As we can see, the two last verses are intended as the conclusion which follows the preceding premises. We have just seen that through the spatial channel, it is his death, his agony, and not himself as a person who can be loved; and if things stayed that way, then the sonnet would be ridiculous, because the young man would be invited to love well the illness and agony of a dying person projected in the images of dying leaves, of a dying sun, of a dying fire.

This very concrete, spatial way to analyse and interpret a literary text may appear too schematic, but it is not so. This schematicism refers to a most primary level of meaning which cannot be eliminated by successive phases of processing, and therefore this process is also carried out by words, thus becoming the most solid basis for understanding the real meaning beyond any possible misunderstandings. Before we come to believe Shakespeare as unintentionally ridiculous, as if one saying, "Hurry up and love my oldness, my illness and do your best because all this will last a very short time", let us examine more attentively the spatial network intrinsic to the image.

Following the spatial channel, we are now more easily aware that there is a space or location to which the relative pronouns can be coherently and successfully matched. It is the place represented by the substantive "well". With this, we have come to the second misunderstanding. The word "well" can have at least two different meanings, each of a different spatiality: one meaning refers to the adverb as in traditional interpretations, another refers to a place for an underground water source to come up to the earth's surface. In this perspective, the endospacial schemes carried out by the word "well" represent a most coherent continuation of the endospacial schemes underlying the actions around which the three quatrains are built: the source of water is deep underground; i.e., one must go downwards to find the source. But the spatiality of the word "well" is specifically intrinsic to the upwards direction. The water source goes from the deepness of the underground up to the surface of the earth, where year in and year out it flows over the soil, nourishing it and refreshing animals, humanity included.

Thus, we have obtained an utterly new and meaningful landscape introduced by the motions underlying the main actions of the poem. What does it mean? In the context of the whole poem, the last motion downwards

into the ground recalls the burying of a corpse, which is consistent with the situation of the protagonist, who is near to death and presents himself as continuing the direction of motion existing in the three preceding stanzas. The motion downwards relates to the near death of the protagonist, and the upwards motion of the source presages a new coming of the protagonist to Earth, as an everlasting water supply which is to be seen as a perennial balm for humanity, water being indispensable to life. Since the protagonist is a projection of Shakespeare and therefore an artist, specifically a poet, it is the poetry of the protagonist – and the protagonist with it – which after the death of the body will remain on Earth as a perpetual balm for humans. In this new spatiality, the person who remains will have no possibility to love the protagonist *qua* well – as a water source springing up from the deep, as poetry which wells up mainly from the deepest, most unconscious circuits of the brain. The beloved young man, who is apparently not a great poet, will vanish into nothing after death, whereas the poetry of the dying protagonist will last for ever and with it the protagonist too.

Let us now analyse two hemistichs of the monologue of King Lear from Shakespeare's tragedy of that name (Act III, Scene V), the whole text of which consists in the twelve blank verses that follow (my italics):

(Lear:) No, no, no, no! Come, let's away to prison;
 We two alone will sing like birds i' the cage:
 When thou dost ask me blessing, I'll kneel down,
 And ask of thee forgiveness: so we'll live,
 And pray, and sing, and tell old tales, and laugh
 At gilded butterflies, and hear poor rogues
 Talk of court news; and we'll talk with them too,
 Who loses and who wins; who's in and who's out;
 And take upon's the mystery of things,
As we were God's spies: and we'll wear out,
In a wall'd prison, packs and sets of great ones
 That ebb and flow by the moon.

The images chosen for analysis are contained in the verses emphasized in italics. Traditional interpretations and translations not based on the dynamic-spatiality view. In general, they see King Lear and Cordelia going courageously if not happily to prison, because there they will solemnly cancel from their all the bad persons, all the noble ones who have condemned them to jail and death. If Shakespeare had meant such an action

for his protagonists, it would have been a comic situation indeed: King Lear solemnly invites Cordelia to go with him to jail and death, so that they can forget the past. But the past could have been forgotten somewhere else and in some other way/ Jail and oblivion are hardly a victory, to be announced in the tone of a triumphant counter-attack! There is a strong crescendo between the parallel declaration “so we’ll live”, of the fourth verse, and “and we’ll wear out” of the third-to-last verse, prepared by the six actions introduced by the conjunction “and”, which hints at a piling up of actions which thereafter burst into the greatest attack and revenge. If we compare the tone of this powerful crescendo with the goal to be achieved, i.e., the forgetting of all, past, present and future, we have a disillusionment which leads to a ridiculous absurdity of the Shakespearian text. Besides, it is not they who have decided to go to jail; they must go because others oblige them. In addition and not least, they will forget because they will soon die, which represents their definitive defeat, and not a victorious counter-attack. Within the context of this interpretation, the invitation of King Lear is not such a solemn action as the general crescendo built by Shakespeare implies. Current interpretations misunderstand the image at least in two points relevant to the meaning of the piece.

The first misunderstanding to be dealt with here concerns the image “In a wall’d prison”. Currently, a “wall’d prison” is considered a prison with four walls, and the critics speak of it as such: little, four-walled rooms with a door for going in and out and a big lock, and sometimes a small window. But the linguistic form chosen by Shakespeare does not explicitly express the spatiality of a room with four walls; it only implies it. It explicitly expresses the spatiality of a room, the entrance of which has been walled up and therefore has no lock; i.e., one cannot go out once one has gone in, because the door is walled up.

The spatiality of this room, rather than resembling a normal prison, matches more with that of a burial niche. It is a room with four walls but with the entrance walled up. King Lear has thus invited his daughter to live with him in a burial niche, where they will survive all others, however powerful they may have been during their life. A clarification of this meaning will soon follow.

The second misunderstanding regards the spatiality carried out by the verbal form “and we’ll wear out”, normally interpreted as *we’ll cancel from our memory*. We have already emphasized the ridiculous aspect of the situ-

ation, if that is the meaning. Therefore, before we ascribe to Shakespeare a fall into absurdity, we must look for other possible meanings which may be more coherent. We can see that the last verse concerns persons, the great ones, whose power goes up and down like the waves of the sea according to the phases of the moon. Now, if the endoschemes connoting these powerful nobles refer to going up and down as the sea waves do, i.e., if there is a very rapid rising and a very rapid vanishing as if by moon phases, and if the tone of King Lear's speech is that of a conqueror in front of them, then this implies that King Lear, together with Cornelia, is sure to survive in some way. The way King Lear will survive with Cordelia lies in the spatiality which the dead have in the grave: they lie without going up and down; they show a material and metaphorical firmness which is opposite to the up and down motion of the great ones. As a consequence of this posture, there is the meaning intrinsic to the verb *to wear out*. This verb has several meanings, all of which centre on the main meaning: the action of consuming. Within this significant area, it also means to consume the other by persistence, to overcome them (*New Short Oxford*), to survive them, to wear them down or, more precisely, to wear them out. But how can Lear and Cordelia, condemned to prison and death, survive anyone? To answer this question we must consider the dynamic spatiality of the first verse. Lear invites Cordelia, his daughter, to go to prison with him. Implicit to his invitation is a gesture which has the spatiality of a man who invites a woman to go with him as a bride. Let us clarify the situation. At first, Lear says "no" four times, concerning the other two daughters, the other two women. The repetition is an emphasis of his refusal, which presupposes a gesture of rejection, for instance, an arm over his eyes so that he does not see the refused objects, the refused persons, for him to remove them from his sight. Then he changes his mind and enters a psychological state of acceptance of the third daughter, Cordelia. Thus, as he refuses the other two, he now stretches his arm towards Cordelia for her to give him her hand, and he also changes his tone. Lear is no longer in front of his daughter, he is in front of a woman he wants to raise to the dignity of a bride, *his* bride. Lear will live for ever with her, but he must die and Cordelia too. As flesh and blood persons, they are going to prison, to die. But Lear is triumphant. Has he gone mad from suffering? A verb which he repeats twice, in the second and fifth verses – *to sing* – makes us not accept this conclusion. They will sing together and live. His daughter, contemporarily his bride,

is now the truest companion of his life, a companion after death, for eternity, as no mortal daughter and bride can be: she is the personification of poetry. Therefore, Cordelia will live with Lear after death, and both will “wear out” or down those who will not last after their death because they cannot do so. Shakespeare/Lear is a great artist and knows it; he will survive after death thanks to his companion, his poetry, which after the death of the body will last forever. This way they will survive the others who now condemn them to death and who will disappear for ever after their short life. It is in death, as the walled prison hints at, that Shakespeare/Lear will survive with his most beloved companion, beloved as a daughter, as a bride, as the truest bride. Hence the triumphant tone, the outstretched arm, the calling to her, the promise of eternal love and life together. If we follow the spatiality of the piece, we reach the truest and deepest meaning of the speech of Lear. As to the falsification of Freudian interpretations, which fail every comprehension of the piece, see my study (2002). The dynamic spatiality has shown that there is a Leitmotif in Shakespeare’s personality and message to humanity: his consideration of poetry as the most important companion of man and his total devotion to it.

4. Conclusions

The identification of the above “endo- and exospatial schemes” within the above evolutionary spatial hypothesis has resulted in a novel interpretation of Sonnet LXXIII and of the monologue from *King Lear*. We have seen how the identification of the dynamic spatiality intrinsic to the linguistic level can give a more objective comprehension of the meaning intrinsic to the surface and to the deep structures of understanding and misunderstanding. Viewed through the dynamic-spatiality frame, psychoanalysis itself obtains a means by which objectively to verify and falsify its interpretations of symbols carried by language, which it too often fails to do when it analyses literature and art.

Ludisme et violence dans les conversations entre jeunes gens en Grece

Le courant d'études communicatives qui se développe depuis les années 70 porte de plus en plus sur les échanges communicatifs quotidiens dans des disciplines et des perspectives différentes. Nous allons, dans un premier temps, présenter quelques notions et outils qui nous permettent ensuite d'aborder nos propres données d'analyse. A ce stade, et dans un deuxième temps, nous allons nous occuper des objets présents dans le titre.

1. Les problématiques communicatives

Les approches communicatives, et notamment le courant de l'ethnographie de la communication (Bachmann et al. 1981), ont centré l'attention sur les *situations* et les *interactions quotidiens*. Le dispositif de *Speaking* proposé par Hymes (1991) nous permet d'intégrer dans l'analyse les différents paramètres de la *situation*: le *cadre* (setting), les *participants* (participants), les *buts* (ends, goals), les *actes*, la *tonalité* (key, mood), les *codes* (instrumentalities), les *normes* et les *genres*.

La notion de *situation* se trouve plus largement au centre de la problématique sur le contexte culturel appréhendé dans sa dimension dynamique. Ainsi, les *normes* sont renégociées et réadaptées à chaque fois en fonction d'un ou plusieurs des paramètres ci-dessus mentionnés. Par exemple, les mêmes participants n'auront pas la même conversation dans deux cadres différents, le bureau de l'un d'eux et la cantine ; ou encore, une conversation dans un cadre donné, la cantine, n'aura pas la même teneur ni la même tonalité selon la présence ou l'absence de tel ou tel participant habituel.

La démarche ethnographique constitue donc une étape importante pour appréhender les situations de communication ordinaires dans leur

spécificité socioculturelle. Elle constitue d'autre part une source d'inspiration majeure pour les travaux de la linguistique interactionnelle qui se développe actuellement. Les linguistes qui se réclament de ce nouveau champ d'investigation développent une problématique et une méthodologie d'analyse des corpus de type conversationnel. On parle d'*analyses conversationnelles* en se référant au nouveau courant des travaux linguistiques qui au cours de ces vingt dernières années a élaboré des propositions et des hypothèses pour décrire des objets comme les différents types d'interactions (Cosnier & al. 1987; Bange 1987; Cosnier & al. 1988; Kerbrat-Orecchioni 1990; Vion 1992). Les typologies des interactions établies par la linguistique interactionnelle nous fournissent des concepts pour caractériser telle interaction ou tel moment interactionnel soumis à l'analyse.¹ En ce qui concerne l'interaction qui nous intéresse, à savoir la conversation, l'analyse interactionnelle définit celle-ci en tant que type d'interaction particulier : une problématique proprement conversationnelle ne se contente pas de décrire des comportements dans l'épisode interactif considéré, mais pose nécessairement une typologie des diverses interactions observées au sein d'une culture donnée. Les linguistes se référant explicitement ou implicitement à Erving Goffman retiennent sa tentative de donner un sens plus restrictif au terme de conversation, qui dans les travaux sociologiques pionniers recouvrait à peu près toute interaction en face à face. En effet, l'auteur distingue un type d'échange particulier qu'il appelle "bavardage", "causette" ou "conversation": "Ce type de langage suppose un échange facile des rôles de locuteur et d'auditeur et implique un petit nombre de participants qui ont peut-être décidé de passer ensemble un bon moment, plus ou moins long, où ils prendront plaisir à ne rien faire, ou qui s'accordent un court instant de diversion" (Goffman 1991: 488). R. Vion (1992) relativise l'aspect "gratuit", "anodin" de la conversation, parce que ce point de vue risque de compromettre la définition de celle-ci comme "instance sociale de base". Il souligne même que la conversation, "échange spontané et convivial", est aussi une sorte d'obligation sociale:

La fonction de la conversation consiste à affirmer et confirmer l'existence de liens sociaux privilégiés entre individus. Les personnes avec lesquelles nous conversons relèvent donc de la constellation de ceux avec lesquels nous entretenons des relations sociales généralement suivies. Chaque fois que nous rencontrons l'un d'entre eux nous sommes donc dans l'obligation de lui manifester ce statut particulier et d'engager une conversation.

Le sujet qui veut alors éviter l'échange doit s'en excuser, donner des raisons apaisantes et valables de ce refus et, dans bien des cas, verbaliser son regret de ne pouvoir satisfaire ce rituel de consécration réciproque. (Vion 1992: 127)

Retenons ici que, la *conversation* étant considérée comme une instance sociale de base, il convient de la distinguer de la *discussion*, dont la dimension argumentative est beaucoup plus marquée. La *discussion* est en effet définie en ces termes par C. Kerbrat-Orecchioni: "Il s'agit pour les partenaires en présence d'essayer de se convaincre les uns les autres à propos d'un objet de discours particulier" (Kerbrat-Orecchioni 1990: 118). Plus largement, R. Vion rapproche la *discussion* et la *conversation*, dans lesquelles il voit des formes de communication essentielles:

Conversation et discussion pourraient alors être considérées comme les deux piliers de la communication: la première centrée sur le consensus et la coopération, la seconde sur l'expression de la divergence et l'affirmation d'une compétitivité. Solidarité et différenciation pourraient être les ressorts les plus profonds de la vie sociale, de sorte qu'on pourrait vouloir sortir ces deux types et les placer en exergue d'une sous-catégorisation des autres interactions. (Vion 1992: 138)

Cette tradition récente des travaux linguistiques communicatifs et la définition de la notion de conversation constituent une nouvelle donne pour l'approche de certains usages particuliers de la langue et leur signification, sur lesquels nous allons à présent nous pencher.

2. *Les données de l'analyse*

Nous allons évoquer d'abord quelques aspects méthodologiques concernant notre corpus.

2.1. Le lieu

Nous avons effectué l'enregistrement d'une conversation entre jeunes Grecs dans un bar. On peut évoquer à propos des rencontres dans des lieux publics un contexte de vie méditerranéen qui, par ses conditions climatiques et un certain mode de vie en extérieur, favorise les rencontres régulières ou aléatoires. On peut ainsi penser ces rencontres comme des épisodes

de vie que partagent ces personnes,² et qui se tissent essentiellement dans des lieux publics, lors des sorties diurnes et nocturnes. Signalons que le bar en question est fréquenté par un public relativement jeune, amateur de musique moderne étrangère ou d'une musique grecque inspirée largement du rock anglo-saxon.

2.2. Les participants

Le groupe des conversants est constitué par deux femmes (Véta et Thénia) et deux hommes (Andréas et Apostolos). Ils ont tous un âge qui s'échelonne entre vingt-trois et trente ans et ont tous fait des études supérieures.

2.3. Le "paradoxe de l'observateur"

Nous nous sommes demandé dans quelle mesure la présence du micro avait pu induire certains comportements des personnes que nous enregistrions. Nous nous heurtons là au "paradoxe de l'observateur", pour employer le terme de Labov, qui consiste à tenter de "découvrir comment les gens parlent quand on ne les observe pas systématiquement; mais la seule façon d'y parvenir est de les observer systématiquement" (Labov 1976: 290). Ce "paradoxe" est relevé dans de nombreux travaux sur l'interaction, car le problème se pose dès qu'on entend travailler sur des corpus conversationnels. Il est difficile de le résoudre, mais il apparaît néanmoins que pour la majorité des gens la dynamique de l'échange contribue à faire oublier le micro.

3. *Remarques sur le caractère dynamique de l'interaction étudiée*

3.1 Un moment ludique

L'enregistrement commence alors que la conversation a déjà été entamée entre Βέτα (Véta), Ανδρέας (Andréas) et Απόστολος (Apostolos). Véta exprimait son appréhension à l'idée du jour de son mariage qui approchait.

Extrait (a)

- 1 Véta : το σιχάινομαι το σιχάινομαι μα το Θεό το σιχάινομαι
je déteste je déteste je te jure je déteste
- 2 Andréas : κι εγώ το σιχάινομαι κι εγώ το σιχαινόμουνα στην αρχή
moi aussi je déteste je détestais au début
- 3 αλλά τελικά είναι εύκολη υπόθεση γιατί όλα είναι σκέψη
mais finalement c'est une chose facile parce que tu penses
à tout ça
- 4 και μια μέρα που γίνεται ο γάμος είσαι φυτόλας εντελώς
(γέλια)
et le jour où ça a lieu le mariage tu es un légume carrément
(rires)
- 5 φυτό ρε μαλάκα (γέλια) φυτό δηλαδή τη μέρα του γάμου
un légume un légume tu sais le jour du mariage
- 6 που είναι η κρίσημη είσαι φυτόλας εντελώς
qui est crucial tu es un légume carrément
- 7 Véta : δεν ενεργείς
tu ne fais rien
- 8 Andréas : μόνο σε ποτίζουνε στ'αρχίδια σου (γέλια)
on t'arrose seulement tu t'en fous (rires)

Dès le début le thème du mariage a été abordé par Véta, qui exprimait son angoisse. On était donc dans la confidence, dans l'évocation de sentiments personnels, plaçant les trois personnes en situation de complémentarité, l'une (Véta) verbalisant ses émotions tandis que les deux autres lui renvoyaient une écoute bienveillante. A l'intérieur de ce moment confidentiel Andréas donne un tour ludique à l'échange grâce à ses choix argotiques *φυτό* (fito), *φυτόλας* (fitulas) (= légume) (4), (5), (6), (8).

Dans les travaux récents sur la "langue des jeunes",³ on constate que l'argot ne remplit qu'accessoirement une fonction cryptique et que son utilisation devient de plus en plus ludique contribuant ainsi à renforcer la connivence dans le groupe. Toutefois, nous remarquons que, dans notre cas, cette fonction ludique et convivencielle se manifeste et se négocie dans le déroulement de l'échange.

3.2. Un moment de dispute

Nous assistons en effet au changement de cette ambiance joyeuse à la suite d'un moment de querelle entre Andréas et sa femme, Thénia. Andréas provoque la dispute en décochant une réflexion très vexante à Thénia, et quand elle veut obtenir de lui réparation il tente de lui faire croire que ce n'était qu'une plaisanterie. On retourne alors à du conversationnel, un peu comme si rien ne s'était passé. Mais nous verrons qu'en fait cette escarmouche a laissé des traces. En effet, Andréas revient régulièrement à la provocation.

Extrait (b)

- 313 Andréas : δε μου λες γουστάρησες που τη ψώνησες μωρό μου
dis moi ça t'a plu de te mettre en rage ma chérie?
- 314 (γέλια) με μισείς
(gires) tu me détestes?
- 315 Thénia : άσε με ρε Αντρέα
lâche-moi Andréas
- 316 Andréas : και να σ' αφήσω και να και να μη σ' αφήσω δε τρέχει τίποτα
que je te lâche ou que je ne te lâche pas ça change rien
- 317 τη ψώνισες πολύ
tu t'es vraiment mise en rage ?
- 318 Thénia : ναι τη ψωνίζω κι'όσο θα με πιέζεις ακόμη πιο πολύ θα τη
ψωνίζω
oui j'ai la rage et plus tu m'embêtes et plus ça me rend
furieuse
- 319 Andréas : ψώνισέ την δυνατά βάρα με και καμιά σφαλιάρα να
γουστάρω
mets-toi en colère fort donne-moi une gifle pour que je
prenne mon pied
- 320 έτσι βάρα με έτσι να την ακούσω μια δυνατή έτσι καλή
comme ça frappe-moi pour que je m'éclate mets m'en
une forte comme ça une bonne

Depuis le début, Andréas se positionne par rapport à son image de drôle, de désinvolte. Il fait celui qui ne respecte rien (le mariage, par exemple), qui est revenu de tout (et le fait qu'il soit le plus âgé du groupe renforce et facilite ce positionnement). Son irrespect généralisé se traduira

dans son vocabulaire, par l'emploi massif de termes argotiques, branchés, souvent injurieux. Pour plaire, il doit à la fois se conformer à une image attendue, mais aussi la cultiver par des nouveautés: il fera donc aussi des choix linguistiques surprenants et même s'efforcera d'inventer des formules nouvelles. Comme tous les rôles, celui de drôle ne se conçoit pas sans un public. Il s'agit pour Andréas de faire rire les autres et ainsi de se concilier leur faveur. Dans cette configuration, ceux-ci sont placés en situation de spectateurs: c'est une relation inégalitaire, mais que le public accepte sans difficulté. C'est ce qu'on constate particulièrement dans le premier tiers de notre conversation, où l'humour caustique d'Andréas remporte un vif succès et entraîne les autres à l'imiter. Andréas se conforme à une image attendue, mais en même temps celle-ci est le produit de l'interaction, elle se négocie constamment et on note qu'elle évolue de celle de bouffon plaisant vers celle de bouffon déplaisant.

4. *Constats*

Ce que nous retenons au terme de cette analyse, c'est l'aspect de liberté qui caractérise le déroulement de l'échange considéré. Cette liberté se manifeste linguistiquement, et précisément par la présence dominante d'un lexique hétérogène. Précisément, nous avons distingué certains choix lexicaux particuliers en rapport avec la construction d'une relation variée qui va jusqu'à la distorsion. Et par là même nous considérons un type d'unités lexicales dans leur finalité discursive, qui est interne dans ce cas précis. À travers ces unités lexicales, les sujets présents ont pu gérer leur échange autrement que d'habitude et, en tout cas, autrement qu'ils ne le pensaient initialement. Notre analyse se propose alors comme un mouvement qui va de la théorie exposée au début vers la considération des données dans leur spécificité. Ainsi, d'après sa définition la conversation constitue un type d'interaction fondamentale pour la coopération et l'intercompréhension humaines. Dans cette étude nous avons choisi d'aborder une conversation où l'on joue beaucoup avec les mots, et où cela peut provoquer le malentendu et la distorsion. Ainsi, notre étude contribue à l'éclairage d'une pratique sociale importante qui est partagée par tous, celle de parler pour le plaisir de parler en tant que jeu de langage particulier qui n'est pas forcément dissociable de la violence.

Notes

1. Voir les typologies des interactions dans Kerbrat-Orecchioni (1990); Vion (1992).
2. Rappelons à ce propos les notions d'histoire *conversationnelle* (Golopendja 1988) et d'histoire *interactionnelle* (Vion 1992).
3. Pour le domaine anglo-saxon: Eckert (1989), Andersson & al. (1990), Eble (1996); pour le domaine francophone: François-Geiger & al. (1991), Boyer (1997); pour le grec: Iordanidou & al. (1997).

Jean-Claude Mbarga

Entente/mésentente dans le cadre de la diversité culturelle à l'ère de la globalisation

Le phénomène de la Globalisation est un véritable signe des temps. Le fait que la plupart des congrès de sémiotique s'en préoccupent est symptomatique de son importance. Il s'agit d'un terme, pour ainsi dire, *up to date*, non seulement en tant que slogan, mais aussi par rapport à la problématique de l'effectivité de son applicabilité. A l'heure actuelle, nous ne pouvons en aucun cas évoluer en marge de la mouvance actuelle qui fait du Monde un village, le fameux Village Planétaire auquel nous appartenons tous. Le monde étant donc un mouchoir, comme disent les espagnols, nous ne pouvons rester indifférents face à ce phénomène que nous subissons ou que nous consommons quotidiennement, et que nous devons pourtant éclairer et questionner de temps à autre comme c'est le cas aujourd'hui.

A mon avis, il s'agit d'une notion complexe dont la compréhension est multidimensionnelle. Plusieurs sont les définitions de la notion de Globalisation. Entre autres, le *Globalization Guide* (www.globalizationguide.org) nous signale par exemple que sur le plan économique ce vocable désigne "l'interaction croissante ou l'intégration des systèmes économiques nationaux par la croissance du commerce international, de l'investissement et des mouvements de capitaux"; ce terme se réfère aussi à la croissance rapide de l'échange social, culturel et technologique (cf. aussi Dagorn 1999: 188–201).

A l'ère de la Globalisation, la notion de *diversité* apparaît comme l'un des thèmes majeurs du discours humain. Il s'agit d'une notion à tout le moins complexe dont la compréhension peut être multidimensionnelle. Cette notion peut être cernée, entre autres, dans ses aspects interdisciplinaires, interculturels et internationaux. C'est pourquoi, pour des raisons de fourchette temporelle, et si tant est que "qui trop embrasse mal étreint",

je me dois de préciser que je vais limiter mon champ d'analyse à la dimension culturelle.

Quel regard, pour ainsi dire, actuel et proleptique, le sémioticien que je suis, jette-t-il sur la diversité culturelle dans le contexte mondial actuel de la Globalisation? Quelles relations d'assonance et/ou de discordance existe-t-il entre les deux concepts? Telle est mon entendement de ce thème que je m'en vais immédiatement développer en guise de plaidoyer pour un monde meilleur.

Parler de "diversité culturelle" c'est reconnaître implicitement l'existence d'une identité individualisante, entendue ici, dans le sens du Père Engelbert Mveng (1985: 67), comme, je cite:

ce qui fait qu'un être est lui-même et se distingue de tous les autres. [L'identité] est constituée par l'ensemble des caractéristiques qui rendent cet être différent des autres, et le constituent à la fois comme "ipséité", c'est-à-dire comme lui-même, et comme "altérité", c'est-à-dire comme différent des autres.

C'est-à-dire, pour parler comme Charles Morris (1948), le "Self", qui se manifeste dans les relations entre les personnes, lesquelles relations constituent encore tout un continent assez inexploité. La formulation des identités est circonstancielle et dynamique, car tributaire du discours dominant du moment, essentiellement différentialiste et qui de ce fait même rend compte de l'effectivité du phénomène de la diversité. Comme le constate si bien David Simo (2006: 51), on désigne des peuples par les notions de race, nation et ethnie, chaque terme renvoyant à un degré d'unité, et j'ajoute à la suite de Simo que ce phénomène va s'accroissant, entraînant tous les *ismes* dont souffre l'humanité aujourd'hui (tribalisme, nationalisme, intégrisme, fanatisme, ethnocentrisme, racisme, etc.), qui ne font que rendre compte de l'égoïsme de l'être humain. Cet égoïsme se manifeste sur le plan idéologique, entre autres, à travers le darwinisme social et le capitalisme.

En effet, dans le monde actuel, qui est fondamentalement capitaliste, les relations entre les individus ou les états se caractérisent essentiellement par le darwinisme social. On dirait que l'œuvre de Charles Darwin *The Origin of Species* (1859), confère une certaine garantie scientifique aux défenseurs du fameux processus inévitable de la sélection naturelle dans laquelle le fort anéantit le faible dans la lutte pour l'existence. En sorte que le monde actuel est beaucoup plus un véritable règne de l'arbitraire, où la

force sous toutes ses formes (physique, économique, politique, etc.) a la primeur sur le droit. Cet état de choses explique aussi, dans une certaine mesure, le véritable darwinisme culturel qui est imposé par certains sous des formes parfois déguisées, parfois à peine voilées. A ce sujet Gianna Pallante (2003: 11) déclare avec raison:

Un autre aspect de la mondialisation est l'homogénéisation culturelle à travers la circulation des marchandises qui véhiculent des modèles de vie. Tous boivent Coca-Cola, s'habillent en *jeans*, mangent du *fast-food*. De plus la mondialisation tend à homogénéiser et donc à détruire la diversité culturelle. La publicité propose une culture homogénéisée qui s'aplatit sur les valeurs de la culture économiquement plus forte, ce qui aboutit à l'uniformisation des valeurs plutôt qu'à la rencontre des valeurs différentes.

A tout cela j'ajouterai, entre autres, les impérialismes linguistique et cinématographique nord-américains, l'arrimage du monde entier au système éducatif anglo-saxon, appelé en Europe système LMD, devenu le Modèle à suivre avec grand M dans le monde entier, la tendance à la disparition des cultures dites traditionnelles au bénéfice des cultures dites modernes, et j'en passe.

L'égoïsme de l'être humain comme signe de manifestation du "Self" explique aussi la série de maux que nous vivons au quotidien, par exemple, les guerres et le terrorisme qui constituent, s'il en était besoin, la preuve de ce que en ce début du XXI siècle, la violence, malheureusement, ne peut pas être considérée comme une diplomatie périmée. A ces maux on pourrait ajouter la misère humaine, l'exploitation de l'homme par l'homme, signes d'une injustice sociale et d'un égoïsme certains.

Le capitalisme, parlons-en. A la suite de la chute symbolique et significative du mur de Berlin, le capitalisme entend affirmer permanentement son hégémonie en tant que système mondial ou universel à l'échelle planétaire. Il y a lieu de relever sur les plans idéologique et politique, une contradiction entre le discours universaliste du capitalisme qui a la prétention d'être un système mondial, c'est-à-dire, globalisant, et la réalité quotidienne de ce que produit son expansion en termes d'inégalités sans cesse croissantes entre les peuples de la planète. Au dire de Gianna Pallante (2003: 10), l'une des caractéristiques de la mondialisation est qu'elle "augmente l'injustice sociale, parce que la richesse est poussée vers le haut à l'intérieur des pays et vers le Nord dans le cadre des relations entre les pays".

A ce sujet, il n'est pas inutile de citer l'observation suivante du *Globalization Guide*:

Rising inequality is the inevitable result of market forces. Given free reign, market forces give the rich the power to add further to their wealth. Hence, large corporations invest in poor countries only because they can make greater profits from low wage levels or because they can get access to their natural resources.

Par conséquent, la déclaration suivante de Margaret Thatcher – également citée dans le *Globalization Guide* – n'est pas du tout surprenante: "It is our job to glory in inequality..."

Depuis ce prisme d'appréciation, on peut dire que le capitalisme apparaît comme la manifestation constante d'un certain impérialisme à plusieurs ramifications du point de vue des relations humaines. La recherche effrénée du profit et de la puissance symbolisée par l'argent, qui passe d'un simple moyen à une fin en soi, sont autant de mobiles qui ne permettent pas de respecter la diversité, le "Self". C'est avec raison que Karl Marx disait que l'argent est la cause de toutes les discordes, et moi j'ajoute, dans ce monde qui prétend être globalisant. Shakespeare observe à propos dans *Timon d'Athènes*, en se référant à l'argent: cite:

Cet or suffirait à rendre blanc le noir, beau le laid, juste l'injuste, noble l'infâme, jeune le vieux, vaillant le lâche... Cet or écartera de vos autels vos prêtres et vos serviteurs; il arrachera l'oreiller de dessous la tête des mourants; cet esclave jaune garantira et rompra les serments, bénira les maudits, fera adorer la lèpre livide, donnera aux voleurs place, titre, hommage et louange sur le banc des sénateurs; c'est lui qui pousse à se remarier la veuve explorée. ... Allons, métal maudit, putain commune à toute l'humanité, toi qui mets la discorde parmi la foule des nations... O toi, ... cher agent de divorce entre le fils et le père, ... toi dieu visible qui soudes ensemble les incompatibles et les fais se baiser.

Force est donc de constater que l'être humain a deux caractéristiques essentielles: la générosité et l'égoïsme, qui constituent de véritables dynamiques dans ses entreprises et qui se manifestent dans la société dont il est membre, en influant sur la vie interne et sur l'action de la société dans ses relations avec l'homme et avec les autres sociétés. L'identité culturelle de chaque individu, de chaque peuple, de chaque pays, et de chaque nation est sous-tendue par ces deux caractéristiques de l'homme. Dans un monde

qui se veut désormais globalisant, la cohabitation des identités culturelles est-elle possible, ou alors la Globalisation implique-t-elle l'anéantissement de ces identités? On ne peut pas nier que le capitalisme à outrance que nous vivons aujourd'hui est l'une des causes majeures de la déshumanisation du monde, en sorte que l'avenir de la dignité humaine ne peut qu'être obscur, à plusieurs niveaux: relations entre individus, entre peuples, entre états, entre continents, etc., relations caractérisées d'une manière générale, par le mépris, l'abandon et la négation d'un certain nombre de valeurs universelles, telles que le respect de la diversité, du droit à la vie d'autrui, avec tout ce que cela suppose comme exigences, par exemple: lutte contre la pauvreté, respect du sang humain, santé et bonheur pour tous, même si paradoxalement le principe même de la diversité, dans son sens vicieux et manichéiste, voudrait aussi qu'il y ait un peu de tout pour faire un monde, s'entend: des riches et des pauvres, des forts et des faibles, des oppresseurs et des opprimés, des traditionalistes et des modernistes, etc.

Sans être pessimiste, je pense que cet état de choses rend utopique, ou à tout le moins difficile, l'édification du fameux Village Planétaire, un slogan qu'affectionnent les partisans de la Globalisation et qui, de ce prisme d'appréciation, a toutes les allures d'un marché de dupes. La Globalisation, que je considère comme une intégration respectueuse dans un cadre respirable pour la diversité et la complexité, doit s'entendre comme la recherche du bien de tous. Nous ne pourrions pas atteindre la Globalisation – véritable idéal, vu sous certains angles – tant que nous n'apprenons pas à partager, et la Globalisation ne pourra être un succès que si elle profite à tous. Mais malheureusement, l'univocité de la pensée, à travers le capitalisme qui est une doctrine fondamentalement égoïste, ne favorise pas la perception optimiste du monde dans la perspective de la Globalisation. Car, à y regarder de près, la Globalisation, en tant que rendez-vous du donner et du recevoir, s'accommode mal de la pensée unique. C'est pourquoi il ne serait pas superfétatoire de rêver en guise de solution – pourquoi pas – d'une redéfinition de la société planétaire dans le sens d'une plurivocité idéologique.

En ce début du 3^e millénaire, nous devons faire face à trois défis majeurs qui sont dans une certaine mesure des conséquences de ces caractéristiques. Le premier c'est la paix, le second c'est la pauvreté, et le troisième c'est la gestion adéquate de l'environnement humain. Pour que la mondialisation ou la Globalisation ait un sens, nous nous devons de l'humaniser en acceptant la diversité comme une réalité inévitable dans les relations humaines.

Pour ce faire, nous devons réfléchir sur la manière dont nous pouvons promouvoir l'essor d'une culture de la paix et de la tolérance, synonyme d'acceptation d'autrui. Ainsi nous ne pouvons pas exclure l'hypothèse d'une redéfinition de la société planétaire. Nous devons signer un tout autre contrat social à l'abri de tous les appétits capitalistes, en vue de reconstruire une société basée sur la coopération, afin d'éradiquer la pauvreté et de réduire les disparités scandaleuses qui ne conduisent qu'au désespoir et à l'exclusion.

La culture en tant que ensemble des manières d'agir, de penser et de sentir, est un signe important d'identification d'un groupe social déterminé. Ainsi donc, l'identité culturelle renvoie à tout l'héritage culturel d'un peuple, d'un pays, dans ce qu'il a de riche ou de pauvre, dans sa variété, dans son originalité, dans ce qui précisément le rend différent des héritages culturels des autres peuples. C'est pourquoi l'historien africain Ki-Zerbo observe à raison que la culture constitue la dimension la plus immédiate et la plus importante de l'indépendance. Il n'y a pas de nation consciente sans culture nationale.

Dans un monde divers, ambigu et paradoxal caractérisé à la fois par le protectionnisme culturel, le darwinisme culturel, le libéralisme culturel dans un contexte de globalisation, l'interculturalité, *stricto sensu*, est-elle possible?

Le phénomène de la Globalisation ne doit pas supposer l'anéantissement d'une culture par l'autre, par exemple, la culture traditionnelle par la culture moderne, la culture africaine par la culture occidentale, la culture occidentale ou asiatique par la culture américaine, mais plutôt la réception compréhensive et tolérante de la culture d'autrui en vue de l'exposition, pour ainsi dire, de toutes les cultures dans la tour du Village Planétaire, à la disposition du citoyen planétaire qui, conformément aux droits que lui confèrent le libéralisme culturel – et non le colonialisme culturel –, condition *sine qua non* du Peuple culturel, peut opérer librement son choix ou ses choix, en fonction des paramètres ponctuels ou permanents qu'il juge axiologiques (esthétiques, éthiques, psychologiques, etc.). Ainsi, je suis parfaitement d'accord avec Gianna Pallante (2003: 11) qui pense que la destruction des cultures au bénéfice d'une homogénéisation culturelle "appauvrit le genre humain qui, à travers la dialectique des différences, crée le progrès des idées et la dignité".

En effet, ce dont il s'agit bien ici c'est d'une intégration des cultures. Rendre intelligible chaque réalité culturelle pour le reste du monde, en respectant et en préservant leur essence, ainsi que leurs différences par rapport aux autres. Depuis ce prisme d'appréciation, la notion d'interculturalité doit donc être entendue, non pas comme le règne des *diktats*, mais comme un rendez-vous du donner et du recevoir, étant donné que chaque culture en tant que reflet d'une identité est une valeur en soi; il n'y a pas de sous-culture, et parce que chaque culture est une valeur, toute culture dans un contexte de Globalisation ne doit pas s'enfermer sur elle-même, elle doit s'affirmer et chercher à séduire autrui. Cela est possible. Il s'agit simplement de la bonne gestion des relations d'assonance et/ou de discordante entre les diverses identités nationale et l'intégration planétaire. A mon avis, la nécessaire construction des diverses identités individuelles et collectives ne devrait pas conduire à l'identité fermée et excluante de tant de nationalismes et tous les ismes que nous avons déjà mentionnés (le tribalisme, l'intégrisme, l'ethnocentrisme, le racisme, etc.), qui ont de tous temps été des sources de division et de violents conflits.

Quel Village Planétaire voulons-nous? Aujourd'hui le Monde est un grand village en devenir constant, qui prêche la Globalisation qui devrait s'entendre comme l'intégration respectueuse dans un cadre respirable pour la diversité et la complexité. Cela suppose le refus de certaines attitudes de résistance par rapport à autrui. Je soutiens *mordicus* que l'intégration planétaire ne sera un succès que par la culture, en passant par des arguments humains, et en ne se servant de la matière et de la technologie que comme des moyens de rapprochement et non d'éloignement des êtres humains, et en tenant compte de ce que les technologies opèrent des transformations matérielles, fonctionnelles et relationnelles qui peuvent être négatives ou positives.

Pour terminer, on peut dire par exemple que tant que nous continuerons de trouver étrange la culture de l'autre ou que nous manifesterons des attitudes de résistance ou de mépris vis-à-vis d'elle – même si par ailleurs il faut reconnaître ici que les africains sont plus globalisants que quiconque, ne serait-ce que pour avoir déjà adopté, bien que malgré eux, diverses cultures étrangères – l'intégration culturelle à l'échelle planétaire sera toujours un mot, demeurera un vœu, et la réalité nationale règnera triomphante, cloisonnant la construction du Village planétaire dans un discours qui s'usera au fil des temps.

Marga Van Mechelen

The sign-ificance of showing in-sign-ificant pictures

Two exhibitions caught my attention last year as having two things in common: (1) The representation of war and (2) what may at first appear to be insignificant images. Why was it important to use these last, and what made them *significant* in the end?

The first exhibition was entitled *Breaking the Silence*, an exposition of snapshots made by Israeli soldiers, accompanied by their written and spoken remarks. No “art” pictures, no press photos, but just ordinary, not to say trivial pictures of their lives as soldiers and their daily confrontations and/or meetings with Palestinians. The second exhibition was not really an exhibition but a two-part installation, assembled by the well-known artist, Aernout Mik.¹ The first part, called *Raw Footage*, was a two-channel video installation for which Mik used documentary footage made during the Balkan War. This footage had been stored in media archives but was considered either too trivial or technically not good enough for broadcasting. The second part was also a video installation, entitled *Scapegoats*, which consisted in the screening of a fictional film that showed a wartime situation staged by the artist (see Figure 1).

Figure 1.

On the performance/film set there were around 90 people, some of them in uniform, armed or unarmed, some civilians, who in a few cases also carried weapons. Contrary to traditional iconography, the attributes were not very helpful in identifying the actors: “In fact, as Mik masterfully destabilizes the meaning of the narrative that unfolds on the set, we further lose our bearings both about who is who and about what exactly is occurring” (Hlavajova 2006: 19). Though we can hardly say that the aggression between some individuals on the set is insignificant, the impossibility of naming what is going on makes the things we see at the same time *in-sign-ificant*.

In both *Breaking the Silence* and *Raw Footage/Scapegoats*, questions arise: “What do the things we see symbolize?” “In what way do the images speak?” Though they have things in common – the use of insignificant images and the representation of war – the displays differ considerably. One is made by soldiers, the other by an artist; the first is a photo exhibition of so-called static pictures, whereas the second is a topical installation with moving images. Mik showed his material without any comment; the photo exhibition, on the contrary, used additional “texts” in explaining the subject of the pictures while at the same time keeping us from misunderstanding.² The photos showed things you normally wouldn’t see on television; they speak of things one usually is silent about. As one of the former soldiers notes: unlike the images one sees on television, these pictures are not *about* us or *about* our enemies, but “we are part of the scene one is looking at”.³ At the exhibition one could see a variety of pictures, photos of soldiers made by and of themselves, sometimes with prisoners, as well as pictures of the landscape and of “normal” life during war, and of people, both adults and children (Figure 2). As one of the soldiers explained, these photos show normal surroundings and not extreme things. Yet certain photos might shock the average visitor; for example, the one of a dead body surrounded by ammunition, a so-called terrorist pictured as the soldiers’ prey. For me the most significant example was a photo of soldiers shown with a Palestinian family. All of them are smiling at the camera, as if wishing to preserve the memory of their encounter. The first impression is that of friendliness. But the interpretation of an Israeli soldier, who explained the picture in a television program, takes another direction. According to him these smiling, polite Palestinians in fact had given up hope; the joy we see masks a feeling of “surrender” (*EénVandaag*, October 17, 2006).

Figure 2.

Both the soldiers and Mik try to present the story of war in an unusual manner, probably because such a tale is too often told in the same way. We have become immune to all the “same” war images. The Israeli soldiers of *Breaking the Silence* express their particular moral and political goals. Mik’s engagement is more general, and could be seen as part of an art historical tradition that started with Goya, of artists who took an independent position as critical observers.⁴ However impressive and effective the “format” of *Breaking the Silence* is, Mik’s *Raw Footage* holds much more interest from a semiotic point of view – which is further reason to concentrate on this installation and address the questions “what makes this installation significant, and what does it signify?”

1. Aernout Mik

Aernout Mik (born 1962, Groningen) is known internationally from his video installations that recall strange realities, or better said, that make realities strange. They always show something familiar to everyone, for example a kitchen or a sports hall, but what happens in these familiar surrounding makes things strange or even uncanny. In the video called *The Kitchen* two elderly men are doing something together, but it is hard to identify precisely what. Are they fighting, either seriously or jokingly? Are they dancing? In another video called *3 Laughing, 4 Crying* (1998) we see seven people, and it is hard to tell who is laughing and who is crying (Figure 3). As in most of Mik’s work, one has to accept this ambiguity and the fact that some things remain unidentifiable. In most of his videos the camera

watches events from a distance. And – as in reality – it is not always clear if the things that are happening will come to seem important. Meaningful and meaningless images are not clearly distinguished one from the other. Though Mik sometimes has in mind a certain development of the action, as in his latest installation for the Venice Biennale, the viewer usually gets the impression that things can go in all kinds of directions. In *Scapegoats*, for example, it is hard to tell which of the simultaneous actions is the most important and which character one should follow. The viewpoint of the camera is somewhat comparable to the position of a schoolteacher watching kids at play, but having no personal knowledge of them. As a result, the viewer is placed in a here-and-now position.

Figure 3.

Mik's videos usually move much slower than do films on television or in the cinema (such slowness being not unusual in contemporary video art). Also the role of sound differs from what we are used to. Often it plays a minor role while at other times it is left out completely.

The Kitchen is a video about two men, but most of Mik's videos are about large groups of people with different backgrounds and positions. In these videos Mik directs their behaviour, not by prescribing it but rather by creating its conditions. One such example is *Training Ground*, part of his installation in the Dutch pavilion in Venice, where one is invited to watch

an imaginary training of policemen to deal with illegal refugees. In *Training Ground* the roles of refugee and policeman are at first quite clearly separate, but as time passes they become more and more blurred, until suddenly the policemen are arresting each other and the refugees temporarily take over. The training exercise takes on a life of its own, and consequently positions become destabilized.

In general Mik does not rehearse scenes. The actors receive some instructions, but room is left for interactions between the groups or individuals. Of course, in a video such as *Training Ground* they have their own idea of what such training should entail. Although things are not “under the control” of the director, the overall impression is one of repetition, ritual behaviour, imitation of realities and ambiguity as to what is real and what is not. For this reason Mik often mixes existing footage together with subsequently recorded material, actors with real victims, or staged video with a “documentary” film. This was the case in Venice and also in the combination of *Raw Footage* and *Scapegoats*.

Raw Footage

Most of Mik’s video installations are shown in a loop, but that is not always how the video is conceived. In *Training Ground*, for example, Mik wanted to work towards a certain situation (Braidotti 2007: 35). Whether the viewer notices this depends on the moment he starts watching the piece or the time he is willing to spend looking at it. For the signifying process it therefore makes a big difference whether one starts in the middle or at the beginning of the video (not knowing, of course, where the starting point is). In a way I was lucky when I entered the room where *Raw Footage* was shown. I did not realize it at that time, but what I saw in the first few minutes was near the beginning of the video. I found this out much later, when I got a DVD of *Raw Footage* and found that the sequence of scenes was the same as in the video I had seen. In fact there were two screenings, but when I entered one of the screens was blank. People were nevertheless sitting on the ground and attentively watching both screens. Though I realized that it was a two channel video, I at first neglected to compare one screen with the other. When I did, I saw no spectacular images. It was not even clear what I was looking at, though I knew from the publicity information that it was all about the Balkan War. The images moved slowly, and if one

isolated them from their context they would probably be quite boring. Yet, the audience was not bored at all, so apparently the installation as a whole offered something more. After a few minutes I began to compare the screens, a semiotic behaviour that is not reserved just for semioticians. The comparison of images projected one after the other on one screen seemed to be relevant. A crucial moment occurred when I saw the image of a tractor behind some military machinery (Figure 4).

Figure 4.

A biblical expression came to mind: and the peasant (farmer) he kept on plowing. I realized immediately that this expression could have been applied to things I had seen a few minutes before. It was a repeated, cogent image that seemed to have a metaphorical meaning. So I constructed one narration: Life continues, even during wartime. Later images were also connected to this narrative; for example, the scene of girls drinking something on a sunny terrace and images of children playing with guns (Figure 5). It became obvious that these formed a kind of paradigm, either intentionally or not.

Other images drew my attention because they seemed to form a different group. These were images of animals, such as a cow, a wounded pig, a horse and a goat in the city (Figure 6). The narration of this second paradigm I would state as follows: Animals get lost in wartime and are therefore victims of war too. I am not sure if this second message would have come to mind had I not formulated the first paradigm, but of course the

Figure 5.

Figure 6.

repetition of the images of animals was striking and therefore significant. Both of these story lines were based on chains of images seen at irregular intervals.

Another comparison was made by a simultaneous viewing of both screens. There emerged a dominant image of people and groups of people. Often these images were close-up shots, so that one could see how people were dressed, if they were armed or not, if they were shackled or not. In other cases they were filmed from a longer distance, and identifying the group was difficult, either because of the distance or because of the morning fog (Figure 7).

Figure 7.

These images were surely the most alarming ones, not because of what one could actually see but because of the association which, I think, most Dutch viewers made: the association with the deportation of men from Srebrenica, a black page in the history of the Dutch Bat. I also made a second association, namely, the relation to the treatment of groups in Mik's other video-installations. Taking this into consideration, it was no surprise that one could not easily identify the groups of people. Were they filmed in a day to day situation or in the midst of wartime? Were they hostages or refugees? Were they civilians or unarmed soldiers? These kinds of questions continually came to my mind, but an answer was seldom possible, at least not for a foreigner like me, nor for the audience to whom the installation was addressed. As in Mik's other installations, indecisiveness and ambiguity had to be accepted as its signifying features. Though most of the footage Mik used had not yet been broadcasted, similar images could have been seen on television – images that were not by definition less ambiguous nor more significant. Those images were *made* unambiguous only by their contextualization.

One means of contextualizing images on TV is the voice of the war reporter, who stands in front of the camera and tells us what to notice in the following pictures, or the voice-over of a man or woman in the studio, who situates the images and tells us what we are viewing. Mik's images,

however, pass by without any voice. There is some ambient sound, such as the noise of gunfire, but it does little to establish context. If there is any resemblance to footage seen on TV, it is with the live images on CNN, after the reporter has told everything he knows and, like the viewer, is waiting for what will happen next. Mik is able to generate this sensation in his videos in spite of the fact that he applies a “hard” montage of images, which leaps from one place and time to another. We, the onlookers, are anxiously waiting for something to happen because there is neither a guiding voice-over nor a predictable structure.

2. *The signifying process*

In traditional iconography the signifying process is reduced to identification of the signified form, motives, figures and themes based on ordinary experience as well as knowledge of art history and literary sources. The first step is one of which we are hardly conscious; for example, the identification of a person as a woman or man. Our daily experience is in most cases sufficient. But to identify a woman as Judith or Salome we have to look at the attributes of these women or to the different stories in which they play a part. Still, even that may not always be enough. We also have to be informed about the history of character-types. As soon as we are able to combine certain figures we are able also to construct stories or allegories. This method of identification and interpretation was developed by Erwin Panofsky, once called “the Saussure of Art History” (Argan 1975) and “a great structuralist” (Lévi-Strauss 1965: liii).⁵ As I argued in my book, *Form and Signifying Process* (Van Mechelen 1993: 74), the relation of the first steps to the later step can be related to the difference between denotation and connotation as made by Roland Barthes in his *Éléments de sémiologie* (1964). The artistic motive derived from what is identified on the first level becomes the signifier of the second level, and so on. In the discussion of Mik’s *Raw Footage* we saw that the first level, the identification of what we saw, was sometimes possible only in this most rudimentary way: a group of people and not a “group of hostages” or “group of soldiers”. For the signifying process this indecisiveness appeared to be relevant. Questions like, Who are they? What are they doing? What is going to happen?, could not be and didn’t have to be answered (Figure 8).

Figure 8.

I thus associated some of these images with those of Srebrenica, the way I remembered them, long before knowing what happened to the Muslim men of that Bosnian town. This indecisiveness also had to do with the fact that we were looking at images of a civil war, where it is very hard for an outsider to distinguish one party from another, even soldiers from civilians. Despite problems of identification, the signifying process continued through the construction of paradigmatic as well as syntagmatic relations. It became clear that those relations helped constitute the semiosis. Courtés (1986) argued that such relations, though paradigmatic more than syntagmatic, were also important for Panofsky's iconographic analysis; for example, the latter's interpretation of three versions of *Et in Arcadia ego*: one by Guercino, and two by Poussin. The second painting of Poussin differs from the first in that it no longer features the motifs that made the first painting (and also that by Guercino) a *memento mori*. Also, the element of surprise is missing. His interpretation is based on paradigmatic correlations, which are of course fundamental for interpretation. Courtés, however, is not satisfied with the analysis of these kinds of relations, for one reason, because Panofsky's interpretation is restricted to the expressive content of the figures – their emotions and behavior – and the role of attributes (such as the skull) that were omitted from the second painting of Poussin. Courtés thinks that there is more to say, and also faults Panofsky for paying

no attention to the syntagmatic relations in-between the pictures, which Courtés claims are of more importance.

Though I would support Courtés in his criticism of Panofsky's method, I also realize the difficulties involved, especially when one is looking at moving images that operate on two levels at the same time: the level of substitution and selection, and the level of combination. The first is a metaphorical process based on paradigmatic relations, the second a metonymic process based on syntagmatic relations, as Roman Jakobson argued (and after him, Lacan amongst others). Looking back at the image of the tractor and the military machinery, it appears that the syntagm was one of two things behind and above each other: the machinery, in front and below, the tractor and the field, above and behind. (We speak of below and above when we consider the picture plane of the image and in front and behind from the perspective of a represented space.) Before viewing this particular condensed image, and even later on, we could see more "analogue" images; for example, those of soldiers walking through a field, but now in a diagonal line or in one that followed the their movements (Figure 9). Either way, two "worlds" are combined into one space. In the later images of girls sitting at an outdoor café, the war attribute was technically missing, but it was substituted by me, the viewer, who had previously seen and interpreted the image of tractor and machinery. This is somewhat similar to what Lacan argued, namely, that through the paradigmatic relations war is also present in the images of the girls (Lacan 1966: 507, 70; see also, Mooij 1975: 116).⁶ However, precisely because war attributes are not depicted, a new association comes to the fore: innocence, and the ability of youth to forget about the war or to see it as a game (one recalls images of young boys playing with guns or around tanks).

Are we talking about associations or connotations? In either case, we see how paradigmatic and syntagmatic relations intervene in the end. We can follow the same procedure with the chain of animal images. The similarity between these images was identified as "Animals get lost in wartime and are also victims of war". However, the images also display differences. One animal, a pig, is wounded; another animal, a horse, is standing calmly; cows are wandering about, not knowing the difference between a road and a canal. In a way, all these pictures tell us something that can easily be associated with the character or functional role of the animal. Although they have lost their way, the animals retain some identifying traits.

Figure 9.

3. Symbol, metaphor, association and connotation

I described above the crucial moment of seeing in one image a tractor and military machinery. To me this became a metaphor for one story line in the video. But is the word “metaphor” the right word? Both Ricoeur’s and Kant’s definitions of symbol bring “the symbol in close proximity to the metaphor” (Nöth 1995: 119), but is this particular image a metaphor or a symbol? To follow these authors we would have to replace metaphor with symbol. A symbol is defined here as a sign that keeps its primary senses and also has a deeper layer of meaning that it has acquired by association. In the interpretation of a metaphor, however, the literal sense must be abandoned and replaced by the figurative sense (*ibid.*). There is another argument in favor of calling it a “symbol”: it refers to an inexpressible and invisible content, which is neither defined nor explained by the symbol itself. “Symbol” in particular seems to be quite an elastic concept, certainly with Freud, who distinguished between two types of symbols. For one type, he said, we can give constant translations; for the other, there are no such fixed translations. Yet, the problem with these definitions of symbol, also in comparison with the concept of metaphor, is the ambiguity as to whether the deeper layer of meaning is a connotation embedded in the work or a subjective association made by the viewer. In the former case, one could use the word “symbol”; but in the latter, the term “metaphor” is more appropriate.

Semioticians, especially in the line of Roland Barthes, have tried to abandon the psychological concept of association, which, though still used, is hardly compatible with the Saussurean semiology. Other semioticians, certainly those advocating psychosemiotics, thought it impossible to avoid the notion of association in semiotic vocabulary; such a position was held even by a Greimassian such as Courtés (1986: 30). In my examples I used the concept of association twice without any doubt about its necessity: the association I had with images of the deportation of men in Srebrenica and the association with other installations of Mik. Both are connected to (partially emotional) memories that I identified with these new experiences and observations. In the other examples I hesitated, first between connotation and association, and second between metaphor and symbol. There is one important argument for using the concept of metaphor: the fact that it is the result of a creative effort that can be inspired by the work itself. In the case of the documentary images, this obtained both in the person who selected them and the creativity of the viewer. I do not deny that the expression “and the peasant he kept on plowing” was a very personal association, whereas the idea of “life continues even in wartime” represents a more universal reaction, which more people had or would agree on, based not particularly on “my” image but possibly on other images in the video. Here both concepts – association and connotation – touch upon one another. Here, we encounter a complex problem that has a long history in semiotics, too complex to deal with in this limited space. Nevertheless, I do hope that this article has set forth the complexity involved in perceiving moving images that are selected (not made!) by a visual artist, as well as the signifying processes involved in such perceptions.

Notes

1. Aernout Mik represented the Netherlands in the Dutch pavilion at the Venice Biennale of 2007. His prize-winning work is shown worldwide, especially in Europe and the USA. See also Guldemond and Mik (eds.) 2000 and Braidotti et al. (eds.) 2007.
2. During the opening hours of the exhibition there was always someone present who could explain the pictures. Moreover, the pictures were accompanied by texts.
3. The quote is from the documentary about the exhibition *Breaking the Silence* put out by *EénVandaag* (Avro/Tros) on Tuesday October 17, 2006.

4. Goya is considered to be the first artist who stressed the evil of unbelievable violence, while not taking sides with any of the parties involved. Mik's imagery, however, bears more resemblance to Manet's painting of the execution of Maximilian of Mexico.
5. The first publication was in 1932 (Hariolf and Verheyen 1974), and the best known that of 1939 (Panofsky 1939).

Kristeva's subject-in-process: From structure to semiotic criticism

As presented in the early work, *Revolution in Poetic Language*, Julia Kristeva's "subject-in-process" can be interpreted as a semiotic alternative to older conceptions of the philosophical subject. However, although previous discussions of Kristeva's early work have centered around the break with structuralism, the feminist implications of the early work as well as the application of semiotics to cultural analysis, we require a somewhat different exposition to see how the theory of a "subject-in-process" involves a departure from received notions of subjectivity. This discussion will attempt to demonstrate how Kristeva (i) opposes Fregean logic to Husserlian phenomenology and (ii) adopts a Lacanian view of negativity and exclusion in displacing the traditional philosophical subject, while (iii) employing Hegelian dialectics to introduce a "textual" conception of cultural practices that (iv) allows actual works of art to be used as the material basis for a critical analysis of social reality.

1. Subjectivity in Husserl and Frege

Kristeva's early work is immediately concerned with the task of clarifying the possible role of phenomenology within the semiotic context. Phenomenology in its 'classical' form evokes a thematic of subjectivity and argues that experience is brought to light through intentional acts of ego-consciousness. Its notion of constitution is based on a conception of the ego that tends to privilege the results of normal functioning, rather on modes of awareness associated with non-intentional mental activity. Hence, while acknowledging that phenomenology provides a source of insight into the importance of constitution to verbal experience, Kristeva challenges the

tendency of 'classical' (Husserlian) phenomenology to identify linguistic research with the operations of the ego as such. The genesis of the ego is more crucial than the issue of how the ego consolidates the space of signification. In Kristeva's account, the genesis of the ego is related to the positioning of the subject, rather than to its phenomenological constitution. While phenomenology suggests that the "speaking subject" can be interrogated and linked to various horizons, Kristeva claims that the conditions that *produce* the subject cannot be examined within the scope of phenomenology (1984: 36).

Kristeva discusses Frege in order to develop an alternative to a phenomenological conception of the speaking subject. The analytical tradition, dominant in Anglo-Saxon countries for nearly a century, has drawn upon the contributions of Frege as an epistemologist, and, more recently, as a philosopher of meaning. Kristeva attempts to establish the internal difference between predication and meaning through a new reading of Frege that replaces the traditional subject with an inherently divided structure: "By straddling these two 'levels,' Frege's *Bedeutung*, in our view, designates, precisely, the break that simultaneously sets up the symbolic thesis and an object; as an externality within judgment, it has a truth value only by virtue of the scission" (53). Thus, rather than attribute the bestowal of meaning to the activity of a philosophical subject, Kristeva examines the structure of judgment from within and identifies the emergence of the Thetic with "the pre-condition for both enunciation and denotation" (53).

Nevertheless, Kristeva does not completely invalidate the oppositional framework in which Frege operates. While citing "Über Sinn und Bedeutung" as a key source, Hans Sluga has argued that "empirical objects as items of acquaintance" should not be posited as the primary concern of Fregean logic (Sluga 1980: 159). Comparisons have been made to the medieval theory of supposition and also to J. S. Mill's distinction between connotation and denotation, but Sluga contends that an originally Kantian background is essential to an understanding of Frege's thought: "My suggestion here is that Frege's distinction is to be found in neither of these sources but that it lies in the Kantian distinction between objects and concepts" (154). According to Kristeva, however, Frege demonstrates how a break occurs within the structure of judgment, instead of foregrounding transcendental unity. This new approach to judgment would allow Kristeva to re-articulate Foucault's "empirical-transcendental doublet" as

a divided subject, and to transform a Kantian opposition into a linguistic one (Foucault 1972: 303–343). At the same time, the break that occurs within the structure of judgment itself explains the emergence of the symbolic as an unstable foundation.

2. *The Lacanian turn in psychoanalysis*

Kristeva agrees with Freud as revised through Lacan in stressing the role of repression in clarifying the break with the semiotic in the formation of symbolic consciousness. Repression can be interpreted psychoanalytically through the myth of castration, which can be read as an attempt to explain the blockage that invariably accompanies the rise of symbolic thought. From the structuralist standpoint, Lacan employs a notion of Law that accentuates the radical nature of the symbolic break presiding over the repression of the imaginary that occurs in mature ego functioning. The *chora* of castration in Lacanian analysis would mark the site where the semiotic ceased to intrude on symbolic awareness. Kristeva, however, argues that the *chora* of castration does not refute the importance of the semiotic *chora* but sustains the possibility of achieving new (and less repressive) ego positions: “castration may have been a problem, a trauma, a drama, so that the semiotic can return through the symbolic position it brings about” (Kristeva 1984: 51).¹

Moreover, Kristeva translates the opposition between the semiotic and the symbolic into a distinction between the genotext as a “pre-subjective” process and the phenotext as an essentially “communicative” structure in the new semiotic theory (86–89). The opposition between spoken and written Chinese articulates the functional difference between a continuous field and a discrete action (87). This difference situates semiotic mobility in the space of writing rather than on the sidelines of an analytic structure. Nonetheless, we should proceed cautiously: writing is not a new ground, nor does it function in a “space” that is entirely separate from the utterances of the speaking subject. Moreover, the inexorable movement toward communication in psychoanalysis is a reminder that speech is not simply “the shadow of something that was once alive” (Lacan 1981: 254). Hence, in this new situation, the phenotext continues to assume the form of a linguistic structure, while the signifying process as a whole now includes a

new dimension insofar as “language” (as something that exceeds structure) *is not limited to the role of speech in the scene of transference.*

Kristeva's special view of psychoanalysis becomes defensible insofar as Freud himself often made use of figures and metaphors in order to convey his most provocative hypotheses. For instance, while attempting to clarify the concept of repression in *A General Introduction to Psycho-Analysis*, Freud at one point suggests that the dynamic structure of almost every mental process can be compared to the development of a photograph (Freud 1943: 259–260). His use of a topological metaphor allows the Unconscious to be compared a photographic negative, and also to explain how most thoughts must pass through a psychic dark-room before they can become conscious. This *textual* metaphor even illustrates how thought can remain unconscious (or undeveloped) while continuing to possess psychic importance. The possibility that a “textual” conception of the human mind could deepen the psychoanalytic structure requires a separate exposition, which will cast light on what is unique about the new semiotics.

3. *Semiotics and Hegelian dialectics*

Kristeva's understanding of “textual” difference provides us with the outlines for a new reading of Hegel that sheds light on semiotic theory itself. Jacques Derrida has suggested in *Of Grammatology* that Hegel's philosophy could be re-read as a meditation on writing, rather than as a mere eschatology (Derrida 1976: 26). Hence Derrida supplies an “archeological” index to the emergence of writing itself: “Spacing as writing is the becoming-absent and the becoming unconscious of the subject” (69). Derrida implies that writing cannot be thought under the category of the subject but always refers to a self-same presence, or identity in difference, and thereby eludes the closure of metaphysics. Writing is what “produces” differences, not as an external cause but as the effect of language in a situation that cannot be stabilized with regard to its final outcome.

Hegel becomes a semiotic resource to the extent that “the first thinker of writing” can be linked to an encounter with the text in a manner that has precise implications (68–69). Kristeva's suggestion that negativity is “the fourth term of the dialectic” allows us to grasp triplicity as the non-dialectical appearance of rational experience. Negativity enables us to relate semiotic motility to a highly developed conception of (philo-

sophical) Reason (Kristeva 1984: 109–113). In opposition to Kant's logic of judgments, Hegel's logic refuses to maintain the unity of the subject outside the element of negativity and the dialectical process. The element in which the subject dies occurs in a phenomenological drama or 'text' whose meaning implies the despair of consciousness as well as the preservation of an alien presence in the dialectical context. The Hegelian subject cannot be grounded in a single moment of consciousness but acquires its features in an extended narrative in which truth and error intermingle, just as two speakers are sometimes surprised to learn what can be revealed only through an extended conversation.

The dialectical conception of negativity provides a key to Kristevan semiotics in at least two respects. First, Kristeva specifies the importance of negativity to semiotics by citing the "Introduction" to Hegel's *Phenomenology of Spirit*, which emphasizes how the *experience* of negativity profoundly disturbs natural consciousness: "Whatever is confined within the limits of a natural life cannot by its own efforts go beyond its immediate existence; but it is often driven beyond it by something else, and this uprooting entails its death" (Hegel 1977: 51). Kristeva presents the death of consciousness in the light of this uprooting (*Hinausgerissenwerden*) to emphasize the disturbing qualities of dialectical experience (1984: 185). Hegel's often neglected discourse on language provides Kristeva with the second aspect of a new conception of negativity. In the "Preface" to the *Phenomenology*, Hegel distinguishes the usual interpretation of subject/predicate relations from an understanding of linguistic unity that is no longer based on the identity of grammatical forms. The true form of the proposition entails a movement between expression and subjective fading that can be grasped according to the musical analogy of rhythm (Hegel 1977: 38). For Kristeva, therefore, the emergence of negativity as well as the formation of "subjective" unity in dialectical thought casts light on the symbolic break that occurs in the semiotic process.

The concept of experience inscribed in Hegel's phenomenology requires a theory of mediation to explain how the object as in-itself can be transformed into a being-for-consciousness. The practical confrontation with heterogeneity performs a more theoretical role in Hegelian dialectics than it does in Kantian thought. At the same time, practices are dialectically meditated only because the role of the negative can emerge in terms of conscious experience: "It comes as no surprise, then, that Hegelian experi-

ence leads to a practice; the latter is not only a subordinate moment of theoretical synthesis, it must also be a test – a confrontation with heterogeneity” (Kristeva 1984: 197).² Knowledge in this framework would involve an interpretation of cultural practices that constitute a limitless “text” that cannot be identified with a single, unequivocal meaning.

Readings of Hegel commonly assimilate the movement of the negative to dialectical results. Of course, the possibility that adequacy may not be the ultimate dialectical goal at least suggests that Hegel’s thought is compatible with the limitless “production” of cultural texts. If texts are capable of registering the movement of the negative in the signs of rejection itself, cultural practices might be interpreted in Hegelian terms. However, this special understanding of Hegelian thought would not allow us to assimilate practical experience to a purely logical conception of the dialectic: “Although Hegel was the first to identify and put so much emphasis on this movement and its negativity, he subsumes it under the *presence of consciousness*, which Heidegger in turn over-emphasized, by reducing the essence of the dialectic to it” (184).

Kristeva readily admits that the problem of presence necessarily haunts Hegelian discourse. Heidegger argues that Hegel allows us to read phenomenology as a path that runs “in-between” what connects natural consciousness and knowledge (Heidegger 1989: 53). Kristeva partially concurs, suggesting that Hegelian phenomenology tends to confuse the presence of consciousness with the meaning of the dialectical process itself. Nonetheless, Heidegger’s critique of dialectical ontology is clearly “overstated” when it argues that the Hegelian Subject is simply a more recent version of the Cartesian Subject (Kolb 1989: 213–232). The identification of Hegel’s thought with an “egological determination of being” leaves little room for what exceeds metaphysics (Heidegger 1988: 126). In contrast, Kristeva conceives of the dialectic as a movement whereby human beings can confront the alienated majesty of the past and achieve mediation with what would otherwise escape the boundaries of conscious experience.

4. *Semiotics and cultural practices*

Kristeva develops the notion of *texts* as signifying practices that are inseparable from the situation of speakers engaged in actual language use. The possibility of understanding is inseparable from our ability to identify the

text as the vehicle for a new sort of practice: “In calling the text a practice we must not forget that it is a radically new practice, radically different from the mechanistic practice of a null and void, atomistic subject who refuses to acknowledge that he is a subject of language” (Kristeva 1984: 210). The semiotic text that emerges in this way functions in a general economy of signs as a mediatory link, drawing together signifying practices that are conscious and other practices that occur on the threshold of unconscious, or, more loosely, “natural”, processes. As the bridge between spirit and nature, the semiotic text provides a space in which signifying practices can begin, just as it marks the limit of what can be achieved by an ego that continually strives for higher levels of cultural awareness.

Kristeva helps us see that art cannot be limited in meaning to momentary aesthetic experiences (215). Art both supports a critique of the subject and opposes the idealistic dissolution of the subject that occurs in most speculative thinking. Moreover, while separating us from direct experience, art has the capacity to present the semiotic in a mimetic guise: “Mimetic verisimilitude does not, therefore, eliminate the unique break Frege saw presiding over signification. Instead it maintains that break and, within, a certain object” (58). In offering us a *critique* of mimetic realism, Kristeva claims that the work of art is neither “true” nor “false” but the locus of semiotic possibilities (58). The work of art is a *text* that provides the “space” of illusion that opens up after an epistemological break has occurred, just as it offers legible signs of being connected to the world that exists “outside” the break. What this means in semiotic terms is that the work of art constitutes the space of a non-true “presence” that testifies to both an inside and an outside, just as it opens up the possibility of *untruth* (and *misunderstanding*) while testifying to the virtual possibility of societal knowledge.

Notes

1. Kristeva derives the term, *chora*, from Plato’s *Timaeus* to denote “a non-expressive totality” that pre-exists the speaking subject as an unstable foundation of semiotic drives (1984: 25). The *chora* is part of the field of language, rather than a fixed abode, since “it can never be definitively posited: as a result, one can situate the *chora* and, if necessary, lend it a topology, but one can never give it axiomatic form” (26).
2. The importance of Hegel to early pragmatism is reinvented in Kristeva’s semiotic approach to cultural practices. A partial explanation for this

might be that the Peircean *interpretant* is analogous what motivates Hegelian Reason, which dispenses with the Kantian thing-in-itself in opening the human subject up to a new sense of the Infinite.

Entrepreneurship and communication

Understandings/misunderstandings as means for adventure

Introduction

Some theorize entrepreneurship as a hermeneutic dialog of learning while others connect it to a social construction of identity where boundary crossing and boundary spanning are pursued by engaging participants. Common to these two positions is the acceptance of reality as social constructions created in ongoing socializations, institutionalizations, and sense-making interaction between women and man; wo/men. Writing this text my ambition is to discuss entrepreneurship from these two positions in association with communication focusing performance. I will present entrepreneurship within a semiotic perspective and make the suggestion that understandings/misunderstandings can be interpreted to play a meaningful role in entrepreneurship. I will try to show that, sometimes and in some places, people can believe they understand the entrepreneurship as they emotionally experience on-going events as I portray how (mis)understandings can make wo/men take part in an adventures business. Thus, I state that in theories of entrepreneurship, (mis)understandings must be expressed as means for entrepreneurship.

The business venture I've been studying and am about to put in the picture as a sign of entrepreneurship is named "Wij Trädgårdar i Ockelbo", which is located at an old forest and steel estate in a sparsely-populated area in the Swedish country-side. The study is part of my PhD studies and I've been at the location as a researcher from January 2004 to April 2005. Following on-going actions and engaging people as close as possible during this time I've made observations, participating observations, and comple-

mentary interviews. I have read about 430 news items and paper articles concerning the venture (published 2001–2003) and different kinds of internal documents (minutes of meetings and quarterly reports) produced from autumn 2003 until summer 2004. I also permanently resided in the municipality for one year (April 2004 to April 2005).

Here I will first briefly introduce the notion of the *relational sublime* (Gergen 1996a) and address some cornerstones of the social construction of reality (Berger and Luckman 1967). Thereafter I will tell, in somewhat non-academic fashion, a narrative story (Czarniawska 2004). I first present a social background of the settings of the storyline, then proceed to the plot of the harvest celebration at Wij Trädgårdar i Ockelbo in late summer 2004, a moment in time when I am surrounded by many actions and a lot of people: a living (Dutton 2003) and moving collage of eye-catching events and folks taking part in entrepreneurship. All parts presented are chosen because they are significant for the establishment of Wij Trädgårdar i Ockelbo and therefore helpful to understanding entrepreneurship in practice. After the narrative, I return to theories, presenting three discussions; the first, on entrepreneurship as performance of learning and identity; the second on actantial interaction and communication; the third, on the adventurous force of (mis)understandings, in which I share my impressions of that day at the harvest celebration of 2004 at Wij Trädgårdar i Ockelbo. Suggestions are made that both understandings and misunderstandings, under certain circumstances, can play a meaningful role in entrepreneurship.

1. *The relational sublime*

Gergen (1996a) addresses social construction in a realm of the *relational sublime*. To enable elaborations on human relatedness as fundamental to understanding wo/men, the author unfolds a semiotic space in which both languages and articulation are understood to form the boundaries of peoples' relational worlds. Gergen writes: "It is language that furnishes the capacity to distinguish this from that, me from you, up from down, in from out. 'There is' ... is a move in linguistic space" (1996a: 8). He goes on to state that relationships are formed where "the source of 'awe', 'inspiration', or 'terror' is not to be found in nature ... or in persons..., but within unfathomable processes of relatedness which make meaning possible" (9)

The sublime is increasingly present in our daily experiences, relational to and associated with a powerful force. Acknowledging the power of inter-related emotions, Gergen presents a wo/man who is comprised both by “normal” feelings, such as fear, anger and sadness, and by “extremes”, for instance, overwhelming melancholy. He states that, even though emotions and emotional expressions can be acknowledged as ontologically connected blueprints, emotions can also be interpreted as relational experiences closely connected with the conditions in which they are experienced and expressed. Thus, internally emotions are experienced as mere commonly known feelings, but “tears shed at a funeral are indicative of sadness ... the same tears at a wedding or the presentation of an award are indicators of joy” (1996a: 3). Gergen also claims that, in theories of psychology, feelings of love are mostly left out of the picture and suggests that this is so because the term has been used to index so many different and varied actions over the centuries – from adoration to avoidance, suicide to homicide, the trivial to the profound – that it has lost its scientific respectability as a term (*ibid.*). Widening the perspective to include social psychology, Gergen argues that “scientists can offer society enormous riches in terms of principles of human interaction” (1996b: 2). In using the word “principles”, the author again stresses ontological and relational implications when identity is understood in relation to inter-relationally expressed and experienced emotions, as well as with internally experienced feelings. In real life, social constructions are most effectively deployed in studies that illustrate interesting and challenging ideas, and/or those which trace patterns of manners deemed generally to be of significance to the society. Bits and pieces gathered “out there” can dramatize and illustrate provocative ideas about how people live, and give rise to intriguing and important questions concerning “the power of social influence, and the needs and problems of both belonging to social groups and remaining independent of them.” (*ibid.*: 5)

2. *Settings*^t

Wij Trädgårdar i Ockelbo as a commercial venture dedicated to gardening and garden design, as well as recreation, handicraft, ecological and locally produced food, and a variety of musical and cultural events. At the time of the harvest celebration (12th of September 2004) it was said that the

business would open “for real” in spring 2006, but such things as a rose garden, a kitchen garden, a shop for handicrafts and souvenirs, and a restaurant had already opened for business. The main business idea is articulated in the mission to build a national and international centre for plants that can grow and flourish in cold climates, and this is to be done in a way “the world has never seen before”.

This sort of entrepreneurship dates back to the late twentieth century, initiated by some officials and politicians at the local government-office in Ockelbo, together with some local business owners and a well known Swedish gardener. The gardener, viewed as the head acting entrepreneur, is acknowledged as one of the most knowledgeable gardeners in the country and an extraordinarily skilful garden designer. He is also well recognized as one of the initiators of Rosendahls Trädgårdar at Djurgården in Stockholm, a success story still in the telling.

Also involved with *Wij Trädgårdar i Ockelbo* are a large number of other people, such as approximately 100 local inhabitants and people from surrounding villages and cities. Most signed up to take part in the venture after an information meeting held at the Free Church in late autumn of 2000. Many of them are middle-aged women taking time off from other off-work duties. Others are professionally related to different parts of the planned venture, who seek an opportunity to work with and learn from the gardener. It is my belief that many of them also participate in hopes of contributing to something they believe will, in the long run, prove a benefit for the municipality. Pure curiosity as well as the joy of participation in different happenings might also explain the high number of participants. The concept of “engaged participants” is used to label individuals whom I interpret as part of this group.

The location, land, and buildings have a long and glorious history of almost 400 years of steel and forestry business. Buildings and other facilities built in the eighteenth and nineteenth centuries are currently owned and maintained by a foundation. The estate was bought at the price of one Swedish krona from the local government of the rural district and municipality of Ockelbo; the last private owner of the manor was STORA ENSO AB, a business that most of the population in this part of Sweden either historically or currently have some kind of professional and/or familial connection to. Financing currently comes mainly from the county administrative board and EU-grants.

Photo 1. The location, July 27th 2001 (photo by Thomas Grönberg).

The Harvest celebration was announced in e-mailed newsletters sent to subscribers (on July 28 and August 2004). Judging from conversations heard on planning of the day, it seemed to me that the celebration could very well speed up the progress of the business venture. On the 12th of September 2004 festivities were arranged for the first time, with plans to make the Harvest celebration an annual tradition.

3. The harvest celebrations

On the 24th of September 2004, the weather is slightly cool but quite pleasant; the sun is shining and only some light clouds appear in the sky. Here I am, standing in a field, gazing across the premises of Wij Trädgårdar i Ockelbo, a place that usually would be described as silent and serene, but that now exudes an air of excitement.

Some distance away and slightly to the left, on the avenue, I see a horse and wagon where people are invited to go for free rides up and down the road. It's only a few hundred meters, but the trip will take you down the avenue to the pond and the old, long-closed factory that presently serves as a steel-works museum open to the public. Then it's back to the manor house again (photos 2 and 3).

Photo 2. Avenue and Manor house.

Photo 3. The pond.

To the right of the steel-works museum, far off in the field, I can see an old and very noisy reaper churning up large clouds of dust, and still further down, in the middle of the field some horses are being used for the same purpose, which is to demonstrate different ways of harvesting (photos 4 and 5). Even further down, to the right, I see three men working together, building a hay-drying rack.

I recognise two of them, Tobias and Klas, gardeners and employees highly engaged in the realization of the venture (photo 6). Just behind my back a sheep racetrack has been erected and a flock of sheep is currently being restrained by a shepherd at the starting line; all of them have a large number painted in black on their back. Someone is walking around with a bucket and taking bets from people gathering along both sides of the fence,

Photo 4. Horses in a field (12-09-2004).

Photo 5. Hay-drying rack (September 2004).

many of them trying to get a good position near the finish line. There is a lot of laughter and some intense discussions; it looks as though they're having fun. I stay there for a short while watching the race and then decide to take a short walk, passing the open space, the gravelled square, in front of the Mansion between the north and the south wing, and slowly stroll up to the kitchen garden and the Rosarium, and finally end up in the Garden House.

Photo 6. The avenue and one of the gardeners (July 2004).

Today the square is turned into an old market, where a lot of visitors, including myself, are slowly moving along the lines of market stalls where different kinds of merchandise are exhibited and put up for sale by local producers (see photos 7 and 8).

Photo 7. Visitors on the Market Square (12-09-2004).

Most of the stalls offer free samples of products for sale. Some of the engaged participants of the venture are selling vegetables, probably some of the harvest from the kitchen garden (photos 9 and 10).

Photo 8. The Market Square and the Mansion (12-09-2004).

Photo 9. Local producer selling honey (12-09-2004)

In the centre of the square a large tent has been erected for the harvest exhibition, where a contest which has been arranged in cooperation with one of the local morning newspapers. In its shade participants display their entries for the competition (photos 11 and 12).

I walk along the gravelled garden path across the shady school yard, past red-painted houses, where actions are taken to start an education in gardening at college-university level. Today Lars, the head acting entrepre-

Photo 11. Entry for the harvest competition (12-09-2004).

neur and well-known gardener, stands there preaching, sharing his skills of how to create great compost out of kitchen- and garden-leftovers (photo 13). Many have stopped to listen, pleasantly amused at his way of using gardening terms in different metaphorical moods.

I cross the asphalt thoroughfare and wander onto the sidewalk and up to the kitchen garden, the Rosarium, and finally enter the Garden House (photos 14 and 15).

Photo 12. Harvest on display (12-09-2004).

Photo 13. Lars, one of the initiators and head acting head gardener (undated).

I enjoy a cup of coffee and a piece of cake, baked either by Monika or any of the numerous others who have joined the group in charge of the kitchen at Wij Trädgårdar.

4. Entrepreneurship as performance of learning and identity

In business economics, theories of entrepreneurship and entrepreneurs have often been concluded that the latter are a special kind of people who are motivated by performance. It has been explained that (wo)men (Ogbor 2000) who start a business are task-oriented, have an interest in business growth (Miner et al. 1994; Miner 1990), and feel a need for achievement (McClelland 1961, 1987). Delmar (1996) has measured the effects of entrepreneurial behaviour in business progress and survival; in assessing quality of performance, he considers the environment, the psychological characteristics of the entrepreneur, present competition, attitudes among co-workers, motivation, ability and emotional responses. Entrepreneurial performance is seen at its best if motivation and ability result in a persistent and expanding venture organization. Situations at hand demand some sort of (modest) risk-taking, responsibility and anticipation of the future.

Performance has also been expressed as a concept in interpretations that engage features of entrepreneurship in quite a different discussion. This discussion is in search for knowledge of entrepreneurship as on-going organizing processes. In this regard, Gartner et al. (1992) declared that entrepreneurs have to “act as if”, in order to motivate and persuade other people to contribute and willingly engage in (seemingly crazy) ideas. In

Photo 15. The rosarium (August 2004).

this line of theory some researches have set out to express entrepreneurship and the acting of entrepreneurs as constant performances. Today Johannisson (2005) makes an attempt to formulate a life-long research achievement and presents a theoretical contribution in an “acting as if”-related essay exposing reflections on the essence of entrepreneurship. Entrepreneurship is vividly exposed as an event-driven “staging”, continuous performances where relational struggles are expressed and experienced emotionally as successes and failures, where doubts and convictions are endured.

Perhaps less spectacular but highly related to staging is the theoretical translation and representation of entrepreneurship as common narrative learning. Here, Steyaert (1995) theorizes entrepreneurship as a dialogue among different actors. Entrepreneurs and other actors who engage in a venture are placed in a central position where knowledge can (and must be) put up for option. To perpetuate and conceptualize new ventures as social constructions created in interactions among people, Steyaert and Bouwen (1990) describe how people narrating can transform social settings and structures; the authors metaphorically portray the movements of entrepreneurship as “a warp and weave” and argue that entrepreneurial stories change social settings and structures, the history, the “context”. Entrepreneurial weaving discloses disparate knowledge and intertwining personal relations, and in this way an attractive, diverse, and unique social (construction) of the environment can be created (Steyaert and Bouwen

1997). Anderson (1995) describes the attraction of entrepreneurship in a rural context as communication and transformation of temporal and spatial features. Entrepreneurial performances and rural attractions can develop gravitations that turn periphery into center. New business ventures awake bright and colourful textures of hopeful thoughts of days that are yet to come and nostalgic shimmers over the good old days that are long gone. Attention is gained, “off” turned into “on”, and “cold” into “hot” as new meanings are communicated and created.

Wählin (1999), as does Steyaert, makes a vigorous effort to combine entrepreneurship with social constructions among humans, but instead of using an epistemological lens, directs the theory of entrepreneurs and entrepreneurship to ontological issues. Combining theories of identity creation with theories of entrepreneurship in search of how “the actor’s imaginative actions are constructed within networks” (1999: 115) he argues that in order to enact entrepreneurial changes, self-confronting questions constantly have to be put up for examination. Identity, then, is not seen primarily as a fixed or fully matured entity, but is assumed to be open-ended and lifelong, a “continually socially constructed and subject to contradictions, revisions and change” (ibid.). In this way Wählin’s unfolds a self-reflexive construction, and entrepreneurs are injected into an “individual” that moves both in and out of “different institutional environments” and through “time and space” (ibid.). To express the entrepreneurial organizing and to capture the entrepreneur as a traveller, a tourist, Wählin formulates the concepts of “boundary spanning” and “boundary crossing”. The spanning and crossing of boundaries summarize how entrepreneurs travel both inward, through self-reflexion, and outward, through the change of environment and through narratives expressed to others (Lindgren and Wählin 2001). Unlike the pilgrim, who travels to reach a predetermined and final destination, the entrepreneur is always on the move and does not belong to places she/he might come to visit. This way the entrepreneur is able to keep some objective distance. During the movement and in interaction with others, boundaries are expressed between here and there, now and then, and I and you. But in order to understand life and “authentic feelings and experiences”, these boundaries are constantly crossed in ongoing narratives, by which entrepreneurs, as actors, give voice to something beyond “institutionalised identities” (Wählin 1999: 125).

I would argue that in entrepreneurship learning and identity, creation is a cooperative activity. In theories of entrepreneurship and in the light of social constructions, *performance* is a useful concept for describing entrepreneurial wo/men in their various interactions. In the following section I therefore discuss interacting in terms of concepts connected to human performance, which enable a semiotic reading of entrepreneurship.

5. Interacting actants, canonical mediation, and recursive communication

Recognizing features of constraints and relations of provocation, Greimas (1982/1990) theorizes performative interrelations among actants, in which articulations and seductive manipulations take part. Things and people are put forward as object-and-subject, sender-and-receiver. Challenges may be accepted or rejected. By their actions, wo/men connect to other peoples' interpretations and to stories and discourses. Here, things that can be known are explicit and exposed whilst the known is implicit and semantic. In between things that can be known and the known a space of interpretations appears in people's need to search for understandings. Life involves interpretation, a struggle that is born of a will or a need to understand. Opportunities to interpret, as well as manipulate, appear at the intersection of previously assigned mandates and/or sanctions of cognition (Greimas 1983/1990). This way, the ability to interpret is manifested in feelings of desire. This way, and in the concept of the *actant*, bodily personified semantics and signifying become features of discursive expressions/impressions. Through actions and reactions people become part of a polemic held through interpretation and knowledge. By unveiling convictions and tensions that trigger our desire and need to respond, one action is connected with other actions. The progression, or trajectory, of interactions is expressed as a dynamic movement of perspectives from one space and time to others. The subject embraces "beings or things that participate in processes in any form whatsoever, be it only a walk-on part and in the most passive way ... which precedes any semantic and/or ideological investment" (Greimas and Courtés 1982: 5).

In the legacy of Greimas, and in the light of laboratory-life (Latour and Woolgar 1986), Latour (2000) describes scientific mediation as a circulatory system that can project a canonical process. This process is described

to involve five conceptualizing practices: *mobilization of the world*, *autonomization*, *alliances*, *public representation*, and *links-and-knots* (Latour 2000: 98 passim). Mobilization of the world refers to when and how objects are used and charged with meaning. Autonomization is when and how actions are taken to release particularities of a context. Alliances refer to long-term cooperations where participants anticipate gained mutual benefit. The concept of public representations covers activities that communicate and give information on on-going actions and happenings in the system. Public representations are propagated through media in connection with “the man and the woman on the street” (ibid.: 105). The final practice, links and knots, describes evolving associations. Together these associations represent an understanding that develops over time as coherent actions are taken to create mobilization (of the world), autonomization, alliances and public representations. Latour (2000) argues that macro-actors of truth are organized in practises that disclose space for content; experiences of personal, internally located situations and happenings; and externally comprehended institutionalized circumstances. A circulatory system is built as human actants (people), non-human actants (artefacts), and quasi-objects (routines) are connected and negotiated in relation to one another and in company with a super-actor, a common spokesman and or a purpose (Callon and Latour 1981; Latour 1987). Latour (2000) emphasizes that super-actors do not evolve only from these five practises or from the actants. Super-actors are literary and linguistic articulations that derive from the translations of actions and actants in practice. Latour writes: “In its linguistic and mediation connotations, it [translation] refers to all the displacement through other actors whose mediation is indispensable for any action to occur. In place of rigid opposition between context and content, chains of translation refer to the work through which actors modify, displace, and translate their various and contradictory interests” (2000: 311). He goes on to emphasize that the canonical power of a super-actor can be comprehended chiefly in the articulation of links and knots. The power of a super-actor is never stronger than associations concerning actions and actants (Latour 1999).

Viewing all this from a semiotic perspective, it can be stated that all people have the desire and will to interpret. Interpretations are coloured by an ontological striving, since in order to survive people need to interpret. In semiotics, interpretation is connected to interactions effected by

passions and manipulations. In interaction, interpretations contain stuff already known and things yet to be discovered. The known can be more implicit, producing a bodily experience in feelings closely connected to established norms and cognitive sanctions, as memories of other times and other places. The unknown, so as to be known, can be made explicit and shared in emotions closely connected to on-going actions and happenings in the here-and-now. Things as well as people become objects of contents merely by being there and participating in a given moment. Interactions can release distinctive and autonomous parts of a context. Alliances, media and “men and women on the streets” promote associations – links and knots – that weave interpreted bits and pieces together into an understanding. Associations and interpretations promote canonical forces and movements.

Krippendorf (1994) suggests that communication is constructed in language as practiced, concluding that mutually acceptable understanding/misunderstanding constitute qualities of interacting people. In his recursive theory of human communication Krippendorf states that “everything said is communicated to someone understanding it as such” and “assert that anything is what it is because someone understands it that way” (1994: 80). “To say” refers to all kinds of communication, spoken, pictures, and gestures and so on. Understanding is not only local to the listener or the observer but also to the speaker or the expressive context. Krippendorf also states that “the awareness of something being said and communicated ... must be located *within* one’s horizon of understanding” (81). Communication can only arise in cognitive participations and judgments that make communicated things exist, and norms of understanding can only be set by one who “knows”. This doesn’t mean that understanding is something total subjective and free from circumstantial input. Instead it suggests a reflexive loop guided by knowledge and practical experiences of actions taken in the environment and disrupted by objections, challenges, and disruptions. Nobody can be forced to understand; how someone else understands can never be directly observed or accessed. Still, human communication somehow takes place, constituting itself “in the recursive unfolding of communication constructions, held by participants (inclusive of each other) into intertwining practices that these participants recognize and explain in terms of being in communication” (ibid.: 85). When practices joined together, without disrupting or challenging one another, then

understandings “resonate”. To avoid objections, communicating people try to shape others to fit into one’s own construction of reality. These invented others are understood to have the same capacity to understand and communicate as oneself. The invented other can also, in terms of its respective conception of communication, understand things that arise. This theory of communication proposes a “recursive frame *whose space can be filled* by any construction which participants happen to bring to it or develop in the process of communicating with each other” (ibid.: 90). Participants in communication have the ability to move within “the virtual space of their known” ... to position themselves in their own construction of reality” (91) in relation to other people. Furthermore, they can “see and understand themselves through these others’ eyes” (91). Krippendorf stresses that communication can not be reduced to “a monologue, neither to a performance for an audience, nor to the mere production of messages” (ibid.), emphasizing that “in a recursive theory of communication, individuals are *invited* to include themselves in their own knowledge and [they] are able to take different positions within the realities they construct” (94).

6. *Concluding a tour de force of entrepreneurship*

In viewing Wij Trädgårdar i Ockelbo and the harvest celebrations as part of entrepreneurship, a semiotic perspective on which includes all kinds of words, pictures, bodily gestures, and so on. Understandings are here not merely local to the listener but also to the speaker, the performer. The awareness of things being said and communicated is located *within* people’s understanding. At the harvest celebrations nobody could be forced to understand, and someone else’s understandings could never (and by no one) be directly observed or accessed, nor ever be completely finished. The on-going communication provided spaces for anyone to enter into the action. These spaces could therefore be filled by any construction that happens to be brought in or develop in the communication among the men and women participating in the event. Even though the event was planned and executed by those engaged in the business venture of Wij Trädgårdar, communication on that day could not (and should not) be reduced to “a monologue, a performance for an audience, or to the mere production of messages” (Krippendorf 1994: 91). Instead, the interaction among every participant can be expressed as performing the parts of entrepreneurship.

At the harvest celebration, people and things were assigned features of provocation, as challenging proposals were put up for acceptance or rejection. But there was also a risk (or a possibility) that propositions made in the name of Wij Trädgårdar i Ockelbo would be met with a negative response. Mistrust and disappointment among the visitors and other participants could not be averted altogether. Nevertheless, visitors and other participants anticipated making alliances where both gained mutual benefits, as in the market stalls handled by local producers and the engaged participants of the business venture. The collaboration with media, in the harvest competition, the contestants, jury, and visiting onlookers resulted in both a public representation of the harvest celebration as well as a pre-view of business to come.

At the harvest celebration, this relatively unknown business-to-be was exposed. Ongoing activities during the day created a positive atmosphere of expectation. There were eye-catching motions of people and on-going events at the site: watching and betting on the sheep races, riding on the wagon up and down the avenue, working in the field, participating in the harvest contest, dissertating on the art of compost, putting products up for sale. Not as moving but still quite eye-catching were the flowers and other things planted in the Rosarium and the kitchen garden, and growing to become part of the Wij Trädgårdar in Ockelbo. Visitors justified the future business by their high numbers (said to be about 3000). At the same time and place, more implicit, but constantly present, things also took part and interacted in the entrepreneurship. The surroundings and the landscape, the old trees and the horses and wagon in the avenue, the old reaper and horses harvesting in the field, the hay-drying rack, the gravel market square and the stalls, harvest goods on display. All of these things created a somewhat nostalgic mood, by recalling the positive values of the simple, good old days.

The explicit features (actions associated with the unknown business to be) and implicit features (the well known history of the place) opened the way for different interpretations. There was a *will* and *desire to interpret* both the actual goings-on as well as plans for the future. But the unknown explicit and the implicit known also provided possibilities to create a *need to search for understandings*. As interactions took place between gardeners, engaged participants, local producers, and visitors, not only did opportunities to interpret arise, but also to manipulate. On that day and on that

site the ability to interpret was connected to passion and manifested in feelings of amusement and joyful experiences. Visitors and others were encouraged to embrace beings and things in any form whatsoever, be it in a highly active form as the performance made by one of the initiators, the head gardener, or in the most passive form, such as an entry in the harvest competition or goods on display. Objects and people could be interpreted, but they also changed in meanings as emotions and feelings varied. The semantic history and signifying business-to-be became features of expressions/impressions. and through their interactions, people became embodied in communication and part of the ongoing polemics on whether or not Wij Trädgårdar in Ockelbo was something to have confidence in.

I have suggested that theoretically and in a semiotic perspective, entrepreneurship gives birth to desires, a will to interpret, and a need to understand. Entrepreneurial interpretations are coloured by ontological and epistemological striving, for as previously mentioned, to be able to interact in entrepreneurship always involves interpretations. In entrepreneurship, interpretation is connected to interactions affected by passion and by manipulations. Interpretations contain stuff already known and things yet to be discovered. In entrepreneurship the known can be more of semantic, implicit, and bodily experienced in feelings closely connected to established mandates and cognitive sanctions, memories of other times and other places. By contrast, the unknown can be signifying, explicit and shared in emotions closely connected to on-going actions and happenings then and there. In the on going interpretations of entrepreneurship things as well as people can become objects of contents merely by being the and participating, if only for a moment. The various interactions reveal and release distinctive and autonomous parts of a context. Business alliances, media, and “men and women on the street” promote association; these are the links and knots that connect interpreted bits and pieces of the entrepreneurship and the “business to be” together in an understanding. To operate, communication always constitutes a mutually acceptable level of understanding/misunderstanding. In theories of entrepreneurship, understandings/misunderstandings can be expressed as a force and means in ongoing interaction between interpreting men and women. My experiences from the field and from the harvest celebrations at Wij Trädgårdar in Ockelbo, tell me that sometimes and in some places understanding/mis-

understandings make people more than ready to take part in an adventurous journey into mankind's destiny in the unknown future.

Note

Anneli Mihkelev

Literary dialogue in the literary text

The play between understanding and misunderstanding

1. The components and functions of literary communication

The author, the text and the reader are the three components which make up the literary dialogue in Mikhail Bakhtin's work. All the components of the dialogue work together and constitute the meaning of the text, and every component has its own function in the dialogical process. The interaction between all three components is dynamic and the meaning of the literary text is created in the process of communication.

At the same time, the dialogue – the literary communicative process – is not the same as that in everyday life, when two or more people communicate with each other: the author does not reveal to the reader a definitive meaning, but rather meaning is created in the process of interaction – that communicative process is associated with Bakhtin's theory.

Literary dialogue and communication also maintain distance, both spatial and temporal, between the author and the reader: the author and the reader do not stay in the same room and usually they do not have contact with each other, because the literary communicative process is mediated through the literary text, which is written beforehand. In other words, the author and the reader have no physical contact in the literary dialogue; the communication takes place through the text. This means that, first, dialogue takes place between the author and the text, or between the creator and the creator's object. The third component, the reader, comes into play a bit, sometimes much, later. The distances, both spatial and temporal,

are different, varying from reader to reader. It is possible that there is only one author, whereas many readers communicate through the text.

According to Mikhail Bakhtin, every communicative process includes not only direct verbal signs, but every communicative process, every dialogue, also includes all the discourses or (social) contexts with their different sign systems and they exist around the utterance or the text; not only verbal signs take part in the dialogue, but also different sign systems. And the author and the reader are usually involved in different discourses. That fact also influences the text, which consists of verbal signs: the text is surrounded by different sign systems in discourse (Bakhtin 1987: 212–234).

The text itself usually contains only verbal signs (though sometimes it may contain other kinds, for example, visual signs), but the discourses surrounding the text contain different sign systems: verbal, visual and aural. The written text may indicate or allude to different worlds around itself: fictional worlds (verbal or visual signs) or illustrations and pictures (visual signs), other literary texts (verbal signs), mass-media (a combination of different sign systems), etc. Different sign systems are always mixed in the processes of writing and interpretation.

In a poetic text, the poetic function of communication dominates. Poetic language refers to itself, but at the same time we can see that in a poetic text there is also a referential function, a referring not to the poetic language itself but to something beyond the text (cf. Jakobson 1960: 350–377). For example, the Estonian poet in exile, Kalju Lepik, writes about the Tartu (the city in Estonia) of Soviet times in his poem, “The Shadow of the Stone Bridge” (“Kivisilla vari”), published in 1985 in the collection *Kadunud külad* (*The Lost Villages*). In the poem, he enumerates and personifies the characteristic buildings and other objects of Tartu. The ruins of the Stone Bridge, the shadow of Lake Peipsi, other ruins and other objects become indexical signs that point to the occupation and the war. He uses almost all elements of the material substratum of the text of Tartu: Jaani Church, red brick ruins of the Dome Church, the conglomeration of the Kaubahoov shops, Barclay Square, the Observatory, Toomemägi and Ema-jõgi. All these objects acquire the function of indexes in relation to Tartu, as being as signs in an immediate relationship with the objects they signify. At the same time they also form a metonymy, depicting the atmosphere of the Tartu of Soviet times, and it is also a political allusion (Mihkelev 2002: 431–454).

The author may lead the reader in the proper direction. Or he may use rhetorical acts to manipulating the reader. Lepik does this in the poem titled “Mõru mõte” (“A Bitter Thought”), published in 1958, in the collection *Kivimurd* (*Stone Quarry*). Lepik imitates the style of the epic in this poem, but it is in fact a parody of the epic:

Lend me your zither, Vanemuine,
A bitter thought comes to my mind:

When Kalev one day comes home
to drink home-made beer from a piggin
to hang his own children.

(Lepik 2002: 173, tr. by Jüri Talvet)

Lepik’s text, written during the Soviet occupation, ends on an optimistic note, when Germans occupy Estonia in the thirteenth century: “Kalev certainly will return home/ to bring happiness to his children, / to create the new life in Estonia” (Kreutzwald 2003: 341, tr. mine). It is possible that the message of Lepik’s text is a prophetic threat or a fine political allusion, because the last verses are far too serious to be simply a playful or nonsensical song. The allusion that leads the reader to the deep structure of the text makes several interpretations possible, as well as misunderstandings, since the author allows the reader to interpret with relative freedom.

The existence of authorial functions in the text suggest that the author is definitely not dead, as some interpretations of Roland Barthes’s famous essay “The Death of the Author” (1968) would seem to indicate, but that the author’s intentions live in his/her text. It is possible that the author leads the reader, through the text, to connotative meanings. It is also possible that the author manipulates the reader’s memory or collective memory of the nation.

In terms of the three components of the literary dialogue, the central one is still the text, which is created by the author and interpreted by the reader. Lotman refers to the text as a personified phenomenon, which has its own very important, and at the same time very specific, function(s) in the literary communicative process. The text, for Lotman, also operates as a very active, communicative person, who activates other parts or components in the literary communicative process. Lotman has written about these functions of the literary text: “Artificial languages model not lan-

guage as such but one of its functions – the ability to transmit a message adequately; because semiotic structures, when they achieve this function to perfection, lose the capacity to serve other functions which are inherent to them in the natural state” (Lotman 2000: 13).

The first textual function that Lotman mentions is the creative one. The sign systems which are able to transmit the message “not only transmit ready-made messages but also serve as a generator of new ones” (ibid.). The inside of the text is a heterogeneous phenomenon: the message is received from input as a result of simple transformations from one language to another; the languages may be more than verbal and visual. It is important that, in an artistic translation, the transmitter and receiver use different codes, which overlap but are not identical; then the result of the message or translation is a third text or third meaning (Lotman 2000: 14-15). That part of the meaning which it is not possible to transmit precisely has a semantically creative potential in language. It is the translation of untranslatable meaning that has the potential to create some new meaning. It is possible to change the meanings in the poetic text – that is the normal creative function of the poetic text.

The third function is memory, which is very important to both normal and poetic language: “The text is not only the generator of new meaning, but also a condenser of cultural memory. A text has the capacity to preserve the memory of its previous context. [...] The sum of the contexts in which a given text acquires interpretation and which are in a way incorporated in it may be termed the text’s memory” (Lotman 2000: 18).

The last function is connected with the social-communicative operations of the text/ First, the text functions as a message between author (addresser) and reader (addressee) in the communicative process. Second, the text functions as a memory, both creative and informative, between the public and the cultural tradition. Third, the reader communicates with himself/herself and the text influences the personality of the reader. Fourth, the reader communicates with the text. Fifth, the text communicates with the cultural context. (Cf. Lotman 2000: 63–81.)

The cultural context itself is a heterogeneous and complicated phenomenon, because the same text might relate to different levels of context; it is also possible that the text can move from one context to another. Then a new literary communicative process begins and new, “foreshadowed” contexts come into being.

If the text communicates, creates meaning and provides information, a specific space is needed where all these processes can take place. This place includes different spheres around the text: social meanings, different texts, external reality and collective cultural memory. It is a place where bridges are created, where poetic and rhetorical languages mix and where the meanings – which have originated from both the author and the reader – are created. Renate Lachmann has named that place the mnemonic space (Lachmann 1997: 4-24). Joseph Pucci, an Italian researcher, calls this mental location the “allusive space” (Pucci 1998: 43). So, it would be the mnemonic and allusive space where the connotative meanings have created (Fig. 1).

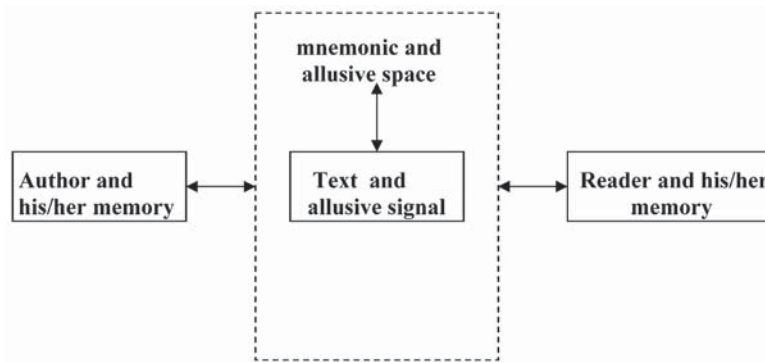

Fig. 1. Allusion and dialogical relations between author, text and reader.

It is also the space where playful interaction takes place between the author and the reader, as well as the play between understanding and misunderstanding. The aspect of play is very important for Lotman, as well as for Roland Barthes. According to Lotman, the interaction between different codes creates playfulness in the text. Barthes emphasizes the dynamic character of the text and also the experience of marginal readings, because the text is paradoxical and can be read in a different way and with different meanings each time. At the same time, Barthes presupposes that the reader is an active reader and interpreter (Barthes 2002: 126–139). A similar idea is stressed by both Lachmann (1997: 31) and Pucci, who describes a “full-knowing reader” (Pucci 1998: 28).

The author also has his/her own intentions, which live in his/her text. We can say that the author's intentions depend on the reader's competence and capacity to understand them. The most important role of the reader is to discern and recognize those intentions. The reader constitutes meaning according to the text created by the author, and the dialogue requires a balance between author, text and reader.

The author may lead the reader through the text to the connotative meanings that exist beneath the surface level of the text. Or the author may manipulate the reader's memories or the collective memory of the nation, as has occurred in different periods in Estonian literature. It depends on the intention of the author. How free the reader is to interpret the text depends on the text's "openness". Some kinds of texts are more "open" than others. Concerning the play between understanding and misunderstanding in the dialogical process of the literary text, we must say that it is a question of new meanings in the text and also the latter's creative potential.

2. *Examples from literature*

Our theoretical explanations can be illustrated through an analysis of two texts from Baltic literature: Emil Tode's *Piiririik* (*The Border State*) and Nora Ikstena's novel *Dzīves svinēšana* (*Celebration of Life*). The former work, published in 1993 and translated into several languages (14), may be considered one of the symbols of Baltic identity (Baltic Assembly Prize in 1994). Ikstena's novel *Dzīves svinēšana* was published in 1998, translated into Estonian in 2003 by Ita Saks, and into Lithuanian in 2005. The author was awarded the Baltic Assembly Prize in literature in 2006. Both novels are significant in Baltic cultures, and these prizes also create a social, even political, context for these books. The structures of these novels are modern and innovative, rich in creative meanings and, at the same time, "open".

We are familiar with both authors. Each comes from a Baltic State, one from Estonia and the other from Latvia. Each of the authors has his or her own cultural memory, which they put to use in their works. The next question is, Who are the readers? The answer is, we presume the readers are mainly from the Baltic States, and hopefully also from Europe and elsewhere. If we remember the social context of these books, the readers, as well as the context of Europe, are most important for both works.

An important potential of these texts is the creation of a common Baltic identity. On the one hand, these texts realize the goal of the Baltic Assembly Prize; on the other, they can help to create a Baltic identity also through the textual contents and structures.

A common idea runs through both novels: Baltic countries occupy a peripheral position between the East and the West. This is something special which separates us from other regions. The special characteristic of the Baltic memory and identity is the balance between West and East, between the Russian Empire and western European culture, and between the experience of freedom and the loss of it. This is the tragedy of the Baltic countries, but it is also our joy – we know the price of freedom. This tragic, historically ambivalent cognisance is the foundation on which to interpret Tode's and Ikstena's novels, and in these texts exist the experience of the borders and the strong potential to create and play with meanings related to that experience.

These novels examine closely, and for the first time, the oppositions between East and West, and perhaps between Estonia, or the Baltic States generally, and Europe. If this is so, then it is also a new layer of experience of the Baltic identity which is different from the one we have from the Soviet period, or even from earlier times.

The tragedy of Eastern Europe and the Baltic States becomes manifest when national borders are open and it is possible to compare life in the East with that in the West. It is also significant that the novel is set in Paris, a place of neutrality in the history of the Baltic states. Paris has no border with Estonia and Latvia; it is the centre of Europe. In the novel, there is an interesting and very semiotic movement: a man from East Europe, from a peripheral border state, moves to the centre of Europe, the very centre of the semiosphere. He brings new information to the centre, and in return gets new information from that area. The centre and periphery are always in opposition. Life in the periphery is more active and variable, containing more information; life in the centre is concentrated but at the same time more static. The man from East Europe needs the help of an older man from central Europe. He receives the help and a better if more sterile life, but he must also do what the older man wants. It seems that the border between freedom and prison is still delicate even in the free world. Who is exploited here – the man from East Europe or the one from West Europe? They both need each other, but the man from East Europe kills the man

from West Europe. It is a symbolic act; from the borders comes new information, and a fresh lifestyle that is wilder and more arrogant. East Europe disturbs the life of the West, which is comfortable and problem-free. East Europe is inconvenient and a mystery to the West European man. It seems that we can take these two protagonists as the symbols in this novel.

In speaking of Baltic identity, we cannot ignore history. The latter is one of the main constituents of that identity, and the memory bank of all three components of the literary communicative process. I am not referring to the history of wars and deportations, but to the history of a little town by the river, with streets full of holes, where there is a little flat with wood heat, a pile of kindling, and a foul-smelling outhouse. This is a history without comforts, but it is in some ways more free than a welfare society. Again, the boundaries between freedom and prison are ambivalent and delicate. This is also a story of dreams and reality: what is beautiful in our dreams is not beautiful once we have attained it.

This history also includes a grandmother who is a figure from the past, connecting the world of the deceased with that of the living. The motifs of death and the past are very important if we speak of the Baltic identity: our history has been complicated and tragic, and it still obsesses us.

Tode's novel also revolves around the boundaries between sexuality and gender. In the Estonian language the grammatical gender is absent, and the writer plays with that linguistic fact. The ambivalence of gender in his novel also represents a new experience and meaning in Baltic countries. The young homosexual man who has escaped from East Europe seems to belong to West Europe because homosexuality was a crime in Soviet times, and the phenomenon itself was downplayed and kept secret. In Paris, however, gender is not the problem. Rather, the problem is the freedom that so strongly attracts Franz. Still, the boundaries between gender and sexuality are ambiguous in this novel. The homosexual man does not want to accept the stereotypes of gender, he wants to be gender-less, androgynous, or just angelic (Hennoste 1998: 70). The sexual status of this young man is truly ambivalent: he stands on the border.

The same ambivalence also appears concerning the nation of the young man. We may suppose that he is Estonian, but actually the country is not mentioned and his nation is not important to him. It seems that this will be our new identity in the European context: it will be absolutely new and will attempt to overcome national borders and frames.

His East European past constantly manipulates the young man – it is not possible to break free of history and the past, and perhaps not from gender either. Maybe such freedom is impossible, according to the new rules, if you have a tragic history and tragic memories.

Nora Ikstena's book, showing aspects of the traditional novel, consists of a series of short stories. All the travelling in this novel takes place in the memories of the storytellers; the real setting, where a funeral is taking place, is very small and quiet. It is the framed space of a room in which different trips into the past take place. And through the past, Eleonora's life will be celebrated.

The semantic and creative potential is very great in this novel, because the author plays on the border between understanding and misunderstanding. The situation is very mystical and mysterious, and the seven people invited to the funeral are very odd. The text is full of quotations from the Bible. The atmosphere is solemn and horrible at the same time, similar to the biblical situation imposed by the New Testament. As we know, Estonians and Latvians have read Ikstena's novel differently. Estonians interpret the story more optimistically, as a celebration of life. Latvians see in it more of tragic history and past.

Perhaps West European readers will add new meanings to these texts if they interpret them through their own memory and historical experience. Both novels indicate that the Baltic identity will undergo change, perhaps fusing together into a European identity in future. As for now, it seems the essential and most important question in contemporary Baltic literature is, Who are we?

Effets de sens qu'un objet singulier a d'un point de vue sémiotique sur la réalisation d'un film dit de genre historique

Introduction: Semiose entre objet filmé et objet filmant

Partant du postulat qu'un film, du point de vue des pratiques, peut être interprété aussi comme un acte performatif entre celui qui filme et l'objet filmé, cette recherche accomplit un travail sur l'analyse de la construction d'une matière non-langagière (l'image mentale d'un plan) constituée par tous les éléments variables qu'un réalisateur doit maîtriser pendant le tournage.

“C'est par elle (l'image) qu'est retenue une sensation de l'infini exprimée à travers des limites: le spirituel dans le matériel, l'immensité dans les dimensions d'un cadre” (Tarnovski 1989: 47). Les plans, dans un film, ces “énoncés et narrations ne sont pas une donnée apparente, mais une conséquence qui découle de cette réaction” (Deleuze 1983: 45), dans notre cas, il s'agit d'énoncés spécifiquement cinématographiques appartenant à un système de production, fruit d'une intelligence collective (équipe image, équipe artistique, équipe machiniste, etc.). Comme Andrei Tarkovski lui-même le déclare: “la création artistique n'est pas découverte mais construction” (Tarkovski 1989: 47), le fait de nous approcher d'une oeuvre filmique à travers ces pratiques, qui témoignent de la préparation sur la performance, permet de percevoir la réalité cinématographique sur son plan d'immanence.

1. *Pour une approche sémiotique de la prise de vue sur la "scène du cinéma"*

Ce travail s'insère au cœur des études sur l'iconicité textuelle, ici est fait "un usage assez extensif du terme 'image'" (Bordon 1998) et tant qu'il est utilisé, textuellement parlant, les images auront de multiples fins et se révèlent être de précieux indices pour remonter aux structures de signification, au discours derrière "l'iconicité des événements" (Cerami 1992: 48) qui préside à la construction d'une image film. Puisque nous devons nous confronter avec une œuvre cinématographique, ce sont les photogrammes en tant que "traits", qui nous permettent de remonter au film comme "unité de ces traits au niveau supérieur", il faudra ainsi articuler la question des différentes strates énonciatrices "correspondant aux divers masques dont le spectateur revêt l'émetteur du film". Dans cette perspective, François Jost (1991: 11) distingue: (i) l'*énonciation cinématographique* produite par un supposé-réalisateur qui parle cinéma, avec un style propre, une "manière"; (ii) l'*énonciation narrative* renvoyée à un narrateur qui raconte les événements; (iii) l'*énonciation filmique* ancrée dans un sujet empirique (caméraman, preneur de son, etc.). Si la "scène du tournage" est l'espace englobant où prennent forme ces "images particulières", où l'on perçoit la synthèse de ces trois moments, alors, à plus forte raison, la caméra comme "machine énonciative" sera le dispositif à l'intérieur duquel la réalité filmique nous apparaît, car, comme l'écrit Merleau-Ponty non seulement "toute pensée ne se détache pas tout à fait d'un support" (Merleau-Ponty 1964: 91), mais aussi "cette procession de ce qui est sur ce qu'on voit et fait voir, de ce qu'on voit et fait voir sur ce qui est, c'est la vision même" (ibid.: 87). L'intuition générique et infinie de l'espace des phénomènes naturels à cause de la limite spatiale donnée par la géométrie du cadrage se dévoile à l'observateur comme un ensemble d'objets-signes qui attendent d'être iconisés à l'intérieur du plan énoncé, unité minimale de sens par rapport à la scène d'énonciation mise en place pour tourner. A ce propos, les recherches de Cerani sur "comment le sens vient aux images" comme celles de Bordon (1994: 33). "sur la limite d'une grandeur extensive" et sur les "multiples interprétations iconiques" des images sont centrales pour réfléchir sur la manière de lire les isotopies sous-jacentes aux intentions picturales et cinématographiques où "l'expression est ce qui est perçu directement tout en

étant thématique, tandis que le contenu est thématique, alors même qu’il est donné d’une manière indirecte” (Ceriami 1992: 46).

2. *Pour une logique interprétative de la prise de vue:*
Marie-Antoinette de Sofia Coppola

Étant intéressée d’un point de vue sémiotique à l’objet caméra et aux différentes inventions techniques utilisées dans les scénarisations d’un film. Dans ce cadre, le concept de scénarisation désigne l’organisation des représentations, toujours déterminée par des conceptions philosophiques implicites (conception du monde, de la connaissance, de la narration, du spectateur; Faroult 2003: 27). Ce texte met alors en lumière dans quelle mesure une étude sur l’objet caméra en tant que “machine énonciative” peut contribuer à reconnaître: a) l’influence que la technique a sur la réalisation de la prise de vue lors du tournage d’un film comme celui de Sofia Coppola, *Marie-Antoinette* (2006), d’après le livre de ce titre d’Antonia Fraser, qui, malgré son thème, est tout autre chose qu’un film historique ou d’époque; b) dans quelle mesure on peut expliquer la présence de la caméra film Aäton 35 III mm dans un film historique qui scénarise “le passage à l’âge adulte” d’un personnage public. En effet, un directeur de la photographie, initié à cette caméra, n’ignore pas son “utilisation moyenne”, c’est-à-dire l’utilisation de type documentaire pratiqué sur les tournages.

1. *Photogramme du plan du film Marie-Antoinette de Sofia Coppola, (image tournée en pellicule Kodak). Le plan: l’énoncé de la prise.*

2. *Photo de tournage. À l’intérieur de la scène énonçant la caméra Aäton 35 III, utilisée par la seconde équipe image lors de les prises en configurations particulières.*

La façon de filmer laisse *des traces* de la présence réelle du corps-caméra sur la situation filmée. Par rapport à l’Arricam, la caméra silencieuse, utilisée par la première équipe image sur le tournage, l’Aäton 35 III, utilisée

par la seconde équipe image, historiquement elle se distingue de la production de Caméras allemande, par trois principes que l'ingénieur Jean-Pierre Beauviala lui-même, définit fondateurs pour comprendre la morphogénèse de cette "invention technique" face à la culture cinématographique :

Premièrement, la plus haute qualité d'image possible. Deuxièmement, avec un magasin instantané lorsqu'on doit recharger la caméra on ne coupe pas la relation qui s'est créée entre la personne qui filme et les personnes qu'elle est en train de filmer. Troisièmement, ce qui est fondamental et qui a été la caractéristique même de l'Aâton c'est que c'est une caméra qui – à l'épaule – se met très en arrière sur l'épaule du cadreur (c'est la première d'ailleurs à être ainsi). C'était la première caméra à vraiment faire corps – profondément – avec le caméraman et qui ne s'interposait pas entre lui et les gens qu'il filmait. (Beauviala 2005: 61–62)

Il suffit de réfléchir sur certains éléments signifiants de l'image dans ce film, sur les aspects techniques intrinsèques à l'utilisation de cette caméra lorsqu'elle décrit à la manière du documentaire, une sorte de "cahier secret et ludique" des moments intimes de la vie de Marie-Antoinette, pour remarquer ainsi, le saut de "régime sémantique" auquel le film parvient. En effet, la mise en scène préfère un registre sémiotique d'actualité de type psychologique et contemplatif à une approche historique "tout court".

La façon de tourner certaines configurations comme les intérieurs carrosse, la promenade en bateau sur le lac, les extérieurs jours dans le jardin privé du Petit Trianon, les extérieurs nuit, le bal masqué, la fête d'anniversaire à Versailles, montrent comment les modalités du "dire" et du "faire" au cinéma sont strictement liées à l'outil avec lequel on capte cette réalité. Cependant, l'étude du dispositif cinématographique nous révèle que les appareils *transforment* la réalité plus qu'ils ne la restituent, car chaque choix technique est un choix de représentation, les caméras mettent en jeu un code perspectif qui n'est donc pas neutre. Il ne s'agit pas ici d'affirmer que, tout choix de mise en scène est soumis aux appareillages techniques utilisés dans un film, il est plutôt question d'étudier la restitution "transparente" des effets de sens que ce corps *filmant* met en jeu dans le processus de composition du plan. Le corps filmant ne doit donc pas être considéré uniquement comme un "appareillage filmique" ou d'enregistrement par rapport à l'objet filmé. Bien au contraire, il doit nous apparaître comme un macro-actant complexe qui résulte tantôt de la somme d'un corps d'éléments: spatiaux-temporels-actoriels qui sont hors et dans le cadre, tantôt

de “l’image mentale” du plan composée par le réalisateur, et à laquelle le directeur de la photographie fait toujours référence au moment de la mise en place de la caméra sur le lieu de tournage.

3. *La caméra Aäton 35 III, portée à l'épaule dans le décor très affolé du bal masqué, grâce à sa légèreté favorise ce genre de configuration du plan en mouvement. La caméra recule tandis que Marie-Antoinette avance dans la salle (photogramme tiré du making-off du film).*

4. *Photogramme du plan du film tiré de la séquence d'anniversaire de Marie-Antoinette. Les prises de vues privilégient une relation d'intimité avec les personnages (Scène énoncée).*

5. *Scène énonçant la prise de vue du plan rapproché sur les deux actrices. Remarquons les deux caméras : la Aäton sur l'épaule de l'opérateur de bout en train de chuter des plans et l'Arricam sur l'épaule du cadreur assis.*

Les “situations filmées” citées peu avant, “mettent en image” le monde et le temps intériorisés par la reine. En ce qui concerne la praxis de tournage, les longues séquences en extérieur, les scènes de foule, ainsi que les poursuites ou les plans rapprochés en configuration épaule et steady-cam sur Marie-Antoinette témoignent d’un style de tournage qui connote la façon de capter la réalité propre à un “style” Aäton. Ainsi s’imposent deux esthétiques de tournage pour deux caméras différentes. L’Arricam pour des configurations plus installées et construites à l’avance, les cas de figure les plus communs voient cette caméra installée sur une autre machine. Voici certains exemples: I) le réveil de la future reine ; II) la descente des escaliers de Marie-Antoinette en compagnie de la comtesse Polignac au bal masqué; III) la scène imaginaire où Marie-Antoinette prononce la mythique phrase “qu’ils mangent la brioche”.

En revanche, la Aäton se prête davantage à être utilisée dans des configurations difficiles à contrôler, elle laisse plus d’espace à l’improvisation, ses chorégraphies sont à l’unisson avec des mouvements de Marie-Antoinette dans le but “d’exprimer visuellement la psychologie du personnage” (cité par Coppola 2006: 9) combattu entre ces deux mondes.

6. Scène énonçant la conception de la prise de la descente par les escaliers de Marie-Antoinette. La caméra Arricam est posée sur des rails. Le machiniste donne la vitesse au mouvement du travelling en arrière.

7. Scène énonçant l'installation d'un plan toujours tourné en Arricam. (Photogrammes tirés du *Making-off*).

8. Photogramme du plan du film illustrant à la manière d'un clip la scène imaginaire.

9. Configuration de la prise de vue: lourde installation de la caméra Arricam nécessaire pour cadrer ce plan. (Photo tirée du *Making-off*).

Pour mettre en évidence l'asymétrie entre ces deux univers mis en scène, nous pouvons dire que: si d'un côté il y a la cour, fondée sur la tradition, les règles, une scène en quelque sorte, sur laquelle il faut "paraître" et où prédominent des "images citations" remplies d'une iconographie historique, de l'autre "il y a son monde à elle, privé, qu'elle peut transformer, de façon à ce qu'il lui ressemble plus", et qui iconisent l'axe de regard de Marie-Antoinette contrastant avec les regards de la cour qui sont pointés sur elle.

10 – 11 – 12. Plans vraisemblablement tournés en très longue focale (135 mm) qui pour leur conception du cadre iconisent toute une esthétique iconographique de tableaux historiques.

La réalisatrice, tente de traduire en langage cinématographique l'isotopie de la "transition" existentielle vécue par la jeune héroïne au moment où elle devient une femme mûre. En cherchant à rester fidèle à la construction passionnelle et cognitive de Marie-Antoinette, deux moments narratifs semblent émerger: a) le dépassement de la frontière culturelle autrichienne

(pays natal) pour aller vers la culture française (état contractuel) ; b) son accession au trône, où s'exaspère le conflit existant entre le rôle social acquis et un "moi – intérieur" encore inexprimé. Tous deux sont fondamentaux pour pénétrer l'univers iconique du film, rempli de plans de façon inhabituelle, que nous pourrions baptiser des "icônes de la vie post-moderne".

13 – 14 – 15. Images-icônes qui renvoient à l'interprétation moderne de la vie de Marie-Antoinette proposée par la réalisatrice.

La représentation du véridique à l'écran conduit à nous pencher seulement en apparence sur le genre historique, stade désormais dépassé cinématographiquement (La reine Margot, les films de cape et d'épée, Pirates des Caraïbes) de par le langage utilisé et la liberté prise pour filmer. Toutefois, en ce qui concerne la représentation à l'écran de la reine Marie-Antoinette, un « imaginaire visuel d'étiquette » a toujours été respecté pour ce qui est des longs-métrages ayant traité certains moments de sa biographie. Voici quelques cas de personnages: la Marie-Antoinette de la *Marseillaise* (1937) réalisé par Jean Renoir, la *Marie-Antoinette* réalisée par W. S. Van Dyke (1938), la Marie-Antoinette de *L'affaire du collier de la reine* (1946) de Marcel l'Herbier, celle de Sacha Guitry dans le film *Si Versailles m'était conté* (1953), et enfin la *Marie Antoinette reine de France* (1956) réalisé par Jean Delannoy, pour ne pas parler de la grotesque et lamentable *Autrichienne* (1990) de Granier-Deferre. Dans le film de Sofia Coppola, sur le plan expressif, les décors et les costumes conduisent aussi à un type de cinéma véridique. Pourtant, ce n'est que la partie visible de l'iceberg, ce propos est en effet trahi et servira uniquement comme prétexte pendant le film. La question est donc de poser le problème à l'envers. Il s'agit plutôt d'un pacte que la réalisatrice signe avec le spectateur lorsque sa caméra devient l'outil pour "anecdotiser" délibérément son histoire et l'Histoire de France à travers un destin brisé. L'illusion des situations est dépassée dès que la réalisatrice peut sortir de l'Histoire pur pour raccrocher son récit au monde actuel, car tout le langage de la caméra est en symbiose avec la comédienne qui trahit ce propos.

3. *Expérience du monde cinématographique*

Si "l'image est une existence située à mi-chemin entre la chose et la représentation" (Bergson 1939: 17), alors, cette relation fonctionnelle valide la proposition que ce travail tente de mettre à jour. Essayons de la reformuler en l'appliquant au champ des pratiques sémiotiques ouvertes aux formes de représentation cinématographique se souciant tantôt de la nature polysémique de l'«image» tantôt de la nature apparemment insaisissable des "choses" et des "objets" qui contribuent à sa réussite. Au moment de la réalisation d'un film se mêlent étroitement questionnements techniques/scientifiques et questionnements esthétiques. La spécialité du matériel utilisé influe sur les praxis de tournage et sur la réalisation d'un film contribuant à renverser les imaginaires visuels préconçus.

Au niveau de l'énonciation filmique, le directeur de la photo Lance Acord, décrit la performance de la caméra face à une scène toute particulière:

As the young queen matures, most of the film's exteriors are set at Le Petit Trianon. The camerawork de la photographie, Lance Acord, décrit la performance de la caméra face à une scène toute in these sequences is more impressionistic and personal, with looser, handheld shots contrasting with the straightforward and often locked-off approach to the interiors. (Acord 2006: 71)

La réalisatrice elle-même raconte à ce propos (entretiens avec la réalisatrice 2006: 10, 27):

J'ai une idée de ce que va faire la caméra, et j'en discute avec les techniciens, ... ce n'est que sur le plateau qu'on peut voir la façon la plus efficace de filmer une scène. Je crois que je sais à peu près ce que chaque scène doit exprimer, et que chaque plan s'y intègre, en conformité avec cette idée.

Elle déclare avoir: "une intuition assez précise de la manière dont il faut filmer: ... pas de grands plans-tableaux comme souvent dans les films historiques, pas de mouvements caméra tape-à-l'œil".

C'est pourquoi, au niveau de l'énonciation cinématographique, les prises de vue relativement longues, les plans rapprochés sur la peau, les visages, les acteurs, privilégient surtout cette "relation d'intimité" envers les personnages où culmine l'entière construction poétique de l'auteur. Mettre en images l'espace/temps de la *vision*, afin de lui donner la forme et

le contenu esthétique envisagé, veut dire tenir compte de tous les aspects signifiants et variables censés construire le sens que préside l'énonciation cinématographique. Si l'œuvre filmique est une "opération syncrétique plurisémiotique" (Jost 1991: 15), alors la conception de la prise de vue doit être pensée en sémiose avec la création de l'image. L'image moderne, que certaines séquences tournées avec la caméra Aäton donnent de Marie-Antoinette, la saisissent sur le point de courir librement dans le jardin du Petit Trianon, son espace réservé, lieu d'évasion de la cour. De cette réalité, il ne reste qu'un puzzle de sensations, un temps subjectif vécu en synesthésie avec les éléments de la nature, des détails et des nuances éphémères.

16 – 17 – 18 – 19. Pour le style de prise de vues, ces plans tournés en extérieur témoignent d'un discours de type documentaire. La caméra, libérée de tout empêchement spatial, chorégraphie le mouvement imprévu en révélant des fragments d'une réalité hors cadre en complète sémiose avec la nature et avec le texte de Diderot que Marie-Antoinette lit.

D'un point de vue sémiotique, ces plans-énoncés donnent forme à une énonciation narrative où monde extérieur et intérieur de l'héroïne coïncident. Dans cette spirale performante, l'esthétique de l'image et la manipulation de la caméra sont des éléments de continuité dans l'inter-espace entre celui qui filme et la situation filmée. C'est pourquoi nous parlons d'un cinéma quadridimensionnel, car il tient compte de l'improvisation, du facteur humain, "variable collective" de celui qui manipule depuis l'en-deça et de ce qui est manipulé dans l'au-delà, face à la caméra.

4. "Scène énoncant" et "scène énoncée"

Dans sa "matérialité spatio-temporelle", la prise de vue est une "construction dynamique en acte ... qui comprend tout ce qui est présent dans l'image, décors, personnages, accessoires" (Deleuze 1983: 23). C'est donc pendant la prise de vue, non avant en phase de découpage ni ensuite pendant le montage, que le rôle performatif de l'outil entre en sémiose avec la création de l'image. Au moment de filmer la promenade en bateau, la

“caméra embarquée” est la solution qui se prête le mieux à recréer cette atmosphère d'intimité qui unit la nature extérieure des décors au sentiment intérieur de la protagoniste: l'isotopie *aquatique* exprime bien le “flottement” mélancolique de la reine sur l'époque qu'elle traverse et sur son repli vers la nature. La lecture du texte de Rousseau souligne ce comportement et explicite la métaphore naturaliste de la scène: “Si l'homme a été corrompu par la civilisation artificielle, quel est l'état de nature? L'état de nature auquel il a été soustrait. Imaginons-le vagant çà et là dans la forêt sans industrie sans discours et sans foyer.”

20. Photogramme du plan tourné avec une caméra Aäton 35 III.

21. Scène énonçant la prise de vue du plan. Configuration caméra embarquée (photogramme tiré du Making-off du film).

Essayons d'analyser la scène filmique de ce moment du tournage, que nous segmentons en scène énoncée (le plan tourné) et en scène énonçant (tout ceci concerne l'appareillage sans lequel le plan manquerait de support physique). Dans une configuration circonstancielle de ce type à contre-jour et en pleine nature, la Aäton 35 III est pratique pour obtenir l'éloquence de l'image recherchée, l'emboîtement des accessoires sur le corps caméra est minime, l'outillage léger. Notre approche étant de type morphologique, elle permet de reconnaître les parties reliées au corps-caméra où alternent, pendant les différentes phases, les accessoires (Bordron 1991: 22, fn. 21). Une séquence de ce type requiert une configuration de tournage munie des accessoires essentiels, en observant la scène énonçant, la distance entre l'objet filmant et l'objet filmé (x) est de quelques mètres. Les dimensions du décor (y) par rapport aux proportions du bateau où Marie-Antoinette est étendue (x) n'apparaissent pas trop réduites, l'objectif utilisé est donc une focale moyenne ou légèrement longue entre un 50 mm ou un 75 mm.

Il en résulte que la caméra n'est alourdie ni par l'interface objet de l'objectif ni par le pare-soleil, qui introduit des fonctions auxiliaires au moment de "filmer" la scène. En outre, les batteries de la Aäton étant déjà incorporées, elles n'entravent pas les techniciens pendant la prise de vue. Une main assure la stabilité du bateau, tandis que les sacs servent à stabiliser la position du chef opérateur et à permettre d'amortir les secousses maritimes qui seraient agrandies dans le cadre. À droite du cadreur, le premier assistant caméra, sujet empirique responsable de la bonne mise au point du plan, interagit uniquement avec la monture de l'objectif en mesurant à l'oeil la distance entre le foyer de la caméra et l'objet filmé. L'équipe-son accompagne l'équipe image sur la barque. La situation inter-énonciationnelle tient ensemble objets et sujets en-deça de la caméra avec les objets et sujets au-delà de la caméra, comme deux mondes tenus ensemble par leur force d'attraction. Il ne s'agit pas de considérer l'image comme un langage autonome, dans la description de la réalisation de la prise de vue sur le bateau, les contraintes techniques influent sur la manière de composer le cadre et simultanément elles suggèrent les solutions de mise en scène pour des configurations particulières.

5. *Conclusion*

L'univers visuel du réalisateur documente et/ou reconstruit la réalité à partir du support choisi pour s'exprimer. En effet, si la toile permet au peintre de "penser en peinture" la caméra est alors l'outil qui permet au réalisateur de "penser cinématographiquement". La durée de la prise détermine les modes de perception d'un plan cadré. L'étendue de la prise de vue par sa forme temporelle est susceptible de servir le film en vue de la signification à créer.

Mais l'image d'un film est aussi un plan énoncé géométriquement et physiquement qui, excluant une portion du monde, donne un sens au fragment de la vision sélectionnée. Le corps filmant de la scène, existe uniquement "au-delà" du cadre, ancré dans une réalité empirique sur un autre niveau de pertinence que l'organisation visuelle du plan, même si c'est justement pour sa réalisation que le corps filmant modèle la réalité et la "met en image". Au moment de la réception d'un film, de la présence de la caméra, il ne reste que le mouvement iconisé d'un style d'écriture et de sensibilité filmique. Entre l'image de l'écran (le plan énoncé du

film) et l'image performante élaborée au cours de la prise de vue (la scène énonçant) se réalise un moment important du sens. Mon travail a mis en évidence, à partir des analyses des effets de réalisation de la prise de vue, combien la frontière entre le cinéma de fiction et le cinéma documentaire est peu marquée dans le cinéma contemporain, cette brèche est de plus en plus invisible. Avec l'arrivée du cinéma léger et du son synchrone, le documentaire est entré dans la fiction, un nouveau canon s'est établi, celui de la fiction documentée. Actuellement, pour citer Jean Luis Comolli (2007: 119), "il me semble que l'essentiel du cinéma se joue dans cet entre-deux de la fiction et du documentaire".

Susana Moreno Fernández

Misunderstandings in ethnomusicological research

Reflections on fieldwork in Cantabria

1. Ethnomusicology and communication

The process of communication can be approached from different disciplinary perspectives. Specialists in the study of communications point out that

the great strength of communications as a field of study is that it is an *interdisciplinary* space where a range of existing academic disciplines meet, bringing their own particular questions, concerns and intellectual traditions with them ... to puzzle out how best to make sense of the complex connections between communications systems and the organisation of contemporary social and cultural life. (Deacon et al. 1999: 3)

As an ethnomusicologist, one of my main concerns is the understanding of the ways in which communication takes place in cultural systems and everyday life. I am particularly interested in communicative processes that involve cultural practices, knowledge, values and meanings that are transmitted through verbal discourse and through expressive culture in which music plays an important role.

Ethnomusicology can be defined as the “study of social and cultural aspects of music and dance in local and global contexts. Specialists are trained primarily in anthropology and in music, but the multidisciplinary nature of the subject leads to different interpretations” (Pegg et al. 2001: 367). Among the main concerns of the discipline are the relationships between music and culture, musical processes as symbolic and signifying forms of expression, and the ways in which music contributes to the construction of society and history.

The main methodological strategy of Ethnomusicology is field research which involves human interaction, and therefore different kinds of communication between the researcher and the community studied. Ethnomusicological interest in communicative processes has increased since the 1980s, especially as a result of the influence of post-modern thought with its concern about discourse on social phenomena. The “crisis in representation” and the rise of “reflexive ethnomusicology” stimulated scholars to explain how they are epistemologically positioned and reflect upon their relationship with the culture analysed, given the importance of the researcher’s subjectivity in the construction of the research object and in the production of ethnographic discourse (see, e.g., Barz et al. 1997; Baumann 1992; Keil and Feld 1994).

The analysis of communicative processes in my fieldwork experience draws upon current theoretical and methodological perspectives in ethnomusicology. As Coupland et al. (1991: 16) point out: “... the goals of academic inquiry itself predispose characteristic lines of interpretation ... particular traditions and disciplines may themselves contribute a dimension of miscommunication ... and *the same* communicative acts are open to interpretation in highly *diverse ways*.” The concept of miscommunication is problematic, and “... has usually been applied, very loosely, to any sort of problem that might arise interactionally, and typically to local processes of misunderstanding ...” (ibid.: 1–2). However, in their particular review of that concept from a more general perspective oriented towards the study of language, those authors opine that an “important starting point is the observation that language use and communication are in fact pervasively and even intrinsically flawed, partial, and problematic. To this extent, communication is itself miscommunicative ...” (ibid.: 3).

In this paper I use the concept of *misunderstanding* to refer to “... a retrospective recognition that one person’s intentions have not been ‘read’ accurately by another participant, and that future actions or opinions of the participant will be predicated on the inaccurate reading ...” (Banks et al. 1991: 104).¹

2. *Fieldwork in Cantabria: (Mis)understandings*

In preparing my doctoral dissertation, I carried out in fieldwork in Cantabria (Fig. 1), a region on the north coast of Spain, from 2000 to 2006 (Moreno Fernández 2006).

Figura 1. The Cantabria region of Spain.

My focus was on the revival movement of the musical practice of the *rabel*, a bowed lute, traditionally used to accompany songs, ballads and dances (Fig. 2).

Figure 2. Rabelista Antonio Morante playing the rabel in the Certamen de rabel, “Valle de Polaciones” (Pejanda, Cantabria, 2004).

My fieldwork involved observation and ethnographic interviews with different generations of *rabel* players (*rabelistas*) and promoters, as well as my own participation in local events as a *rabelista*.

The issue of misunderstanding was very relevant to my research. I was born and raised in the region that I studied. Several factors such as my social background, age and gender conditioned my field research. In reflecting upon my experience, I shall revise the concept of misunderstanding to extend beyond its common connotation as an “error”, “problem”, or communicative “deficiency” which undermines the development of a research project. Here I would second Eero Tarasti’s view:

... paradoxically, it is in misunderstanding where a possibility of understanding the other lies ...because misunderstanding often develops into a conflict, it makes the latent situation manifest and thus enables one to correct the misunderstanding. It opens the possibility for dialogue, since ego has to listen to alter-ego...” (2003: 6).

Clarifying misunderstandings in field research can contribute to the understanding of basic issues, thus providing new theoretical and methodological perspectives. As some authorities observe, there is a need “... to rescue ‘miscommunication’ from its theoretical and empirical exile, and explore its rich explanatory potential in very diverse contexts” (Coupland et al. 1991: 1–2). It is likely that several of the problems I faced during my field research are common in the research experience of other ethnomusicologists and scholars in related disciplines.

In my research experience, some misunderstandings were inevitable, partly because of the attitudes of my interlocutors, who were themselves involved in the revival process. As is common in such situations, revivalists defended contradictory and conflicting positions and aims regarding the contemporary musical practice of the *rabel* in Cantabria. For that reason, they would sometimes refuse to communicate among themselves, or with me, thinking that I might reveal information which they did not want to share. I will now turn to some misunderstandings that occurred during my fieldwork and evaluate their possible causes (see also, Coupland et al. 1991: 9).

First of all came “problems” in conversation. Though I share the same language with the community I was studying, that did not always assure successful communication. I did not share the same knowledge or cultural,

social or historical referents with my interlocutors, and was often unaware of the meanings of the messages transmitted by them. For example, when I interviewed elderly *rabelistas* who were active during Franco's dictatorship, they would talk about their repertoire including song texts with veiled political meanings. Not having shared their political experience, I did not initially realise that my interlocutors had been politically engaged and that these songs communicated their opposition to the regime. This is an example of "deceptively adequate talk" (Coupland et al. 1991: 6), what Habermas refers to as "pseudo-communication":

On the other hand, some collaborators in Cantabria, who were themselves collecting local repertoires, felt that I was intruding on their territory. This fact, and our different ages, sociocultural and educational backgrounds sometimes had negative consequences for my interactions with them. This was especially true in the case of elderly interlocutors with a low level of literacy, who came from remote rural areas of the region and used local accents and vocabulary which sometimes made it difficult for me to understand their discourse. This experience resonates with the observation that "... some semantic 'slippage' is common in the management of meaning transfer..." (Coupland et al. 1991: 5), which can in turn block the process of understanding.

In fact, interviews as a basic methodological strategy sometimes proved problematic, mainly because most of my collaborators were not used to being interviewed. The musical practices of the *rabel* in Cantabria had not been studied in depth before, hence locals would occasionally feel intimidated by the expectations placed on them as interlocutors.

Miscommunication became more evident as regards musical concepts, such as style and playing techniques. In fact, several ethnomusicologists have pointed out the difficulty of using language in communicating about music (e.g., Seeger 1962; Merriam 1964). Musical lore concerning the *rabel* is mainly transmitted mainly orally among different generations of players, all of whom rely on various musical notions of repertoires and playing techniques. Hence, unlike in western music theory, diverse concepts and terminologies come into play as regards the "same" musical phenomena.

The exotic imaginary that the revival movement constructed of the *rabel* as a medieval and bucolic instrument also had implications in my fieldwork. In my interlocutors' discourse, most of them revivalists, there were a number of recurrent ideas about the origin and musical practices

of the *rabel* in Cantabria; these were used to legitimize and add value to the musical practice, and to reinforce the musicians' identity as performers and promoters of the instrument. For example, they attributed to the *rabel* a remote Arab origin and, in the early twentieth century, associated the instrument with shepherds and with picaresque (comic, ironic and satiric) lyrics.

However, these characteristics are not sustained by historical data. The *rabel* combines characteristics of medieval chordophones with the *rabâb*; and the *rabeles* played nowadays in Cantabria have little to do morphologically with medieval instruments of the same family. The association of the instrument with Cantabrian shepherds cannot be verified ethnographically; a romantic construction, both the "pastoral" and the "picaresque" are only part of a large corpus that deals with many themes such as love, daily life, historical events and myths, or songs in praise of the region.

Many of my interlocutors had their own revivalist agendas, which were reflected in their discourse. In response to some of my questions, they selected the information transmitted, often omitting important aspects of their experience in the revivalist movement, or even offering slanted answers.

Following three years of fieldwork, I began to share the results of my analysis with my main interlocutors, both through discussion and by showing them parts of my written work. In this I employed the strategy of *dialogic editing* (Feld 1994: 240), which involves negotiations and interactions between the researcher and the community studied. I realised that I had occasionally misunderstood (misinterpreted) some of the data. For example, I had first classified the *rabelistas* – taking into account their relationship with different stages of the revival process – as *antiguos*, *nuevas generaciones*, and *de transición*. As a result of discussions with the revivalists, however, it became clear that the movement was much too fluid to be captured in such terms, its protagonists moving across generations and approaches to *rabel* practices.

3. Concluding remarks

In my field research in Cantabria, my attempt to clarify misunderstandings in the communicative process with my interlocutors enabled me to understand some of the main issues that characterize the revival movement of

the *rabel*. In addition, using dialogic editing as a methodological strategy allowed a level of communication which was not possible through verbal discourse alone. Finally, by adopting a reflexive approach, I was able to gain a fuller perspective on (mis)understandings in my overall field research.

Notes

1. Banks et al. (1991) refer to this concept as *miscommunication*: “Popular synonyms for miscommunication include such terms as *misunderstanding ... error ... trouble ... problem ...*” (1991: 104).
2. As others have noted: “... the very sharing of a common language code is itself deceptive, since it falsely suggests a common ground and a ‘naturalness’ of communication that binds communicators to their actual misalignments ...” (Coupland et al. 1991: 7).

Audrey Moutat

Vertus et limites de la mécompréhension dans le processus d'interprétation des commentaires œnologiques

Introduction

La mécompréhension trouve sa rigueur herméneutique avec Schleiermacher selon lequel elle doit être méthodologiquement postulée pour que le sujet interprétant puisse procéder à une reconstruction complète du sens du texte. En faisant abstraction de toute compréhension immédiate, elle impose une procédure interprétative rigoureuse du contenu textuel et conditionne en permanence les parcours interprétatifs des lecteurs. Dans la mesure où comprendre un texte n'est pas seulement se rapporter à un savoir objectif mais à un "autre" qui l'a énoncé, la mécompréhension relève tant du langage que de la torsion que cet autre lui a imprimé. Cependant, on ne saurait limiter la compréhension à un simple usage de la langue sans tenir compte de ce à quoi elle réfère. En l'occurrence, dans le cas du commentaire de dégustation, on peut ajouter que la mécompréhension résulte en partie du genre textuel duquel il relève et de la nature de son référent: le commentaire de dégustation ne décrit pas un objet concret et palpable mais rend plutôt compte d'un rapport perceptif entre un sujet et un objet (comme la critique à l'égard de la musique). La description porte sur les effets produits par le vin sur le corps du sujet percevant, ainsi que sur les rapports qu'ils entretiennent lors du procès de dégustation. Il s'agit là de rapports de forces avec, d'une part, un objet qui se laisse appréhender plus ou moins facilement, et de l'autre, un sujet qui veut en saisir un maximum de propriétés. Par conséquent, le commentaire de dégustation, avec son vocabulaire imagé et les procédures discursives qu'il préconise, se présente comme le lieu d'expression de cette tension perceptive entre source

et cible; ce qui n'est pas sans conséquence sur la compréhension souvent aléatoire des lecteurs.

1. *Mécompréhension et commentaires de dégustation*

1.1. Rôle de la mécompréhension dans le parcours interprétatif

Bien que le commentaire de dégustation dispose de son propre lexique renvoyant aux techniques de viticulture ou à des impressions sensorielles mesurables, il a souvent recourt à des termes plus usités dont l'emploi dans le domaine de la dégustation perturbe le sujet interprétant non averti: "La robe est profonde, brillante et nette. Au nez comme en bouche, il s'exprime dans un style flatteur, velouté, déjà ouvert et néanmoins construit pour tenir, comme le rappelle la finale charpentée, sur les amers de jeunesse du mourvèdre (70%)" (*La Revue du vin de France* 2004: 72)/

On constate ici que ce sont souvent les mots, en apparence les plus simples, qui sont à l'origine de la mécompréhension du commentaire. Celle-ci se traduit par une incomplétude interprétative, générée par une rupture isotopique liée à la coexistence de deux isotopies génériques:

a) Première isotopie mésogénérique: le //vin//:

Elle est définie par la récurrence de sémèmes appartenant au domaine du //vin// et s'organise selon trois taxèmes correspondant aux phases de la pratique de dégustation:

- /propriétés visuelles: "robe", "profonde", "brillante", "nette";
- /propriétés olfactives/: "nez", "ouvert";
- /impressions gustatives/: "bouche", "velouté", "finale", "charpentée", "amers".

b) Seconde isotopie mésogénérique: //bâtiment//

La seconde isotopie se caractérise par la récurrence de sémèmes relevant du domaine du //bâtiment//: "profonde" (profondeur des pièces, de la structure), "style" (architectural), "ouvert" (espace procuré par les fenêtres et les portes); "construit", "tenir" (à propos des murs soutenant la structure d'ensemble); "charpentée".

c) Détails du parcours interprétatif:

La première isotopie mésogénérique est celle qui permet de déterminer l'impression référentielle; cette reconstruction du *fond isotopique* étant renforcée par le genre textuel auquel le commentaire de dégustation appar-

tient (scansion du commentaire en fonction des phases de dégustation) mais également par le contexte de production de l'énoncé, notamment son entour textuel (ce texte intègre un magazine dédié au vin et compile divers commentaires de dégustation). La seconde isotopie se présente alors comme métaphorique, les sémèmes indexés étant employés afin de décrire les propriétés organoleptiques du vin.

Par conséquent, en dépit d'une impression référentielle déterminée par l'isotopie dominante, il subsiste des zones d'opacité interprétative correspondant à des sémèmes polyisotopes tels que "ouvert", pouvant s'indexer sur des isotopies génériques très diverses, et à des sémèmes relevant d'un tout autre domaine sémantique, le //bâtiment// (cf. 'construit'). Ces derniers s'inscrivent au sein d'une connexion métaphorique qui met en évidence une analogie sous-jacente entre les deux domaines sémantiques: "Le vin est profond, ouvert, construit, charpenté comme une construction architecturale." C'est précisément sur ces coexistences isotopiques, traduisant sémantiquement des correspondances expérientielles, que le travail interprétatif va opérer: il consiste à identifier les sèmes spécifiques des sémèmes comparants indexés sur i_2 car, communs aux sémèmes comparés de i_1 , ils permettront de reconstruire l'intégralité de l'isotopie dominante.

Sémèmes sur i_2	Sémèmes sur i_1	Sèmes spécifiques communs
'profonde'	'intense'	/intensité/
'ouvert ₁ '	'ouvert ₂ '	/étendue/ - /non résistance/
'construit ₁ '	'construit ₂ '	/multiplicité/ - /assemblage/
'charpentée'	'équilibrée'	/multiplicité/ - /cohésion/ - /équilibre/

Figure 1. *Correspondances sémiques et opérations interprétatives.*

La reconstruction des sémèmes sur i_1 s'effectue grâce à deux types d'opérations interprétatives:

a) Réécriture sur une isotopie des sémèmes lexicalisés chacun sur une isotopie différente:

"profonde" → | "intense" |; "charpentée" → | "équilibrée" |

b) Flotaison d'une molécule sémique:

L'opération de réécriture ne pouvant s'effectuer pour ces sémèmes, on constate l'existence d'une molécule sémique en flottaison. Tel est le cas des sémèmes "ouvert" et "construit" dont les sèmes spécifiques inhérents sont strictement identiques sur i_1 comme sur i_2 . Par conséquent, en l'absence de termes propres, l'interprétant est contraint d'accepter l'existence d'un "ouvert₂" et d'un "construit₂". Ces nouveaux sémèmes intègrent la molécule sémique extraite de i_2 et s'enrichissent sur i_1 des sèmes contextuels et afférents liés à la pratique de la dégustation.

On remarque alors que les connexions entre ces sémèmes procèdent à un transfert sémique d'un concept existant sur un concept nouveau qui était jusqu'alors dépourvu de termes propres, traduisant de ce fait la véritable vertu de la mécompréhension.

1.2. Vertu de la mécompréhension

Ce transfert de sens opéré par le dégustateur fonctionne comme une passerelle sémique qui permet au sujet interprétant d'élaborer des impressions référentielles vineuses partielles. Elle instaure une connexion entre deux savoirs distincts: l'un dit "courant", partagé par l'ensemble de la communauté d'une société donnée, et l'autre, savoir "spécifique", acquis par un groupe plus restreint (et, en l'occurrence, lié à la pratique de la dégustation). Le passage du premier au second est garanti par la molécule de sèmes spécifiques extraite du sémème connu et renvoyant à des propriétés analogues à celles de l'objet vin.

Figure 2. La passerelle sémique.

C'est l'élément dissonant, foyer de mécompréhension, qui, une fois identifié, engage la procédure interprétative. Cette reconstruction, qui débute par la reconnaissance d'une coexistence isotopique, va déterminer le lien dialectique entre degré perçu et degré conçu: après avoir sélectionné les éléments sémiques compatibles entre ces deux degrés, le sujet interprétant effectue une projection sur le second de toutes les représentations qu'il aura du premier afin de créer un degré conçu complet. On saisit ici le rôle que joue la mécompréhension: si l'intrusion d'un de ses foyers va, dans un premier temps, "violenter" le lecteur, la passerelle sémique qui lui est sous-jacente va faciliter la médiation entre ces deux domaines sémantiques. En ce sens, la mécompréhension permet de rendre compétent un lecteur novice grâce aux sèmes nucléaires partagés par les deux domaines sémantiques. D'autre part, on constate qu'à l'issue du parcours interprétatif, bien que le sens tropique des sémèmes polyisotopes s'actualise, leur sens non tropique se virtualise mais ne s'efface pas: il reste présent, comme gardé en mémoire. Ce "spectre" du sens non tropique souligne une autre particularité de la mécompréhension, à savoir son influence constante au sein du parcours interprétatif. Par conséquent, si la mécompréhension accompagne le parcours interprétatif et le conditionne en permanence alors la variation de ses foyers aura une influence sur les opérations interprétatives employées dans la reconstruction du sens. C'est ce que montre l'exemple suivant de *La Revue du Vin de France*: "Riche, suave, très gras et chaleureux, mais isolément sec: c'est un édifice à la charpente haute mais encore en cours de stabilisation. Le temps va fortifier sans faille les fondations de ce vin d'artisan d'art. A oublier au moins 5 ans en cave" (Hors-Série n°4 novembre 2003: 134).

Ce commentaire se distingue du précédent par la nature des relations inter-isotopiques: le premier manifestait des isotopies entrelacées tandis que celui-ci présente deux isotopies génériques superposées; d'où un parcours interprétatif différent.

a) Interprétation intrinsèque: isotopie mésogénérique 1

Une première lecture naïve permet d'identifier une isotopie générique dominante, celle du //bâtiment//, encouragée par la prolifération de sémèmes relevant explicitement de ce domaine sémantique (huit au total: *édifice, charpente, haute, fortifier, sans faille, fondations, artisan d'art, cave*) et qui permettent d'identifier le topic du texte comme étant celui d'une description des propriétés architecturales d'un bâtiment. Cette isotopie

peut être enrichie de nouveaux sémèmes tels que: *riche, gras, suave* ou *chaleureux* car, polyisotopes, ils sont compatibles avec le domaine /bâtiment/, leur indexation s’effectuant par contagion sémique. Cette première phase dans la reconstruction du sens correspond à l’opération d’interprétation intrinsèque dont le rôle consiste à mettre en évidence les sèmes (inhérents et afférents) dans une séquence linguistique.

Cependant, cette interprétation immédiate est rapidement contestée par l’identification d’un élément allotopique, le sémème “vin” qui, en introduisant un nouveau domaine sémantique, engage un nouveau travail interprétatif.

b) Interprétation extrinsèque: Isotopie mésogénérique 2

Il s’agit de l’interprétation extrinsèque qui procède à une réévaluation de l’interprétation intrinsèque en convoquant l’entour textuel et les connaissances encyclopédiques liées à la pratique de dégustation. Dès lors, le sujet interprétant peut procéder à des inférences et reconstruire la seconde isotopie en vertu des sèmes spécifiques que ses sémèmes partagent avec ceux de la première. Il s’agit du fonctionnement de base de la mécompréhension identifié précédemment à travers la notion de passerelle sémique.

Sémèmes sur i_1	Sémèmes sur i_2	Sèmes spécifiques communs
'riche'	'riche'	/multiplicité/, /mélioratif/
'suave'	['moelleux']	/douceur/
'gras'	['moelleux']	/douceur/, /quantité/
'chaleureux'	['alcooléux']	/intensité/
'sec'	'sec'	/manque/
'édifice'	['(grand) vin']	/multiplicité/, /volume/, /force/, /mélioratif/
'charpente'	['équilibre']	/multiplicité/, /cohésion/, /équilibre/
'stabilisation'	'stabilisation'	/durativité/, /équilibre/, /maintien/
'fortifier'	'fortifier'	/force/, /évolution/
'faille'	['défaut']	/faiblesse/, /altération/
'fondations'	['composants']	/fondamental/, /robustesse/, /complétude/

Figure 3. Correspondances sémiqes et opérations interprétatives.

2. Mécompréhensions et modes de reconstruction du sens

Bien qu’ils articulent des domaines sémantiques identiques, ces deux commentaires requièrent des modalités de reconstruction du sens bien diffé-

rentes, elles-mêmes engagées par une mécompréhension préalable dont la nature varie de l'un à l'autre. Si l'on compare leurs parcours interprétatifs, on constate que la mécompréhension joue un rôle différent sur la détermination des opérations interprétatives. Bien que, dans les deux cas, nous soyons en présence d'un énoncé polyisotopique, la nature des relations inter isotopiques est différente, ce qui conduit à un changement de nature des foyers de mécompréhension: dans le premier exemple, ils sont multiples tandis que dans le second, il s'agit d'un foyer unique: le sémème dissonant 'vin'. Par conséquent, l'incomplétude du sens, qui traduit le phénomène de mécompréhension, revêt elle aussi une nature différente selon les relations inter isotopiques manifestées.

Dans le premier cas, il s'agit d'une compréhension *entravée* où la détermination complète de l'impression référentielle /vin/ est contrecarrée par la présence répétée d'éléments allotopiques empêchant une lecture continue du texte. Le travail interprétatif est ici un travail de *réajustement isotopique* impliquant une coopération, une négociation entre les isotopies, afin de convertir cette discontinuité isotopique en un ensemble cohérent grâce à un recours répété à la passerelle sémique.

Dans le second, l'incomplétude du sens se présente comme une compréhension *erronée*: le sujet interprétant est déjà parvenu à construire une représentation mentale du contenu textuel à l'aide d'un premier travail interprétatif; il en a saisi la thématique générale ainsi que ses différentes spécificités, néanmoins remises en question par l'introduction du sémème "vin". A la différence du cas précédent, la mécompréhension fonctionne à rebours: c'est l'élément allotopique "vin" identifié en fin de texte qui contraint le sujet interprétant à engager un nouveau travail interprétatif, travail de *réévaluation isotopique*, qui ne porte plus sur des localités (lieux de rupture), mais sur la totalité du texte. Il ne vise donc pas à isoler des unités sémiques communes entre sémèmes mais consiste à rabattre un ensemble sémantique construit sur un autre.

Le changement de nature de la mécompréhension implique alors deux types de parcours interprétatifs: local et global. Dans le premier cas, la mécompréhension porte sur des sémèmes en rupture isotopique, renvoyant à des propriétés spécifiques de la thématique: robe, nez, bouche. Dans le second, en revanche, c'est une phase précise de l'examen de dégustation (la bouche) qui est entièrement décrite en termes d'une autre isotopie; la mécompréhension portant davantage sur une représentation mentale liée

à un ensemble sémantique que sur des unités sémi-ques éparses. Alors que dans le premier cas, la mécompréhension focalise l'attention du sujet interprétant sur des particularités spécifiques de l'objet, ici elle oriente le travail interprétatif sur un "bloc" expé-rientiel. D'où l'hypothèse selon laquelle la mécompréhension manifesterait une certaine *intentionnalité* à l'égard du sujet interprétant: à travers l'usage varié de ses foyers, elle occuperait des degrés de présence différents et imposerait, de ce fait, des parcours interprétatifs orientés qui traduisent sa visée particulière dans le mode de compréhension qu'elle préconise. Elle fonctionnerait comme une stratégie interprétative, au service d'une compréhension précise et ciblée, corrélative à une stratégie énonciative du dégustateur.

Foyer	<ul style="list-style-type: none"> ▪ Relations inter isotopiques <div style="text-align: center;">↓</div> Foyer simple ou multiple
↓	
Mécompréhension	= Tension discursive <ul style="list-style-type: none"> ▪ Degrés de présence ▪ Impression référentielle (= compréhension préalable) ▪ Doute (spécifique vs générique)
↓	
Travail interprétatif	= Résolution de la tension discursive <ul style="list-style-type: none"> ▪ Local vs Global ▪ Opérations de conversion ▪ Variations intentionnelles } Moments interprétatifs

Figure 4. Fonctionnement de la mécompréhension.

2.1. Mécompréhension et temporalité des parcours interprétatifs

Dans la mesure où elle détermine les opérations interprétatives et influe sur la complexité des parcours, la mécompréhension va corrélativement exercer son influence sur leur temporalité.

Le premier commentaire pose d'emblée le problème de la mécompréhension par l'actualisation de deux isotopies associées au sein d'une relation prédicative. Par conséquent, le travail interprétatif visant à résoudre la tension discursive s'engage immédiatement et se conclut rapidement (deux moments), comme le montre le tableau suivant:

<i>Moments du parcours</i>	1. Tension discursive = mécompréhension	2. Résolution de la tension
<i>Percepts thématiques</i>	VIN /BATIMENT	VIN
<i>Interprétatifs</i>	Coexistence i_1 et i_2 dans une relation prédicative ; Allotopies intrasyntagmatiques	Interactions isotopiques i_1 et i_2 (passerelle sémique) ; Isotopie dominante /vin/

Figure 5. *Temporalité du parcours interprétatif (commentaire n°1).*

Or, dans le second exemple, le doute sur le contenu textuel apparaît un peu plus tard, une fois que le parcours interprétatif ait bien été engagé. C’est l’identification de l’élément allotopique “vin” en fin de texte qui déclenche le travail de réévaluation isotopique et engage un nouveau moment dans le parcours interprétatif.

<i>Moments du parcours</i>	1. Interprétation intrinsèque	2. Identification de la tension discursive	3. Interprétation extrinsèque
<i>Percepts thématiques</i>	BATIMENT	BATIMENT OU VIN ?	VIN
<i>Interprétatifs</i>	Dominance isotopique i_1	Allotopie intrasynagmatique ; Contexte équatif	Relations inter isotopiques ; Connaissances encyclopédiques

Figure 6. *Temporalité du parcours interprétatif (commentaire n°2).*

Par conséquent, plus la mécompréhension est structurée, plus son degré de présence est faible, plus le parcours interprétatif se complexifie en multipliant les moments interprétatifs.

3. *Limites de la mécompréhension*

C’est précisément cette notion de temporalité qui, selon les moments qu’elle recouvre, permet de soulever les limites de la mécompréhension. L’exemple suivant permettra d’étayer ce point: “Le nez de l’altesse trône au milieu des arômes exotiques avec une petite pointe miellée, entourée de fleurs” (*Cuisine et Vins de France* 2003: 75).

3.1. Moments du parcours interprétatif

La particularité de ce texte, c'est qu'il induit une mécompréhension très structurée, celle-ci résultant d'une torsion profonde opérée sur le genre textuel du commentaire de dégustation, aussi bien sur l'aspect tactique que thématique: il ne présente pas le découpage canonique en phases robe/nez/bouche mais se focalise uniquement sur l'une d'entre elles. En outre, les isotopies génériques sont parfaitement superposées si bien que le sujet interprétant ne parvient à saisir aucune allotopie. Enfin, dernière spécificité macrosémantique: le sens de ce texte réside essentiellement dans les connexités entre isotopies génériques et spécifiques; dès lors, le parcours interprétatif ne doit pas se contenter d'identifier les isotopies du texte mais doit également déterminer leurs connexions: ici, l'impression référentielle se construit à partir du corrélat de l'isotopie générique princière i_1 et de l'isotopie spécifique de la spatialité i_2 : le topic n'étant pas celui d'une simple figure princière mais plutôt la mise en scène de cette dernière au sein d'un jardin exotique. A cela, s'ajoute une seconde isotopie spécifique, celle de la /saillance/ indexant les sémèmes: "nez" (partie la plus saillante du visage), "altesse" (titre honorifique indiquant une supériorité hiérarchique), "trône" (place d'honneur/position dominante), "au milieu de" (valorisation la position centrale), "pointe" (extrémité la plus fine du sceptre), "entourée" (valorisation de la position centrale). Cette nouvelle isotopie spécifique s'articule avec la première au sein d'un rythme sémantique $a\bar{a}a\bar{a}$ (où a renvoie à l'isotopie de la saillance, notamment au sème /intensité/ et \bar{a} renvoie à l'isotopie de la spatialité, en particulier au sème /étendue/) matérialisant ainsi un ajustement entre une forme et un fond. D'ailleurs, les acteurs dotés d'un fort degré d'intensité relèvent de l'isotopie générique /princière/; ils se présentent alors comme des formes qui se détachent, selon des variations d'intensité, sur le fond de l'isotopie spatiale.

Ces variations dans le champ de présence, mesurables en termes d'intensité et d'étendue, correspondent en fait au principe d'ajustement focal, opéré par l'observateur de la scène qui procède à des mouvements de zoom et de dézoom. Ainsi, le topic n'est plus celui d'un prince dans un jardin mais devient celui d'un ajustement focal opéré par un observateur extérieur (passage du noème à la noèse perceptive).

Toutefois, un recours à l'entour textuel ainsi qu'aux connaissances encyclopédiques sur la pratique de dégustation permet de soulever une nouvelle

isotopie générique, celle du vin, objet de dégustation, dont le sémème 'nez' en est un interprétant direct. Poly-isotope, il permet de connecter les deux domaines sémantiques au sein d'une relation métaphorique. S'engagent alors des conversions isotopiques liées au changement d'isotopie générique: l'isotopie spécifique de la spatialité est alors convertie en l'isotopie spécifique de la temporalité, permettant de dégager une nouvelle thématique du texte, celle de la succession temporelle des arômes émanant du vin. Cette seconde conversion isotopique entraîne une transformation des relations entre isotopies spécifiques qui se traduisent par un rapport forme/ intervalle temporel où les formes de la saillance se détachent sur des intervalles temporels précis, selon l'alternance āāā du rythme sémantique qui, lui, reste maintenu. Etant données ces multiples conversions, le rapport global entre les isotopies du texte est lui aussi modifié et permet d'identifier un nouveau topic: les variations intentionnelles du dégustateur, en particulier le double mouvement de visée et de saisie, dans l'appréhension des propriétés olfactives du vin.

En bref:

Périodes du parcours	Période 1			Période 2			
Moments du parcours	1. Isotopie princièrè + spatialité	2. Isotopie spatialité + saillance	3. Interrelations isotopiques	1. Conversions isotopiques	2. Isotopie temporalité + saillance	3. Interrelations isotopiques	
Percepts	PRENRE DANS UN JARDIN	RAPPORT FORME/FORME	AJUSTEMENT LOCAL OBSERVATEUR	SUCCESSION TEMPORELLE D'AROMES	RAPPORT FORME/ PRESENCE / INTERVALLE TEMPOREL	VARIATIONS INTENTIONNELLES DU DEGUSTATEUR	
Interprétants	Complémentarité de i, et i;	Interaction i, et i; intensification de i,	Forme tactique āāā; interactions i, et i; interaction i, et i;	Erreur textuel; Connaissances encyclopédiques; Polyisotopie de 'vin'	Interaction i, et i; intensification de i,	Rythme sémantique; interaction i, i et i	
Méta percepts	NOÏME	→	NOÏME	→	NOÏME	→	NOÏME

Figure 7. Temporalité du parcours interprétatif (commentaire n°3).

3.2. Complexité de la mécompréhension et conséquences sur le parcours interprétatif

Ici, la mécompréhension se présente comme une représentation hautement structurée du contenu textuel, ce qui a pour conséquence un redéploiement temporel des interprétations intrinsèque et extrinsèque qui ne se réduisent plus à de simples moments mais deviennent des périodes interprétatives,

elles-mêmes recouvrant plusieurs moments. De plus, la torsion affectée au genre textuel renforce le pouvoir de la mécompréhension, l'absence de structure tripartite ne permettant plus l'ancrage référentiel dans la pratique de dégustation. Dès lors, la mécompréhension se présente comme auto suffisante car, en l'absence de contexte immédiat ou de situation de communication identifiable, le topic de l'ajustement focal d'un observateur externe aurait été suffisant, le rabattement de la seconde isotopie sur la première n'étant pas possible. C'est là que se situe le véritable danger de la mécompréhension: en l'absence d'élément allotopique, elle est moins saisissable et le contenu inféré peut facilement être entendu comme le véritable sens du texte. Si dans nos deux premiers exemples, la résolution de la tension créée par la mécompréhension est à proprement parler interne, facilitée par différents indices, ici, faute d'élément allotopique identifiable, la résolution de la tension discursive n'est possible que par un recours à l'entour textuel ainsi qu'aux connaissances encyclopédiques sur le vin. La passerelle sémique reste donc inefficace. Par conséquent, le travail interprétatif repose exclusivement sur une image mentale activée par la métaphore vive, la reconstruction du sens s'effectue uniquement sur le rabattement d'un ensemble expérientiel hautement structuré sur un autre. Il ne s'agit plus d'une simple conversion sémantique opérant à la réécriture de sémèmes mais d'une conversion sémantico-gestaltique où le sujet interprétant, guidé par des transformations isotopiques, procède à des transferts expérientiels. On en déduit alors que le phénomène de la mécompréhension ne se réduit pas simplement à des entorses faites au langage et/ou au genre textuel du commentaire, ces dernières pouvant également se présenter comme la manifestation discursive du mode de conceptualisation du dégustateur à l'égard des éléments qu'il perçoit. En l'occurrence, il s'agit de son système conceptuel personnel, lié à son propre vécu ainsi qu'à son ressenti lors de la dégustation. Par conséquent, le contenu textuel devient difficilement saisissable, faute d'une communauté conceptuelle avec l'énonciateur.

En conclusion, si la mécompréhension vise à guider et à faciliter la compréhension du lecteur en se référant à des connaissances ainsi qu'à un contenu expérientiel communs, elle peut néanmoins s'avérer dangereuse lorsque l'énonciateur recourt à un système conceptuel personnel et non plus partagé par la communauté des dégustateurs. Dès lors, la mécompréhension peut s'avérer fort structurée et déroutante, engageant le lecteur dans un travail interprétatif fastidieux; elle peut alors nuire à ses vertus

communicationnelles en se réduisant à un simple enjolivement textuel, dépourvu de contenu et uniquement destiné à séduire une cible marketing peu avertie.

Josep Muntañola

The hidden semiotic- chronotopic core of architecture

1. The semiotics of space and the hidden dimensions of culture

Thirty years have passed since my first semiotic investigation of architecture (Muntañola 1973), and a lot of other semioticians have written excellent works on the topic since then (Pellegrino 2000; Levy 2003; Boudon 1981). They have designed what I have called an *Architecture of the Semiotics of Space and Time*. Tchertov (2002) has analysed with precision the special characteristics of the semiotics of space in general, and I agree with his vision of a peculiar code of communication in space, a “palette-like-code”, where a lot of meanings can be simultaneously working at different speeds, locations and intensities.

However, the distinction between linguistics and communication that led the late Professor Jose Luis Prieto to define a double sense in the semiotic systems (Prieto 1986) points to a very serious problem.¹ Architects have solved this problem with so-called “architectural autonomy theories” of the profession, a new formalism in which form and content are totally separated in architectural practices and theories. Architects build the same building everywhere, and the only “codes” that are accepted are those defined by architectural practices as such, with no discussion of contextual constraints, and without historical and social considerations. All this is a perfect example of the formalistic approach that Mikhail Bakhtin tried to fight in the early years of his life, although his writings were not published until after his death (Bakhtin 1990).²

I have tried to explore poetics and rhetoric, along with hermeneutics, dialogics and developmental cognition, in order to articulate design prac-

tices and theories to semiotics (Muntañola 1996). In doing so I have found what a lot of philosophers, sociologists and psychosociologists are analysing now (Valsiner and Van der Veer 2000; Searle 1995): our mind has a strong social dimension, which is hidden much of the time, but which can be detected in developmental psychology (Langer et al. 2003: 141–172), in psychosociological studies, and in developmental and anthropological sociology and cognition (D’Andrade 1995). This hidden social dimension, pointed out in the seminal work by E. T. Hall (1966), is a perfect “alibi” for professionals such as architects, educators and legislators, allowing them to “practice” without theoretical justifications.

In fact, what we find at this point is a “conversational”, or dialogical, structure of human space and time, an “order of coexistence” between subjects and objects, as Leibnitz stated some centuries ago. What we see of this psycho-socio-physical “order of coexistence” is just the tip of the iceberg – not all the hidden content. It is similar to the diagnosis of the genesis of madness: we clearly notice the signs of madness, but the origin of it is very hard to figure out, and we still know little about it. Still, as an art of interpretation of signs as symptoms, we should be able to explore this invisible, spatial-semiotic underground world of communication.

2. The dark side of the semiotics of space: Theory and methodology

Paul Ricoeur is one philosopher who wanted to invent tools for exploring the dark or hidden aspects of mankind: the unconscious, fascism, manipulation of memories, poetic deep structures and so on (Ricoeur 2000). He, among others, encouraged me not to be afraid to peer below the tip of the iceberg.

Although the concept of the unconscious is important, as Deleuze’s writings prove, the unconscious is not enough; we should be able to build up a semiotic account of what Jaan Valsiner calls “the social mind” (Valsiner and Van der Veer 2000). The concepts of equilibrium and disequilibrium are useful tools, as Jonas Langer has shown, and, of course, the concept of *chronotope* by Bakhtin is important to architectural theories and to the semiotics of space, as Ricoeur himself insisted (in a personal conversation in Barcelona).

The key concept is the mental “embodiment” of objects and subjects by virtue of a semiotic (invisible and mute) spatial link. For this reason, Plato insists that place-ness can only be understood when “all the senses are absent, and we use some kind of spurious reason, that is neither ideal nor real, but somewhat in the middle and like a dream-like knowledge”. Children express exactly this when they associate (at three years of age) the genesis of empty spaces (void) with sleeping inhabitants. How should this strange semiotics be analysed? One way is, of course, to probe the imagination, as Kevin Lynch and many environmental psychologists have done. But, again, this remains far from architectural design itself. The concept of “schemata”, both in the mind and in culture, is another good starting point (cf. Rapoport 2007).

Much more promising can be the combination of dialogics with the chronotope concept, “points of view” and “voices”, with the “natural logic” developed by Borel, Grize, etc. in the Neuchâtel group, which was very active in the Piagetian institute in Geneva. In both cases the key concept is the logic of dialogue, and the structural conditions to achieve it. They define this logic in the following way: “We define a non-formal argument when it includes implicit knowledge, and its conclusion is not the output of implementation of a rule. In this way, the output of a non-formal argument contains new elements that are different from the premises” (Grize 1984: 21).

It is not difficult to relate this “natural logic” with Ricoeur’s call for a semiotics of text that can describe the “configurative” dimension of any work of art, literary or otherwise. Let us reproduce some arguments related to this point by Jean Blaise Grize:

The actions of schematization must assume the equilibrium inside the organization of a whole where the objects move. They associate objects and make transformations. All these actions are controlled by the principals of coherence. These principals of coherence participate on the transformations of the objects. Coherence and cohesion are interdependent, in such a way that the organization of the objects constrains the context where the objects move. (Grize 1984: 214)

On the other side is Bakhtin, who rejects the autonomy of the text produced by “codes” as indifferent to the contextual qualities of the communicative process itself: “The linguistic code is a killed context” (Bakhtin 1996: 147).

3. *The semiotic link between architecture, education and society: Sigfried Giedion revisited*

A few years before his death, Sigfried Giedion was living in a neighborhood near Zurich, very close to the Jean Piaget residence. It is not strange then that in his last work as an historian and theorist of modern architecture he uses Piaget's ideas in the book published after his death, *Architecture and the Phenomena of Transition*, a book for which I wrote the foreword of the Spanish translation in 1970 (Muntañola 2007: 107–123).

This strange and ambitious book is a theory of architecture that follows exactly the same dialogical paradigm that Mikhail Bakhtin defined in the 1920s, plus Piaget's idea of a developmental and structural psycho-social genesis. The changes between Greek architecture and Roman architecture, and between Roman and modern architecture, are defined by Giedion as "phenomena of transition" or sociophysical (human) developments. The key character of these changes is "sociophysical", that is, "chronotopic", because it implies new links between social dwellings and built forms. The parallelism with the development of Bakhtin's theories in the literary field (for example, the novel) is striking, because in both cases the cultural object – books or buildings – increases the capability of representing the inner and outer dimensions of our social lives, and new chronotopes are produced. Environmental changes and social changes are linked chronotopically, and new "cultures" arise.

Developmental cognition is also exploring this "heterochrony", which differentiates human beings from other living species (Langer et al 2003). The conclusion is inevitable: the hidden semiotic dimensions of the human species (the huge hidden part of the iceberg), as manifest in education and social interaction, constitute the most fundamental aspects of human life: gender identities, the body's own image, psychosocial rhythms of space and time (celebrations, etc.), social expectations of prestige and power. A specific kind of social interaction blends ontogenetic and phylogenetic development, thanks to a heterochronic (and chronotopic) synchronization between human bodies and places.

Andy Clark has recently theorized this process of "mutual reciprocity", which characterizes natural logic. According to Clark, the "reciprocity between minds" is a key factor for mental development, but it is neither a "computation" nor a "neurological process" (Clark 1998: 103–128); rather,

it points up the simultaneous production of individual and social, shared meanings, such that there are no differences between conventional and non-conventional (or intentional) meanings.

4. *An example: Children's conceptions of places to live in*

Drawing upon my work on children's conceptions of places to live (Muntanola 1973), I offer an example of chronotopic semiotic analyses. Diagrams 1 and 2 represent cities conceived by children from two different international schools in the city of Barcelona in experiments carried out recently by a PhD student. The results are consistent with similar experiments realized ten years ago in 100 schools in the same city (Muntanola 2007: 41–54). Generally speaking, all these experiments found the same basic features:

a) Each school has unique kinds of “ideal cities” conceived by children aged 4 to 12 years.

b) When a child changes school, he or she either changes his or her “ideal city”, in order to interact with the new social environment, or he/she will have huge difficulties in socializing.

c) This “ideal city to live in”, built with wooden blocks by teams of 5 to 10 children, reflects the dialogical and physical characteristics of the social life of the school, all following the dialogical and chronotopic notions defined by Bakhtin.

d) A close look at the “videos”, in order to follow the “design process of the city”, can even detect the “heterochronic” qualities of the process, in a way analogous to the “embryo” space and time rules of development, as a “bridge” between ontogenetic and phylogenetic development (or psychosocial synchronization).

e) Another confirmation of this fact is the total identification between the key factors of these psychosocial bridges and the human qualities that, according to Linneo, are lacking in “wild” children: clear sexual identity, control of sleeping and waking rhythms, correct bodily posture, the recognition of one's own image in the mirror, the control of language, drawing, etc. in order to communicate. That is: the cognitive chronotopic qualities discovered by Jonas Langer and followers, and analysed above as “human”.

f) The chronotopic-semiotic qualities of these cities (diagrams 1 and 2) are precisely the rules of the “natural logic”, or configurative semiotic

structures, which I was looking for. Of course, they are simply the developmental roots of these configurative structures; and yet, like the “space syntax” analyzed by Hillier (1996), they can be progressively used in town planning and in architecture.

g) Special attention should be paid to the “dialogical” character of these structures, as a chronotopic, life-and-death synthesis, between boys and girls, grandparents and grandchildren, nights and days, private and public spaces, etc. Building and dwelling are, then, chronotopically interrelated, through poetic, rhetorical and semiotic links, or “habits”.

Diagrams 1 and 2 show two different architectonic structures. These structures affect the aesthetic, political and cognitive relationships between children, as well as those relationships between children and adults.

Diagram 1. Monological cities.

The specific geometrical forms of each of those two different structures are not arbitrary; but of course, these forms are neither logically nor naturally universal, nor are they inevitable. They are simply conventional. Nevertheless, these conventional social rules constrain our way of moving, living and thinking. They are chronotopically specific, and children use

them as an intersubjective structure of communication. The correlation between social behavior and physical forms is the key architectonic dimension of our environments.

Diagram 1 shows cities with clear semiotic differences from the cities pictured in diagram 2. Space is made of individual houses built by one child (boy or girl) individually, in opposition to the places of the other children. In between these individual places, space does not exist; it is simply a meaningless void, owned by nobody. Often, girls are pushed into a corner of the table, such that male power can be easily detected. Articulation between language and architecture does not exist, only attitudes of aggression and/or defense between the owners of the houses. There are no public buildings or public open spaces. The geometry has one main role: to define the limits of “my” property. The bigger the building, the bigger is my power in the city.

Spatial syntax relates to fragmented individual places located in an indifferent environment: no connections with behavior or with history are made. Physical partitions of space coincide with individual partitions, but there are no conventional social rules in play, only frontiers and limits between “my” place and others’ places. There are no signs of hospitality or intersubjective behavior (social interaction). I call these cities *monological cities*.

Diagram 2. *Dialogical cities.*

Diagram 2 tells a different story. Here the cities have conventional intersubjective rules and representations, where language and architecture are interrelated. There are public buildings, which play specific social roles, and open public spaces, with specific uses. There are different geometries for different kinds of buildings, public or private.

There are “schemata” and “design rules” accepted by all the children. The child (boy or girl) ultimately can explain the city, because it is a social event, not a disordered mass of individual places. Each child builds the city in relation to the others’ task, in a much more “organic” way of building compared to that of the monological cities. Inside spaces and outside spaces are interrelated in a way that allows for social interaction in specific cultural manners. These cities I call *dialogical*, and each one has a different chronotopic structure, responding to the specific rules and representational tools behind their construction.

The semiotic differences between the cities in diagram 1 and those in diagram 2 are represented in diagrams 3 and 4. In diagram 3 we find a “monologic chronotope” where inner spaces and outer spaces are indifferent to each other, and physical partitions do not imply social interactions, but simply social defense or isolation. Each child is a “competitor”, not a friend. Language is not related to architecture, there are no “verbal stories” related to the buildings, only phrases such as: “this is my tower” (boys), “this is my flat” in which to look after my children (girls). Private property is the key factor; public, “shared” property does not exist, but is replaced by “empty” and “non-significant” space and time locations.

Subjects	Objects	
S ₁ —————	O ₁	Physical space and time and “social” space and time are only related at individual level. Relations between objects have not correlations with relations between subjects. Norms for objects are independent from norms for subjects. Objects are context free. Subjects are context free.
S ₂ —————	O ₂	
S ₃ —————	O ₃	
“Points of view” and “voices” are independent of each other		
There does not exist a configuration between subjects and objects		

Diagram 3. Monologic semiotic architectural core (configurative chronotope).

Windows and doors are not needed, only walls, flats and roofs. Forms are almost indifferent to functions: they all look alike and can be used indifferently, so there is no way to verbalize them. The logic here has only one rule: the bigger my own private tower, the better it is for me. *There is no difference between construction and communication.* With 5 or 6 items all the cities can be built. Text and context are the same, and we can say that there is no need for communication at all, only the need for construction. In brief, there is a “zero-semiotic” chronotopic architectural link. All places look alike; there is no need for traveling. This monological chronotope is the best representation of a completely social and liberal capitalistic world. There are neither different voices nor different points of view (except for some sex differences). Geography and social history are always and everywhere interrelated by the same universal autistic forms.

These are the most usual cities: almost ninety percent of schools in Catalonia have this kind of “ideal city” culturally inhabited by children. However, this monological chronotope, as diagram 3 shows, is not socially indifferent. Rather, it forces a concrete interpretation of ideal social interactions where girls are “inside” and boys “outside”, where power is used to destroy the places of others (we have seen violent terrorist actions that destroy the tower of competitors). Social rules are abolished in order to build the biggest tower without restrictions. Public spaces disappear because rules disappear. Beauty is totally subordinated to these “social rules”; there is no way to be original outside the big towers and the symbolic, spectacular power of size. Deviations are aggressively destroyed if they break the rules (if somebody intends to build public spaces or different forms).

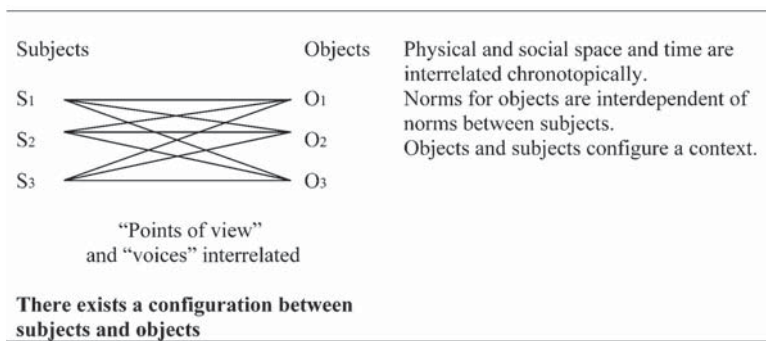

Diagram 4. Dialogic semiotic architectural core (configurative chronotope).

The chronotopes in diagram 4 are very different. Here each city has different chronotopical structures. Thus each city has its own “story” and its own “history”. Children “built” the intersubjective and social reciprocity that they have in the school, they built a place for the culture they have, with more than 100 elements. Hence the chronotope varies with the specific kind of social interaction that each school “produces” during the years that children are there. It is not only the “real” interaction that is in the city, but the “ideal” interaction the schools believe they should have, and this is reflected and built into the city. “Points of view” on the physical constructions and “voices” of the subjects using these constructions, are chronotopically related in each city in a specific manner. There is a structural and semiotic affiliation between the city and the verbal description of it.

Diagram 5. *Visual order of the Middle Ages.*

Diagram 5 reproduces a socio-physical network, or chronotope, from the Middle Ages in the south of France. It shows that the chronotopic structure of architecture is by no means a new invention.

5. Conclusion: New architecture for a better environment

Instead of looking for a semiotics of architecture, I use “architecture” as a way to uncover a general semiotics of men’s life and communication. Amidst this “tower of Babel”, as Rita Messori describes it, (Muntañola ed. 2006), it is easy to get lost. However, if children’s efforts succeed (in a

healthy sociophysical school environment) in producing nice, useful, and dream-like cities dreamlike, adults should be able to surpass them.

Men have a remarkable ability to survive in the face of climate changes, social wars, environmentally hostile conditions, destructive planning processes, etc. – like the child’s ability to change friends, school and cultures. But this flexibility has psychological, sociological and “architectural” limits and huge costs in terms of money, mental health and social peace. Perhaps we can arrive at an “ethical and political semiotics of space and time” sooner than expected, a semiotics of environmental design, that may result in a new architecture for a better environment.

Notes

1. The difference between “communication” and “language” has long been debated. For example, Bakhtin began writing against “formalism” in linguistics almost one hundred years ago.
2. Bakhtin aims to build up a “dialogical” theory against any kind of formalistic understanding of human art and human communication. For an analysis of his writings, see Muntanola 2004 and 2006.

Language and misunderstanding

1. Introductory remarks

The so called “linguistic turn” around the beginning of the twentieth century shifted both methods and contents within the philosophical discourse. According to this new paradigm philosophical problems only arise because we cannot get a clear overview of the grammar of our everyday language. This assumption is closely connected to a particular approach in dealing with metaphysics. Metaphysical questions are thereby identified as purely conceptual misunderstandings and therefore “pseudo-problems” (“Scheinprobleme”). As a consequence of another paradigmatic turn towards the natural sciences at the end of the nineteenth century, propositions that did not fit into the synthetic/analytic scheme were regarded as nonsensical and irrelevant for further philosophical analysis, as was argued by members of the Vienna Circle.

In his *Philosophical Investigations*, Ludwig Wittgenstein maintains that a grammatical investigation of our language would clear away misunderstandings concerning the use of linguistic expressions. Those misunderstandings are due to certain analogies between particular forms of words or sentences in various fields of language.

I shall briefly focus on Wittgenstein’s concept of a grammatical rule and its connexion to metaphysical and empirical statements. It is thereby particularly important to see the semantic ambiguities of linguistic expressions in metaphysical, grammatical and empirical contexts. And as we will see Wittgenstein’s approach quite differs from the views held by Vienna Circle members and their philosophical predecessors.

2. *Dominating tendencies*

In the second part of the nineteenth century we can identify a paradigmatic shift in the philosophical discourse. In his *Analysis of Sensations* Ernst Mach postulated the complete elimination of metaphysics from any scientific investigations, particularly Kantian “things in themselves” (*Dinge an sich*). Another important figure, Franz Brentano, maintained that the only true philosophy is that of the natural sciences and the early Ludwig Wittgenstein argued that to express propositions of natural sciences is the only right method in philosophy.

Now, particularly Gottlob Frege and Bertrand Russell caused another turn of the discourse at the beginning of the twentieth century by focusing philosophical investigations on the analysis of language. The concepts “sense” and “meaning” became crucial for the question whether we should eliminate a particular sentence as scientifically irrelevant.

The Vienna Circle members understood themselves in the tradition of Mach, Frege, Russell and the young Wittgenstein. Their philosophical direction is usually associated with the terms “logical empiricism”, “neopositivism”, or “logical positivism” which already implies the paradigmatic shift towards a fusion of classical positivistic doctrines with elements of logic and mathematics. As opposed to empiricists like Comte or Mach, who regarded metaphysics as useless or superfluous, the Circle argued that *propositions* of metaphysics are strictly speaking not false but meaningless. The purpose of philosophical investigations is therefore the clarification of the meaning of propositions and the elimination of all meaningless pseudo-propositions (cf. Blumberg and Feigl 1931: 282). Here we can see the paradigmatic shift that was introduced by the linguistic turn at the beginning of the new century.

Furthermore, the idea of a clarification of our ordinary language by means of logical analysis alone counts as one of the central doctrines in Wittgenstein’s *Tractatus* (Wittgenstein 1989: 3,25), which was intensely read and discussed by the Circle members during the twenties. According to their conviction, propositions that are neither analytic a priori nor synthetic a posteriori have to be rejected from any kind of philosophical analysis. Or as Hans Hahn, a prominent member of the Vienna Circle, puts it: “The scientific world view only knows empirical propositions

about objects of all kinds and the analytic propositions of logic and mathematics” (Mach 1929: 18, my translation).

In principle, synthetic propositions are verifiable by experience, and a statement only has sense if it either empirical or else tautological in the sense that its truth is solely determined by the meanings of the concepts contained in the particular statement. The only two relevant questions are: “What do you mean?” and “How do you know?” (cf. Feigl 1981: 409). The meaning of an empirical proposition consists in the method of its verification and a sentence has sense when it is verifiable that is, when we possess a method to ascertain its truth. This approach led to the famous Verifiability Principle: “The sense of a sentence is the method of its verification” (Waismann 1978: 47, my trans.).

Now let us turn to Wittgenstein, who proposed a way of dealing with empirical and metaphysical propositions that quite differs from approaches of the Vienna Circle although he was held to represent a similar position with respect to the problem of verification at the beginning of the 1930s.

3. Wittgenstein’s alternative

All of Wittgenstein’s philosophy was dominated by the relation between language and the world which he regarded as internal throughout all his writings. In the *Tractatus* he proposed his famous picture theory, based on the assumption that a proposition having sense is a picture of a possible state of affairs if both are of the same logical structure. Because the logical form of a proposition is hidden by our everyday language use, only logical analysis within a truth-functional calculus can unfold the general form of elementary propositions i.e. truth arguments for any propositional function. And in his introduction to the *Tractatus*, Wittgenstein writes that philosophical problems were only based on misunderstandings of the logic of our language.

Now, although Wittgenstein did reject some of his early *Tractatus* positions in the *Philosophical Investigations*, he nevertheless adhered to the assumption that philosophical problems are genuine problems of language. Those problems only arise because we cannot overview the grammar of our language. His concept of a rule, which he introduced in the beginning of the thirties, was supposed to prevent misunderstandings in language by defining the meaning of a word within a language game, which is no more

the very object it represents or stands for but instead solely determined by its use.

Philosophical investigations were still investigations concerning our language, although Wittgenstein regarded certain of his *Tractarian* assumptions as erroneous. In the *Philosophical Investigations* Wittgenstein remarks: “We feel as if we had to *penetrate* phenomena: our investigation, however, is directed not towards phenomena, but, as one might say, towards the ‘*possibilities*’ of phenomena. We remind ourselves, that is to say, of the *kind of statement* that we make about phenomena. ... Our investigation is therefore a grammatical one. Such an investigation sheds light on our problem by clearing misunderstandings away. Misunderstandings concerning the use of words, caused among other things, by certain analogies between the forms of expression in different regions of language ...” (Wittgenstein 2005: §90). Similarly, in another context, Wittgenstein claims that the main source of misunderstandings lies in the fact that our grammar lacks perspicuity and that we do not oversee our language use (cf. Wittgenstein 2005: §122).

Now, to what kind of problem is Wittgenstein referring in these two remarks? First of all, it seems to hang together with the fact that a proposition is ambiguous with respect to its meaning. In the *Tractatus*, the meaning of a word or name was clearly fixed by the object it names and a proposition having sense expresses a possible state of affairs. This semantic relation Wittgenstein replaced by the famous remark that the meaning of a word is its use in language (cf. Wittgenstein 2005: §43). And here the trouble starts, because it is quite obvious that we can use one and the same proposition in order to make rather distinct statements.

Despite the fact that we always have to take into account the particular context, within which something is said, we generally can distinguish two essentially different kinds of contexts and that is a metaphysical – Wittgenstein sometimes says “philosophical” – and an empirical one. About the relation between grammar, a metaphysical statement and an empirical proposition, Wittgenstein makes the following interesting remark: “... it is particularly difficult to discover that an assertion which the metaphysician makes expresses discontentment with our grammar when the words of this assertion can also be used to state a fact of experience” (Wittgenstein 1972: 56–57). Thus when, e.g., someone enters a doctor’s surgery, claiming that only he has real pain, he probably just wants to point out that

other patients may suffer less pain than he, that he should be the next to be treated, etc. A solipsist, however, who states that only his pain is real pain, does not want to make any empirical assumptions about the physical or mental states of other persons, e.g., that he has good reasons to assume that they are only cheating or are exaggeratedly sensitive with respect to pains. What he wants to say is that it is *inconceivable* to imagine that anyone except him could be in pain. And this conception of what is possible to imagine and what makes sense to say is already found in the *Tractatus*. A proposition that has sense expresses a possible state of affairs, a state that is imaginable in the sense that the statement that expresses it does not contain a contradiction or concepts excluding each other (cf. Wittgenstein 1929: 162–171). And the distinction Wittgenstein draws between empirical and logical possibility and impossibility is crucial for the whole understanding of metaphysical, grammatical and empirical propositions. It seems, however, quite obvious that every metaphysician would agree to the statement that when she is maintaining something metaphysical, she is not interested in claiming anything empirical. And this leads us to the question of how to treat such statements, and here we also find Wittgenstein's position towards metaphysical claims.

Generally speaking, and as already mentioned, for Wittgenstein philosophical problems are purely conceptual problems and what is essential to metaphysics is that it blurs the distinction between such investigations and factual ones (cf. Wittgenstein 1992: 381). But what is this supposed to mean? Logical positivists argue that any metaphysical statement has to be rejected from philosophical investigations. Although some propositions that are neither empirical nor analytical may have some use, it is certainly not one of philosophical interest. Expressions that do not fall under these categories are in any case meaningless or nonsensical, whether they are semantically or syntactically ill-formed.

But Wittgenstein's approach seems quite different and this hangs together with his understanding of metaphysical and empirical statements. First of all, it is important to notice that empirical propositions are justified by reality with respect to their truth and falsehood. The meaning of the concepts involved is governed by particular rules and the sense of propositions is related to a particular state of affairs. Particularly in his discussion of mental concepts it becomes clear that Wittgenstein regards our semantic rules as the justifying authority for the right use of such terms and

not as we may assume a particular mental state we refer to when applying a mental expression. In one of his lectures we find the following remark: “Supposing I look at the colour of these shoes and say ‘I now see brown.’ I am very inclined to say that there is something which made me say ‘brown,’ – just me, now – namely, that I had a peculiar impression. The idea of this justification would be roughly this: – Not a justification derived from a rule but a justification by intuition. ... It seems as though I pointed privately and informed myself of the fact that this impression justified me. ... ‘This impression suggests to me I should say “brown.”’ There isn’t so far mentioned a language game. You would have to specify” (Wittgenstein: forthcoming). And in another series of lectures Wittgenstein remarks that if someone says that he is in a particular state of pain it is “entirely correct to say in the description of a language game, the mention of an experience as the justification of what he says does not enter” (Wittgenstein, forthcoming).

Now, the rules or grammatical propositions that constitute the meaning of our everyday usage of language are themselves *not justified* by anything in reality. Wittgenstein regards them as absolutely arbitrary. Therefore, any rule or system of rules is as good as any other and we are open to introduce any kind of conceptual frame that shall govern the future application of a particular language game. And since rules are not justifiable by anything in reality Wittgenstein regards them as nonsensical.

But the semantic ambiguity of linguistic expressions causes another source of possible misunderstandings, in cases where we not clearly distinguish between grammatical rules that constitute meaning and empirical propositions, claiming something to be true or false. Or as Wittgenstein puts it: “[We are] likely to muddle statements of fact, which are undisputed with grammatical statements. Statements of fact and grammatical statements are not to be confused” (Wittgenstein 1979: 18).

We may ask, What is the relation between a metaphysical and grammatical proposition? With respect to metaphysical statements, Wittgenstein argues that the metaphysician makes a fundamental mistake, that is: What the metaphysician wants to say is something about the nature or essence of things and the necessary and absolute truth of such statements she sees justified by the particular phenomenon, the statement is about. So, e.g., to say that “I can’t feel his pain” is justified by the nature of human pain, belonging to one and only one substantial being, as the bearer of that

particular quality. In other words: the essence of pain is of such a kind that it can only belong and must necessarily belong to the one person, who is uttering such a statement, provided that she is not lying, play-acting etc. Even if I had pain in another person's body it would still be my pain and not his. Generally speaking, an object and its nature guarantees the necessary truth of a particular metaphysical claim, or as Wittgenstein puts it: "It seems as though it would be not false but nonsense to say 'I feel his pains', but as though this were because of the nature of pain, of the person etc. as though, therefore, the statement were ultimately a statement about the nature of things. So we speak for example of an asymmetry in our mode of expression and we look on it as a mirror image of the essence of the things" (Wittgenstein 1993: 208–209). In contrast, Wittgenstein argues that such statements are not about the nature of pain but are grammatical remarks about the use of the concept "pain". If we are in a metaphysical context, what we really want to state, when applying such an expression, is that we do not want the expression "pain" used in a way that allows attributing my pain to another person. And this is what he means by arguing that philosophical problems are purely conceptual and that they can only be dissolved once we apply conceptual frameworks, consisting of rules that would forbid such uses as "I have his pain", "Two persons can have the same pain", etc. Sticking to a system of rules that determines the meaning and thereby the use of expressions in a particular context or language game will prevent misunderstandings due to possible semantic ambiguities that arise without such a catalogue of governing guidelines.

L’image de l’Autre

Entre fantasme et réalité dans *al-Hayy al-Lâtîni* (Le Quartier Latin) de Suhayl Idrîs

Introduction

Commençons par dire qu’il s’agit, dans *Le Quartier Latin*,¹ de l’histoire d’un voyage qui a pour point de départ l’Orient, pour point de transition l’Occident, et enfin pour point de retour l’Orient. Si ce voyage est appelé par Elias Khouri “structure circulaire” (1990: 104), l’Orient étant à la fois point de départ et de retour, il est, à nos yeux, avant tout, une quête d’identité. En effet, le départ, à ce niveau, correspond à la volonté de chercher un nouvel espace, propice à l’émancipation d’un système omniprésent en Orient; à un niveau plus profond, il s’agit, pour le héros, de partir à la recherche d’un nouveau système de valeurs après avoir rompu avec le système autochtone.

1. La femme occidentale dans l’imaginaire du héros

Nous allons analyser l’attitude adoptée par le héros pour décoder la réalité occidentale à laquelle il va être confronté durant son expérience parisienne. En ce qui concerne l’Autre, précisons dès maintenant, qu’il s’agit, dans le roman exclusivement, de la femme occidentale, représentée par plusieurs acteurs (la fille du cinéma, Zînâ, Liliane, Marguerite, Jeannine, etc.), car à travers l’itinéraire de son expérience parisienne, le héros recherche continuellement la femme absente de sa vie en Orient. D’ailleurs, nous constatons que l’absence quasi-totale, tout le long du roman, des acteurs masculins occidentaux, est compensée par la présence diversifiée de la femme occidentale. L’image de celle-ci nous est dévoilée lorsque le héros se lance dans une expérience et accepte l’invitation de son ami Kâmil à une surprise party. Au cours de cette première soirée typiquement occidentale, il fait

la connaissance de quelques filles françaises. Bien qu'à ses yeux, Suzanne, Jeannette et Hélène soient belles, il trouve Zînâ aguichante. En lui serrant la main, il sent qu'elle la lui serre très fort. Embarrassé, il ne comprend pas ce que signifie cette manière de saluer: "En la saluant, il avait senti que Zînâ pressait sa main comme si elle désirait la retenir dans la sienne, ou peut-être était-ce lui qui ne savait pas saluer chaleureusement" (20).

2. La poignée de main ou l'incompréhension gestuelle

Voilà une incompréhension qui mérite d'être examinée. Constatons que l'intensité du geste (serrer très fort la main) fait de la part du héros l'objet d'un faire interprétatif qui manifeste son incapacité à décoder correctement le message culturel contenu dans ce geste. Tantôt, il considère que l'intensité de ce geste exprime le désir de Zînâ, tantôt il l'interprète comme normale, et considère que c'est lui qui ne sait pas serrer la main d'une fille de manière chaleureuse. En effet, le geste de se donner la main peut avoir diverses significations sociales, en fonction du contexte culturel dans lequel il s'inscrit. En l'occurrence, la différence entre les deux cultures mises en communication (orientale et occidentale) fait du décodage de cette gestualité une opération complexe. D'autant plus, que le fait de se serrer la main est, dans la plus part des sphères sociales orientales, réservée aux hommes. Certes, ce geste commence à se répandre dans les milieux citadins et surtout là où la mixité est omniprésente "on y voit souvent un homme qui serre la main d'une femme", mais il n'en a pas pour autant acquis une signification unique et demeure, par conséquent, ouvert aux interprétations qui varient avec les individus et les situations. C'est cet écart culturel, séparant l'univers du héros et celui de Zînâ, qui provoque la double interprétation dont nous venons de faire état.

3. De la danse à la jalousie ou du gestuel au passionnel

Une autre manifestation de cette incompréhension des comportements occidentaux est illustrée par le fait que le héros hésite à inviter Zînâ à danser, de peur que cela ne provoque la jalousie de son ami Kâmil. Cette hésitation ne va pas durer longtemps, parce que Zînâ prendra les devants et parce qu'un nouvel acteur, qu'on appellera arbitrairement la voix intérieure, intervient et rappelle au héros qu'ici, à Paris, toutes les filles dansent

avec tous les garçons et que le sentiment de jalousie n'a pas de sens dans ces conditions, si bien qu'il se laisse faire: "Regarde-la, elle désire danser avec toi, non, ne crains rien et ne sois pas stupide. Ici, il n'y pas de place pour la jalousie. Tous les garçons dansent avec les filles" (23).

Ceci dit, il convient d'analyser le rapport imaginé par le héros entre la danse, en tant que faire gestuel réunissant deux participants – lui même et Zinâ – et le sentiment de jalousie que cette conjonction est susceptible de provoquer chez l'ami Kâmil en tant que spectateur.

4. La jalousie dans la sémiotique des passions

Nous commençons par l'analyse de la jalousie amoureuse, en ayant recours à Greimas et Fontanille qui, au vu des dictionnaires, retiennent que "la jalousie, en tant que passion, se situe à l'intersection de deux sentiments; l'attachement à un sujet humain, et la rivalité" (1991: 191). Dans notre texte, nous retrouvons ces deux sentiments: d'une part l'attachement de Kâmil à l'égard de Zinâ, de l'autre la rivalité possible entre Kâmil et le héros. Or, dans la définition même de la jalousie, l'attachement correspond au "désir de possession exclusive" (ibid.: 200–205) et si la notion de possession nous renvoie, à son tour, à l'idée d' "avoir" jouissance de ..." il s'en suit que le jaloux éprouve de la souffrance, du fait que son rival, non seulement est en possession de l'objet/sujet aimé, mais, de surcroît, en jouit. Nous allons voir que c'est bien cette définition de la jalousie qui est en cause dans notre texte. Pour vérifier cette hypothèse, nous allons procéder à l'analyse de la conception que le héros se fait de la danse.

5. La danse et la conjonction sexuelle

En examinant la scène de danse qui réunit le héros et Zinâ, nous constatons que:

a) La danse, parce qu'elle permet le rapprochement, voire le contact somatique des deux participants, est jugée par le héros comme équivalent à la conjonction d'ordre sexuel: "En la serrant contre lui, il sentait ses seins qui frissonnaient" (24).

b) Cette conjonction, illustrée par l'expression "avoir une fille dans les bras", est vécue par le héros comme une possession: "Une femme dans

ses bras, plein les bras.... Une femme qu'on désirait. Une femme qu'on en embrassait follement sur les lèvres" (24).

c) Le héros, en tant que sujet de la prise de possession, n'est pas seulement un sujet de faire qui vise la conjonction avec Zînâ, mais un sujet qui, en étant conjoint, vise à satisfaire son désir sexuel. Une telle conception de la danse ne fait qu'orienter l'imagination du héros vers une scène où sa conjonction avec Zînâ ne peut que provoquer la jalousie de Kâmil. C'est pour cette raison que le héros renonce à inviter Zînâ à danser, de crainte que Kâmil souffre, en le voyant jouir de sa conjonction avec elle. Or, cette souffrance n'est autre que la jalousie. Cela nous donne le droit de dire que le rapport entre le faire pragmatique et imaginaire "danser" qui met en scène le héros et Zînâ et l'état passionnel virtuel la jalousie de Kâmil trouve aisément son explication dans l'image que le héros s'est construite de la femme occidentale. A ses yeux, celle-ci correspond à un sujet dont le corps, les seins et les lèvres n'ont d'autres fonctions que de donner du plaisir à l'homme. Mais, la réalité qui définit Zînâ comme un sujet libre qui dispose de son corps intervient et lui démontre l'illusion de l'image qu'il a de la femme occidentale. En fait, au cours de la danse qu'elle va lui accorder par la suite, Zînâ, et d'une manière inattendue, se détache de lui et regagne Kâmil dans la cuisine. Le héros découvre, avec amertume, que la femme occidentale représentée par Zînâ, ne correspond pas à l'image qui la réduit à un objet sexuel. Mais cette déception ne l'empêche pas de se lancer dans une nouvelle aventure qui aura pour lieu une salle de cinéma.

6. Fantômes sexuels d'Orient et réalité occidentale: De la manipulation sexuelle à l'amour passionnel

Après l'échec survenu au cours de la surprise party, une réflexion vient à l'esprit du héros:

Une longue semaine passée à Paris, et tu ne rencontres que déceptions en ce qui concerne la femme, n'importe quelle femme. Une longue semaine durant laquelle un feu brûle dans ton corps, et dans ton imagination mille images de femmes nues, allongées sur le lit qui piquent ton esprit et ton corps de mille langues de feu. (28)

C'est dans ce contexte que s'inscrit l'aventure de notre héros avec la fille du cinéma: il décide d'aller voir un film qui s'intitule *Demain, la vie*

commencera. Pendant qu'il regarde le film, une fille accompagnée d'un homme, s'assoit à côté de lui. Après quelques minutes, elle enlève sa veste. En la regardant, le héros ressent un frisson qui envahit tout son corps. Tout à coup, sans être conscient, il allonge sa main vers la fille pour lui toucher la main. Alors, elle tente de s'en débarrasser. Cependant, le héros n'hésite pas à lui serrer la main plus fort, et la fille se résigne et le laisse faire:

Il continuait à serrer cette douce et tendre main comme s'il s'agissait d'un trésor. Puis, elle remuait légèrement ses doigts, alors, il lui pressait la main avec un peu de dureté. Et voici qu'elle se résignait à cette dure emprise (33).

Tout à coup, une transformation située sur le plan passionnel, met le héros dans un état d'amour-passion; il découvre qu'il commence à aimer cette fille, qu'il n'a même pas vue, et suppose qu'elle commence, elle aussi, à l'aimer:

Mais était-ce vraiment possible? J'avais le sentiment étrange que je commençais à aimer cette fille que je n'avais pas vue et que je ne connaissais pas. Cette fille qui avait accepté de me donner sa main sans me connaître; cela ne prouvait-il pas qu'elle commençait, elle aussi, à avoir un penchant à mon égard. (34)

Pour un lecteur occidental, ce passage brusque du sexuel au passionnel demeure incompréhensible, surtout que le texte se contente de donner la description du faire interprétatif du héros sans expliquer ses origines culturelles. Pour surmonter ce genre de difficulté d'interprétation, nous proposons une procédure complémentaire de lecture, consistant à confronter le faire interprétatif du héros au système de valeurs oriental auquel il se réfère.

7. L'approche du corps féminin et l'amour en Orient

Il s'agit de voir comment l'approche du corps peut produire l'amour chez un Oriental. En fait, le système de valeurs oriental considère le corps de la femme, non seulement comme provocateur de scandale, mais encore comme sacré. D'où le devoir de protéger la femme et de la remettre à l'homme apprécié de la famille, lors d'une cérémonie de mariage accompagnée de tout un rituel (as-Saadaoui 1983: 296). La société orientale, pré-

occupée par le souci de protéger la femme, a instauré la séparation entre les deux sexes, ce qui entraîne une restriction de l'espace de rencontre, donc de la communication entre l'homme et la femme.

Mais cela n'a pas empêché le développement d'un autre genre de communication non-linguistique, d'une communication gestuelle dont le regard, comme nous l'avons vu, est le moyen par lequel cette relation se noue. "D'où cet amour à distance, fondé presque exclusivement sur le regard ou sur l'ouï-dire et qui se nourrit de phantasmes de l'imaginaire, puisque la moitié de la société passait son temps à dissimuler l'autre moitié à sa propre vue, tout en cherchant à l'imaginer. L'amour peut naître d'une description, d'un portrait" (Bouhdiba 1986: 54). Et comme l'amour peut naître d'une communication gestuelle à distance, il est plus probable encore, qu'il naisse d'une communication gestuelle rapprochée entre un homme et une femme. C'est le cas de notre héros et de la fille du cinéma, surtout que celle-ci accepte que le héros lui touche la main et ne manifeste aucune résistance.

8. *La passivité de la fille vue comme signe d'amour*

Une telle approche permet de constater que pour comprendre l'attitude de l'Autre, en l'occurrence la passivité de cette fille, le héros ne peut que se référer à son propre système de valeurs qui y voit la preuve d'un amour-passion. Vu sa conception globale de la fille occidentale, notre héros ne peut que lui faire confiance, en tant que sujet contraint de respecter le contrat imaginaire qui consiste à /devoir satisfaire l'homme/. D'autant plus que ce minimum de confiance lui était indispensable pour l'établissement de sa communication avec la fille (Saadaoui 1970: 122).

Après quoi le héros lui glisse une carte dans laquelle il lui propose un rendez-vous, devant l'entrée du cinéma, le lendemain à 8h du soir. Mais le fait que la fille ne donne pas suite au rendez-vous fixé nous montre qu'elle a laissé faire le héros, non parce qu'elle était amoureuse de lui, mais pour d'autres motifs que nous ne connaissons pas. Ce constat nous permet de surmonter la difficulté qu'il y avait à analyser les gestes de la fille et nous montre qu'il existe deux sujets que celle-ci assume en même temps: (1) *sujet réel* qui produit les gestes; (2) *sujet imaginaire* que le héros a créé, et auquel il attribue ses propres interprétations concernant cette gestualité. Com-

ment réagit le héros lorsqu'il découvre que l'idée de "la fille amoureuse" n'est qu'une illusion?

9. De l'humiliation à la vengeance

Suite au rendez-vous fixé, le héros se présente devant le cinéma à l'heure prévue.

Il l'avait entendu chuchoter (oui). Alors, il avait compris qu'elle acceptait le rendez-vous qu'il lui avait fixé." (36) Après avoir attendu la fille une quarantaine de minutes, il se rend compte qu'elle ne viendra pas. Le voilà qui quitte le cinéma, déçu et humilié:

Et lorsqu'il décida, désespérément, de quitter la place, il marcha à pas lents vers le boulevard St Michel, tout en ayant un sourire stupide qui ne tarda pas de contracter son visage et de se transformer en une rage... Humilié et convaincu [qu'elle l'avait trompé], il poursuivit son chemin, puis soudain, furieux, il s'arrêta. Non, je n'ai pas besoin de pitié. Je suis plus fort que la pitié et je m'en moque... Mais qu'est ce que tout cela veut dire, et à propos de quoi? N'est-ce pas pour justifier ta déception? (40-42)

10. Déception ou l'aboutissement négatif d'une attente

Or, nous savons que toute déception n'est, en fait, que l'aboutissement négatif d'une attente. En l'occurrence, l'attente de notre héros n'est pas un simple souhait qui se réduit au plaisir sexuel, mais tout un programme virtuel qui consiste à se libérer de l'emprise du système de valeurs oriental. Notons également que cette attente est liée à l'idée de confiance; le héros pense pouvoir compter sur la femme occidentale. Dans son imaginaire, elle est, comme nous l'avons vu, la femme qui voue sa vie à satisfaire l'homme. Et la fille du cinéma n'est autre qu'une fille occidentale, il lui fait confiance et ne peut admettre qu'elle peut manquer son rendez-vous avec lui. Or, ce simulacre qu'il s'est construit de la femme n'a pas résisté à la réalité des faits. Déçu, le héros perd confiance en la fille du cinéma, et d'une manière générale en la femme occidentale: "Ne convient-il pas que tout jeune homme qui rencontre l'une d'elles, s'en méfie, dès les premiers instants? Car, elle le trompera au tournant de la rue." (42)

11. Humiliation ou perte de confiance en soi

Par ailleurs, l'humiliation, en tant qu'offense, perturbe l'image que le héros a de lui-même. En effet, il n'a plus confiance en lui, en tant qu'homme indépendant. Dans les deux cas (déception, humiliation), il s'agit d'une crise de confiance, dans le sens où le héros perd confiance aussi bien en lui qu'en la femme occidentale. Alors, pour liquider ce manque de confiance provoqué par le rendez-vous manqué, le héros décide de se venger de la femme occidentale et de la punir.

Est-ce qu'elles méritent respect toutes ces filles françaises qui mènent une vie frivole et vide? ... Ce qu'il convient d'en faire, c'est de la [une fille française] prendre dans ses bras, de la presser, d'en sucer la douceur et ensuite de la jeter comme l'on jette un noyau. Et il verra après que c'est elle, la pauvre, qui fait pitié. (42)

12. La vengeance ou la recherche d'un équilibre

La vengeance, formulée ainsi, est non seulement le désir de se venger, mais une action qui implique deux sujets et qui cherche à rétablir entre eux un équilibre perturbé à la suite de l'offense (Greimas 1970: 122). En fait, le héros veut faire souffrir la femme occidentale, incarnée par la fille du cinéma, comme il a souffert; il veut l'humilier comme elle l'a humilié, en lui faisant croire qu'elle l'aime. Ceci dit, il convient de nous interroger sur la nature de cette vengeance. Celle-ci consiste, comme la définit le héros, à prendre la femme occidentale dans ses bras, la presser pour en sucer toute la douceur, et la rejeter ensuite comme on rejette un noyau. Autrement dit, en la comparant à un noyau, le héros décide de dévaloriser la femme occidentale. Ainsi, elle sera dépréciée par le premier acte sexuel, et les suivants accéléreront cette dévalorisation jusqu'au moment où elle sera comme un noyau qu'on jette, après avoir mangé le fruit. Non seulement le héros fait de cette vengeance son propre programme, mais il veut en faire un programme canonique qui doit régler toute relation entre l'homme oriental et la femme occidentale.

13. *L'acte sexuel et la contre-agression*

Dès lors, l'acte sexuel, source de plaisir, devient pour le héros, une contre-agression et prend la forme du combat et de la guerre. Notons que cette notion de "combat amoureux" n'est pas nouvelle, dans la mesure où elle est l'un des thèmes principaux de la littérature érotique. En effet, la relation entre l'amour et la guerre est étroite, car, comme le constate Pierre Guiraud:

il y a un parallélisme évident entre les deux situations; dans les deux cas, nous avons: a) deux adversaires, deux individus placés l'un en face de l'autre; b) une agression au moyen d'un instrument pénétrant; c) une pénétration de l'arme dans le corps, ou autre thème; pénétration de l'attaquant dans la place de l'attaqué, avec invasion, prise de possession ou/et soumission de cette dernière. (Guiraud 1978: 119)

Ajoutons que l'itérativité de l'acte sexuel, pris par le héros comme un acte de guerre, a pour but d'anéantir l'adversaire qu'est la femme occidentale. Certes, cette vengeance conçue comme une contre-agression, comporte, de ce fait, une activité somatique – acte sexuel – mais cela n'empêche qu'elle se définit, tout de même, par les effets passionnels éprouvés par l'adversaire (ibid.)

En ce qui concerne le déroulement du programme de vengeance, nous allons voir si ce désir de vengeance restera à l'état de rancune, sans que pour autant ce programme virtuel conduise à un faire, ou bien s'il se déroulera dans les faits. En fait, le héros ne tarde pas à prendre sa revanche, en se dirigeant vers Pigalle, il rencontre une prostituée. Avant l'acte sexuel, il affiche son intention de mettre son programme de vengeance à exécution.

Il prit le métro vers Pigalle. Et lorsqu'il descendit à la place Pigalle, il aperçut, non loin de lui, une fille qui se déhanchait [...] Mais, tu ne vois pas? Elle est l'une des filles de la rue, une fille de trottoir, comme on l'appelle ici. Peu importe. Il lui adressa quelques paroles, l'emmena au bar où ils burent du vin. Puis elle le conduisit à un hôtel. Oui, je la presserai, et je la presserai, puis je la jetterai comme un noyau. (43)

En conclusion, en réalisant son programme de vengeance, le héros a voulu créer chez son adversaire l'état passionnel d'humiliation, donc de douleur. Du moment que nous avons reconnu que cette vengeance est d'ordre passionnel, la liquidation de la souffrance éprouvée par le héros

ne peut être que la douleur qu'il inflige à la femme occidentale représentée par cette prostituée. Une fois cette vengeance assouvie, le héros poursuit sa quête de liberté à travers l'aventure sexuelle. En analysant le parcours du héros, tout au long de ces séquences, nous avons constaté qu'en dépit des déceptions qu'il connaît lors de ses aventures amoureuses et qui trouvent leur explication dans l'incompatibilité entre la réalité de la femme occidentale et l'image qu'il fait d'elle, le héros réalise un progrès significatif sur le plan de sa libération sexuelle. Cette émancipation à caractère sexuel une fois réalisée, nous relevons le premier tournant dans le roman: de purement sexuelle qu'elle était, l'émancipation recherchée par le héros se veut désormais aussi passionnelle et acquiert ainsi un contenu nouveau. Ce qui méritera une autre analyse qui pourrait faire l'objet d'une autre intervention dans l'avenir.

Semiotic identity of a performer

Endo- and exo-signs in the art of interpreting music

In this article I apply the theory of existential semiotics to the field of musical performance, to show that analysis of many socio-musicological issues can be significantly expanded and enriched by approaching them from a semiotic perspective. Issues concerning artistic *Umwelten*, authenticity, and the semiotic subject already proved to function well in relation to musical performance. But the concept most capable of broadening discourses on music performance practices, and the new meanings they create, is that of the *Semiotic self*.

Here, the concept of Semiotic self is applied in analysing the balance between artistic subjectivity and culturally-determined standards in the art of music performance. It is combined here with the code, or principle, of *Me-Tone (Ich-Ton)*, borrowed from Jakob von Uexküll. By determining the characteristics – the identity and individuality – of a particular organism, the concept of *Me-Tone* suggests further revelations concerning the performer's art. We assume that each interpreter of music has one or more characteristic features, a kind of "semantic gesture" (*Me-Tone*), which dominate his or her interpretation and distinguishes it from others' performances. Despite having these immanent personal qualities, however, an artist is significantly influenced by the full social and cultural background forming his or her social identity. Moreover, a person may accept just certain parts of his/her environmental norms, and refuse, or resist, the others. Thus, a continual dialogue is established, between the inner self and the outward identity, the spheres of a performer's *Moi* and *Soi*, the individual and collective subjectivities.

Using Eero Tarasti's theory of the performer's subjectivity as a model, and his four logical cases derived from Hegel and Fontanille (see Tarasti 2005), I examine the standards and subjectivity of twentieth-century Russian pianists interpreting music of Ludwig van Beethoven. Three *Me-Tones* are involved in this artistic discussion: the composer himself, the prominent Russian piano school (with the standards it has set for its practitioners), and the individual performers. To start, let us briefly reflect upon what might have been considered in music history as the inner identity, the *Moi*, of Beethoven's music, and how it was perceived in Soviet Russia.

1. *The composer: Beethoven in Russia*

Although the reception of art is always political and ideological at some level, the history of Beethoven reception has been especially distinctive by the explicit social appropriation of his music and the ideological monumentalising of his figure as a spiritual hero. Such was especially the case in twentieth-century Russia, a country where art and politics were so intertwined and ideological viewpoints so dominant that a separation of the issues was virtually impossible. The question particularly important here is how Beethoven, being the representative of, first, a German nationalism, and, second, the bourgeois era, has functioned in a country that has just experienced such enormous cultural and political shock. How was it possible that this composer was allowed to remain in the repertoires of Soviet musicians, and was so much admired in this country? Russia's attitude towards Beethoven had been rather unique since the nineteenth century, when Russian musicians were absorbed with Beethoven studies. After the Revolution, a new element was added – the identification of Beethoven's personality and music with revolutionary ideals. Boris Schwarz observes in his key study on musical life in Soviet Russia: "The idolisation of Beethoven as a revolutionary hero became a Soviet obsession, stimulated by Lunacharsky, Asafiev, and many other authors" (Schwarz 1972: 93).

There is no need to discuss here all the subtle changes in the political circumstances of the Soviet era. Perhaps it would be enough to mention that the most important aesthetic doctrine in the country since the year 1934 was that of Socialist realism. Espousing revolutionary aims in the socio-political sphere, and yet adopting a conservative canon of aesthetic values, in musical terms this doctrine resulted in the favouring of such

forms as the program symphony, the dramatic cantata and similar “narrative” genres, that could range from private suffering to reaffirmed social values. Naturally, a connection could be made with the Promethean works of Beethoven’s middle period. “Naturally” because for a long time, and not only in Russia of course, the dispute over meaning in Beethoven’s instrumental music has centred on a single issue: whether or not it has any “extra-musical” significance. In the course of time, as Scott Burnham argues, the original teller of a heroic story (Beethoven himself) has become *the protagonist* of a similar story – “a romantic hero”. Beethoven-reception treated him as the subject of his heroic-style works, bringing him through a similar trajectory of struggle and renewal to a point of apotheosis. The understood meanings of the *Eroica* and the act of its creation have merged, establishing a symbolic conjunction of the work and the artist (see Burnham 1995). Thus, no wonder that the meaning firmly conferred on Beethoven’s personality and his music in Soviet Russia was that of a revolutionary hero. How important the existential values embodied in Beethoven’s music were to certain ideologies can be seen from the fact that the symphonies and other works by Beethoven have been repeatedly used at various political events, and always perceived as occupying a moral high ground. In semiotic terms, it is possible to state that the features of Beethoven’s music accepted by Russian music theorists and practitioners were entirely taken from what they imagined to be his *Moi*, so deeply dominated by the Greimassian modality of Will, and rejecting anything related to societal norms, the *Soi*, all the Know and Must that Beethoven mastered so well.

In writings by the most influential music critic and theorist of the post-revolutionary period, Boris Asafiev, another interesting point emerges, something particularly suitable for the Bolshevik ideology. In one of his numerous articles Asafiev argues that Beethoven was perhaps the first composer-individualist, composer-citizen, i.e., not dependent on the church or on any aristocratic patronage. Emphasis is put on the assumption that only this individualism could raise music to such heights of psycho-realism and pictorial potential (these are all terms that Asafiev used in his writings, referring to Beethoven’s creative output). In other articles, the sense of “collectivity”, of patriotism in music (especially in a mass song, which was one of the most important genres at that time), is said to have its roots in Beethoven. Moreover, the sources of inspiration for Beethoven’s “mascu-

line rhythmic images” and melodies are the songs and theatrical life of a revolutionary in Paris (see Asafiev 1957).

Here I shall examine two phenomena that were accomplished amid this passionately ideological atmosphere: the ongoing Russian political and theoretical admiration of Beethoven, and the formation of the strong and distinctive Russian piano school through the course of the twentieth century. The impact of the strong ideological-aesthetic-pedagogical environment on the interpreter, and on the latter’s individuality, is of particular interest when one analyses performance practices from a semiotic point of view.

2. *The school: Russian piano performance tradition*

However vague the question of a national school might be nowadays, the idea of “the Russian piano school” is definitely not a term coined for the sake of this article. Even though the notion of the “school” has changed over the course of time, as has its influence on individual pianists, this term is still widely used, especially in the case of the Russian tradition. Due to the country’s comparative isolation through more than half of a century, Russian pianists were following a tradition with roots in the Romantic era, thus forming a highly specific school, in contrast with western pianism of the same time. Moreover, in Russia, the bonds of the student-teacher relationship are much stronger than anywhere else. Unlike American piano students, for example, who are encouraged to add as many names of teachers as possible to their resumes, Russians rarely have more than two teachers, and sometimes only one. Moreover, the concept of the “Russian school” still serves well as a commercial label, for instance, in the series of CDs issued by the Russian company Melodiya.

However, defining the *Me-Tone* of a certain school might indeed be considered the most dubious point of any research, and this is so for several reasons. Most of all, it is difficult to specify fundamental features of an “organism” that is so heterogeneous and that changes constantly. How does one define the *Moi* of a “school”? Does it depend on the mentality of the people living in a certain geographical space, under certain specific social or cultural circumstances, or is it their immanent physical qualities? We might assume that there exist several specifically “Russian” features,

immanently characteristic to pianists born, or – what I consider much more important – trained in this part of the world.

Subjective penetration into the inner world of music, beauty of sound, extraordinary melodiousness and extension of piano sound, a wide range of emotional and dynamic contrasts – all these features constitute the distinction of the Russian piano school. A somewhat mysterious, “Russian technique” has been posited; but even so, I would say that the artistic image, creative hearing and intonation, and embodiment of a certain idea in one’s performance have always been more important to Russian performances. Also, extremely important in the Russian pedagogical system, from a purely technical point of view, are ways to use the natural weight of the arm, to hold the body in a relaxed state to create phrases – these, too, may make Russian pianists sound “different”.

What is the *Soi* of this school? Its surrounding ideology? A particular kind of training? Traditional training of young Russian players has indeed proved to be highly beneficial and successful. The fact that each virtuoso in the school was expected, in turn, to devote part of his time to teaching insured the continuance of tradition. In addition to the aforementioned technical aspects of the teaching, the cultural context is extremely important for Russian teachers. A great deal of literature, art, and cinema examples is always used in their lessons, and this undoubtedly contributes to creating imaginative minds in future virtuosos. We should also not forget the impact of prominent theorists on the art of performers. Boris Asafiev’s writings on “intonation” come to mind. Indeed, a very precise intoning, close attention to every phrase, a singing, “vocal-expressive” style are among the features of the Russian school. As also evident there is the reception of Beethoven as “powerful”, “enthusiastic”, “massive”, “gigantic”, “flying onwards”, “stormy”, “passionate”, “revolutionary”... these are all the terms by Asafiev used to describe Beethoven’s creative output (see Asafiev 1957).

In what follows, we shall see how concepts borrowed from existential semiotics contribute to the analysis of musical performance. The third *Me-Tone*, the one of the individual performer, is discussed below, through a semiotic approach to the subjectivity of a performer.

3. *The performer: Semiotic self*

Many authors have dealt with the concept of Semiotic self, which consists usually of two aspects of the subject: an inward and an outward side. Among these dualities, we have, for instance, the “I” (self as such) and “Me” (“I” in the social context), as used by George Herbert Mead; *Moi* and *Soi* by the French authors (Ricoeur, Sartre, Fontanille); Controlling, deeper self versus Critical self, by Charles S. Peirce; or the Bergsonian differentiation between the “superficial” and the “deep” ego. In the domain of semiotics of musical performance, Naomi Cumming has reflected deeply upon what might constitute a performer’s identity, in terms of “an outward and an inward face”.

The process of musical semiosis (also in the art of musical performance) is affected by many cultural, social and psychological factors. Artistic identity, interpretative choices, mental and physical selfhood of a performer are determined by various circumstances such as personal background, the artist’s physical characteristics, stylistic requirements of a musical work, constraints of a particular tradition, etc. As stated above, every performer possesses a certain “semantic gesture” that distinguishes his or her interpretations from other performances. On the basis of this semantic gesture, the performer’s *Me-Tone* as it is called in this article, we can speak of two kinds of signs: endo-signs and exo-signs, inner and outer characteristic features that dominate one’s interpretative choices and constitute a performer’s semiotic identity.

To provide these reflections with a more structured shape, a semiotic model is employed here, which serves as an illustration of the inner and outer influences, individuality and standards underlying the creative work of a performer. The scheme in Figure 1 is elaborated from Tarasti’s semiotic square of performer’s subjectivity and his four logical cases in the light of Hegel and Fontanille. The *Moi* side of the performer’s self is related here to the Greimassian internal (endogenic) modalities Will and Can, while the *Soi* part of one’s identity is reflected by the external (exogenic) modalities Know and Must, thus encompassing all the spheres and categories through and in which the performer’s art is communicated.

Being-in-myself (Greimassian modality of “will”) means an inner identity (*Moi*) of a performer. This part might include a personal (family)

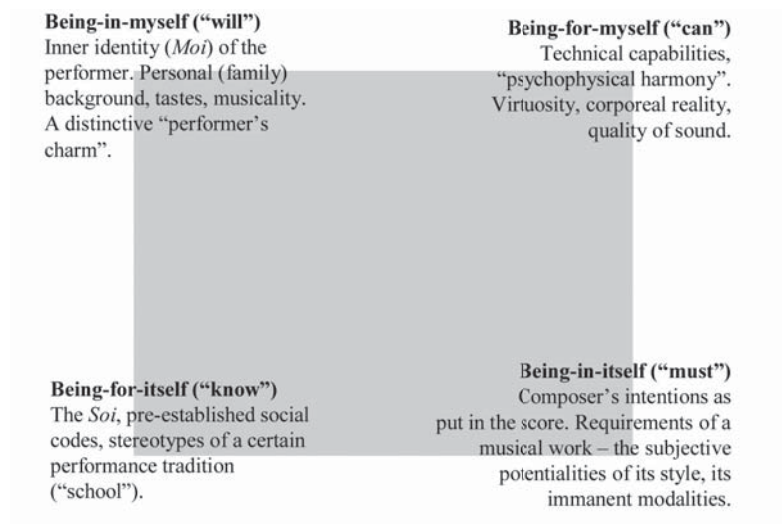

Figure 1. Individuality and standards in the performer’s art (after Eero Tarasti’s theory of subjectivity).

background, tastes or religiousness, if any. It also encompasses the person’s musicality, together with a distinctive “performer’s charm”, or charisma.

Being-for-myself (“can”) embraces the performer’s technical capabilities, “psychophysical harmony”. Virtuosity, corporeal reality, a certain quality of sound, realised in performance, are also included here.

Being-for-itself (“know”) or the *Soi* of a performer, consists of pre-established social codes, stereotypes of the given performance tradition (school); usually, manners of playing are rated according to certain criteria, with some adjudged better than others.

Being-in-itself (“must”) means the composer’s intentions as put in the score, the work’s immanent modalities. It is something called out by the requirements of a musical work – the subjective potentialities of its style which, if absent, would not allow the work to “live”.

It is relevant here to apply this scheme to the art of performers, in reference to some specific circumstances and tastes during Soviet times.

It is surely difficult to categorise the manifestations of the “will” modality – this would be possible only by discussing individual artists. In general, however, this modality, and in principle the *Moi* side of a performer’s art, forms the core of the Russian piano tradition. Indeed, a highly Roman-

tic approach to performance is a characteristic of the mentality of Russian pianists – many of whom may be considered “magnetic” individualists. Further analysis of this first angle of the semiotic square would also consider ethnic and ideological identities of the Soviet performers.

The modality of “can”, which embraces the performer’s technical capabilities, also receives much emphasis in the Russian piano school. A rather athletic perception of professionalism is evident in the case of Russian pianists, as is the fact that a large sound and tempo extremes prevail in their performances. Specific features of a particular instrument also belong to this modality, and they are important for the Russian piano tradition, which especially pursues a *cantabile* quality of the piano.

This brings us to the third modality, that one of “know”. Varied as the individual pianists of this school were and still are, they tend to follow the Romanticist piano tradition. Consequently, they concentrate on tone and timbre, on deep, swelling, and as mentioned above, *cantabile* sound. Conveying extra-musical meaning is important, representing the illusion of romantic mystique. Depending on the artist, the latter ranges from powerful emotionalism to meditative contemplation, from profound reflections to extrovert brilliance. The “know” modality represents also the idea of the institutional school itself. And in Russia, the bonds of the student-teacher relationship are especially strong, perhaps overly so.

Finally, we reach the modality of “must”, and this is the angle of the square where the composer’s identity comes to the fore. The analysis of this semiotic aspect of performance surely has to take into account particular works of music. Ideological and theoretical idolisation have undoubtedly contributed to the highlighting of romantic and heroic values in Russian-school performances of works by Beethoven. And this is rather related to another modality absent from the scheme, namely, that of “believe”, the importance of which I would like to emphasise. Of extreme importance to interpretations of his music by Russians, is precisely the epistemic value of Beethoven’s music, its persuasiveness in reception, the implicit extra-musical meanings that this music has been believed to carry to performers and listeners. It is this value that prompted Asafiev to describe Beethoven’s music as “true speech”.

4. Further steps

Having acknowledged the existence of a certain “collective identity” and assuming that it may affect the process of performative signification, a further step may be taken by empirical research, which is most of all related to the “subjective identity” of the individual performer. It requires registering carefully all the subtle differences among various interpretations, finding each interpreter’s particular ways of modalising, and trying to find the connections between this modalisation and the internal semiotic paradigm of certain musical works. In this way, it is possible to reveal how, in the case of this “Russian Beethoven”, the uncompromising Beethovenian *Moi*, his individual subjectivity, interacts with both the subjective and collective identities of a performer.

And, finally, of particular interest in the case of the “Russian Beethoven” is that conjunction of musical, personal and existential qualities needed for communication to become possible between the endogenic aspects of the several *Me-Tones*. Thrown into the flow of passionately Romanticised interpretations, the *Moi* of this creator, in belonging to a certain cultural and ideological context, has gained a remarkable universality. A mystical and powerful aura, adoration, and the constructing of doctrines or beliefs that mould our imaginations about this artist have kept evolving, from his lifetime up to our days. This has enabled interpreters of various ideological and aesthetic concepts and trends, and from different cultural epochs and performing styles, to claim this music and the extra-musical meanings surrounding it as being *theirs*.

Leopoldo Neri de Caso

An approach to the poetics of the guitar

The influence of Lorca's poetry in Regino Sainz de la Maza's *Petenera*

Spain became important to artists at the end of the nineteenth century and beginning of the twentieth century. This influence had its musical parallelism when composers of romantic nationalism looked for melodic and rhythmical material in music for Spanish guitar. That exogenous vision of the instrument was another element that allowed Spain to be considered an *imagination colonizer* (cf. Tarasti 2001: 155). Antonio Machado (1975: 128) synthesized this situation in these verses:

Tu eres alma que dice su armonía
solitaria a las almas pasajeras ...
Y siempre que te escucha el caminante
sueña escuchar un aire de su tierra.

In this article, I make no claim to an exhaustive study of guitar references in the music of that period. Rather, I shall investigate, from a semiotic musical analysis, certain guitar-narrative elements, how they are used, and the musical contexts in which they appear.

1. Context and circumstance

Carlos Mainer (1999: 9–16) chronicled the Silver Age in Spanish letters between 1902 and 1930. This cultural exuberance had its negative counterpart in a debilitated political and economical situation, as well as in an unbalanced society. Nevertheless, for the first time, the music was integrated actively within Spanish artistic and intellectual society. Music came to be admired and enjoyed by the intellectual elite. Manuel de Falla's

musical legacy influenced young composers, whose main member was the musical critic Adolfo Salazar. The influence of the new European musical aesthetic yielded revolutionary and substantial nationalistic compositions. Sainz de la Maza became a fundamental piece of that sonorous puzzle, and numerous works for guitar were dedicated to him.¹

2. Conceptual frame: *The symbolic guitar*

The piece I look at here was composed as a result of the friendship between the guitarist Regino Sainz de la Maza and the poet Federico García Lorca (Neri 2006: 95–106). To understand better the meaning of this work, it is necessary to consider the concept of the “written guitar”, that is to say, the dimension of the instrument as it appeared within Lorca’s poetic universe. The relatively brief period in which the guitar flourished, as well as its subsequent renaissance, were noted by García Lorca (1996: 1281–1282): “No es posible que el hilo que nos une con el Oriente impenetrable quieran amarrarlo en el mástil de la guitarra juerguista”. The poet contributed to the Spanish musical restoration in several ways. His poetry was used by numerous composers, and Lorca himself was a promoter and entertainer of musicians of that period. Thanks to him the music was heard by a general audience; he moreover created one of the best examples of folkloric music with his *Trece canciones españolas*. That “written guitar” had already appeared in Lorca’s early poetry, *Fantasia simbólica* (1917), which includes various *clichés* from the end of the nineteenth century:

El color de todo era azul, plata y rosa.... Unas guitarras, sonaban desgarradas y sublimes. Sus bordones eran gitanos de amor y pasión. Las flores de los balcones estaban abriéndose y los gallos hablaban unos con otros. (Lorca 1996: 40)

The “adivinanza de la guitarra”, integrated in the *Seis caprichos* dedicated to Sainz de la Maza and included in the *Poema del cante jondo*, is seen as a new poetic trend because it includes flamenco canto hondo, traditional children’s riddles, and Góngora’s “culteranismo”. The guitar appears metaphorically, as a poetic nucleus, according to the dictates of the Ultraism and Creationism. After the “Poema de la saeta”, sung without instrumental support, comes “Gráfico de la Petenera”. The guitar is found in almost all the poems, from the first, “Campana (bordón)”, in which the death knell

is related to the bass string of the guitar, to “Muerte de la Petenera”. The guitar is a decisive element in the poem “Las seis cuerdas”, in which each metaphor is “a small enigma about desire” (Soria 2004: 266).

Las seis cuerdas

La guitarra
hace llorar a los sueños.
El sollozo de las almas
perdidas
se escapan por la boca
redonda.
Y como la tarántula
teje una gran estrella
para cazar suspiros,
que flotan en su negro
aljibe de madera.

(García Lorca 1996: 322)

Dobrian (2002: 115) considers that, in this assonant rhyme, García Lorca endows the guitar with the capacity to capture and express human pain. Lorca wrote an analogy comparing the movement of the right hand on the strings of the guitar to a tarantula: “Y, como la tarántula/ teje una gran estrella/ para cazar suspiros”. At the intertextual level, it is necessary to emphasize the metaphor of the instrument’s resonating box, seen from above, in which the “tarraja” of the guitar is the mouth of a wooden rain tank where sobs and memories well up: “que flotan en su negro/aljibe de madera”. In this sense, these verses recall the tragic image of the gypsy in the rain tank, as sung by the poet in the “Romance del sonámbulo”.²

3. *Musical analysis*³

3.1. Morpho-syntactic dimension

I try at this level to relate the formal elements of the musical text to semantic values. The piece has three interrelated *endocentral* syntagms (Ogas 2002: 37).

A. Gypsy syntagm. This 12-bar unit opens the piece with a semantic-symbolic motif that is repeated twice. It is composed of two moments of tension-release, coordinated with the rhythm of the *petenera*. This Gypsy syntagm is written on a basis of long-short “tribaco” rhythms. According to Benavente (1983: 18), these rhythms appear frequently in the Spanish song lyrics and, in particular, in Andalusian folklore, where a particular kind of triplet is often used. Both structures are combined by the composer in the well-known hemiola rhythm 6/8 and 3/4. The harmonic language is tonal, Mi Minor, displaying classic-romantic harmonic syntax and using traditional harmonic progressions. To this mix Sainz de la Maza adds the ninth chord, an impressionist influence, as a colouration of the functional harmony.

Example 1. Gypsy syntagm: semantic-symbol motif, measures 1–4.

B. Jondo syntagm. This unit, consisting of sixteen bars, uses the same rhythmical elements as the Gypsy syntagm. The term Jondo tries to express a sung song in intimacy, in which the flamenco singer attains a special state of mind, evoking the tragedy of the gypsy world. The melodic element sung in the second voice is the most important. This melodic line ascends from tonic to dominant in the main tonality; but it can also be understood as a distorted or inverted use of the Andalusian cadence (La-Sol-Fa-Mi), the lower Dorian tetrachord, the rhythm arranged in augmentations: the dotted quaver (m. 13) corresponds to crotchet and quavers (m. 15), and the crotchet (m. 14) with the half note (m. 16).

Example 2. Jondo syntagm: Semantic-symbol motif, measures 13–16.

C. Andalusian syntagm. This 16-bar unit displays rhythmical, melodic and harmonic coherence with the previous syntagms. All this reinforces

the unit of musical text. The word “Andalusian” expresses that popularly-perceived atmosphere invoked by the melodic material. Here the melodic range is reduced and the notes arranged as neighboring tones projected in anapestic rhythm (m. 36).

Example 3. Andalusian syntagm: semantic-symbol motifs, measures 33–36.

Table 1. General scheme of the petenera.

3.2. Semantic dimension: Intersyntagmatic relations

I attempt to define the semantic content of each syntagm, according to the previously explained, semantic-symbolic motifs. For this I have used Narciso Yepes' recording (1989: 423–699) of the piece, made for Deutsche Grammophon, as well as the notated score.

3.3. Pragmatic dimension: The semantic-symbolic motifs in situation

To peer further into the relations between the different semantic-symbols motifs that make up the musical text, I make several divisions. The first one is related to the register of the guitar, that is to say, the scope of three and half octaves from the sixth to the first string of the instrument. The

<i>Petenera</i> by Regino Sainz de la Maza	
Textual sequence	Concepts
Gypsy Syntagm	Energetic/Lively/ Spirited
Jondo Syntagm	Calm/Meditative/ Contemplative/ Gloomy
Andalusian Syntagm	Popular/Vivacious/ Broad

Table 2. Intersyntagmatic relations.

composer has not indicated any articulation signs, but I will delimit them using Narciso Yepes recording (1989: 423–699). Nuances not indicated in the score have been obtained from contextual characteristics, as well as from the mentioned above recording. From these I have established the following table:

Syntagm	Register	Articulation	Nuance
Gypsy Syntagm	Low	<i>Legato</i>	<i>P/misterioso</i>
Jondo Syntagm	Middle	<i>Legato</i>	<i>mf/dolce cantado</i>
Andalusian Syntagm	Treble	<i>Legato</i>	<i>f/cantado lírico</i>

Table 3. Semantic-symbolic motifs in situation.

3.4. Interpretation

In the last part of this analysis, I attempt to relate the musical text to Lorca's poetry, specifically his "Gráfico de la petenera"⁴ from the *Poema del cante jondo* (García Lorca 1996: 321–325). In the narrative-musical sequence, there is a predominance of the Gypsy syntagm, which is the substratum of the entire work. This syntagm is integrated harmonically into the rest of the syntagms. Each one of them, with its semantic-symbols motifs, tries to characterize the profile of the Andalusian gypsy, not in an exotic way, in the

manner of many composers from the end of the nineteenth and beginning of the twentieth century (e.g., Glinka, Rimsky Korsakov, Ravel). These syntagms fuse together three branches of musical art: flamenco, popular music, and highbrow music. In addition, this poetic-musical characterization of the gypsy is based on four concepts: dance, social protest, death and Andalusia.

The feeling of the Gypsy syntagm is expressed poetically in the first verses of “Danza”: “En la noche del huerto/ seis gitanas,/ vestidas de blanco/ bailan” (García Lorca 1996: 322). The dance, as a vehicle of gypsy expression, is accompanied by *cantaor* (singer) and guitar. Lorca enhances the dance through the poetic contrast of the night with the white clothes of the gypsies; in addition, there is a parallelism between the number of dancers (six) and the meter of the petenera, as well as the number of strings of the guitar. Sainz de la Maza translates the dance into music with rhythms that endow the piece with force when they are played, on the ictus parts, as a recreation of the *taconazo* (kick with the heel) of an imaginary gypsy dancer. The resultant poly-rhythm outlines the typical misfortunes associated with gypsy witchcraft.

The subhuman life of the gypsy makes him protest loudly. This protest appears as a song, and the mournfulness that surrounds it is expressed by Lorca in his poem “Falseta”, and by Sainz de la Maza through the Jondo syntagm. In the gypsy repertoire of “Cante Jondo”, the petenera is classified among the “cantes grandes” (Rios Ruiz 1972: 5–40). The melody, interpreted by the guitar, finds its poetic expression in these verses: “Ay, Petenera gitana!/ Yayay Petenera” (García Lorca 1996: 324). The constant moaning expressions are translated musically with the repetition of the same note, Mi. On the other hand, the ascending scale, typical of the flamenco petenera, culminates with a melisma on the letter “a”, translated musically by dotted half note with a chord and harmony added. This complaint connects with the recurrent subject of death: “Tu entierro fue de gente/ siniestra./ Gente con el corazón/ en la cabeza, que te siguió llorando/ por las callejas” (García Lorca 1996: 324). Death is represented musically with the minor mode, used in all syntagms, but swinging with the modal harmony symbolic of the gypsy. The life/death duality that permeates the fateful destiny of gypsy life, extends to all the poem, and to all the score.

Andalusia is the fourth subject that matches music and poetry. Lorca expresses the deep reality of the gypsy using specific elements resonant of

Andalusia: cities, like Cordova, Seville or his native Granada, “Ni Granada la que suspira/ por el mar” (García Lorca 1996: 321); the scent of orange blossoms “¿Dónde irán/ los cien jinetes andaluces del naranja?” (322), the feminine guitar and the Mediterranean sea. The poet ends up personifying Andalusia with the blood flowing in his veins: “Andalucía tiene/ largos caminos rojos” (324). Sainz de la Maza takes the Andalusian guitar, in turn, as the main vehicle of expression of the gypsy reality. And as we have seen, the composer adopts a completely Andalusian form, the *petenera*. Finally, he modifies popular melodies of the cities evoked by the poet, and collected in the *Cancionero* by Felipe Pedrell, to elaborate the Andalusian syntagm.

4. Conclusions

In the analysis of the *Petenera* by Sainz de la Maza, two interpretative approaches may be combined to obtain a more complete vision of the work. The first approach analyzes the musical language in a traditional way, which allows me to focus more deeply on the symbolic aspect. This last relates the piece to the Lorca’s poetry and inserts it within the Spanish musical culture of the first half of the twentieth century. The musical structure of the *petenera* features rhythmic, melodic and harmonic elements from Spanish folklore. Phrases are articulated by rhythms of the *petenera* (alternation of 6/8 and 3/4), which forms the basis of later melodic development. The musical text uses tonal language, complemented by modal and impressionistic influences, such as those that arise when you strum the implicit harmony in the tuning of the guitar. In the symbolic level, there is a connection between Lorca’s “Gráfica de la petenera” and Sainz de la Maza’s *Petenera*. Both works synthesize concepts-syntagms that define the Andalusian gypsy: dance, social protest, death and Andalusia, all of which complement each other. The union of both discursive levels, the musical and the symbolic, emphasizes the *jondo* art in the Spanish culture, as Manuel de Falla describes it (Falla 1988: 15–36). *Jondo* art is an element of the *imagination colonizer*, which made Spain the model to follow in Europe during the first half of the twentieth century (Fernandez [forthcoming]). Given all this, I conclude that, at the symbolic level, the Spanish values in Sainz de la Maza’s score and Lorca’s poetry become universals, constituting an indissoluble unity of cultural sources.

Notes

1. The most important scores are: *Giga* by Rodolfo Hallfiter, *Elegía-Homenaje para la tumba de Murnau* by Gustavo Pittaluga, *Homenaje a Mateo Albéniz* by Gustavo Pittaluga, *Española* by Rosa García Ascot, *Preludio y Danza* by Julián Bautista, *Toccata* by Joaquín Rodrigo.
2. “Sobre el rostro del aljibe/ se mecía la gitana/ Verde carne, pelo verde, con ojos de fría plata. Un carámbano de luna la sostiene sobre el agua” (García Lorca 1996: 420–422).
3. I have followed the semiotic methodology of Julio Ogas (2002: 35–74). In his own study, Ogas analyzes the *Sonatas* for piano by Alberto Ginastera.
4. This group of poems were selected because the “Las seis cuerdas” was dedicated, on first writing and with the title “Guitarra”, to Sainz de la Maza in the Henar Café in 1923. In his final elaboration, Lorca integrated this poem into “Grafico de la Petenera”, dedicated to the poet Eugenio Montes (Neri 2006: 104).

Capturing bodily actions by modal predicate logic

1. Modeling of a human skeleton

When an individual, a human or an animal performs an action, it takes a sequence of postures by moving its part(s). By selecting from the possible names for the set of movements in an action, we can verbalize that action. Those movements are highly dependent upon the physical construction of the parts of its performer. To more deeply understand the human modes of recognizing and verbalizing actions, we made a proposal to specify the relevant motions involved in its actions in terms of the rotations/turns around the joints of the human skeleton (Nishina 1999). When modeling the physiological joint structure into a skeleton model, we borrow a limited number of actual joints and endpoints and subsume both types of vertex under the “content vertices” of the model skeleton. With respect to an arbitrary individual, its content vertices set is the union of those of its simplified joints and endpoints: $C=J\cup EP$, where C is the set of constituent vertices(c), J is the set of joints (j), and EP is the set of end points (ep).

2. Support structure, and rotations and turns around joints

From a physical point of view, when an individual makes a motion, there remain one or more stable parts that “support” the moving part(s). When a motion is made by a body part, some joints cause other vertices to move, on that part. A whole action consisting of the movements on the relevant parts contains such causations. For one joint to cause another content vertex to move, the former needs to be supported by a third vertex, which, in turn, may be supported by a fourth, and so forth, finally grounded on the earth or its equivalent. Each movement transmits to the endpoints via

a support path from the supporting center of the skeleton, which is supported via a support path by the earth. Thus, a “support “relation underlies a motion, acting as the basis for transmitting movements to the point of operation, at which the outer causation on the referent of the object begins. We define the relation “a supports b” on an ordered pair of vertices $\langle a, b \rangle$. As a unit of movement, a “direct support” set of ordered content-vertex pairs is defined based on the notion “support” as follows: $\{\langle c_i, c_j \rangle \mid c_i \text{ “supports” } c_j, \text{ and there is no } c_k \text{ such that } c_i \text{ “supports” } c_k \text{ and } c_k \text{ “supports” } c_j\}$. Assuming that direct support is a transitive relation, we have an indirect support set by transitively connecting pairs from the direct support set. The union of the “direct” support set (dS) and the “indirect” support set (iS) is the “total” support set (tS): $tS = dS \cup iS$, where $dS \cap iS = \emptyset$

Real human joints are subcategorized into five groups or more by their modes of rotation (Zatsiorsky 1997; Köpf-Maier 1997). We, however, reduce their number and also abstract the variety of rotations into three simplified kinds of “rotation”: rotation, turn and turn’. We simulate real rotations by using the simplified types and their combinations (Nishina 2003). The connected support pairs $\{\langle A, B \rangle, \langle B, C \rangle\}$ simplify rotations as:

Rotation is the type of rotation in which the rotating vertex C, its center vertex B and the vertex A, which supports B, belong to the same plane. In this type of rotation, we say that C rotates around center B.

Turn is the type of rotation in which the rotating vertex C forms a circle whose center is always at some vertex on the edge $\langle A', B' \rangle$ extended bi-directionally from the edge $\langle A, B \rangle$, where A supports B, which supports C. Thus, C turns around axis $\langle A, B \rangle$.

Turn' is the type of rotation in which the rotating vertex C is always on the edge extended from the edge $\langle B', B \rangle$, which is virtually extended backwards from the edge $\langle B, C \rangle$, where B supports C. C turns' around axis $\langle B', B \rangle$. Thus, turn' is a special case of turn having $\langle B', B \rangle$ as its virtual axis.

One or some union of these three types is expected to cover complex cases of real rotations by the human joints. We can capture the nature of these types, by describing their definitions as (i), (ii), and (iii) in their function

- (i) B “rotates” C by acting as the center of C’s rotation. \implies (i’) iff C rotates around center B, its center B causes C to move.
- (ii) $\langle A, B \rangle$ “turns” C by acting as the axis of C’s turn. \implies (ii’) iff C turns around axis $\langle A, B \rangle$, we its axis $\langle A, B \rangle$ causes C to move.
- (iii) $\langle B', B \rangle$ “turns’” C by acting as the axis of C’s turn’. \implies (iii’) iff C turns around axis $\langle B', B \rangle$, its axis $\langle B', B \rangle$ causes C to move.

Adopting Talmy’s causative (1976), Jackendoff’s conceptual semantics (1983, 1990) and Parson’s event logic (1990), which are accommodated from Lakoff (1967) and Davidson (1967), we rewrite the transitive verbs in (i), (ii), and (iii) into “the center of rotation (the axis of turn) cause to move” and get (i’), (ii’) and (iii’). Connecting support units into a graph leads to a whole skeleton.

3. *Skeleton as a support structure and its home position*

Each body part of our skeleton is represented a set of connected support pairs, which consist of joints or a joint and an endpoint. In the skeleton’s home position, when it stands still, each joint has its default angles relative. We comment on the center of rotation. As was defined, rotation has, not an axis, but a center, which is on the line vertical to the plane containing the moving vertex, the center vertex causing it to move and the vertex supporting the center, so the center is taken as the axis of rotation vertical to that plane. Turn and turn’ have their axes, as were defined. The orientation in which these three axes are built in the skeleton is of three kinds. We categorize them as vertical (vr), seen from a person occupying the skeleton’s position, between the left and the right (lr), seen from the same person looking forward, and between the front and the rear (fr) seen from a third person standing beside the skeleton. The type of each joint with its orientation on our skeleton is as follows:

Head (He): endpoint; Top of Cervical Vertebrae (N): connecting vertex; Bottom of Cervical Vertebrae (V): joint[R/T]; Shoulder Joints ($Sh_{L/M}$): joints [R(fr)/T(lr)/T’(vr)]; Elbow Joints ($E_{L/M}$): joints [R(lr)/T(vr)]; Wrist Joints ($W_{L/M}$): joints [R(lr)/T(vr)]; Fingers ($F_{L/M}$): endpoints; Pair of Sacro-iliac Joints (S): joints [R/T]; Hip Joints ($H_{L/M}$): joints [R(fr)/T(lr)]; Knee Joints ($K_{L/M}$): joints [R(lr)]; Ankle Joints ($A_{L/M}$): joints [R(lr)/T(vr)]

Here, note that $\langle A_{L/R}, B_{L/R} \rangle$ is short for $\langle A_L, B_L \rangle$ and $\langle A_R, B_R \rangle$. From the above joints and endpoints, we construct a simplified skeleton as: $\{ \langle S, V \rangle, \langle V, N \rangle, \langle N, He \rangle, \langle V, Sh_{L/R} \rangle, \langle Sh_{L/R}, E_{L/R} \rangle, \langle E_{L/R}, W_{L/R} \rangle, \langle W_{L/R}, F_{L/R} \rangle, \langle H_{L/R}, S \rangle, \langle S, H_{L/R} \rangle, \langle H_{L/R}, K_{L/R} \rangle, \langle K_{L/R}, A_{L/R} \rangle, \langle A_{L/R}, T_{L/R} \rangle \}$.

We need to fix the angles of rotation, turn and turn' at each joint of our skeleton in their home positions and also their ranges. Here, we concentrate ourselves to the relevant joints, S, H, K and T. The pair of sacro-iliac joints is simplified as one vertex S, which has three types of rotation. In the case of rotation, vertex S, shared by $\langle H_L, S \rangle$ and $\langle H_R, S \rangle$, doubly causes vertex V to move. In the case of turn, both $\langle H_L, S \rangle$ and $\langle H_R, S \rangle$ cause V's to movement. In the case of turn', $\langle S', S \rangle$ causes V's movement. One can tilt one's backbone to the left and to the right. So, V rotates around center S of $\langle H_L, S \rangle$, with this and edge $\langle H_R, S \rangle$ fixed as if one connected edge. Likewise, V also rotates around center S of $\langle H_R, S \rangle$. V rotates from 90° counterclockwise through 180° and clockwise through 0° . One can bend our upper body forward, but not backward. So, in our terms, V turns around both axes $\langle H_L, S \rangle$ and $\langle H_R, S \rangle$, simultaneously. Seen from the left side of the skeleton, V lowers forward around $\langle H_L, S \rangle$ from 90° counterclockwise to 270° . Seen from its right side, V lowers forward around $\langle H_R, S \rangle$ from 90° clockwise to 270° . As one can twist our waist both left and to right, we simulate this action in terms of the turn' at S, where, V of $\langle S, V \rangle$ turns around the virtual axis $\langle S', S \rangle$, which is attained by extending the original $\langle S, V \rangle$ from S in the opposite direction. Thus, the rough angle ranges of S in its rotation, turn and turn' are: $\langle r: 0^\circ \leq - = 90^\circ = + \Rightarrow 180^\circ, t: 90^\circ = + \Rightarrow 0^\circ \ \& \ 270^\circ \leq - = 270^\circ, t': 180^\circ \leq - = 90^\circ = + \Rightarrow 180^\circ \rangle$, where the angles are the default values, those when the skeleton is in its home position, that of standing still. Second, the hip joints have also three types of rotation. The ranges of each are, for H_L : $\langle r: 180^\circ \leq - = 270^\circ = + \Rightarrow 360^\circ, t: 270^\circ = + \Rightarrow 90^\circ, t': 0^\circ \leq - = 90^\circ = + \Rightarrow 180^\circ \rangle$ and for H_R : $\langle r: 180^\circ \leq - = 270^\circ = + \Rightarrow 0^\circ, t: 90^\circ \leq - = 270^\circ, t': 0^\circ \leq - = 90^\circ = + \Rightarrow 180^\circ \rangle$. Third, K's have only r 's as their own rotations. Thus for K_L : $\langle r: 90^\circ \leq - = 270^\circ \rangle$ and for K_R : $\langle r: 270^\circ - + \Rightarrow 90^\circ \rangle$. Fourth, for A_L : $\langle r: 315^\circ \leq - = 0^\circ = + \Rightarrow 45^\circ \rangle$ and for A_R : $\langle r: 135^\circ \leq - = 180^\circ = + \Rightarrow 225^\circ \rangle$. The pairs of toes are simplified as endpoints ($T_{L/E}$).

4. Rotation and turn function as simplified transition functions

We discuss the method for describing how each vertex transfers its movement to another one on the support path. Focusing on a joint's (or a pair of joints)'s causation of another vertex to move, involved in the rotations, turns and turns', we define a function which, having one content joint vertex c_j accompanied by its transition in location $\langle L_{c_j}^i, L_{c_j}^{i+1} \rangle$ over an interval $[i, i+1]$, takes another vertex c_k and returns its transition in location $\langle L_{c_k}^i, L_{c_k}^{i+1} \rangle$ over that interval as its value. We define *location transition function* as $F^{[i, i+1]}(\langle c_j, \langle L_{c_j}^i, L_{c_j}^{i+1} \rangle \rangle, c_k) = \langle L_{c_k}^i, L_{c_k}^{i+1} \rangle$, where c_j directly supports c_k . To implement each joint's angles for rotation, turn and turn' at both of the endpoints of each interval where a relevant movement in the action is being made, we attach the transition of state $\langle S^i, S^{i+1} \rangle$ to both of the input and output vertices, having *posture transition function* as: $M^{[i, i+1]}(\langle \langle c_j, \langle S_{c_j}^i, S_{c_j}^{i+1} \rangle \rangle, \langle L_{c_j}^i, L_{c_j}^{i+1} \rangle \rangle, \langle c_k, \langle S_{c_k}^i, S_{c_k}^{i+1} \rangle \rangle) = \langle L_{c_k}^i, L_{c_k}^{i+1} \rangle$. The pairs $\langle S_{c_j}^i, S_{c_j}^{i+1} \rangle$ and $\langle S_{c_k}^i, S_{c_k}^{i+1} \rangle$ attached to the causer and caused joints designate their angles for rotation, turn and turn', at the initial and final time points of the relevant interval, respectively.

Comparing the pair of values in each of the input and output locations in the location transition function enables us to see whether the relevant joint has moved or not by their nonequivalence or equivalence. So, if we represent their nonequivalence or equivalence simply as moving (μ) or staying (σ) and differentiate functor F into three types, R , T and T' , in this function, we have three "rotation" function. We define *Rotation Function* as: $\pm R^i(\langle c_j, \sigma/\mu \rangle, c_k) = \sigma/\mu$, where c_j directly supports c_k . In this function, its polarity "+/-" distinguishes the counterclockwise (+) turn and the clockwise (-) turn as are seen forward, downward and from center. Having c_j as the axis of rotation in its saying (σ) or moving (μ) state, it takes c_k as its input, and as its output returns " μ " if it is moving and " σ " if it is not moving, during period "i". We keep each interval distinct from its adjacent interval as its member. Furthermore, we define *Turn Function* and *Turn' Function* as: $\pm T^i(\langle \langle c_j, \sigma/\mu \rangle, \langle c_k, \sigma/\mu \rangle \rangle, c_l) = \sigma/\mu$. Here, c_j and c_k directly support c_l and c_l respectively. Turn function is a bit different from rotation function. The "axis" of a turn is an edge, an ordered pair, not as a vertex as was seen in rotation. The polarity " \pm " distinguishes the counterclockwise (+) turn and the clockwise (-) turn as are seen forward, downward and

from center. This function, with the edge $\langle c_j, c_k \rangle$, each of whose member is in the state σ or μ , as the axis of *turn*, takes c_k as its input and returns μ , if it has moved during the interval i , or returns σ , if it hasn't, as its output.

5. Action of kicking and its rotations and turns at each interval

When describing bodily action verbs, we face and other cases where even all the motions are not sufficient. The kicking action is one case where only a few of the involved motions are sufficient for description, its partial description providing the sufficiently distinctive information to define the meaning of the verb denoting it. For this sake, we utilize the lower half of the skeleton. The total support set for kicking is as follows:

$$\{ \langle c_{SL}, c_V \rangle, \langle c_{SR}, c_V \rangle, \langle c_{SL}, c_{HL} \rangle, \langle c_{SR}, c_{HR} \rangle, \langle c_{HL}, c_{KL} \rangle, \langle c_{HR}, c_{KR} \rangle, \langle c_{KL}, c_{AL} \rangle, \langle c_{KR}, c_{AR} \rangle, \langle c_{AL}, c_{TL} \rangle, \langle c_{AR}, c_{TR} \rangle, \dots \}$$

Here, c_V is the connecting point standing for the bottom part of the cervical vertebra, $c_{SL/R}$ the connecting points simplified from the pair of sacro-iliac joints, $c_{HL/R}$ the left or right hip joint, $c_{KL/R}$ the left or right knee joint, $c_{AL/R}$ the left or right ankle joint, and $c_{TL/R}$ the left or right endpoint standing for the simplified left or right toes. Look at the following postures in Figure 1, showing kicking with the right side leg and foot:

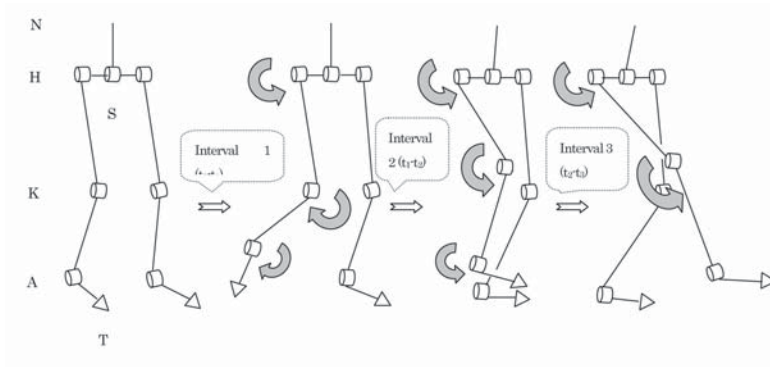

Figure 1. Action of Kicking.

Whether the moving parts is predominantly on the left or right side is not specific to the definition of “kicking”. We will concentrate ourselves

to the left side, omitting the inferior L-marks to be attached to the vertex symbols. The verbal description of kicking at each interval is as follows: at interval 1 (t_0-t_1): the right foot is being pulled up backward, while the right knee is being raised; at interval 2 (t_1-t_2): the right leg and foot are being pushed forward, as the right thigh is being pushed forward; at interval 3 (t_2-t_3): the right thigh and leg continue to be pushed forward, with the right foot kept a fixed position relative to the right leg.

We can calculate the movements involved in the kicking action in terms of rotation and turn. Note that hereafter we will omit the subscript L representing the left side of the body at each symbol and follow this convention. At its 1st interval, we have two cases of simple (direct) rotation: $(\text{IKA}) + R^1(\langle c_K, \mu \rangle, c_A) = \mu$ and $(\text{IAT}) - R^1(\langle c_A, \mu \rangle, c_T) = \mu$. In the former, as the center of counterclockwise rotation, c_K , which is moving, causes c_A to move. In the latter, as the center of counterclockwise rotation, c_A , which is moving, causes c_T to move. We also have a turn function: $(\text{ISHK}) - T^1(\langle \langle c_S, \sigma \rangle, \langle c_H, \sigma \rangle \rangle, c_K) = \mu$. Here, edge $\langle c_S, c_H \rangle$, whose members are staying at their own places, as the axis of clockwise turn, causes vertex c_K to move. Let us assume that a turn is equivalent to the union of the two rotations the axes of which are the endpoints of the turn. So, $-T^1(\langle \langle c_S, \sigma \rangle, \langle c_H, \sigma \rangle \rangle, c_K) = \mu$ is decomposed as $(\text{ISK}) - R^1(\langle c_S, \sigma \rangle, c_K) = \mu$ & $(\text{IHK}) - R^1(\langle c_H, \sigma \rangle, c_K) = \mu$. Note that in the resulting rotation functions, the direction remains the same, clockwise. Embedding a direct function into another by substitution leads to an indirect function. Substituting the left side of (IKA) for μ of (IAT) under the identity of " c_A ", which mediates these functions, we have an indirect rotation: $(\text{IKT}) + R^1(\langle c_A, -R^1(\langle c_K, \mu \rangle, c_A) \rangle, c_T) = \mu$. Here, one rotation function is embedded in another rotation function. Note also that substitution often leads to a hybrid case, where a rotation and a turn are mixed in the involved motions. By substituting the left side of (ISK) , which is the one component of the pair decomposed from (ISHK) , for μ of (IKA) and that of (IHK) , the other component decomposed from (ISHK) for μ of (IKA) , we have indirect rotations (ISA) and (IHA) respectively: $(\text{ISA}) - R^1(\langle c_K, +R^1(\langle c_S, \sigma \rangle, c_K) \rangle, c_A) = \mu$ and $(\text{IHA}) - R^1(\langle c_K, +R^1(\langle c_H, \sigma \rangle, c_K) \rangle, c_A) = \mu$. Furthermore, substituting the left side of (IHA) for μ of (IAT) and the left side of (ISA) for μ of (IAT) , respectively, under the identity of " c_A " in both case, we have the "doubly indirect" rotations: $(\text{IHT}) - R^1(\langle c_A, -R^1(\langle c_K, +T^1(\langle c_H, \sigma \rangle, c_K) \rangle, c_A) \rangle, c_T) = \mu$ and $(\text{IST}) - R^1(\langle c_A, -R^1(\langle c_K, +T^1(\langle c_S, \sigma \rangle, c_K) \rangle, c_A) \rangle, c_T) = \mu$. Look at the second interval of kicking.

The turn around the hip-sacroiliac axis in this interval is the same as that at the first interval, where (2SHK) is decomposed as the union of (2SK) and (2HK): $-R^2(\langle c_S, \sigma \rangle, c_K) = \mu$ & $-R^2(\langle c_H, \sigma \rangle, c_K) = \mu$. The directions of the rotations around the knee and the ankle at the second interval are reverse of those at the first. So, we have the following functions: (2KA) $-R^2(\langle c_K, \mu \rangle, c_A) = \mu$, (2AT) $-R^2(\langle c_A, \mu \rangle, c_T) = \mu$, (2HA) $-R^2(\langle c_K, -T^2(\langle c_H, \sigma \rangle, c_K) \rangle, c_A) = \mu$, (2SA) $-R^2(\langle c_K, -T^2(\langle c_S, \sigma \rangle, c_K) \rangle, c_A) = \mu$, (IKT) $-R^2(\langle c_A, -R^2(\langle c_K, \mu \rangle, c_A) \rangle, c_T) = \mu$, (2HT) $-R^2(\langle c_A, -R^2(\langle c_K, -R^2(\langle c_H, \sigma \rangle, c_K) \rangle, c_A) \rangle, c_T) = \mu$ and (2ST) $-R^2(\langle c_A, -R^2(\langle c_K, -R^2(\langle c_S, \sigma \rangle, c_K) \rangle, c_A) \rangle, c_T) = \mu$. Finally, look at the third interval, where the hip and the knee joints work as the axis/center of turn/rotation in the same manner as those do at the second interval, though there is no more rotation around the ankle. (3SHK) is decomposed as (3SK) & (3HK): $-R^3(\langle c_S, \sigma \rangle, c_K) = \mu$ & $-R^3(\langle c_H, \sigma \rangle, c_K) = \mu$. We also have: (3KA) $-R^3(\langle c_K, \mu \rangle, c_A) = \mu$. As for indirect rotations by substitution, we have: (3HA) $+R^3(\langle c_K, +T^3(\langle c_H, \sigma \rangle, c_K) \rangle, c_A) = \mu$ and (3SA) $+R^3(\langle c_K, +T^3(\langle c_S, \sigma \rangle, c_K) \rangle, c_A) = \mu$. Note that at this interval we can see no (AT), which holds at the second interval.

6. Valuation of modal predicate formulas based on rotation and turn functions

We construct a sequence of models from the moving structures of the skeleton performing an action. The modal structure attained represents the propagations of the movements caused by joints and axes at the intervals. In modal predicate logic, in each of the possible worlds between which an accessibility relation is defined, formulas are multiply valuated for its particular domain and the valuated formulas are re-valuated in each world from which the worlds where they hold are accessible (Gamut 1991: 53–66; Hughs & Cresswell 1996). On our skeleton, the joints acting as a center of rotation or an axis of turn are worlds. Each world has as its own domain all the joints and endpoints directly and indirectly supported by the joint co-indexed to that world. In the domain of each joint defined as a world, the exhaustiveness of the vertices it directly causes to move is quantified by the existential formula “there is a moving vertex in this world” and its universal equivalent. There are cases one active joint directly or indirectly supports another active joint, which may cause another joint or an endpoint to move. To connect these causations, we define an accessibility relation

between worlds as: a world (active joint) is accessible from another world if and only if by rotation or turn, the latter directly or indirectly causes the former to move.

Let us consider how we value the existential and universal movement formulas with respect to the rotation/turn functions describing the relevant motion of a vertex around another as its center or around a pair of vertices as its axis. If and only if a rotation function with the causer joint j returns μ , as its output, for some input content vertex from its domain, the existential movement formula is valued as true in the relevant world. Otherwise, the formula is valued as false: $\forall wj(\exists x: C(x) \ \& \ \text{MOVE}(x)) = 1$ iff for some $c \in D_j$; $\pm R^i(\langle c_j, \sigma/\mu \rangle, c) = \mu$, otherwise $\forall wj(\exists x: C(x) \ \& \ \text{MOVE}(x)) = 0$. If and only if a rotation function with the causer joint j returns μ , as its output, for all the input content vertices from its domain, the universal movement formula is valued as true in the relevant world. Otherwise, the formula is valued as false: $\forall wj(\forall x: C(x) \rightarrow \text{MOVE}(x)) = 1$ iff for all $c \in D_j$; $\pm R^i(\langle c_j, \sigma/\mu \rangle, c) = \mu$, otherwise $\forall wj(\forall x: C(x) \rightarrow \text{MOVE}(x)) = 0$. We must add that as a rule of inference, the existential formula is validly inferred from the universal formula.

7. Propagation structure of kicking action

We apply the model discussed in section 11 to the movements in the kicking action described by the postures in Figure 1. Out of the skeleton performing this action at interval 1, $\{c_s, c_{HL}, c_{HR}, c_{KL}, c_{KR}, c_{AL}, c_{AR}, c_{TL}, c_{TR}\}$, we find the active joints, which act as causer joints, at interval 1 as in: $\{c_s, c_{HL}, c_{KL}, c_{AL}, c_{TL}\}$, where c_s and c_{HL} act as the axis of turn jointly, but this case is decomposed into the union of two cases of rotation, as was discussed in section 10. We count causations in each world, which is defined as an active joint and as having, in its domain, all the vertices it directly and indirectly supports. For lack of space, we will hereafter write U for “ $\forall x: C(x) \rightarrow \text{MOVE}(x)$ ” and E for “ $\exists x: C(x) \ \& \ \text{MOVE}(x)$ ”.

Let us first look at the causations at the first interval. Focusing on the vertex c_s , it directly support c_H , and indirectly support c_K, c_A and c_T . All in all, c_s supports $\{c_H, c_K, c_A, c_T\}$, which forms the domain of the world with the same index as the supporting vertex c_s . Thus, in w_s , the joint c_s , causes c_K , in its domain $\{c_H, c_K, c_A, c_T\}$, to move, which case is described in terms of rotation as: for some $c \in D_s$: $-R^i(\langle c_s, \sigma \rangle, c) = \mu$. Here, this c falls on c_K .

There is only one vertex c_K out of its domain moved by the joint. So, by the existential validation, we have $\forall w_s(E)=1$. Likewise, we can value the formulas in the other worlds as follows. In w_H , the joint c_H causes c_K , in its domain $\{c_K, c_A, c_T\}$, to move. In w_K , the joint c_K causes c_A , in its domain $\{c_A, c_T\}$, to move. In w_A , the joint c_A causes c_T to move in its singleton domain $\{c_T\}$. Thus, we have in each world: $E=1$ in w_S, w_H, w_K , and w_A , so $(U)=1$ in w_A . Remember that the direct and indirect causation by the active joints is the accessibility relation of our model: $\{<c_H, c_K>, <c_S, c_K>, <c_K, c_A>, <c_H, c_A>, <c_S, c_A>\}$. With this, we value modal formulas. First, in all the worlds, w_K and w_A , accessible from w_H , the existential formula holds true. The formula is necessarily true in this world. Thus, $[\Box]E=1$ in w_H . In only one, w_A , of the worlds, w_K and w_A , accessible from w_H , the universal formula holds true. So, the formula is possibly true in this world: $<>U=1$ in w_H . Second, in all the worlds, w_K and w_A , accessible from w_S , the existential formula holds true. Thus, $[\Box]E=1$ in w_S . In only one, w_A , out of the worlds, w_K and w_A , accessible from w_H , the universal formula holds true. So, we have $<>U=1$ in w_S . Likewise, we have: $[\Box]U=1$ and $[\Box]E=1$ in w_K ; $[\Box]U=1$ and $[\Box]E=1$ in w_A . Also, the only worlds accessible from w_H are w_K and w_A , where $[\Box]U$ and $[\Box]E$ hold. So, we have $[\Box][\Box]U=1$ and $[\Box][\Box]E=1$ in w_H . We also have: $[\Box][\Box]U=1$ and $[\Box][\Box]E=1$ in w_S . At the second interval, the modal formulas do not reflect the polarity of the rotations, because the former only pick up the moving or un-moving of joints and endpoints. We keep the same set of modal formulas for this interval. Look at the third interval of kicking, where we have $\{w_S, w_H, w_K\}$ as the worlds. The accessibility at this interval is: $\{<w_S, w_K>, <w_H, w_K>\}$. So, we have the following valuations: $E=1$ in w_S, w_H and w_K ; $U=1$ in w_K . We also have: $[\Box]U=1$ in w_S ; $[\Box]U=1$ in w_H ; $[\Box]U=1$ and $[\Box]E=1$ in w_K . We have: $[\Box][\Box]U=1$ and $[\Box][\Box]E=1$ in w_S ; $[\Box][\Box]U=1$ and $[\Box][\Box]E=1$ in w_H . Let us put the valuated formulas together in each world (joint) at each of the three intervals, using a parenthesis convention. $A(i)B$ represents AC or ABC at interval i , and ABC at the intervals but i . We apply this convention to the formulas, also using shortened forms N and P for $[\Box]$ and $<>$ operators, respectively. So, we have the following representations at each world, where each bracket subscribed 1, 2 or 3 represents the total span of the intervals:

$$\begin{aligned} \text{At } w_S : & [{}_{1/2/3}({}_{1/2/3}({}_{1/2}N)N)E], [{}_{1/2/3}PU], [{}_{1/2/3}({}_3N)NU]; \\ \text{At } w_H : & [{}_{1/2/3}({}_{1/2/3}({}_{1/2}N)N)E], [{}_{1/2}PU]; [{}_{1/2/3}({}_3N)NU]; \end{aligned}$$

At w_K : $[_{1/2/3} (_{1/2/3} N) E]$, $[_{1/2/3} (_3 N) U]$; At w_A : $[_{1/2} (_{1/2} N) E]$,
 $[_{1/2} (_{1/2} N) U]$;

In the first complex of formulas at w_S , the outer parentheses shows that both of the first N and the second N attached to the existential formula E can be omitted in any of the first, the second and the third intervals, and the inner parentheses shows that the second N can be omitted in either of the first and the second intervals. In its third complex, the first N attached to the universal formula U can be omitted in the third interval, etc.

As the result of the adopted definition of the frame, as we go up a path from an endpoint toward the center of the skeleton, the number of the joints counted from it increases, so a world more distant from that endpoint has a higher dimensionality of modality (more of the necessity and possibility operators attached to the formulas valued in the world) than the worlds nearer to that endpoint. We can see this from our example. Furthermore, in general, the universal quantification is more unlikely to hold in more distant worlds, because they support indirectly and directly supports more vertices than nearer ones do, in which case more distant worlds have to cover more vertices to attain universality. Our example does not reflect this. The worlds w_S and w_H , more distant from the endpoint, have the universal formulas as well as the less distant worlds. This is due to the order of causation in the kicking action, where the vertices nearer as well as those more distant to it act as an axis and a center even from interval 1 in the whole process, leading to the universal formula not only in the near worlds w_K and w_A but also in distant ones w_S and w_H .

8. *Concluding remarks*

In this paper, we have shown a method of representing the extensional meaning of a bodily action verb by calculating from the skeleton simulating that action, based on the frame with the joints acting as centers or axes as worlds, the relevant joints' causing other joints and endpoints to move as accessibility and the rotation functions (and their unions as the equivalents to turn formulas) as valuations. The order of these causations involved in that action is represented as a set of, not only modal existential formulas such as were used in our previous framework, but also newly-introduced universal formulas, in each interval, which represent the rota-

tions and turns of vertices on others as their centers and axes. Each modal formula is valued in a world representing an active joint directly or indirectly causing the quantified vertices in the rotation and turn functions.

Eilish O'Donohoe & Howard Riley

A systemic-functional semiotic model for the analysis of image/text works

1. Introduction

In offering a systemic-functional model for the analysis of painting, Michael O'Toole (1994: 4) stresses that

... semiotics – the study of sign systems – can assist us in a search for a language through which our perceptions of a work of art can be shared. I believe that we should start with the impact the particular work has on us in the gallery, or even in a book of reproductions....

This is in reference to much gallery viewing emphasising other discourses surrounding our perception of visual works; provenance, the voice of the expert, art theory, history and the social, economic and political factors which can preclude a direct, primary engagement with the visual work, leading to a sense of estrangement rather than recognition.

The impetus of this study shares O'Toole's concerns, but from a pedagogic point of view and from within the art-school context.

It aims to demonstrate the efficacy of applying a systemic-functional semiotic model to the domain of image-text works which empowers the student, as a viewer, to consider such works without necessarily having the cultural references already mentioned, even though these references would obviously benefit perception. Engaging with the work in the gallery or in reproduction *or at a website*, which is the ubiquitous, current form of engagement, the student / viewer can be faced with an enormous amount of information and theory which can be confusing, and which can often lead to aberrant interpretations.

The model provides a way of talking about what one sees, what one is perceiving in the act of looking and how to engage in an immediate anal-

Figure 1. Systemic-functional semiotic model for multimodal visual compositions.

ysis and discussion of the work in question, in a rigorous and sustained manner.

The model is also in the process of being analysed as an enabling tool in the production of the student's own work and helps clarify the process of creativity itself and the creation of meaningful work. This methodological process acts as a platform from which to conduct further research and from which to become familiar with the academic critiques and discourses surrounding the relationship between image and text in visual works.

The systemic-functional model presented here (O'Donohoe 2004) is also influenced by Howard Riley's (2001) matrix for drawing. It is based on a synthesis of linguistic and visual communication theories and facilitates the domain of *typographics* as a semiotic process. The work in question, the IASS9 web page, provides an ideal platform for analysing dual-coded work, in particular, the nature of the relationship between the image and the concrete visible form of the word, the typographic semiotic.

In this study, the nature of pictures and words, as a composite form of communication within the visual arts, is inflected by W. J. T. Mitchell's contention (1994: 3) "that the tensions between visible and verbal representation are inseparable from struggles in cultural politics and political culture". In tracing relations between linguistic meaning, visual represen-

tation and aesthetic principles a systemic-functional semiotic analysis of the artists' works explores and reveals not only dominant readings but also alternative interpretations of the designer's work.

The study also includes the signifying processes of the social contexts of dual-coded works and stresses the *social semiotic* as vital in determining the relationships between image and text in visual works and that social semiotic theory allows for meaningful debate as to what constitutes representation in such works.

2. *Social semiotics*

Social semiotics is a way of construing how the relationship between codes of communication and the (social) contexts in which they are used, construct meaning.

Michael Halliday's (1978) seminal systemic-functional linguistic model has inspired research in visual semiotics by O'Toole, Gunther Kress and Theo Van Leeuwen, among others. A social semiotic approach to negotiating meaning assumes that the social context of the text is all-important. For Halliday,

a text is embedded in a context of situation... an instance of a generalised social context or situation type...a semiotic structure... This presupposes an interpretation of the social system as a social semiotic; a system of meanings that constitutes the reality of the culture. (In O'Toole 1994: 216)

Kress and Van Leeuwen (1996: 32) extend Halliday's linguistic model to visual language and stress its semiotic nature:

Visual communication is always coded. It *seems* transparent only because we know the code already, at least passively – but without knowing what it is we know, without having the means for talking about what it is we do when we read an image. A glance at the “stylized” arts of other cultures should teach us that the myth of transparency is indeed a myth.

Visual sign-making is never arbitrary and motivation should be seen in terms of the sign-maker and the context in which the sign is produced. Sign-makers choose the signs most apt for producing their referents. (Inscribed words are visual signs.)

Kress and Van Leeuwen (1996: 11) also contend with the nature of subjectivity as being the “transformative productive stance towards sign-making” and sign-making “rests on the interest of the sign-makers, which leads them to select particular features of the object to be represented as criterial, at that moment, and in that context”. They have also included the concept of the materiality of the signifier in their work.

3. Materiality

Kress and Van Leeuwen (1996: 231) argue that the material aspects of representation, to include surfaces, substances and tools in the making of artworks cannot be ignored, so that “a real distinction appears between the linguist’s concern and the semiotician’s.” For the signmaker / artist, the choice of material is significant, whether to use brush or knife, canvas or paper, computer or camera is part of the signifying process. The particular context is another vital signifier; “signs as materials are fully motivated though as always the motivations are those of a particular culture and are not global” (ibid.: 232).

The materiality of the sign and its significance as more than a vehicle for other signifiers, be it oil, newspaper print or found objects, and first considered by the Russian Formalists, was taken up later by Yuri Veltrusky in 1973 who emphasised; “the materiality of the significant (signifier) affects considerably the specific way in which the picture conveys meaning” (in Drucker 1994: 32)

Johanna Drucker (1994: 43) in advocating materiality as a facet of an analysis for typographical manipulation contends that:

Invoking the term materiality begs two questions immediately; that of matter, with all the self-referential attention to questions of production... and second, that of materialism and the discourses of cultural theory which index the analysis of social conditions, contexts, and claims for the political effects of signifying activity.

Drucker also insists on the materiality of the typographic sign as central in the process of making meaning.

The force of stone, of ink, of papyrus, and of print all function within the signifying activity – not only because of their encoding in a cultural system of values whereby a stone inscription is accorded a higher stature than a

typewritten memo, but because these values themselves come into being on account of the physical, material properties of these different media. Durability, scale, reflectiveness, richness and density of saturation and color, tactile and visual pleasure – all of these factor in – not as transcendent and historically independent universals, but as aspects whose historical and cultural specificity cannot be divorced from their substantial properties. (Ibid.: 45)

Materiality and cultural context are inseparable from the signifying process; making meaning and assigning value are culturally specific. It is also argued that not only the cultural context but the physical context in which meaning is assigned to an image-text work, is part of the signifying process.

4. The work In physical context

It is inevitable in this kind of study that the work being discussed here cannot be seen in its original form or context. This can be said about a discussion of the *Mona Lisa* as much as about the conference *Web Page*. In the main, the vast majority of people who recognise images of the *Mona Lisa*, could be said to have never seen the original painting, or if they have, their experience of it might well be disappointing. Less imposing and duller than in reproductions, the *Mona Lisa* could be seen as diminished in stature by comparison to its high status as a symbol of Western European artistic achievement.

Experiencing a work of art in its original context, perhaps in a public gallery or museum, produces a range of connotations different to experiencing the same work in a coffee-table book. The positioning of both viewer and work in the context of the privacy of the book format, an aspect of the Interpersonal function of communication identified in the model (Fig 1), the quality of the reproduction, the absence of the original scale, the absence of the aura of the space it is presented in, must contribute to a range of inflected meanings, different to those invoked in the original setting.

The analysis of the web page in this study takes place in two-dimensional form; a printout of the digital design. The systemic-functional semiotic model facilitates alternative meanings to be constructed depending on

the context in which the works are engaged with, in this case, the reproduced form.

5. A systemic-functional semiotic model for image/text works

As the nomenclature suggests, the model in this research is a matrix of systems and functions which provide a mapping facility for decoding image-text works. In Figure 1, the Interpersonal Function positions the viewer in terms of mood and attitude towards the work being analysed. It enables the viewer to engage with the work, and the work in its physical space, through a range of choices from each system.

The Representational function deals with the information conveyed and the meaning of the work. It functions to represent our experience of the world.

The Compositional function, which is the “design” range of choices, what might be called the tool-kit of the artist, and caters for the media, processes and surfaces chosen by the signmaker, conveys “more effectively and more memorably the represented subject and to make for a more dynamic relation with the viewer” (O’Toole 1994: 22). The three functions are interdependent.

Each function is divided into a means of ordering and structuring information as one travels the matrix. There is an escalation of the depth of meaning constructed from the basic level of a single element, to the whole work, so that for instance the external rectangular box in remains at its basic denotative level of *element* if isolated from the other elements of the work or from the work as a whole. Its connotative meaning comes into play at the level of interaction with the rest of the work.

The systemic nature of the matrix allows for a synchronic reading of the works. The model is laid out in a format which is familiar to Western reading protocol, from left to right and top to bottom, or from column to column. In practice however, when looking at a visual work such as the one being discussed here, they are seen in their entirety – as opposed to reading a book or watching a film – and so the systems functioning in the production of meaning operate synchronically, or simultaneously.

In applying the model to the following case study, the conference web page, (with grateful thanks to the designer, Dario Martinelli) not all sys-

tems are necessarily employed at all levels, nor are they applied in a particular sequence. The sign reader can move around the model in whatever direction desired, in no apparent sequence other than what the viewer deems fit. Unlike in conventional reading, the viewer can “hop” from box to box diagonally, from right to left or from bottom up. The subjective viewer chooses particular systems, relative to one’s own experience, in order to negotiate meaning. The range of the semiotic resources the viewer can call upon will determine the depth of meaning acquired.

To this extent, as the viewer can come to the work with little or no knowledge of extraneous detail of history, provenance or academic critique, equally, the viewer can engage with the work with due experience and a portmanteau of cultural references. This does not preclude debate or disagreement. Indeed, this is the ideal site for such fruitful discussion. One viewer’s experience of the work could result in another’s diverse response. This is the where the negotiation of meaning comes into play.

In analysing the conference web page, the functions, systems and individual cells of the matrix are italicised in order to identify them as such, and in order to differentiate the semiotic nature of the terminology from everyday language.

Figure 2. Case Study: IASS Conference Web Page, 2007.

In demonstrating the efficacy of the systemic functional model, it needs to be said that the conference web page was designed for digital media to be accessed online. This demonstration of the analysis is of the printed ver-

sion of the web page. The physical context of viewing the static, printed page is a completely different experience to that of interacting with the web page.

At the Level of the *Work as a Whole*, identified in the model, the viewer is engaged by the visible and visual tensions between image and text. Compositional devices of *framing*, *rhythm* and *perspective* activate Interpersonal systems of *centrality* and *marginality*, invoking a sense of motion. The combination of the linear elements which form the central framing grid connote movement with the diagonals representing a direction from left to right. The blurred background, which might represent Finnish woodland, further signifies movement or travel as if at speed, but without necessarily complying with the direction of the grid.

This ambiguity of direction represented between the background and the foreground is compounded by the immobile imagery. The dynamism of the background and the diagonals is questioned by the still images. Although these images are static, the viewer is allowed to adopt a variety of positions in terms of distance of viewpoint. From the symbolic image of the bus stop to the indexical sign of the map the connotations of travel, *in any direction*, are evoked.

Each of the images is a metonym for travel, but which way to turn? Map reading can be a fraught exercise, one can become lost in the wilds. The reliability of taking public transport is undermined by an iconic national symbol, a deer, which seems in a rush to go in the opposite direction.

Relations between sections of the compositions are tense, a possible metaphor for the historic tensions between image and text. The centrality and prominence of the grid and the images in the grid, is undermined by the position of the text scoring the work as a whole, and dictating the individual cells of the grid. What might be a rhythmic progression from left to right is abruptly disrupted by the arrhythmic diagonals, leading to a certain visual dissonance. The pattern represented at this level is a disjointed one. Images are seemingly randomly dissected and undermined by something more powerful, something which seems to take precedence.

The Compositional device of visual framing at the level of *relations between sections of the work* is subordinated to the length of the written word. The historical dominance of the word over the image is acknowledged and upheld. The need to maintain the integrity of the written word overrides the integrity of the visual devices that would otherwise support

the connotations of rhythmic movement to represent travel. It is the length of the words in the grid which dictates the visual rhythm and the framing of the images. Instead of a smooth journey, the traveller is in for a bumpy ride.

These tensions in the graphic layout may be interpreted as metaphoric of tensions between the visual / verbal factions of semiotic research. The contradictions and contra-visuals of the conference web page also serve to relay the theme of the conference: Understanding / Misunderstanding.

Text, interpretation and memory: What semiotics can say about remembering a tale

Memory is one of the more challenging issues both for the humanities and for the exact sciences. Human beings are able to collect and save experiences and information and, when necessary, the appropriate knowledge is available for them. Trying to understand this phenomenon is a fascinating field of research. The retention capacity of memory deeply concerns the human attitude of living in a meaningful world. The sense phenomenon is strictly linked to recognition processes, and moreover signs are one of the basic external devices for memory, from ancient Egyptian papyrus to the shopping list. It seems clear that semiotics, as a science of signs and meaning, is intensely interrelated with this issue. Memory is a huge research topic and it is possible to outline many distinct approaches to this field, for a survey see Pethes, Ruchatz (2001). There is a difference, that is often underestimated, between *direct* and *reported* memory (Larsen 1988). It arises out of the fact that we have direct experience with just a little part of the events that happen in the world. Most of the information we receive has already been treated, and comes to us in an act of communication, through a semiotic mediation. This happens continuously when we read a book, go to the cinema, or watch the news on television. The difference between direct and reported memory is critical for semiotics because this discipline has the conceptual tools to describe the semiotic artefact, or text, involved in the communication process. Beside this, we have to consider the activity of a subject when he understands and memorizes a text. Many studies that explore this sphere of action have been presented within the field of cognitive sciences. Therefore a dialogue between a semiotic approach to the texts, and a cognitive perspective on the mental operations that allow

understanding and remembering, should lead to a better scientific knowledge of the memorization of the texts.

The present article consists of two sections, one of theory and one of analysis, according to the empirical feature that characterizes semiotics. First I will outline, from a theoretical point of view, the issue of the memorization of texts, showing how several semiotic concepts concern memory, starting a semiotic approach to this topic. Second, I will analyze a single case of the remembering of a tale, presenting the results that this methodology can give, and describing the possible research paths that arise from this perspective.

1. Theoretical framework

Cognitive psychology has developed a framework to study memory. According to this view, every act of remembering is characterized by two main components: encoding and retrieval. From one side the text (or the stimulus) has to be elaborated towards its storage in memory, and on the other side, symmetrically, what has been stored is recalled and restructured towards the production of a new text, the remembrance. According to this view stored information has a mental organization. From a semiotic side it has to be noticed that the starting point of an encoding (in the case taken into consideration in this article) is a text, and the result of the remembering process is a text again. A further comment that has to be made is that memory is not an empty space but is already full of information and past experiences, therefore the knowledge that is present interacts with both processes of encoding and retrieval.

Within this framework it is possible to state a definition of memory, and I suggest considering a very convincing description proposed by Charles Bartlett in his pioneering book, *Remembering: A Study in Experimental and Social Psychology* (Bartlett 1932). He is considered one of the fathers of experimental psychology and he was the first to use meaningful materials, such as texts or images, in his experiments on memory. He argues, as a conclusion of his research, that “remembering is not the re-excitation of innumerable fixed, lifeless and fragmentary traces. It is an imaginative reconstruction, or construction, built out of the relation of our attitude towards a whole active mass of organised past reactions or

experience, and to a little outstanding detail which commonly appears in image or in language form” (Bartlett 1932: 213).

This definition states something crucial: memory is not static, but it is intrinsically dynamic, it always depends on a process of interaction between many factors. The idea of a possible recalling of an original experience as it was has to be abandoned immediately: remembering is always a production, a dynamic construction of something new. This creation of memory has obviously something to do with our past experiences, and they appear as a *whole organized active mass*. Bartlett introduces here, in the cognitive tradition, the concept of schema: the relationship with what is stored is interactive, but the past is organized and schematically structured. This topic has been richly developed in the cognitive sciences under the label of knowledge representation, recovering a philosophical and a logical tradition dated back to ancient Greece. Many models of knowledge (and memory) have been produced, such as schemata, scripts, frames and semantic networks; it is not possible to elaborate the issue in the present article. I will refer to the concept of the semantic network, understood in a broad sense, and I will use it to model the process of remembering presented in the following analysis.

A semantic network is a “a graphic notation for representing knowledge in pattern of interconnected nodes and arcs” (Sowa 2003: 1082). The nodes are the concepts represented by the net, and the arcs express the relationships between the nodes; nodes and arcs are therefore labelled as peculiar concepts or relationships. The idea of drawing models of knowledge is not far from semiotics; Charles Sanders Peirce is indeed regarded as the starting point of the modern theory of semantic networks. “Let us construct a diagram to illustrate the general course of thought; I mean a System of diagrammatization by means of which any course of thought can be represented with exactitude” (C.P. 4.530); this exhortation conducted him to the formulation of the *existential graphs*, a theory of diagrammatic or visual notation for logical expressions. This theory is based on his previous *logic of relatives* whose basic idea is that logic (and knowledge) deals with groups of related elements, the relatives. It is a model that Peirce borrows from chemistry, as it states: “a chemical atom is quite like a relative in having a definite number of loose ends or ‘unsaturated bonds’, corresponding to the blanks of the relative in a chemical molecule, each loose end of one atom is joined to a loose end, which it is assumed must belong to

some other atom ... thus the chemical molecule is a medad, like a complete proposition. ... The proposition 'John gives John to John' corresponds in its constitution, precisely to ammonia" (C.P. 4.469) whose chemical formula is NH_3 .

Figure 1.

This idea has been further developed in the field of artificial intelligence by the *conceptual graph theory* (Sowa 2000). According to this theory a statement like *John is going to Boston by bus* can be visually represented by a conceptual graph with four concepts, namely (Go), (Person: John), (City: Boston), and (Bus); and with three conceptual relations: (Agency) that relates (Go) to the agent John, (Destination) that relates (Go) to the destination Boston, and (Instrument) that relates (Go) to the instrument bus. I have presented a short example because I will use this modern notation in the following analysis of the remembering of a tale.

The issue of knowledge representation comes back strongly in semiotics when Umberto Eco describes the format of a semantic system and how it works. He argues that every sign has a meaning "thanks to the interconnection with the universe of all other signs that function as interpretants, each of these ready to become the sign interpreted by all the others" (Eco 1976: 122). To model the human semantic universe (that becomes semiotic in his view) he borrows a pattern developed within the cognitive tradition by M. Ross Quillian. The Q-Model, as Eco named it, is a semantic network, and Quillian drew it up to describe memory: it is a cognitive representation to illustrate how semantic memory is structured. It is very interesting to notice the parallelism between the model of an inter-subjective system, the semantic one, and the model of the individual storage of information and experience. There seems to be a link between individual memory and the social dimension of meaning, they seem to work in the same manner. In fact every semiotic meaningful act is possible because of the existence of an underlying system that guarantees its intelligibility. The competence

in dealing with such systems is shared by the speakers of that semiotic language. From a semiotic point of view we have to recognize that the inter-subjective systems underlying every kind of language are real devices that store a social memory. This knowledge is shared by the competent users of a sign system, but it is not totally owned by anyone: it is partially stored in everyone's individual memory. Argued that memory is not an individual affair but deeply dependent on a social dimension, it is interesting to show how the inter-subjective side influences the individual capacity of saving information in memory, and remembering it in a correct manner. This is what I will display in the analysis of a single recollection of a tale.

2. *Remembering a tale: An analysis*

One of the experiments carried out by Bartlett consisted of the presentation of a written tale to many subjects whose task was to reproduce it exactly after a period of time. I will try here to produce a new analysis of one of these experiments applying a semiotic approach instead of a psychological one. The tale involved belongs to the American Indian tradition and it is entitled *War of the Ghost*. Here is the complete text:

One night two young men from Egulac went down to the river to hunt seals and while they were there it became foggy and calm. Then they heard war-cries, and they thought: "Maybe this is a war-party". They escaped to the shore, and hid behind a log. Now canoes came up, and they heard the noise of paddles, and saw one canoe coming up to them. There were five men in the canoe, and they said: "What do you think? We wish to take you along. We are going up the river to make war on the people." One of the young men said, "I have no arrows." "Arrows are in the canoe," they said. "I will not go along. I might be killed. My relatives do not know where I have gone. But you," he said, turning to the other, "may go with them." So one of the young men went, but the other returned home. And the warriors went on up the river to a town on the other side of Kalama. The people came down to the water and they began to fight, and many were killed. But presently the young man heard one of the warriors say, "Quick, let us go home: that Indian has been hit." Now he thought: "Oh, they are ghosts." He did not feel sick, but they said he had been shot. So the canoes went back to Egulac and the young man went ashore to his house and made a fire. And he told everybody and said: "Behold I accompanied the ghosts, said I was hit, and I did not feel sick." He told it all, and then he became

quiet. When the sun rose he fell down. Something black came out of his mouth. His face became contorted. The people jumped up and cried. He was dead. (Bartlett 1932: 60)

In the book are presented many recallings of the tale, and I will focus on a particular one. “The following version was obtained six and a half years after the original reading ... he volunteered to try to remember the story. He recalled it in steps, with some pondering and hesitation, but on the whole with surprising ease. I will give his version exactly as he wrote it: 1. Brothers – 2. Canoe – 3. Something black from mouth – 4. Totem – 5. One of the brothers died. – 6. Cannot remember whether one slew the other or was helping the other. – 7. Where going on journey, but I cannot remember. – 8. Party in war canoe. – 9. Was the journey a pilgrimage for filial or religious reasons? – 10. Am now sure it was a pilgrimage. – 11. Purpose had something to do with totem. – 12. Was it on a pilgrimage that they met a hostile party and one brother was slain? – 13. I think there was some reference to a dark forest. – 14. Two brothers were on a pilgrimage, having something to do with a totem, in a canoe, up a river flowing through a dark forest. While on their pilgrimage they met a hostile party of Indians in a war canoe. In the fight one brother was slain, and something black came from his mouth. – 15. Am not confident about the way brother died. May have been something sacrificial in the manner of his death. – 16. The cause of the journey had both something to do with a totem, and with filial piety.- 17. The totem was the patron god of the family and so was connected with filial piety” (Bartlett 1932: 77).

It is immediately clear that this is another story, and the mnemonic performance after such a long time is amazing. The hypothesis that memory is a dynamic production is completely verified, and this kind of behaviour can be checked in many other experiments of the same kind. The interesting thing is to give a theoretical account of the procedure responsible for the construction of the new story. Bartlett’s psychological approach focuses mainly on the individual subject, on his attitudes and appetites; according to this view the memory of a text can be explained only considering the individual variability of behaving. This approach is unsatisfying, and semiotics can offer a different account of the production of recalling a text. The main thesis that is possible to state, from a semiotic point of view, is that the remembering process presents many regularities, autonomous

from the single individuality. The regularities instead depend on the structure of the texts, on the procedure of interaction between text and reader, namely the interpretation, and on the logic of production of a new text. All these aspects have been totally dropped within the cognitive psychological tradition. In the following paragraphs I will try to give a new analytical account of this experiment, that could show how, using semiotic tools, it is possible to stress and explain many mechanisms of the remembering process, giving a better scientific account of it.

First of all, analyzing the list presented, it can be noticed that there is a difference between the first four elements (points 1 to 4), that are absolutely new, prompted only by the request of remembering the tale, and all the following elements (points 5 to 17), that are in some way derived or referable to the former ones. One of the four, the totem, is not present in the tale, and the two protagonists are not brothers; this demonstrates a strong interaction with the contents already present in memory. These first four elements are what Bartlett calls, in the definition of memory presented above, outstanding details, namely the items that commonly come to mind immediately after the request of remembering. They are critical because they drive the process of remembrance, and the new text produced is built around them. The challenge for semiotics is to define and specify the nature of these details. The single detail remembered in one process of recall is just a surface element of a specific text, but from a semiotic point of view we can state it as belonging to a specific deep structure of the text. We can classify it as narrative, figurative, pathemic, thematic, actorial, and so forth. This permits a comparability between different recall processes of some texts, and allows us to state some hypothesis about which kind of semiotic textual structures are better remembered than others. It seems possible to single out a topic of research about the *memorability* of texts that, in a general account, should compare the *texts to be remembered* with the *text remembered*, focusing on what survives, and on what instead disappears. Are some kind of semiotic structures better remembered than others? Does it mainly depend on the configuration of a single text? How is it related to the activity of comprehending and memorizing a text? To answer these and other questions of the same kind a broader research is necessary, that analyzes many processes of remembering. It should show if there are trends in the memory of the texts that we can describe with semiotic concepts.

Starting from the four outstanding details, the remembering process spreads out following an expansive logic that is possible to model using semantic networks. Every item is then a concept, a node of the net, and it is rich of unsaturated bonds. New elements come from memory to saturate these free valences becoming immediately new nodes, and the same process is repeated until all the bonds are filled, or no items can be retrieved from memory any more. The main logic that forces the formation of new links is the propositional one: a verb, that represents an action, develops links towards a possible subject of this action, a purpose, an instrument, a place, a result or theme, and so forth. In the present case this phenomenon is very clear: the *brothers* are *agents* of a *journey*, the *journey's purpose* is a *totem*, the *instrument* of the *journey* is a *canoe*, the *canoe* has a *river* as a *location*, in a *forest* too that has the *attribute* of being *dark*, and so on. It is possible to read the 17th step of the list as a progressive spreading of the terms in a complex semantic network. I attempted a full schematization of this recollection using Sowa's conceptual graph. It is not possible, in the present article, to give a full explanation of the schema. The words used by the subject become nodes and the link between these nodes are those proposed by Sowa (2000: 492–510) following a *case semantics*.

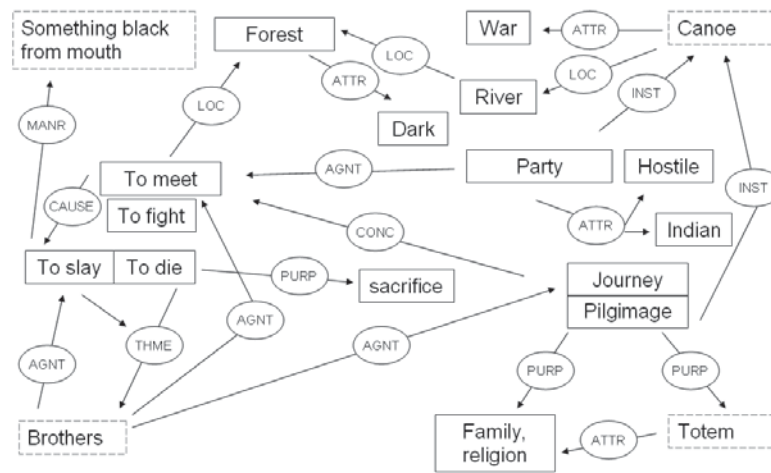

Figure 2.

According to Eco's view we observe the unfolding of several *sememes* (Eco 1976: 105–110) in many of their potential semantic features. It is interesting to notice, in the particular case of remembering a text, that the developing of the net has a *centripetal trend*. In the case of creativity, for instance, the inferential activity moves freely on these semantic networks. In this case, however, there is a sort of unsaid constraint, a trend, a force, that induces the net to a closing: all valences have to be saturated, if possible, with the elements already available, or with others not so far from them. This phenomenon can be explained turning to the semiotic opposition between *manifestation* and *immanence*, between *surface* and *deep structure* of a text. In the recalling observed there is a progressive developing of the surface of a text, driven by a propositional logic, as already described. At the same time a deep dimension is developed that underlies the meaning of the tale as a whole, and that is part of the competence of the producer of the text. I assume that this immanent side acts in the recalling process driving it to produce a surface text which should possibly be close, complete, stable, and coherent. Semiotics has a strong thesis about this, namely that a deep narrative macro structure (Greimas 1979) rules the global meaning of a text at its root. The centripetal force that rules the recalling should then be explained with the need of the construction of such a macro narration, which gives coherence to the whole text. Moreover, using the idea of a deep dimension, we can properly compare the *new* text of the recalling with the *original* one, questioning what kind of deep structure of the text are favoured by this surface logic.

In conclusion: I hope to have shown that memory is an interesting research issue and that semiotics is involved in the scientific challenge to explore this field. Furthermore, there is a topic that is purely semiotic: the memorization of texts. This undertaking consists in studying the capacity of a text to be remembered or forgotten in connection with its structure and with the cognitive activity of remembering. The exploration of this field with semiotic tools, in the present article, has led to some results: first of all, that memory is a dynamic construction, and its unfolding is organized according to a logic that can be represented with the tool of the semantic networks. Such a constraint shows clearly the action of an inter-subjective social dimension, located in the systems of signs, on the individual side of memory. This pressure is exerted on some items that first come to mind in the recall; the semiotic effort should specify the structural nature of these

elements, if a trend can be verified. The general perspective of the research should then move in the direction of a theory of text in terms of *memorability*, with the contribution both of semiotics and cognitive sciences.

How pictures address us

A social semiotic view of adolescents' art-education products

I will deal with the adolescents' idea of the present Knowledge society, or rather with its "landscape" in 2015, portrayed in their art education products. Though my study on one hand is aimed at considering the dimensions of rational 'knowledge', I will on the other hand also outline the "softer" aesthetic aspects of it. The fact that many abstract concepts are structured and represented mentally as metaphors implies that they are fundamental to comprehending, representing, as well as to learning concepts. From the point of view of education, the central role of metaphors is to constantly expand people's experience and to add to the available resources. This idea is also supported by Bruner (1996) who views metaphors and narratives as the earliest and the most natural way of organising new information and comprehending the world.

The important theoretical and methodological basis of my study is semiotics, according to which I view *signs* as fundamental mediating elements between perception and cognition. I will focus on *social semiotics* and particularly on the *critical discourse analysis methodology* developed by Kress & Van Leeuwen (1996, 2001), and, especially in the field of visual arts, O'Toole (1994) & O'Halloran (2004), who have emphasized the *multimodal analysis* of texts and pointed out the importance of the literacy for the reading of these texts.

In this connection I will deal with some theoretical issues related to the "functionalist" background of social semiotics and particularly the "modal metafunction", as well as with the concepts of sign and *experiential metaphor*. In conclusion I will illustrate these ideas with the aid of some pictorial examples of my empirical data depicting the "landscape of the knowledge

society”. I will take an interdisciplinary approach that will benefit from concepts and views originating in semiotics, education, and art research.

1. Landscape of the knowledge society

The idea of a surrounding area, understood as a landscape, has in principle been defined in many fields, such as geography, aesthetics, architecture, agriculture and forestry. In this article I approach the landscape mainly from the viewpoints of students’ art education products. I consider these last from the point of view of social semiotics, and particularly, from Halliday’s “interpersonal” and O’Toole’s “modal” perspectives. The main issue how the students’ landscapes address us, the viewers, and whether this (modal) perspective can add to the interpretation of the pictures. By “landscape” in the title I mean the pictorial representations of the so-called knowledge society’ in 2015, which is the way (16- to 17-year-old) Finnish upper-secondary school students have come to understand the present megatrend: the learning society and an economy based on knowledge.

Eero Tarasti (1990: 156) has suggested that we view the landscape as a kind of border zone, as a part of both nature and culture, a space in which the culture both “looks” back on and projects forward its structures and attitudes. Thus the concept of landscape is based on the dialectics between culture and nature, where it can be seen as the “humanization of nature” and thus, above all, as converting nature into culture. That is to say, cultures do not only define the landscapes, but they also express their points of view concerning which landscapes are beautiful and favourable, or ugly and unfavourable. An example of this is romantic landscape painting, where nature often appears as untouched, sublime, sometimes threatening, whereas in the realist period landscapes were rendered tame, a segment of nature in man’s possession (see Tarasti 1990: 156–159). The landscape of the knowledge society shares in this type of dynamics. As the Copernican revolution and baroque gardens, in their worship of solar centres, reflected organizations and hierarchies of an autocratic time, one would expect students’ drawings of “the landscape of the knowledge society” also to contain signs of the knowledge society as they construct it from their own starting points (cf. Mumford 1970: 28–39).

As stated earlier, the “landscape of the knowledge society” is to be perceived as an imaginary space, a locus, a landscape of the mind charged with

meanings, which people construct on the basis of what they know and their experiences of their Umwelt. These experiences may be represented as pictorial metaphors, metonyms, synecdoches or other tropes. This “mindscape”, which we view “as if” from the inside, may appear as a physical location (cf. Lakoff & Johnson 2003) or as conceptual metaphors of location (Turner 1996: 45). A mindscape is also capable of describing the object by bringing out new aspects and visions of its future. In my study, the reference to the near future, the year 2015, is connected to the objective of the assignment: to look at an imagined future at the present, which is more difficult to shape since it is always in flux. The future, as stories and visions (2000: 17) about utopias or dystopias, may also shed light on the present.

2. *Functionalism in social semiotics*

Social semiotics, from the perspectives of multimodal communication and social sciences, offers an extensive ground for considering students’ visions of the knowledge society. The social semiotic concept of sign can be traced back to the structuralist tradition of the Prague and Paris Schools. The fact that signs can be understood as fundamental elements of, and mediators between, perception and cognition also links up ontologically to Peirce’s pragmatism, which I view as an integrating basis for my study. The primary interest of social semiotics, however, is human communication, viewed as semiosis whose resources, functions, contexts and effects are socially constructed phenomena (Hodge & Kress 1988). A primary focus of social semiotics is how social meanings emerge in different semiotic modes as texts and practices and how they vary in different societies at different times in the past.

The British linguist Michael Halliday has argued that “language is both about what we do and what we mean ...” (Van Leeuwen 2005: 72). Van Leeuwen considers this kind of functionalism as part of societal and cultural development at the turn of the nineteenth and twentieth centuries, drawing a parallel to functionalist architecture and visual design (“form follows function”), sociology, anthropology, linguistics, and semiotics. He supposes a variety of “functionalist” ideas in the background, criss-crossing different areas of society and influencing many fields of theory and practice (ibid.: 71–89).

In studying language development in young children, Halliday concluded that even though they were not adept at using language itself, they nevertheless did learn its functions. On the basis of 7 “protofunctions”, he developed three basic metafunctions: the *experiential* (ideational) function, the *interpersonal* function, and the *textual* function,² which always act simultaneously in language and correlate “function in language” with “function in society” (Van Leeuwen 2005: 76–77). This grounding idea by Halliday later exceeded the limits of linguistics and became the basis for further development and research in social semiotics. Some researchers have become convinced that all semiotic systems can fulfil these metafunctions (e.g., Kress and Van Leeuwen 1996). Thus systemic-functional linguistics can be seen to act *multimodally*, that is to say, in respect to all modes of representation: speech, writing, pictures, sounds, theatre, cinema, etc.

Since the issue in this paper is the visual image, I turn now to the (functional) semiotics of images, as theorized by O’Toole (1994) and O’Halloran (2004). According to O’Toole (1994: 5), the “linguistic” terms of Halliday’s functional “grammar” are not particularly suitable to describing such activities as painting, sculpture and music; he thus suggests replacing Halliday’s three basic metafunctions with the notions of *representational*, *modal*,³ and *compositional* functions. Since the empirical material of my study consists of adolescents’ pictorial products, I shall use O’Toole’s terms to designate semiotic functions.

3. *How pictures address us: The modal function*

Voloshinov has emphasized that the “form of signs is conditioned above all by the social organization of the participants and also by the immediate conditions of their interaction” (in Hodge & Kress 1994: 37). The fact that social semiotics calls attention to the *context* of the production of signs indicates a withdrawal from the universal meanings of structuralism. It also brings us closer to the pragmatist ideas of C. S. Peirce, according to whom each sign always appears in its temporal or spatial context. According to Hodge and Kress (1988: 40), the concept of context also crucially comprises the “logonomic systems”, which are the accrued effects of ideological codes residing in the structures of a society. These effects are always mediated through messages and manifested in the behaviour and positions of the interacting parties. As basic effects associated with social status and

identity, the writers point out, e.g., those of “power” and “solidarity”, which function in inverse relation; i.e., more solidarity means less power, and vice versa (Hodge & Kress 1988: 40, 56). Such modal (pictorial) meanings can be traced back to ideological structures are e.g. the transactions in space (e.g. social distance and proximity). Like Kress & Van Leeuwen (1996; 2001), Van Leeuwen (2005), and O’Toole (1994), I view logonomic systems not as “determined” actions, but rather as constructions and structurings that are “motivated” by social and cultural interests.

Despite the simultaneous interaction of the metafunctions in semiosis and the problems in distinguishing these “fields” from each other, it is possible, according to O’Toole (1994: 189) possible to view them as “analytical tools” of a shared “grammar” and consider their meanings separately. Since I consider O’Toole’s representational (Halliday’s experiential) and compositional (textual) functions as aspects of traditional art history (and Panofsky’s iconography) and art education, I will concentrate on O’Toole’s *modal* (Halliday’s interpersonal) metafunction, which is particularly interesting from the point of view of semiotics. At the same time I will focus on how pictures as modes⁴ “address” us, or how we are attracted to and become involved in their world. I will return to the representational and compositional dimensions in connection with the picture examples.

3.1 Gaze positions: The viewer in space

According to Kress & Van Leeuwen (1996: 121), social meanings in pictures are perceivable on the basis of imaginative face-to-face interaction and spatial positions of the producer of the picture and the viewer. One of the essential transactions in this space is the *gaze*, which seems to position the viewer and affect his or her point of view. In his outline of the “functions and systems in painting” O’Toole (1994: 24) presents some crucial concepts of the modal function as regards the other metafunctions of the work itself: rhythm, gaze, frame, light, perspective and modality, which all have more or less importance in addressing the viewer and provoking his/her interest in the picture. In the following, I consider some of these notions in detail and illustrate them in connection with my own empirical study: drawings of the “Landscape of the Knowledge Society in 2015”. While discussing them generally in terms of social semiotics, and particu-

larly in terms of the modal metafunction, I also consider the potential of these ideas to bring new perspectives to the semiotic analysis of pictures.

4. *Some examples of the case study*

4.1 The information flood

The picture shown in Figure 1 represents an enormous “information flood”, which proved to be a useful (conceptual) metaphor, subsequent to the “tsunami” flood, the (time) context of which was closely related to the catastrophe in Thailand – the pictures were made only four months after the tragedy in 2005. In terms of the *modal* dimension, the viewer is positioned in front of a tap and a fast-flowing “flood”, detached from its background. The attention is at first drawn to the oblique dynamics of the composition, which direct the *gaze* to the wave-like *rhythm* of the spin-drift, which originates in the tube of the tap. Opposite the viewer, addressing her directly, is a faceless figure imprisoned by a water bubble, a mediator, whose *gesture* appeals to the viewer as if asking for or *demanding* help. As explanation for the information flood, the author of the picture, on one hand, seems to suggest the determinist natural force, the tsunami, whose destructive power is increased by a transaction from the upper right corner down to the left, a *vector* towards the “eternal separation” behind the “bars”. On the other hand, the motion directed to the right, “upstream” towards the source of the flood, also reveals a mysterious tap, behind which one can discern traces of a cross-like symbol. There is an obvious tension between the two: the user of the tap, the one with the *power*, and the drifting “imprisoned” figure in the bubble, for whom the viewer may feel sympathy and solidarity. In the student’s own words: “knowledge will steamroller everything”, even religions, the symbols of which are hidden in the whirlpools of the flood. Also the dynamics of the compositional function directs attention to the right top corner (the motion towards the right in the picture space is experienced as a culturally motivated, “natural” temporal change). The user of the mysterious tap, the actor of the mimetic plane, is absent. To the question in the interview “Who uses the tap?” the cryptic answer was: “A power higher than man”. Does the student thus refer to “God” or other supernatural powers (cf. the Christian symbol behind the tap), or could there be other interpretations for the message of the picture? One possible explanation is

offered by bringing in the *modal* dimension of the picture and by positioning the viewer relative to the tap. The viewer, directed by the perspective of the water tap, is then positioned to adopt a slight high-angle stance in respect to the tap and is thus brought within its reach as the user – and thus one having power over it. Also the figure in the bubble, though smaller in size, appeals to the viewer. The arrangement from this standpoint could then shift to speculation concerning the information-flood metaphor: do we also have a share in the origin or control of this flood, and do we have the power to protect people from falling victim to it?

Figure 1. “The Flood of Information”.

4.2 The boxes

The picture shown in Figure 2 may also be approached first from the position of a viewer watching the “landscape” from above, so that the horizon is high above the frame of view. Louis Marin (1993) speaks of landscapes as seen from skyscrapers, and of the “ubiquitous gaze” through which the onlooker identifies him-/herself with the building and thus experiences feelings of visual possession, control – and power. The horizon, especially, seems to produce metaphorically such sublime ideas as “infinity”, “freedom”, “utopia”, “transcendence”. In the context of highly industrialized Western countries, such ideas can easily be associated with economic growth, geographical expansion, and a “victorious future” (as the aerial bombardments of Kuwait and Iraq were represented in press photos and video clips) (Lukkarinen 2004: 40; Marin 1993; Kress & Van Leeuwen

Figure 2.

1996: 146–148). The present picture, however, conjures up no such future; rather, the scenery may be characterized as a gloomy urban “wilderness”. The author has presented the viewer with imaginary power, but over what? The vectors of the rows of boxes in the central perspective seem to indicate a vanishing point outside the picture, which, together with the progressively darker shading, connotes destruction or solipsism. The picture is totally lacking in social interaction, and according to the author, members of the knowledge society no longer need face-to-face contact with other people. The pessimistic attitude of the author is accompanied by experiential metaphors⁵ of angular quadrangles of the “box-rows”, which in this context appear to acquire tones of lifelessness, coldness and machine-likeness in the picture. All seems “mechanistic” here: a root metaphor which philosopher Stephen Pepper (1942) considers to be one of our basic cognitions or presumptions as to the nature of the world. To whom does the author offer this desperate gaze? There is no doubt that, as in the previous case, the viewer is encouraged to view the picture “from on high”, and hence share in this ubiquitous and frightening vision and compelled to consider the possibility of this totalitarian dystopia.

4.3 Anxiety

In the last picture to be analyzed (Fig. 3), the author describes a conflict into which the main character has been driven amidst an urban milieu. The sex

of the figure, as well as of those running away, has been dissolved. Emphasized is a background resembling a corner of the street or a wall or other obstacle, which emphasizes the anxiety of the main character. This figure's gesture reflects the difficulty and ambivalence of making a decision: hands raised to the ears, feet turned inwards. In this pose, the figure stands still and addresses the viewer positioned opposite it, as if "demanding" participation in the solution of a problem. What *is* the problem? We may answer this in two ways. (1) If one considers the modal "truth value" of the depiction, and particularly the articulation of details and modulation of colour, between the main character and the rest of the characters, it seems that the figures running away are represented as less complex and less defined than the main character. Hence the main character can be viewed as more realistic and "plausible" (more truthful, modally speaking), corresponding to the dominant naturalistic or "common-sense" coding orientation, which makes it appear more familiar and acceptable, thus encouraging viewers to feel solidarity with it. (2) On the other hand, if one compares the abundance of detail and colour (the leaves) in the greenish thought-bubble at the top right corner of the picture, to the cold blue "wall" representing the city, it is likewise possible to view the portrayal of nature as having high modality, and accordingly, as being a more desirable choice in this context.

Since the subject of the picture is "the landscape of the knowledge society", the essential tension and anxiety of the main character are not linked solely to the nature-culture contradiction nor to problems of the urban milieu. A parallel and equally plausible interpretation arises from the expression of the "nature" area, which emphasizes biological details

Figure 3.

(green-veined leaves, the bark of the tree trunk), sensuousness (the calmness of the figure lying at the base of the tree, the waterfall in the background), and richer colors than in the rest of the picture. The key issue here is the safe, heavenly atmosphere, characterised by leaves tenderly covering the sleeper and the trees arching protectively over the figure. In terms of functional semiotics, these “movements” may be seen as transactions directed towards the resting figure, the meaning of which is sensuous closeness and soft caring. In comparison with the episode at the corner of the street or wall, it offers a new kind of explanation for the mood of the main character and introduces a social dimension to it. Accordingly, the overall message to the viewer is one of anxiety at the unnaturalness and lack of sensuousness of the knowledge society, as well as the superficiality and facelessness of social contacts obtainable, say, through the “net” – the retreating figures referring to the lack of interpersonal contact.

Notes

1. The information / knowledge society is commonly understood as a new form of society, into which the present one will be transformed, raised to a higher level by the development of information and communication technologies. Particularly from the technological point of view, the concept implies strong optimism and reliance on the capacity of information and communication technologies to resolve societal problems.
2. The *experiential* or ideational function (corresponding to Jakobson’s referential function) refers to constructing representations of what is going on in the outside world (Van Leeuwen 2005: 278). In pictures the relation of two objects may, e.g., be represented as involved in a process of interaction, which visually could be realized in terms of narrative structures and/or analytic ones (Kress & Van Leeuwen 1996: 40–41). The *interpersonal* function (corresponding to Jakobson’s conative function) refers to the establishment of communicative interactions (Van Leeuwen 2005: 279). A depicted person in a picture may, e.g., address the viewer directly, or turn away from the viewer (Kress & Van Leeuwen 1996: 41). The *textual* function refers to the creation of texts, as complexes of signs, and to the context in and for which they are produced (Van Leeuwen: 288).
3. By modal function O’Toole means the various devices used to engage the viewer’s attention, drawing him or her into the world of the picture (O’Toole 1994: 5). Semantically these expressions vary within the range of the necessary, the possible, and the impossible.

4. The “mode” is the material resource (quality, expression) used in recognisable, stable ways as a means of articulating discourse (e.g., speech, writing, picture, moving image). A discourse is realised through a mode, which functions as its “carrier” (Kress & Van Leeuwen 2001: 25).
5. In social semiotics the concept of experiential metaphor is a constitutive one: these metaphors have an important role in sign processes, where they function as “tools” for semiotic innovation. (Van Leeuwen 2005: 29–34).

Mediatización y vanguardias estéticas: Los (anti)happenings argentinos (1965–68)

La propuesta de este artículo es leer las experimentaciones estético-conceptuales de los (anti)happenings realizadas en el marco del Instituto Di Tella (Buenos Aires, 1965–68) como un indicador o catalizador, fuertemente conciente y reflexivo, del proceso de mediatización (Verón 1984; 1992; 1997) en la Argentina. En efecto, estas experiencias y sus teorizaciones elaboraron un verdadero “discurso de la mediatización”, el cual puso en primer plano la categoría de “medio/s” en tanto que conjunto de *condiciones materiales* (canales) y *formales* (códigos) para la producción/recepción de mensajes. En la medida en que introduce un nuevo sistema conceptual que hace posible a la vez que imposible la oposición forma/contenido, el término “medio” viene, así, a desplazar el plano de inmanencia de dicha distinción estética y la clausura metafísica de las oposiciones derivadas o asociadas a ella. De modo tal que el concepto ditelliano de “mediatización” prefigura elaboraciones postestructuralistas tales como la propuesta por el teórico canadiense contemporáneo Ian Angus (2000: 135–136; 141–147) sobre el “medio” en tanto que “Materialidad Externa” capaz de desplazar oposiciones metafísicas tales como contenido/efecto, dialéctica/retórica, contenido interno/efecto persuasivo (contexto institucional), o verdad/retórica, es decir adentro/afuera (o interior/exterior). En términos de la experiencia (anti)happenista ditelliana, se trata del desplazamiento de la oposición contexto real/contexto imaginario, y de la serie de oposiciones asociadas a ella: contexto real/medio, contexto/texto, realidad/representación, realidad/ficción, etc.

Un concepto de mediatización así entendido remite a la noción derridiana de artefactualidad o escritura teletecnológica (Derrida y Stiegler 1998). La tecnicidad o archiescritura, parece demostrar la experiencia

argentina, es la *condición estructural* (*material y formal*, en nuestra lectura de Masotta) que hace posible el sentido. Si bien en las reflexiones teóricas ditellianas no se reconocen referencias a la deconstrucción, el desplazamiento que produce este tercer término “mediatización” es deconstructivo en la medida en que reenvía las oposiciones conceptuales antes mencionadas al problema de los medios: los medios no como instrumentos de contenidos o intenciones preexistentes sino como *materialidades configuradoras de las relaciones sociales y constitutivas de sus propios emplazamientos*. Dos ideas centrales, entonces, en la conceptualización ditelliana sobre el proceso de mediatización: a) su espesor *material* significante, y b) su carácter *configurador* o *constitutivo*, y no simplemente representativo, respecto del mundo y de las relaciones sociales.

A partir de un análisis exhaustivo de sus (anti)happenings y obras comunicacionales (Olivera 2004), he detectado cuatro aportes fundamentales de las experimentaciones estéticas ditellianas a una teoría de la mediatización: (1) materialidad artefactual, (2) configuración del mundo, (3) discontinuidad/ ambientación, y (4) diferenciales materiales intermedíaticos.

1. La mediatización como materialidad artefactual y sus procesos de desmaterialización

Respecto de la mediatización en tanto que condición *material* de posibilidad e imposibilidad del sentido, quisiera insistir sobre el énfasis ditelliano en la materialidad mediática y sus procesos inmanentes de desmaterialización. En este punto, es interesante observar su crítica a cierto reduccionismo estructuralista que sólo consideraba las estructuras – códigos o condiciones formales – pero que era insensible a la materialidad del medio (a las condiciones materiales de la mediatización). En este sentido, la concepción de Masotta fue más allá del horizonte del estructuralismo y de la crítica ideológica marxista, esbozando una noción de mediatización particularmente sensible a su dimensión específicamente material y configuradora del mundo (para lo cual se inspira parcialmente en McLuhan). Esta contribución de Masotta en 1967 prefigura la concepción postestructuralista de la mediatización, sobre la Externalidad radical del medio (de comunicación) como superficie de inscripción material (Angus 2000: 97) o escritura teletecnológica (Derrida y Stiegler 1998).

Con ejemplos tomados de los (anti)happenings, de las tendencias *pop* en las artes visuales, de las historietas y del cine argentino contemporáneo, Masotta reivindica la *conciencia estética sobre los medios* por parte de la vanguardia artística argentina de los sesenta. Las búsquedas fundamentales de los happenistas y del grupo *pop* no habrían estado orientadas, así, a la forma ni directamente a los contenidos, sino a los *medios* en tanto superficies *materiales* que hacen posible la transmisión de esos contenidos, es decir en tanto que *condiciones de posibilidad* de la comunicación. Es precisamente esta suerte de *conciencia artefactual* sobre los medios aquello que conduce a las operaciones de desplazamiento y descentramiento antes aludidas (Jacoby 1967: 128). Es de destacar, en esta “reflexión radical sobre las características materiales” de los “medios” estéticos (Masotta 1968: 223), que el proceso de mediatización esta intrínsecamente asociado a un momento de *hibridez* en el campo del arte: la mediatización como aquel tercer término y como aquel vector de hibridación que hoy podríamos llamar deconstructivo.

2. Configuración del mundo en la mediatización

Conjuntamente a esta puesta en primer plano de la materialidad significativa, el otro gran aporte de las experimentaciones y conceptualizaciones ditellianas radicó en el carácter *configurativo* (antes que reproductivo o representativo) de la mediatización respecto del mundo y respecto de la constitución simbólica de los grupos sociales. Lo que esta operación teórica produce como efecto, en el plano de la reflexión sobre los medios, es un desplazamiento respecto del problema de la alienación (de los contenidos o representaciones alienantes).

Es decir: sabemos que, contra el carácter alienante de las representaciones reificadas por la forma-mercancía, los happenings de Lebel aspiraban a ser “un medio de expresión directa y sin intermediarios” (Páez 1967: 35). Nada más lejos de las experimentaciones formales del Di Tella, focalizadas sobre, precisamente, el proceso de mediatización. Lo que parece sugerir la experiencia argentina es cómo los medios – sus condiciones materiales y sus operaciones formales – son capaces de producir un mundo (sus condiciones), y no simplemente de alienar contenidos de conciencias y representaciones sociales. Los (anti)happenings ditellianos fueron, así, en lo esencial, experimentos que pretendieron demostrar los fundamentos materiales y formales de la comunicación y de la constitución del sentido en los grupos

sociales en el marco de una sociedad de masas. Esto es especialmente claro en *El helicóptero* (Masotta, 1966) y *Happening de la participación total* (Costa, Escari y Jacoby, 1966).

3. *La mediatización como discontinuidad y ambientación*

Los ditellianos hacen suyo el interés de la estética contemporánea por el proceso de mediatización. Dicho interés conceptual puede, en Masotta, condensarse en dos términos – *discontinuidad* y *ambientación* – referidos, respectivamente, a los polos de producción y recepción de las obras. Es decir, el proceso de mediatización atraviesa los (anti)happenings ditellianos tanto mediante la producción de discontinuidad (simultaneidad, sucesividad, etc.) como mediante la inducción de efectos de ambientación en sus espectadores-participantes. Discontinuidad “en producción” y ambientación “en reconocimiento”; (Verón 1987) definen, así, las operaciones de los (anti)happenings.

Según el régimen visual de la estética tradicional (pintura figurativa, expresionismo abstracto, teatro convencional), “sólo hay saltos y discontinuidades entre el campo de objetos reales, al que abre la percepción, y los objetos irreales de la actitud imaginante” (Masotta 1967: 59), esto es, entre percepción e imaginación. Es decir, sólo se admiten rupturas, fronteras y discontinuidades entre contexto real y contexto imaginario, entre marco y cuadro, entre teatro y escenario, pero nunca en el interior de los segundos términos. Pero, a partir de la obra de Rauschenberg, Masotta (ibid.) señalará dos movimientos u operaciones:

a) Por un lado, una perturbación que produce discontinuidad en el interior mismo del contexto imaginario: éste ya no aparece como un “campo cerrado” que permitiría “una lectura continua del sentido”; este efecto de discontinuidad se logra mediante operaciones combinatorias (los “combine” de Rauschenberg o la técnica happenista de la “estructura compartimentada” que aísla parámetros y compartimentos).

b) Por otro lado, la borradura de la discontinuidad entre el contexto real e imaginario de la obra; esta operación se manifiesta en los happenings como participación envolvente.

Combinatoria de elementos discontinuos (yuxtaposición simultánea y sucesiva de componentes y parámetros en los happenings) y *borradura de*

la discontinuidad entre contextos (participación envolvente) serán los dos momentos constitutivos de una estética de la discontinuidad. Si la primera operación produce discontinuidad allí donde sólo había continuidad (el interior del contexto imaginario, la escena), la segunda operación generará una continuidad y un principio de unidad entre dos contextos tradicionalmente separados (imaginario/real; escena/teatro; cuadro/marco). Procedimiento de inversión, entonces, de aquellas convenciones de la representación que distribuyen lo continuo de lo discontinuo para fundar una escena.

En los happenings, la *inversión* es una operación de lectura del sentido que interviene en el propio proceso de producción de las obras: se propone una lectura discontinua allí donde debería haber sentido continuo (escena) y se inducen continuidades entre contextos que deberían permanecer separados y discontinuos. Es decir, las operaciones de inversión se efectúan en el vínculo mismo entre texto y contexto, o contexto imaginario y contexto real, y se manifiestan como “invasión” textual del contexto, y contaminación del contexto imaginario (escena) por el contexto real (participantes, sala teatral).

La estética ditelliana de la discontinuidad se manifestó, entonces, como experimentación analítica con la materialidad de los “parámetros” y con la permanente hibridación entre elementos del contexto real y del contexto imaginario. En las reflexiones de Masotta hay una conclusión fuerte sobre el vínculo entre, por un lado, el “pasaje a la discontinuidad” del arte contemporáneo y, por otro lado, el proceso de mediatización. Es decir, entre una ruptura estético-epistémica y un proceso socio-tecnológico. Dicho vínculo es intelectual y se presenta como visibilidad: la experimentación y la reflexión estética hacen visible el hecho de que las relaciones entre los hombres están “irremediablemente mediatizadas por la técnica y por las cosas” (Masotta 1967: 53). Mediatización y discontinuidad, entonces: esta estética del objeto que “se fabrica” con “materiales discontinuos” apunta a una *conciencia artefactual de fabricación* capaz de desafiar el mito de la continuidad de la obra, “el mito de la vida misma” como continuidad (Barthes, citado por Masotta 1967: 72).

La *ambientación*, por su parte, será la categoría estética a partir de la cual los ditellianos elaboraron el polo del reconocimiento del proceso de mediatización. Y otra vez, la categoría de ambientación remite precursoramente a la teoría mediática postestructural de Angus. En efecto, el

crítico canadiense entiende la Externalidad material de los medios como el “media environment in the social formation: the plurality of media of communication, their interactions and the translations ‘in’ and ‘out’ of the medium in question” (Angus 2000: 139). Los términos de esta definición son más que sugerentes: la mediatización es, en lo fundamental, un “media environment”, un ambiente mediático o, más bien, un ambiente siempre ya mediatizado. No es otra cosa lo que Marta Minujin intentó demostrar en su ambientación *Simultaneidad en simultaneidad* (también elocuentemente denominada por ella misma *Señal de ambientación*).

Recordemos aquí que en la ambientación “simultaneidad en simultaneidad”, el proceso de mediatización se elabora como invasión textual-mediática del contexto real, en aquello que Verón (1967) lee desde la teoría estructuralista como neutralización de la oposición medio/contexto (es decir, en la terminología happenista: neutralización de la oposición contexto real/contexto imaginario). La mediatización se presenta así como invasión mediática del contexto (real): el contexto (real) está siempre ya mediatizado, parece sugerir el happening de Marta Minujin.

La dimensión de la ambientación es fundamental en la experimentación ditelliana sobre la mediatización en la medida en que hace visible el polo de los efectos de los medios no como mero contexto o accidente exterior, sino como condición de posibilidad inherente e interior al accionar significativo de los propios medios. Los (anti)happenings ditellianos intentaron mostrar precisamente el carácter siempre ya mediatizado del contexto real: es decir, en la terminología de Angus (2000: 146–147), el carácter mediáticamente construido del “horizonte”, del mundo.

4. *Los diferenciales materiales intermediáticos y la mediatización*

En estrecha relación con el concepto estético de “discontinuidad”, otro aporte sustantivo de los (anti)happenings ditellianos a la reflexión sobre el proceso de mediatización es la noción de *diferencial* intermediático. Tomando la concepción estructuralista del lenguaje y del sentido como diferencia, los ditellianos trasladan y reinscriben dicha noción de diferencial a la materialidad y externalidad significativa de los medios. Esto es, el sentido es diferencia y negatividad no sólo formal (como nos lo enseña la concepción estructuralista de “código”) sino material: los emplazamientos

o superficies de inscripción de esa diferencialidad material son los medios. Las experimentaciones con los diferenciales de comunicación entre medios – claramente visibles en *El mensaje fantasma*, *El Helicóptero* y *Happening para un jabalí difunto*– conceptualizaron los medios como espaciamentos o superficies materiales de inscripción (escritura teletecnológica). Es decir, los medios como externalidades materiales y como productores de un horizonte/mundo en la interacción y traducción intermediática.

(Anti)happenings mediáticos realizados en el marco de las actividades del Di Tella como *El mensaje fantasma*, u otros en los que no intervienen medios masivos como *Entre en discontinuidad* de Raúl Escari, experimentaron sobre la “discontinuidad” o *diferencia* existente en un mismo contenido transmitido o ambientado, discontinuamente, por distintos medios.

Pero el concepto de diferencial no se puso en juego solamente en la singularidad de los happenings antes mencionados: estuvo presente, como horizonte teórico, en el programa estético antihappening sobre un “arte de los medios de comunicación de masas”. La estética ditelliana antihappening fue una estética de los diferenciales y de las mediaciones, y supuso, de un modo original, operaciones de inversión respecto del horizonte de inmediatez característico de los happenings y de las ambientaciones europeos y norteamericanos. Es decir, si el happening buscaba una comunicación sin mediaciones, el arte mediático se sustentará en el principio inverso, esto es, en el carácter primario del proceso de mediatización: “el medio masivo de comunicación es un medio de lo que de inmediato hay en la mediatización del objeto”. (Masotta, citado por Jacoby 1967: 131)

En este punto el proceso de mediatización conecta con la estética de la discontinuidad: desmaterialización y “desrealización de los objetos” (Jacoby et al. 1967: 122). De allí que, en su arte de los medios, Jacoby esté apuntando precisamente a una estética “anti-happening”, a un arte de las mediaciones que supone siempre, necesariamente, una distancia espacial o diferencia/diferancia, entre las audiencias que reciben la información y los objetos o acontecimientos referidos o representados por ésta.

En esta línea de reflexión sobre los diferenciales intermediáticos, y a manera de original aporte teórico en el campo, Masotta (1968: 271) propone un estructuralismo “ensanchado” cuyo campo sean “las diferencias ... y semejanzas entre los medios de comunicación”. En semejante campo diferencial, la especificidad de cada medio reside en su materialidad puesto que

cada medio de comunicación extrae su potencia de significar de la presencia de otros medios. ... se trata de pensar la comunicación masiva como definiéndose no tanto en el interior de los límites trazados por cada medio, sino siempre *afuera de esos límites*, en un campo donde la comunicación sólo encuentra sus vehículos a condición de no proceder nunca sino a través de *desvíos*. (Masotta 1968: 272; enfatizados míos).

Masotta propone entonces complementar el análisis estructural de los mensajes (códigos) con la “descripción del campo diferencial de los medios de comunicación *en cuyo interior los mensajes se sitúan*” (ibid.), es decir con la especificidad de los medios en tanto que emplazamientos o superficies de inscripción material de los discursos. Con lo cual, las experimentaciones y teorizaciones ditellianas sobre los diferenciales intermediáticos prefiguraron lo que unos treinta años más tarde las teorías postestructurales de los medios llegaron a formular (Angus 2000: 145).

En conclusión, puede afirmarse que la noción de *mediatización* (discontinuidad/ ambientación; materialidad artefactual/poder configurativo), tal como aparece delineada por Masotta, Jacoby y demás intelectuales vinculados al Instituto Di Tella en sus textos críticos de los sesenta, constituye un verdadero *protoconcepto*: anticipa el concepto homónimo que Eliseo Verón (1984, 1992, 1997) desarrollará durante los años ochenta y noventa a propósito de la interfaz entre política y medios, entre discurso político y discurso de la información. Supone, además, un alto grado de conciencia (estética) artefactual, lo cual aproxima las operaciones críticas masottianas al concepto derridiano de “artefactualidades” (Derrida y Stiegler 1998).

Bruno Osimo

Translation as misunderstanding

1. What is translation?

According to Aleksandr Lûdskanov, translation can be defined as replacement of the signs encoding a message with signs of another code, preserving (so far as it is possible in the face of entropy) invariant information with respect to a given system of reference (1975: 7). This definition recalls another very well-known statement that was not devoted to interlingual translation: “A sign, or representamen, is something which stands to somebody for something in some respect or capacity. It addresses somebody, that is, creates in the mind of that person an equivalent sign, or perhaps a more developed sign. That sign which it creates I call the interpretant of the first sign.” The resemblance of the two sentences emphasizes that every “translation” is an interpretant, or a translant, of another text. This has obvious consequences for translation science, where the importance of the semiotic, Peircean approach is apparent. But it has also consequences for semiotics, where the importance of the translational approach should appear evident.

1.1 Why translation is a misunderstanding

According to a dictionary, “misunderstanding” is “a failure to understand or interpret *correctly*” (my emphasis). But in *Universe of Mind*, Lotman is very clear about the fact that no such thing as a ‘correct translation’ can exist outside artificial languages, where “the correct solution of mathematical problems does not create new texts”. If we agree that translation cannot be tautology, then we agree that translation creates new texts. Interlingual translation is a creative process (“*Translation $L^N \rightarrow L^{N'}$ is a creative process, consisting in the transformation of the units of language RC, in which the*

sender's message M is encoded into units of another language RC ; reproducing a constant information $I=I'$ so far as possible"; Lûdskanov 1975: 6), after which nothing – within or without the text – is any longer the same. Translational misunderstanding is something that diminishes the proto-text meaning, and at the same time increases it, as can be said of any misunderstanding:

Since in this case the meaning is not only the invariant remnant which is preserved under all manner of transformational operations, but also what is altered in the process, we can state that there is an increase of meaning in the process of such transformations.

And this is what does happen in general communication: Someone tries to say something to someone, that is taken partly from the semiosphere (outer influences), partly from inner creativity. What he wants to say is partly coded, partly uncoded (missed, lost), so that the receiver cannot wholly perceive it. What he finally does say is partly understood, partly misunderstood, so that the receiver doesn't wholly receive even what is finally coded by the sender. But the receiver attaches meanings to the messages that were not meant to be meant by the sender. So the message, in the receiver's terms, has less meaning than the sender meant, but has also more meaning than the sender meant.

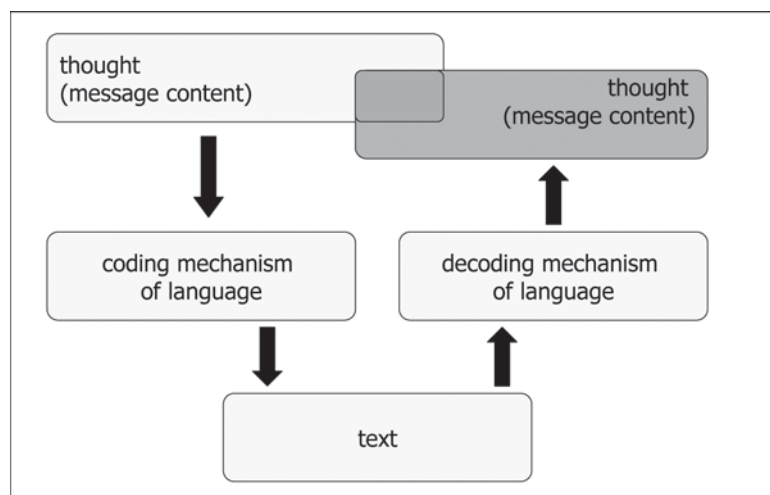

Figure 1. *Difference of thought content as a consequence of a normal act of communication (not interlingual translation).*

As Levý used to say about translation as a game, signification (and decoding) is a multiple-choice process having a single input and several possible outputs. Every interpretant is a multiplier of sense translating the prototext (initial sign) into many different metatexts. The logical line of the speaker's (writer's) mind chooses given signs while having in mind a given meaning, but the logical line of the listener's (reader's) mind chooses given meanings while having in mind a given interpretation. In this way – through what can be named a continuous “misunderstanding” –, meaning evolves.

Specification and generalization play a fundamental role in the evolution of meaning; it is peculiar, though, that their main explicit features do not imply any semantic change at all: specification should only condense, synthesize the general meaning of a sign, and generalization apparently extends, amplifies the meaning to many more objects, but, seemingly, without changing it.

These two mechanisms, which are key in interlingual verbal translation too, are continuously at work in normal semiosis: “Peirce’s semiotic doctrine is the only sound basis for a strictly linguistic semantics. One can’t help but agree with his view of meaning as translatability of a sign into a network of other signs and with his reiterated emphasis on the inherence of a ‘general meaning’ in any ‘genuine symbol’ [Peirce CP 2.293], as well as with the sequel of the quoted assertion: A symbol ‘cannot indicate any particular thing: it denotes a kind of thing. Not only that, but it is itself a kind and not a single thing’” [Peirce CP 2.301] (Jakobson 1956: 118).

We also know that there is another expressive potential depending not on generalization/specification, but on the use of tropes. Metaphor and metonymy, tropes in general, and different kinds of similarities are not embellishments peculiar to artistic texts; they are basically the fundamental mechanisms of meaning construction, together with generalization and specification.

1.2 Context

The continuous translation process of semiosis is due to the continuous change of context: in every context, a more or less slightly different sub-code is used. And every time that a text moves from one context to the next, there is a reciprocal adaptation of the text to the context and of the

context to the text. And the text is read (decoded) in a more or less slightly different light. During such a passage from one context to another, it may well happen that specification and generalization work in the direction of translating words into terms and vice versa. This also is a mechanism of meaning shift: “The ways in which *per translationem* a *nomen* turns in discourse into a *terminus* were intently explored, with many still valid and suggestive linguistic finds, and with a rigid delimitation of *suppositio formalis* (object language) and different varieties of *suppositio materialis* (metalinguage), neatly discerned by Shyreswoode” (Jakobson 1968: 195).

Interlingual verbal translation and general semiosis have a very similar course, and they can be used for a reciprocal checking of each other’s functioning. Here we see how the invariant can be defined in Jakobson’s (and Shannon’s) terms: “The semiotic definition of a symbol’s meaning as its translation into other symbols finds an effectual application in the linguistic testing of intra- and interlingual translation, and this approach to semantic information concurs with Shannon’s proposal to define information as ‘that which is invariant under all reversible encoding or translating operations’, briefly, as ‘the equivalence class of all such translations’” (Jakobson 1961: 578).

Jakobson himself sees the affinity between tropes (metaphor and metonymy) and usual meaning production in ‘normal’ (non-artistic) texts. The shared assumption between the two researchers is the existence of a part of meaning that is expressed, and another part that is not expressed, and may be – arguably – guessed in different ways by different decoders: “Each and every sign is a *referral (renvoi)* (following the famous *aliquid stat pro aliquo*). The parallelism alluded to by the master and theoretician of poetry, Gerard Manley Hopkins, is a referral from one sign to a similar one in its totality or at least in one of its two facets (the *signans* and the *signatum*). One of the two ‘correlative’ signs, as Saussure designates them, refers back to another, present or implied in the same context, as we can see in the case of metaphor where only the ‘vehicle’ is *in presentia*” (Jakobson 1974: 215).

In this process of decoding, the presence/absence of elements means that what is absent in the text must be present in the context. Such problem of presence involves referral to different times. Peirce attributes three different times to the three types of signs (symbol-future, index-present, icon-past). Jakobson holds that artifice (*priëm*) as a fourth dimension of

signification is a bridge over times: “Parallelism’ as a characteristic feature of all artifice is the referral of a semiotic fact to an equivalent fact inside the same context ... allows us to complement the system of times which Peirce includes in his semiotic triad The artifice retains the *atemporal* interconnection of the two parallels within their common context” (Jakobson 1974: 216).

Translation is transportation of a text from one context into another. And, on the other side, communication is the ability to decide what is necessary to express and what can be taken/given for granted since it is suggested by the context, with all the consequent problems of redundancy and loss.

2. *Limits of translational misunderstanding*

Any translation may be a misunderstanding, but not every misunderstanding – from a pragmatic point of view, at least – is a translation. There are many ways in which a text is rejected as a translation (on the market, at school), and there are many types of limit separating translation from what I would call a “delusion”. Delusions are false or “incorrect inferences about external reality” (Spitzer 1990); from this definition one can see that the notion of “delusion” is culture-specific, not absolute. There is a relation between the overcoming of all the three types of limit and a delusional or exceedingly self-referential attitude.

2.1 Voluntary *versus* involuntary misunderstanding

There are two possible types of misunderstanding: involuntary misunderstandings, due to the interpreter’s competence, or to the anisomorphism of codes, and voluntary misunderstandings, due to the wish to manipulate a text. If the problem is considered from the point of view of translation criticism, such a difference is neglectable, since it is often impossible to tell which the case is. But from the theoretical point of view we can distinguish the two different types.

In translation criticism, misunderstanding (translation shift) is seen from the point of view of the text’s reception. In semiotics, misunderstanding is seen from the point of view of communication, the communicative node where loss occurs. For this reason, grids usually used to classify trans-

lation shifts (e.g. Osimo 2004) cannot be used to comment misunderstanding from a semiotic point of view.

2.2 Group culture

This refers to the knowledge of the two different cultural contexts in which the prototext and the metatext are originated.

2.2.1 Source group culture

Knowledge of the source group culture can be defective (and difficult to decode; involuntary misunderstanding), or there may be a manipulative wish not to decode it into the target culture (voluntary misunderstanding).

2.2.2 Involuntary source group culture misunderstanding

Source contextual culture as limit for understandability (i.e. for the interpreter it is difficult to decode the functioning of the source group culture, and she/he misunderstands it); for example:

[mis]assumption:	prototext	metatext
"Samovar" is Russian for "teapot".	"Please, bring me the <i>samovar</i> ."	"Please, bring me the <i>teapot</i> ."

Voluntary source group culture misunderstanding: Source contextual culture as limit for misunderstandability (i.e. the interpreter is not willing to transfer her knowledge of the functioning of the source group culture); for example:

[mis]assumption:	prototext	metatext
"Samovar" is not the Russian for "teapot", because it refers to a different cultural tradition, but for the purpose of this communication this is not significant.	"Please, bring me the <i>samovar</i> ."	"Please, bring me the <i>teapot</i> ."

2.2.3 Target group culture

Knowledge of the target group culture can be defective (and it may be difficult to recode the message in it; involuntary misunderstanding), or there may be a manipulative wish not to recode the source group culture into the target culture (voluntary misunderstanding).

Involuntary target group, cultural misunderstanding: contextual culture as limit for understandability (i.e. for the interpreter it is difficult to recode the message of the source group culture in the target group culture's terms); for example:

[mis]assumption:	prototext	metatext
"moca" is the Italian for "coffee maker".	"Please, bring me the <i>coffee maker</i> ."	"Please, bring me the <i>moca</i> ."

Voluntary target group, culture misunderstanding: Target contextual culture as limit for misunderstandability (i.e. in a given culture it is "socially unbecoming" to overcome given interpretive limits); for example:

[mis]assumption:	prototext	metatext
"moca" is not the Italian for "coffee maker" because it refers to a different cultural tradition, but for the purpose of this communication this is not significant.	"Please, bring me the <i>coffee maker</i> ."	"Please, bring me the <i>moca</i> ."

3. Personal culture

The emitter's and receiver's idiotextual cultures (where one's own culture is "I", and other's culture is "they") poses limits for understandability and, consequently, misunderstandability. The knowledge of the emitter's personal culture can be defective (and difficult to decode; involuntary misunderstanding), or there may be a manipulative wish not to decode it into the receiver's culture (voluntary misunderstanding).

The knowledge of the emitter's culture can be defective (and difficult to decode; involuntary misunderstanding), or there may be a manipulative wish not to decode it into the target group culture (voluntary misunderstanding). Emitter's culture as limit for understandability (i.e. for the interpreter it is difficult to decode the functioning of the emitter's culture, and she misunderstands it):

[mis]assumption:	prototext	metatext
In a text by Umberto Eco, “Diario” is just the name of a personal register of annotations, not the Italian name of a book by the author.	“I once wrote in my <i>Diario</i>”	“I once wrote in my diary.....”

The emitter’s contextual culture may be a limit for misunderstandability (i.e. the interpreter is not willing to transfer her/his knowledge of the functioning of the emitter’s culture); for example:

[mis]assumption:	prototext	metatext
In a text by Umberto Eco, “Diario” is the title of a book (<i>Diario minimo, Misreadings</i>) by the author, but the translator chooses to ignore the fact.	“I once wrote in my <i>Diario</i> ...”	“I once wrote in my diary.....”

The knowledge of the receiver’s personal culture can be defective (and it may be difficult to recode the message in the target culture; involuntary misunderstanding), or there may be a manipulative wish not to recode the receiver’s personal culture into the target culture (voluntary misunderstanding).

The receiver’s personal culture may be the limit for understandability (i.e. for the interpreter it is difficult to recode the message of the receiver’s personal culture in the target culture’s terms).

The receiver’s personal contextual culture may also be the limit for misunderstandability (i.e. for a given receiver it is “socially unbecoming” to overcome given interpretive limits).

The knowledge of the translator’s personal culture can be defective (and it may be difficult to recode the message in the target culture; involuntary misunderstanding), or there may be a manipulative wish not to recode the translator’s personal culture into the target culture (voluntary misunderstanding).

Translator’s personal culture may be a limit for understandability (i.e. for the editor it is difficult to recode the message of the translator’s personal culture in the target culture’s terms).

The translator’s personal contextual culture may be a limit for misunderstandability (i.e. for a given editor it is “socially unbecoming” to overcome given interpretive limits).

4. Intratextual culture

This refers to the knowledge of the two different intratextual cultures: the prototext and the metatext have peculiar microstructures and intratextual links and references.

The knowledge of the source intratextual culture can be defective (and difficult to decode), or it may be impossible to recreate it into the target text (involuntary misunderstanding); or there may be a manipulative wish not to recode it into the target intratextual culture (voluntary misunderstanding). Source intratextual culture as limit for understandability: for the interpreter it is difficult to decode the functioning of the source intratextual culture, and she misunderstands it; or, for the interpreter it is difficult to recode the microtextual source structure into the target microtext, and she fails to do so; for example:

[mis]assumption:	prototext	metatext
In a text by Anton Chekhov, “garden” is just the name of a place with trees and bushes, not the English name of the wild cherry tree garden.	“I wrote that story having the <i>Garden</i> in mind”	“I wrote that story having the garden in mind”

Source intratextual culture may be the limit for misunderstandability (i.e. the interpreter is not willing to transfer her knowledge of the functioning of the source intratextual culture); for example:

[mis]assumption:	prototext	metatext
In a text by Anton Chekhov, “garden” is the English name of the wild cherry tree garden, but I don’t think that this is important for the translation.	“I wrote that story having the <i>Garden</i> in mind”	“I wrote that story having the garden in mind”

The knowledge of the target intratextual culture can be defective (involuntary misunderstanding), or there may be a manipulative wish not to reproduce the target intratextual culture into the target culture (voluntary misunderstanding). Target intratextual culture as limit for understandability; for the interpreter (editor) it is difficult to recode the message of the target intratextual culture in the target culture’s terms. Target intra-

textual culture as limit for misunderstandability; i.e. for a given receiver it is “socially unbecoming” to overcome given interpretive limits.

5. Intertextual culture

This refers to the knowledge of the two different intertextual cultures: the prototext and the metatext have peculiar microstructures and intertextual links and references. The knowledge of the source intertextual culture can be defective (and difficult to decode), or it may be impossible to recreate it into the target text (involuntary misunderstanding); or there may be a manipulative wish not to recode it into the target intertextual culture (voluntary misunderstanding). Involuntary source of intertextual culture misunderstanding: the source intertextual culture as limit for understandability: for the interpreter it is difficult to decode the functioning of the source intertextual culture, and she misunderstands it; or, for the interpreter it is difficult to recode the microtextual source structure into the target microtext, and she fails to do so. Source intertextual culture as limit for misunderstandability: i.e., the interpreter is not willing to transfer her knowledge of the functioning of the source intertextual culture.

The knowledge of the target intertextual culture can be defective (involuntary misunderstanding), or there may be a manipulative wish not to reproduce the target intertextual culture into the target culture (voluntary misunderstanding). Target intertextual culture as limit for understandability; for the interpreter (editor) it is difficult to recode the message of the target intertextual culture in the target culture’s terms. Target intertextual culture as limit for misunderstandability: i.e. for a given receiver it is “socially unbecoming” to overcome given interpretive limits.

6. Translator’s style as preferred misunderstanding

We saw that every translator is subject to two different patterns. The first one, i.e. involuntary mistranslation, involves one’s own culture, education, perspectives, idiosyncrasies; but in the translation process there is also a voluntary implication connected to one’s own translation policy, that is the translator’s views on particular aspects concerning translation. The two patterns are, so to speak, at the opposite ends of Peirce’s “bottomless lake”, the latter being on the surface, the former somewhere in the depth of the lake.

All these aspects are subject to aging, and in the course of time our views of these elements change, thus determining the aging of translations. Every translator chooses – consciously or unconsciously – his own preferred misunderstanding, i.e. variance-invariance combination, and this determines different versions and their aging. But often for the time being the present version of a translator looks like the most ‘appropriate’ and ‘natural’ to him; it is sometimes difficult for him to recognize that a given sentence or footnote implies a general strategic vision of the relationship between the prototext and the receiving culture. (This is why some translators maintain that there is no need for any theory: they don’t realize that they actually do use one.) So it sometimes happens that translators perceive their own strategy only when confronted to the feedback produced by the input of their metatext into the semiosphere. They realize that their originally intended interpretation has been re-interpreted by their readers in ways that they had not foreseen. In other words, they experience the mistranslation of their own (*svof*) when they see the others’ reaction to their mis-discourse.

Two contradictions emerge as characterizing translation: Lotman says that “the meaning is [...] also what is altered in the process”. In other words, a translational strategy aims to devise a text that has an invariant plus a gain, a meaning added. The task of the translator as a cultural mediator does not consist in selecting the informational content that deserves to be transferred into the receiving culture; it consists in selecting – among the different possibilities offered by the concrete means of expression of the receiving culture – the set of meanings to be added in the metatext.

Another contradiction is that even if translation stands for the “culture of the border” (Lotman), such culture cannot be fully aware of its own (personal) borders, or limits. Once again, these have to do with the bottomless lake. It would be very important for research to focus on translational self-awareness and to rationalize the unconscious aspects of the translation process.

Eclectic reflections on incompatibilities in sociotechnical systems

In the present context, the term “sociotechnical” is used for describing a system to signify that it is an assembly of functionally interrelated technical and social entities. These entities differ from each other with respect to the characteristics of their concepts and paradigms. Hence the corresponding incompatibilities that may occur between them have to be taken into account in considerations of the functioning of such systems.

Accordingly, an understanding of the role and importance of incompatibilities cannot be obtained by simply regarding the nature of different entities in isolation. Instead, the sociotechnical systems have to be observed from the inside, as it were. Thus the scope of the present review is to describe such observations and to make an attempt to interpret them from a sociological perspective. Admittedly, the approach is pragmatic in the sense that the aim of these reflections is to shed light on the incompatibilities from non-technical and non-economic points of view.

1. Sociological aspects

One key element in sociological considerations of systems is the communication taking place, within them as well as with their social surroundings, among humans as individuals or in groups and organizations. This refers not only to mental transfer of information and signals but also to communication by other means, for instance by the flow of money in technoeconomic systems or by the exertion of power in political systems. According to this principle, a particularly well-functioning type of systems, with respect to internal communication, are those that have been developed by self reproduction, or autopoiesis. However, what is crucial for the function of many systems is the effectiveness of their communication with their surroundings.

In order to really understand a system, the observer has to be a participant in it. Obviously then, the evaluation of the communication is dependent on the nature of the observation system applied, since this determines the perception obtained. Furthermore, the dynamics of communication means that the contingencies of the system introduce a variability that may either be an option for the communication or a threat to the stability of the system.

2. *Cases*

The first example is the incompatibility between, on the one hand, materials specialists who develop computerized databases and the designers and manufacturing engineers for whom these bases are aimed on the other. It would seem that such computerization of data should present a perfect means for supporting those who are selecting and evaluating materials for constructions. However, most of the many projects working towards this development have failed (Östberg 1990: 127–138).

The basic reason for this failure has been that the difference in perspective of materials between the two parties has been neglected. The education of materials specialists makes them focus mainly on micro phenomena, while the users of materials are less interested in such scientific aspects than in the performance of materials on a macro scale.

The next case is the danger of radon in homes. Radon emitted from some common kinds of building materials as well as from the radon-producing ground in some areas in Sweden may be a cause of lung cancer for the inhabitants in such homes. This is a risk of societal concern. Therefore, national agencies responsible for protection against radiation are making efforts to persuade those affected to take measure to reduce the emission of radon.

However, these appeals have met with limited response only. The reason for that seems to be a lack of understanding on the part of the authorities of the attitudes and values of people threatened by this danger. The common procedure of government agencies to approach the public in such situations is to distribute information on scientific technical and medical aspects by mail in official language. This method does not take into account the perspective of ordinary people, who do not regard their houses as neutral technical artefacts but as their personal homes.

A similar issue is the danger of the possible effects on the safety and reliability of sensitive sociotechnical systems of changing habits of alcohol consump-

tion. This risk has been considered by a Swedish national agency for public health in the context of the entry of this country into the European Union. Hence a study of the risk as such and of the means to cope with it was initiated. Again, the orthodox approach of government authorities was found to be unrealistic. Simply collecting statistics on the consumption of alcohol and correlating this with absence from work on Mondays was the usual method of studying such phenomena in the past. However, this came to be considered less suited to provide a true understanding of the problem (Östberg 1997: 163–167). When more refined investigations on conditions on the shop floor were recommended, they could not be accepted by the conventional sociomedical community. Obviously, they did not realize the difference and incompatibility between the micro and macro situations in this case.

Another example of insoluble incompatibilities between an established professional community and a sociologically oriented project occurred a few decades ago in Sweden. As in some other countries, the steel industry was in need of reorganization and reconstruction in order to be able to maintain its competitiveness. This would mean that certain small steel works would have to be phased out. Most of these were located in parts of the country where no other major industries existed that could employ those who would be made redundant. In order to explore the possible options for replacing the threatened steel production with metallurgical enterprises better suited for the particular conditions, a project that also took social aspects into account was launched for a review of the situation. For this study, specialists with metallurgical competence were engaged as well as experts from non-technical disciplines, including persons with experience of community planning, entrepreneurial work, etc. Yet, despite the dedicated efforts of all the parties involved, it soon became apparent that the holistic approach adopted could not be maintained. In particular, there was a reluctance on the part of the iron and steel establishment to associate themselves with activities of this kind. Clear signs of incompatibility between the roles assumed by the different participants could be noted, indicating that the systems in question suffered from a general lack of communication among the parties in what should have been a team.

Some sociotechnical systems of interest from an incompatibility point of view are composed of smaller ones that are related to each other by similarities in certain respects, but not in all individual regards. One example of incompatibilities between overall macro systems and the systems on a micro level is an industry composed of a number of firms. The changes in various aspects of such

an industry are described by macro economists as “general trends”. In the firms within the industry, the changes in question take place at different points in time. In the statistics making up the trend, their individual contributions are hidden by being balanced against each other. Hence it is a difficult task for the management of an individual firm to decide when it should make the change and follow the trend of the industry. The obvious dilemma of this decision is the fact that the characteristics of the micro system of a firm are determined by the particular individual conditions for its existence, which makes it incompatible with the general pattern of the industry as a whole. In order to shed light on the ways of dealing with this dilemma, a number of experienced industrialists were once interviewed about their understanding of it. Without guidance from the information provided by the statistical evidence of the trend, the decision-making process appeared to become somewhat of a game between representatives of different interests in the firms, who often argued with reference to the incompatibility between their particular firm and the industry in general. What one party involved might consider highly significant might be totally irrelevant to the others.

External incompatibilities in sociotechnical systems due to differences in mentality are even more difficult to handle. One conspicuous example is the case of conflicting views on nuclear safety issues between East and West (Östberg 1993: 35–41). After failing to understand one another in projects on cooperation among respective parties concerning, among other things, nuclear reactors of the Chernobyl type, a seminar was once arranged in Moscow about the impact of differences in mentality in considerations of major accidents. The discussion was hastily brought to an end by a statement that Russia had lost more people than any other country in the world by violent death during the last one hundred years, namely some 140 million. In comparison, the Chernobyl catastrophe was considered to be a minor accident only. Apparently the different attitudes in this case can be related to the corresponding mentalities. These, in turn, are rooted in values that have been cultivated in the respective civilizations by tradition, which makes the incompatibilities in question difficult to handle.

3. General discussion

The common feature of the cases described that will be dealt with below is the imperfections of the communication. Thus the main cause of failure of computerized materials databases was the conceptual misfit between, on the one

hand, materials science and technology and the industrial design and manufacture on the other. It is true that these two parties may have been able to communicate about each other but not with each other.

In the case of the risk of radon in homes, the situation is analogous. From the public health authority's point of view, its communicative functional system fulfilled all the so-called rational requirements that can be placed on presenting the medical and technical aspects of the risk, as defined in accordance with current scientific concepts of risk. Unfortunately, this does not permit sufficient consideration of the mode of perception of the risk by the persons living in the houses. The fact that their rationality is of a different kind makes it necessary to also take personal values into account to the extent that the issue becomes an existential one.

The dilemma of dealing effectively with the risk associated with possibly changing alcohol habits share the difficulty of communication observed in the previous case. Again, the health authority in question works efficiently as far as its method of investigation is considered only from the point of view of scientific rationality and disregards the personal aspect of the systems phenomenon to be examined, including the imprint of values on the attitudes of the individuals concerned.

Another analogy applies to the neglected need to direct communication with those concerned by contacting them individually instead of treating them as statistical numbers. An additional complicating factor is the contingency of the system with respect to the interrelation between, on the one hand, excessive alcohol consumption and the affected individuals' importance for the safety of the system on the other. Furthermore, the reluctance of the sociotechnical community to engage in the unorthodox kind of study recommended indicates that their means of communication with others outside their professional system are inadequate or limited. Apparently, there was also a fear of losing authority involved.

The same incompatibility phenomenon occurred in the project aiming at developing a new sociotechnical system for future steel production. In fact, a great deal of the efforts of the management of the activities was devoted to establishing true communication between the different parties, but eventually their professional interests carried greater weight. Once it became evident that the prospects for certain disciplines to dominate were not as large as expected, their representatives initiated a kind of power game. In such a situation, "soft" subjects have difficulties in vindicating their positions

against “hard” ones. The tendency for the latter to govern the communication by determining the language for the communication is part of the explanation. This, in turn, creates incompatibilities even where they were not present from the beginning.

The case of making decisions in a firm about adapting it to a general trend in the industrial branch to which it belongs differs from the previous ones, since most of the attention here is on communication with the surroundings of the firm regarded in a systemic perspective. Accordingly, the focus is on the conceptual incompatibility between the external macro system of the industry as a whole as opposed to the micro system of the industrial firm, where decision-making concerns the point in time when the contemplated change is to take place. Thus external communication provides part of the basis for the firm’s decision-makers, who have to identify relevant similarities and differences between their enterprise and others in the same industry. Their problem is the fact that the information they can obtain in this way is of a nature that may make it largely incompatible with the characteristics of the system of the firm. In this situation, they are hampered by having to resort to the observation system that they use in their activities in the firm.

One further difficulty in comparison with the previous cases of incompatibilities is the existence of a relatively large number of contingencies to take into account. As a consequence, the functioning of the system of the firm cannot be predicted and evaluated in this case solely on the basis of the communication partners as such. Sometimes the variety of options in the decision-making process may lead to seemingly more or less chaotic situations. However, effective rationalities can be recognized by analysts in economic history (Östberg 2001: 288–294).

Similarly, the impact of the observation system on the perception of a sociotechnical system is very obvious in the case of differences in mentality between East and West in considerations of nuclear risks. While the communication networks in both camps may largely be developed according to common principles and practice, it is the eclectic use of them that gives rise to conflicting opinions due to the corresponding incompatibilities. The importance of the nature of the observation system for the perception of sociotechnical systems is a common denominator in most of the cases referred to. One crucial aspect of this is the social position of the observer. As has been indicated in some contexts above, the role of observers as representatives of authorities or other bodies associated with power may have had a decisive aggravating influ-

ence on the occurrence of incompatibilities in certain situations. Coupled to an inclination for maintaining prestige, this can endanger any effort aiming at bridging gaps between the parties involved.

4. *Final remarks*

The reflections that can thus be made about incompatibilities in sociotechnical systems prompt questions about what could possibly be done in order to make these systems function in ways that may render them not only internally efficient but also externally effective. Unfortunately, in the particular perspective adopted in the present review, sociological systems theory does not seem to provide any simple answers to such queries. On the contrary, the basic concept of communicatively functioning social systems excludes, in principle, the possibility of steering them, at least by intervention from the outside.

The only way of resolving the dilemmas of these systems, as they have been described in the cases discussed in the present review, is for them to transform themselves internally in a creative manner. Again, this is not an easy process for which precise rules or recommendations can be prescribed. In principle, what could be done is to stimulate the evolution of a change of mind.

There are, of course, limits to what can be achieved even by clear insights into the nature of the incompatibilities in question. We have to realize that they are not occasional or irrational, but inherent characteristics of sociotechnical systems. Therefore, the best we can do is to accept this state of affairs and to avoid anything that could make it worse. After all, as Kierkegaard says: "A logical system can be given, a system of existence cannot" (Kierkegaard 1992: 109).

Les parcours de la compréhension et de la mécompréhension dans les œuvres de l'Art Brut

1. La problématique de la mécompréhension

Le dictionnaire de Greimas et Courtés (1993: 56) dit à propos de la compréhension : “en sémiotique la compréhension peut être identifiée à la définition du concept, assimilé lui-même à la dénomination. Dans ce cas, il est légitime de partir de la compréhension d’un sémème, en précisant toute fois qu’il peut comprendre des sèmes négatifs (les propriétés absentes), du fait que la signification réside dans la saisie des différences, ce que le concept n’admet pas dans sa compréhension.” Reste au sémioticien la tâche de dévoiler ces différences à l’aide du parcours génératif. La conception qui est à la base du parcours considère tout objet sémiotique selon le mode de sa production. Normalement en partant des structures profondes on peut arriver à celles de surface. Le Dictionnaire même dit (ibid.: 158): “les articulations qui interviennent dans ce processus [de production] s’articulent les unes avec les autres selon un parcours qui va du plus simple au plus complexe, du plus abstrait au plus concret.

D’où viennent les problèmes d’incompréhension du texte? Il faudrait dégager des structures et la signification comme parcours à travers les différents niveaux de pertinence et, par conséquent, le sens même du texte devait affleurer à la surface. On a vu que les problèmes ne sont pas tous résolus. J. Fontanille dit (2001: 107–131):

on voit clairement comment “travaille” une théorie générative: en jouant à la fois sur l’effectif et sur l’homogénéité de chaque niveau de pertinence, ainsi que sur la place des variables dans la hiérarchie de ces niveaux, elle tend progressivement à réduire chaque niveau à un “noyau dur” uni-caté-

goriel et homogène, par un tri progressif qui élimine les catégories “parasites” ou résiduelles appartenant à d’autres niveaux de pertinence.

Et dit Greimas (1993: 111–112): “Concevoir la théorie sémiotique sous la forme d’un parcours consiste alors à l’imaginer comme un cheminement marqué de jalons, certes, mais surtout comme un écoulement coagulant du sens, comme son épaissement continu...”

Ce dynamisme qui caractérise la sémiotique reste présent aussi dans la théorisation la plus récente de Fontanille (2007) sur les niveaux de pertinence. Le déploiement des différentes et successives manifestations du plan de l’expression et leur progressif enchaînement, permettent aussi d’élargir la compréhension, niveau par niveau, de l’objet étudié.

Comment agir quand les passages à un niveau successif sont problématiques? Pourrait-on envisager la mécompréhension comme un blocage du sens d’un niveau à l’autre et entre les mêmes niveaux? Ce qui serait donc incompréhensible serait un saut logique ou peut-être simplement un brouillement du sens d’un niveau à l’autre.

On va prendre en considération des œuvres picturales du mouvement artistique de l’Art Brut qui semblent justement poser des problèmes dans leur déroulement. Les difficultés sont des plus variées et les obstacles se posent à différents niveaux.

D’abord, rappelons qu’il s’agit d’un mouvement qui comprend des artistes “outsiders”, malgré eux. Ce sont des créateurs qui ont passé la plus grande partie de leur existence, internés dans des hôpitaux psychiatriques sans presque aucun échange avec l’extérieur. On a déjà un problème de définition ambiguë du statut, de la position de l’artiste à l’intérieur de ce courant. Ensuite vient le problème du “déchiffrement” des œuvres produites. Comment s’y prendre quand les signes sont obscurs? Que faire face à une co-présence de mots, de formes iconiques et plastiques, de chiffres, de couleurs et de traits les plus disparates? Comment réagir face à un détournement, voire un cryptage de ces signes visuels et graphiques, accessibles à leur seul créateur?

En restant au niveau du signifiant, on voit réunis ensemble différents langages sémiotiques : iconique, graphique, plastique; leur union engendre des signes nouveaux appartenant certes à ces différentes composantes mais s’en dégageant ensuite de manière autonome. Les différentes grilles de lecture comme les stratégies les plus diverses d’approche du texte ne

parviennent pas à rendre compte du parcours de sens de cette production artistique. Et le spectateur-lecteur semble être confronté à un véritable court-circuit sémantique. Inévitablement, la difficulté de traitement de certains textes pousse le lecteur à chercher dans l'espace environnant ces derniers (con-texte, co-texte, pratique textuelle), des éléments qui puissent contribuer à la construction d'un parcours plus structuré et cohérent.

En outre, l'ambiguïté du message est présente aussi au niveau du contenu: pas de signification évidente, opérations de masquage à la limite du non-sens.

Enfin, l'énonciation se manifeste sous différents aspects: elle est polyphonique, morcelée, contradictoire, incomplète et semble émaner de différentes instances énonçantes qui donnent vie à des expressions iconiques variées et indéfinies. On va se centrer en particulier sur un peintre italien qui invente, à sa manière, des rapports nouveaux entre mot et image. Le traitement de l'expression graphique et de celle iconique suscitent des effets de mélange, de patchwork intéressants.

2. Le cas de Carlo Zinelli: En quoi consiste l'incompréhension?

L'auteur naît dans un petit village à côté de Vérone en 1916. Il fréquente quelques années de l'école primaire et ensuite il est contraint à travailler à la campagne. Ensuite il exerce pour un certain temps comme boucher dans une boutique de la ville. En 1936, il part comme volontaire pour la guerre d'Espagne où il est engagé comme chasseur alpin. À la moitié de la guerre, il est renvoyé à cause de troubles hallucinatoires. Il est interné dans l'hôpital psychiatrique de S. Giacomo alla Tomba. Surpris par le personnel infirmier à gratter des murs et à les couvrir de graffitis, il est invité à participer à l'atelier de peinture de l'hôpital. Il commence son activité de peintre avec une régularité exceptionnelle. Il produira plus de 3.000 œuvres jusqu'à ce que l'hôpital soit transféré dans un autre établissement. Là bas son activité commencera à décliner jusqu'à sa mort en 1972 (cf. Andreoli & Marinelli 2001).

Le parcours artistique de Zinelli commence avec la peinture à la gouache sur des feuilles données pas la structure de soin. On peut retracer le début de sa création avec l'apparition d'icônes de très grand format qui petit à petit se rétrécissent pour laisser de l'espace à l'écriture. D'abord elle

se concentre dans les petits coins de la toile où l'image prédomine encore. Ensuite, elle est "protégée" par des formes circulaires à travers lesquelles elle gagne beaucoup plus d'ampleur. Enfin, la période la plus remarquable comprend une phase de stabilisation où les liens entre mot et image se diversifient et se compliquent. La phase de la maturité entre 1967 et 1970 voit deux manifestations précises: d'une part, on retrouve l'icône encore dominante et l'écriture qui est disposée tout autour, de l'autre part, le graphème et l'icône qui ont la même taille et interagissent entre eux.

La particularité de cet auteur est qu'il expérimente des relations nouvelles. Une créativité particulière qui bouleverse l'union de mot et image. On retrouve des liens pas clairs. On ne comprend pas pourquoi des mots semblent se référer à une image sans une suite logique.

Commençons, par l'exemple de la toile n° 824b, 1970, qui est comprise dans la période finale dont on parlait précédemment.

Image 1. Carlo Zinelli, « Pinocchio » pesce e figure a più colori, n° 824 b, 12 juin 1970, pastelles à cire et crayons colorés sur papier, 50x70, collection privée, Vérone, Italie.

D'abord les images ne sont pas claires. Il s'agit de quoi? En suivant de plus près le parcours artistique de l'auteur, on peut mettre en relation cette œuvre avec son recto (image 2).

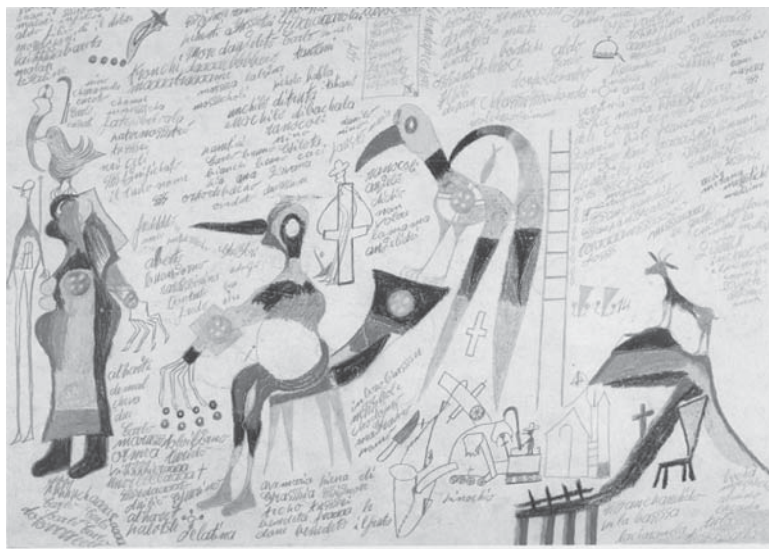

Image 2. Carlo Zinelli, « Pinocchio » e figure a più colori su sfondo a scritte, 12 giugno 1970, n° 824 a, pastelles à cire et crayons colorés sur papier, collection privée, Vérone, Italie.

L'artiste avait l'habitude, pour certains tableaux, de peindre le recto et le verso de la feuille.

On s'aperçoit d'une homogénéité de couleur et des formes qui occupent le centre de la composition. La reconnaissance des formes du monde naturel, pratiquées avec des pastels, devient déjà plus ardue. Des personnages, plus ou moins humanisés, se déploient au centre de la feuille, entourés d'autres formes animalesques et d'autres encore moins définissables. Les personnages semblent être surpris en train d'accomplir une action; le mouvement n'est pas vivant mais au contraire figé et rigide. On pense que ces formes seraient liées entre elles à cause d'une ressemblance chromatique mais on n'en comprend pas la raison.

La substance écrite, tracée par le crayon, s'éparpille dans tous les espaces laissés libres par l'image. Elle n'est pas seulement composée par des graphèmes mais aussi par des petites icônes, des initiales décorées placées au

début des mots, des chiffres et des répétitions de lettres. On s'éloigne donc d'une définition étroite d'écriture. On peut parler de "polyvalence" des substances expressives ou des "polysignes" qui paradoxalement rejoignent leur équilibre dans ce statut incertain de "l'entre deux". Il s'agit de signes qui vivent à la frontière entre mot et image et qui prennent leur force du rapprochement et de la presque soudure entre les deux substances. C'est le cas de la lettre "g" du mot "falegname" (menuisier) qui est montrée soit par son signifiant soit par son signifié (image 3).

Image 3. Carlo Zinelli, « Pinocchio » *pesce e figure a più colori*, n° 824 b, 12 juin 1970, pastelles à cire et crayons colorés sur papier, 50x70, collection privée, Vérone, Italie (détail).

L'écriture semble rester suspendue dans l'air et d'autre fois s'appuyer à quelques traits graphiques. On peut noter comment, par exemple dans la partie en haut à gauche, un trait commence "sous forme" d'icône et se transforme tout au long de la feuille dans une autre icône pour ensuite devenir un mot.

C'est le cas du nombre "11" (image 4) qui devient une fleur pour puis va se camoufler dans des mots incompréhensibles. Les relations de transformation peuvent être envisagées; toutefois le sens reste obscur.

Chaque image garde du texte à côté d'elle mais avec lequel les liens ne sont pas nécessaires. La proximité ne veut pas dire similitude, continuité, lien sémantique. Ensuite, pour ce qui concerne le contenu, on ne retrouve pas de relais directs avec l'image. Certaines fois l'image explique quelques aspects de l'écrit mais dans la majorité des cas les deux substances restent étrangères l'une à l'autre. Pour l'aspect signifiant, mot et image peuvent

Image 4. Carlo Zinelli, « Pinocchio » pesce e figure a più colori, n° 824 b, 12 juin 1970, pastelles à cire et crayons colorés sur papier, 50x70, collection privée, Vérone, Italie (détail).

avoir des ressemblances visuelles mais qui n'entament pas le contenu. Par contre le statut du mot et de l'image est bouleversé, inventé et entièrement remanié.

On a parlé à ce propos "d'écriturisme" (Thévoz 1978: 152) d'un type d'écriture qui prend en considération aussi l'aspect plastique des mots. Les

mots sont bâtis comme des objets mais ils ne sont pas, dans ce cas, peints. Ils sont écrits à la main avec un crayon.

Le mot est manié, retourné en conservant un aspect de continuité et d'alignement comme dans une phrase. Les mots sont unis comme les perles d'un collier mais ils ne gardent pas ni d'homogénéité, ni de succession logique. Leur enchaînement est fictif. Ils se suivent comme dans une succession logique de phrases mais sans que leur sens les suive. L'écriture semble devenir partie intégrante de la texture de l'image par contre en restant sur la surface. L'effet de profondeur est totalement absent. Au contraire elle semble envelopper les formants figuratifs, plus marqués et évidents à cause de leur diverse texture. Le paradoxe est évident: ce qui est tracé d'un geste et d'un trait fin et suspendu (l'écriture à la main), entoure ce qui saute aux yeux pour ses couleurs et sa force gestuelle, l'image. On pourrait y retrouver donc un certain ordre qui, par contre, ne réussit pas à placer les éléments iconiques et graphiques dans une perspective. Une attention particulière devrait être réservée à la modalité sensible, polysensorielle de ces traits graphiques.

En outre, l'importance du geste met en scène les traces du faire et différencie les traces de l'énonciation en acte. La partie en haut à droite est caractérisée par une écriture plus marquée que le reste du tableau. Elle se distingue par une certaine homogénéité par contre caractérisée par une intensité dysphorique de base. L'écriture semble ressortir de la feuille blanche pour s'imposer, dicter une direction de lecture (du haut vers le bas) et rivaliser avec les icônes du tableau. L'apport ressort du support qui le contient provoquant un effet de premier et d'arrière plan. Un effet "à cascade" des mots et une accélération de la lecture s'imposent (image 5).

Sur le plan de l'énonciation, on retrouve le même phénomène. Les instances énonçantes se multiplient sur la feuille. D'abord, l'auteur s'exprime à la 3^{ème} personne au singulier quand il parle de lui-même. Il effectue un débrayage, un éloignement du sujet de son énoncé. Il ne prend pas en charge son acte d'énonciation. L'énoncé semble être extérieur à son énonciateur. Le nom de Carlo est répété plusieurs fois dans différents coins de la feuille (image 6).

Le même traitement est réservé à d'autres noms propres (Bepo, Nino, Aldo, Andrea, Danilo, etc.) qui se suivent dans une liste continue. D'autres phrases traitent des descriptions du monde (pommes de terre, la grenouille, la fontaine) sans aucun critère qui les unisse sauf le fait d'être énoncés.

Image 5. Carlo Zinelli, « Pinocchio » pesce e figure a più colori, n° 824 b, 12 juin 1970, pastelles à cire et crayons colorés sur papier, 50x70, collection privée, Vérone, Italie (détail).

Image 6. Carlo Zinelli, « Pinocchio » pesce e figure a più colori, n° 824 b, 12 juin 1970, pastelles à cire et crayons colorés sur papier, 50x70, collection privée, Vérone, Italie (détail).

On retrouve ensuite des références à la condition historique de l'Italie pendant la guerre. C'est le cas du mot "mitraille" ou simplement on note

des références à des lieux géographiques italiens comme la ville de Vérone même, Saint Candido, la “bassa”, terme en patois de Vérone qui signifie la partie sud de la région Veneto. D’autres phrases encore cherchent de se construire selon une suite grammaticale qui, le plus souvent, est inachevée ou incorrecte.

On peut constater que l’artiste met dans ses toiles des fragments des discours quotidiens, du vécu personnel, des morceaux de phrases qu’il peut avoir entendus à l’intérieur de l’hôpital. En plus la référence au milieu de soin est présente du début de son parcours artistique. Les mots comme “docteur, infirmier, seringue” envahissent les toiles tout au long des différentes périodes. On note aussi que tout ce qui englobe l’univers affectif et émotionnel est éloigné, tenu à l’écart. Par exemple les bribes des discours qu’on retrouve, ressemblent à des prières ou à des litanies répétées sans aucun lien à un contexte bien précis.

L’ensemble du discours est caractérisé par l’impossibilité d’ancrage dans le subjectif et par le collage des instances énonçantes. Il semble que la réalité extérieure envahisse le sujet qui l’organise sur l’espace vide de la toile. Ce qui manque au sujet est la bonne distance entre l’extérieur et l’intérieur. Il n’arrive pas à filtrer les stimuli externes et à ré-élaborer cette matière étrangère.

L’énonciation, donc, n’est presque jamais assumée mais on peut y noter des exceptions. Deux phrases sont remarquables à ce propos: “parlo” (je parle) et “ho veduto due suore” (j’ai vu deux bonnes sœurs). L’énonciation change, quelque chose a été prise en charge par l’énonciateur. On est dans le mode aspectuel duratif pour la première. La formule pourrait s’explicitier ainsi: “Je suis conscient que je parle et je continue à le faire en écrivant ce que je raconte verbalement”. L’autre formule se réfère à un temps passé, mais marqué par une nuance aspectuelle au présent. Le sujet est déjà passé ailleurs.

3. *Conclusions*

La compréhension et l’incompréhension, d’où peuvent-elles surgir? On peut partir du parcours génératif.

Dans le cas de Zinelli, la mécompréhension surgit d’une interruption entre niveaux à l’intérieur du parcours. Par exemple quand on réussit à reconnaître des sèmes ou des nœuds de signification, leur déploiement au

niveau successif reste obscur. Il s'agit d'une césure, d'une coupure entre les passages logiques. Ces "sauts" de signification restent problématiques pour l'interprétation des niveaux ultérieurs. On réussit à concevoir des parcours qui restent par contre inachevés, incomplets et interrompus. Voilà donc apparaître les ambiguïtés de formants, les hybrides, les suspensions, les incohérences dans les relations entre icône et graphème.

Cela dit, nous devons reconnaître que ces hybrides ont leur stabilité en restant à la frontière entre mot et image et qu'ils peuvent subir des évolutions successives à l'intérieur de la production artistique de chaque peintre. Il s'agit par exemple de certains formants qui évoluent dans le temps et auxquels le créateur attribue des significations différentes jusqu'à arriver à une certaine stabilité et cohérence. Ce phénomène nous permet de trouver quelques ancrages dans la compréhension du texte mais les définitions classiques de cohérence, unité et complétude (clôture) qui devraient caractériser sa structure restent floues.

La notion plutôt d'inter-texte et d'un parcours génératif plus étendu qui s'ouvre aux dialogues transversaux à l'intérieur de la production d'un artiste semble plus adapté à ces formes de création artistique. Un parcours exhaustif qui permet la génération des liens entre les différents plans de l'expression (texte, objets, formes de vie) et les contenus qui ces plans véhiculent. Une particulière attention devrait être réservée aux transformations formelles qui, loin d'être simplement des variations, soulignent les étapes de changements significatifs des rapportes entre le créateur et son parcours de vie.

Quand on ne peut pas s'appuyer directement sur les formants (figuratifs et plastiques) à cause de leur statut ambigu et illisible, on peut s'appuyer sur les traces énonciatives laissées par le corps sous forme de coups de pinceau, de hachures, de griffonnages, de déchirures et de déformations plastiques. Le geste du peintre, à ce propos, est le médiateur entre les signifiés et les signifiants véhiculés. Un corps peut énoncer de façon très différente mais laisse son énonciation énoncée sur sa toile comme une empreinte qui évoque à travers sa présence, l'absence du corps dont elle provient. L'istance corporelle donc serait à la base d'un parcours génératif qui prendrait appui sur le corps comme premier échelon de la signification et qui devra être étudié dans tous ses développements et manifestations à niveau des formes de l'expression.

Ana Paixão

Art poétique musical, art compositionnel littéraire

Les œuvres de théorie littéraire et musicale, produites entre les XVI^{ème} et XIX^{ème} siècles au Portugal, nous proposent des modes de (mé)comprendre la musique, par le regard des théoriciens littéraires, et la littérature, par le biais des conceptualisations musicales. Les œuvres théoriques en analyse, que nous désignerons par *les arts d'écriture*, comprennent un vaste champ de genres différents qui vont du traité à la méthode, en passant par le dictionnaire ou par l'essai.

Figure 1. Les arts d'écriture en analyse.

Ces œuvres, comme tant de textes produits ailleurs à la même période, partagent un espace commun créé par l'intersection des systèmes des deux arts. Les traces de la relation entre les règles du discours musical et celles du discours parlé ou littéraire, particulièrement les rapports entre la musique et la rhétorique, furent l'objet de nombreuses études surtout depuis la dissertation de H. Brandes (1935) et le célèbre article de W. Gurlitt (1944), "Musik und Rhetorik: Hinweise auf ihre geschichtliche Grundlageneinheit".

Au-delà d'autres travaux qui analysent les applications concrètes de la rhétorique à la musique, l'étude de la production théorique d'auteurs qui

lient les deux arts devint aussi prolifique; il suffira de rappeler les publications autour de la production de H. Faber, de G. Dressler ou, surtout, de Joachim Burmeister et de ses prédécesseurs (Praetorius, Mattheson, ou Tinctoris, parmi d'autres) qui transposent les principes rhétoriques pour le système musical. Les *arts musicaux* portugais de la période mentionnée ne présentent pas de transpositions si nettes du système de la rhétorique pour les cadres théoriques de la musique à la manière de traités tels que la *Musica poetica* (Rostock, 1606) de Burmeister. D'ailleurs cette absence est aussi constatée par G. Valle (1988: 96) et A. Zaldivar (1993: 47) dans la théorie musicale espagnole des XVI^{ème} et XVII^{ème} siècles.

L'objectif de cette communication est de dévoiler la présence de principes, de techniques et de terminologie musicale dans *les arts littéraires* portugais des XVI^{ème} –XIX^{ème} siècles, et, en suivant le chemin inverse, de présenter l'importance accordée par les théoriciens musicaux, non seulement aux règles du discours littéraire, mais aux principes de la rhétorique appliqués au discours musical. Les *arts d'écriture* portugais présentent fondamentalement trois types de rapport entre le discours, les principes et la théorisation de la littérature et de la musique: des parallélismes, des comparaisons / références, ou des appropriations / intégrations.

1. *Vt musica uerbi*

Le premier pas de la littérature vers la musique est accompli autour de réflexions sur le parallélisme des parcours historiques des deux, sur les œuvres chantées qui font cheminer les signes littéraires et musicaux les uns à côté des autres, ou alors sur des genres qui les rassemblent. L'origine commune entre la musique et le verbe est repérée par plusieurs auteurs du XIX^{ème} siècle. Francisco Carvalho, par exemple, souligne que "la Musique et la Poésie ont eu, toutes les deux, la même origine, parce qu'elles sont nées dans les mêmes circonstances. Les premiers poètes chantaient leurs propres compositions" (1840: 11). La réunion et les modes de complémentarité entre les textes chantés font aussi l'objet d'analyse d'un nombre important d'*arts littéraires*. Manuel do Cenáculo souligne ce dont le compositeur de musique religieuse doit tenir compte, lorsqu'il écrit ses œuvres: "la Musique doit être grave, ajustée aux paroles sacrées, et digne des fins altissimes des Divins Mystères" (1791: 40). La musique doit s'accorder aux mots qui deviennent les maîtres des sons. Dans un contexte profane, les réflexions

de Cândido Lusitano soutiennent celles de Manuel do Cenáculo, dans une critique des modes de complémentarité établis entre les deux arts à son époque. L’auteur souligne justement que “la Poésie aujourd’hui sert la Musique, pas comme anciennement la Musique [servait] la Poésie, (que) c’est ce que l’art prône” (1748: 241). Lusitano met en évidence un changement de paradigme dans la relation entre les textes littéraires et musicaux, un changement que l’auteur critique: “Dans ce siècle tout le soin est de délecter les oreilles, et la Poésie devient donc esclave de la Musique” (ibid.: 240). D’autres auteurs d’*arts littéraires* analysent les genres embrassés par les deux discours. Des commentaires critiques à propos de l’opéra et de la cantate sont fréquents dans les œuvres du XVIII^{ème} siècle. L’union entre les textes littéraires et musicaux et les effets produits par leur jonction, la vraisemblance et bien d’autres questions autour de ces genres occupent les pages de ces œuvres pendant le siècle mentionné. Par exemple, João Chaves parle de la cantate: “Poésie variée de Récitatifs, Airs, Duos reçoit en soi les plus grandes beautés Poétiques, et Musicales; et même ce sera le genre de composition, où les deux Arts unis se rejoignent le mieux pour le plaisir de l’esprit humain” (1784: 41).

Les comparaisons avec la musique ou les références au discours musical sont aussi un sujet de relief dans les *arts littéraires*. Dans un traité anonyme du XVII^{ème} siècle intitulé *Orphea rhetorices cithara*, les différentes phases d’écriture rhétorique sont comparées aux cinq cordes d’une cithare (cf. Anonyme, 16--). Pour un autre auteur du XVIII^{ème} – António Pereira – la musique est considérée comme un champ privilégié d’intersection avec la littérature, notamment avec la rhétorique. L’auteur souligne justement que: “l’Éloquence est une Musique Articulée, et la Musique est aussi une Éloquence Inarticulée” (1787: 3). Les citations d’auteurs musicaux et d’œuvres de théorie musicale dans les arts littéraires sont aussi fréquentes. Parmi d’autres exemples, il est possible de citer: *Harmoniques* de Ptolémée et *L’Istitutione harmoniche* de Zarlino (Cenáculo 1791: 38); *Arte de Musica* d’A. Fernandes ou *Arte minima* de Nunes da Silva (Bluteau 1712–1728); *Musique* de Plutarque (Lusitano 1748: 238).

Les arts littéraires présentent aussi des exemples d’intégration ou d’appropriation de principes ou de terminologie musicaux. João de Barros (1540: 4) soulignait déjà au XVI^{ème} siècle des espaces d’intersection et des principes musicaux sous-jacents à la langue, en affirmant que:

Toute syllabe a trois accidents: Nombre de lettres, Espace de temps, Accent haut ou bas. ... L'espace de temps – puisque quelques-unes sont courtes et d'autres longues, comme dans "Bárbora", où la première est longue et les deux autres sont brèves; puisqu'il faut le même temps pour la première, comme pour les deux suivantes ... Le troisième accident de la Syllabe, c'est le chant haut ou bas: car comme les musiciens haussent ou baissent la voix en chantant, ainsi nous gardons le même ordre.

Au delà de la musicalité des langues, il est possible de repérer du vocabulaire musical fréquemment présent dans les œuvres littéraires. André Christo met en évidence le "Rythme" de la poésie (1667: 3), João Castro parle du "rythme" et de "l'harmonie" du discours (1734: 27).

La profusion de rapports possibles repérés entre la littérature et la musique motive les auteurs des *arts littéraires* à conseiller les écrivains et/ou les interprètes à bien connaître la musique. L'apprentissage musical acquiert un relief particulier pour l'orateur dans une œuvre de G. Bandeira où l'auteur suggère des tonalités spécifiques pour chaque moment du discours: "Thème – Ut; Narration – Ré; Confirmation – Mi; Exclamation – Fa; Exhortation – Sol; Admiration – La; Epilogue – Ré" (1745: 35). Ensuite nous analyserons le contrepoint de ces aspects dans les *arts musicaux*.

2. *Vt verbum musicae*

Le rapprochement de la musique vers les arts du discours se fait par le biais de la grammaire, de la poétique et, surtout, de la rhétorique. Les parallélismes établis entre le parcours historique et les signes des deux discours sont aussi présents dans les *arts musicaux*. La musique est liée à la littérature, notamment à la poésie, depuis son origine. António Fernandes explique la naissance de la poésie lyrique, justifiant que cette désignation est due au fait qu' "anciennement les poètes chantaient leurs vers au son de la Lyre ou de la Cithare" (1626: 3). Francisco Solano réaffirme l'origine commune et ajoute même que "les anciens plaçaient le Poète dans la classe du Musicien, et faisaient entrer le musicien dans celle du poète" (1780: 13).

Surtout la rhétorique et la grammaire pourvoient des éléments de comparaison et de vocabulaire aux *arts musicaux* portugais. P. Thalesio décrit une "mesure grammaticale" (1618: 67) appliquée au chant des psaumes. A. Fernandes justifie le besoin d'élaborer son œuvre en systématisant des règles qui permettront d'établir un cadre théorique solide, comme ceux

de la grammaire et de la rhétorique: “Le Grammairien, le Rhétoricien, et tous les autres ne s’écartent jamais d’un seul point de ce que commande et prescrit l’Art. De même dans la Musique il y a eu les nombres, les voix, et les modes, et à cause de cette confusion l’Art a été inventée par les savants” (1626: 7). Francisco Solano établit une comparaison entre ces deux dernières disciplines et la musique, en affirmant: “Si par la Grammaire on apprend à parler avec des périodes ajustées, la Musique Métrique répond de la même manière aux siennes. Si la Rhétorique consiste en Tropes, et en figures, et apprend à parler de manière appropriée et élégante, le Chant avec sa variété de Figures, et de Temps, exprime, et explique vivement la même chose avec ses harmonieux accents” (1780: 7). Hygino da Silva crée un cadre conceptuel pour l’enseignement de la musique basé sur les principes de la grammaire: “La musique est le langage des sons avec lesquels nous exprimons nos affects: ainsi considérée, elle a une grammaire qui nous apprend le son des lettres, la combinaison de celles-ci formant des syllabes et des mots et enfin l’accord de la phrase mélodique” (1854: 7). Raphael Machado établit même un rapport comparatif entre la ponctuation et les cadences (1851: 80; cf. Fig. 2).

Figure 2. Machado montre des cadences qui ponctuent le discours musical: “Cadence parfaite – termine le sens final” et “Cadence imparfaite – délaye le sens final”.

Les *arts musicaux* présentent aussi des intégrations ou des appropriations de la littérature, notamment de la rhétorique. Sur le plan de l’expression, quelques-unes de ces œuvres utilisent des principes de configuration oratoires, comme la construction en dialogue. Ce procédé de production textuelle est utilisé dans les *arts musicaux* depuis l’*Art de musique* d’A. Fer-

nandes, en 1626, jusqu'en 1883, le *Nouveau livre facile de musique* d'Amélia Ramos. Le recours de la théorie musicale à cette méthode montre le désir d'adapter l'efficacité de l'enseignement oratoire à l'apprentissage musical.

Dans d'autres *arts musicaux*, la rhétorique est aussi patente dans l'utilisation de techniques argumentatives tout au long de l'œuvre musicale. Ce sont surtout les prologues, les préfaces, ou d'autres moments textuels dans lesquels l'auteur présente ses motivations, justifie ses choix ou souligne ses priorités, qui sont marqués par l'utilisation de ce type de techniques. Un exemple significatif de ce fait (c'est un texte du roi portugais João IV qui répond à une lettre de l'évêque Franco concernant "l'impropriété des Musiciens modernes dans leurs compositions des Messes, et du Chant Ecclésiastique" (1654: 13). La réponse du roi suit les différentes parties de la disposition d'un discours oratoire. Le texte présente: Exorde – João IV se propose de montrer que la proposition de Cirillo Franco est fautive; Narration/Énumération – le roi présente les effets de la musique ancienne et moderne; Confirmation – des exemples d'œuvres de compositeurs 'modernes' où ces effets sont présents; Réfutation – João IV prouve que Cirillo Franco ne connaît pas la musique de son époque; et Péroration – le roi résume son discours et rabat ironiquement les arguments de Franco (ibid.). Le rapport entre la musique et la rhétorique passe aussi par le recours à d'autres éléments caractéristiques du discours oratoire, comme *l'unité et la variété*. Par exemple, E. d'Almeida applique le principe mentionné à la musique: "La variété est l'âme de la musique; c'est pour cela qu'il est nécessaire de bien distinguer l'unité de la variété, et ne pas croire qu'une très grande variété puisse détruire l'unité. Tout ce qui permet d'éviter la monotonie appartient à la variété, et tout ce qui relie les idées d'une façon évidente, franche et naturelle, appartient à l'unité" (1868: 62). Il est aussi possible de trouver des appropriations d'aspects de la poétique. Le même auteur, E. d'Almeida, présente des "pieds mélodiques" créés à partir des pieds poétiques (1868: 70).

Figure 3. Les "pieds mélodiques" de Almeida: "La trochée", "L'iambé", "Le dactyle", "L'amphibrae", "L'anapesté".

3. *VerbUMUsica*

Multiplés sont les espaces de jonction entre la littérature et la musique établis dans les *arts d'écriture* portugais analysés. Les parallélismes dressés, les comparaisons / les références établies entre les deux discours, et l'appropriation / l'intégration d'éléments ou de propriétés deviennent trois modes de (mé)comprendre l'autre. Dans cet espace partagé, les principes de la littérature et de la musique se fusionnent fondamentalement autour de la rhétorique ou de disciplines qui lui sont proches comme la poétique et la grammaire. Les procédés rhétoriques, créés, développés et plus au moins stabilisés depuis l'Antiquité Classique, constituent un cadre théorique établi et normatif auquel la musique aspire. Ce cadre, au-delà de la consistance de ses principes et de son organisation, est aussi l'un des modèles les plus propagés par les systèmes d'enseignement depuis l'antiquité. En passant par le *trivium* médiéval, il connaît sa pleine expansion au Portugal au XVIII^{ème} siècle, fait confirmé par la profusion de traités de rhétorique publiés pendant cette période en territoire portugais. Dans les arts littéraires, notamment rhétoriques et poétiques, l'établissement de parallélismes, de comparaisons et d'appropriations / d'intégrations musicales atteste de l'élan centrifuge qui attire les arts du discours vers la musique. La reconnaissance d'une origine commune, l'adéquation entre les textes des œuvres chantées, les éléments de comparaison, l'appropriation de vocabulaire, de techniques ou les conseils donnés à l'écrivain ou à l'interprète pour qu'il apprenne de la musique illustrent les capacités de lecture, de sélection et de production théorique des auteurs d'*arts littéraires* à partir du cadre conceptuel de la musique. Les œuvres de théorie littéraire et musicale sont ainsi des espaces de connaissance et d'appréhension de l'autre, des espaces où l'*Art poétique* est simultanément musical et l'*Art compositionnel* devient littéraire.

Knowing and guessing: In what ways do children approach the meaning of signs?

A teaching intervention with 9 year-old children about weather report signalization

1. Children as sign makers

Our world is full of signs, which are constantly formed and reformed over time and place, in order to fulfill their makers' specific social needs; thus, signs are constantly in a process of re-construction and their meaning can only be understood within a system and through its social use (Bakhtine 1977: 30). In our everyday communication, we are all sign makers, as we combine signs that can create in our interlocutor's mind the interpretations that we wish him/her to produce in order to understand what we really mean (Deledalle 1979: 117).

Symbolic thought is developed in children from a very early age. Piaget points out that, by their second year, children are able to represent things. Objects, facts or even cognitive structures are transformed to signs (Piaget 1967: 133-134; Piaget 1976). Children's symbolic competence is created as they enter the social environment; this competence is dynamic, and is developed and extended throughout their lives. While playing, children use language and objects to convey meanings, converting, by this procedure, concrete objects of their reality into signs (Kress & van Leeuwen 1996: 7-11; Kress 1997). This meaning making process, based on their symbolic competence, entails a process of understanding and constructing signs.

1.1. Visual signs

In our “visually oriented age” (Lowe 2000: 1), a great amount of information is transmitted by virtue of visual signs. Visual language, unlike common beliefs, is not easier than language (ibid.) nor transparent and universally understood (Kress & van Leeuwen 1996: 3). A special kind of literacy is needed for the appropriation of visually transmitted information, meaning the visually literacy, which is defined as the “ability to construct meaning from visual images” (Giorgis et al. 1999: 146).

By 3 years of age most children can use visual symbols to denote things (Bamford 2007: 2), but in order for them to be visually literate in this visual world, they need to further develop skills to interpret visually transmitted information and to produce visual messages.

Weather charts – like all maps – constitute a specific field of semiosis, meaning that they allow procedures of production and transfer of information by means of visual signs. Visual signs used in weather predictions are not firm and standard, unlike signs in other semiotic systems (e.g. road signalization or meteorological maps) where visual signs have a conventional status and whose interpretation is based on strict prescriptions. They can only be interpreted if one already knows the signs used in each and every weather prediction – a task out of reach – or if their semiotic principles are clear to their users.

2. *Methodology*

2.1. Hypothesis and material of the research

The aim of this research was to reveal which ways 9 year-old children use to interpret the meaning of visual signs used in weather report predictions. The research material consisted of visual signs that appear on the site: www.meteo.gr. Prior to the research, the children had no access to the site, so they weren't familiar with this particular kind of semiosis. Visual signs used in the site were classified according to the second trichotomy of the Peircean semiotic theory, meaning that each sign was classified in relation to its dynamic object as an icon, an index or a symbol (Peirce 1978: 138–166).

Although all signs are visual, meaning that they appear in two-dimensional space and are captured by vision, iconicity is not a property com-

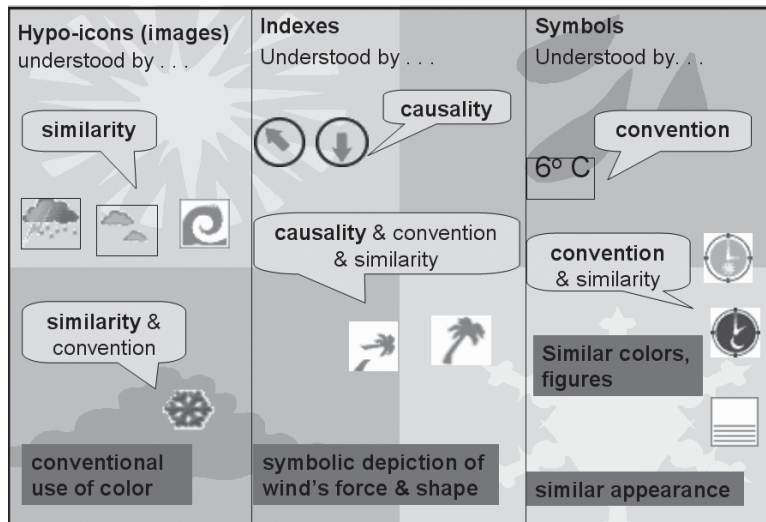

Figure 1. Classification of the visual signs used for weather forecasting on the site: www.meteo.gr

monly shared by all the signs. In fact, only three signs can properly be characterised as icons (and especially images) bearing relations of similarity to their objects (the signs for: thundery showers, cloudy weather, wind force 9+ Beaufort over sea areas; the sign for snowy showers shares common properties with its object which, although not obvious at first glance, can appear when a snow flake is seen through a microscope). Four signs share an indexical ground, two of them being pure indexes (the signs showing the direction of the wind) and two of them having indexical as well as iconic properties (the signs indicating speed of the wind) – although the first is the prevailing property for an accurate interpretation. The double quality of these signs permits interpretations based on physical resemblance – similarity – than indexical properties (in this case the causality principle). Finally, four of the signs were classified as symbols, although only one is a pure symbol (the temperature sign). The other three signs (the night and day time signs and the sign for wind force from 0 to 2 Beaufort over sea areas) share arbitrary – conventional – as well as iconic properties, but these are not sufficient for an accurate interpretation of the signs. In order to interpret the meaning of every sign the children had either to

“transfer” general knowledge about visual signs used in weather forecasting or to “guess” the meaning of each sign by some kind of “technique”.

The hypothesis of the research was that in order to interpret these visual signs correctly, children have to reveal the semiotic system they are part of and then, discover the semiotic principles behind the formation of every sign or group of signs. In the case of hypo-icons (images), the children can guess their meaning by the similarity between the sign and its object, meaning they had to depend on the sign’s appearance (shape, color etc). In order to interpret indexes correctly, the children have to find out the relation (either of contiguity or of causality) between the sign-vehicle and its object. Thus, the interpretation of indexes was based on the discovery of this principle, rather than on the knowledge of each separate sign. Finally, the children could only interpret symbols on the basis of prior knowledge. As this knowledge is acquired by social use, the interpretation of symbols evolves over time and with social interaction. Finally, when signs are mixed – which is the case for many signs –, children have to reveal their primary function and then take any other semiotic principle into consideration. Not having discovered the primary function, a false interpretation may occur.

2.2. Participants

Nine boys and seven girls, all 4th Grade students, participated in the research, which took place in February and March 2006. Their school is located in a semi rural region, nearby the city of Volos (a medium sized city in Central Greece).

2.3. Method

The research presented here is part of a wider project, which comprised six class activities and a personal interview with each child. The results of this part are the conclusions arrived at from the first two activities which aimed at investigating the children’s knowledge or accurate guesses of the meaning of visual signs used in weather prediction. The personal interview, conducted with each child separately, aimed at investigating the techniques used by the children in order to reveal the meaning of the visual signs.

During the first activity the children were given the list of the visual signs presented above and were asked to write down each sign's meaning in a two column table (a blue and a red one). In the cases in which they were sure about their answers, these were to be written down in the blue color column, if the children thought they could guess an interpretation by some kind of "clue", they were asked to use the red column. Having completed the table, the children were separately asked, by two interviewers, about the way they had revealed the meaning of each sign. The second activity consisted of finding correspondences (see Figure 2). The children were given both the visual signs and their verbal interpretation, and were asked to find which sign stands for each meaning.

3. 02.00 a.m.
4. 15.00 hours
5. Wind speed from 9+ beaufort over terrestrial areas
6. Wind speed from 4 to 6 beaufort over terrestrial areas
7. Wind speed from 0 to 2 beaufort over sea areas
8. Wind speed from 9+ beaufort over sea areas
9. Thundery showers
10. Snowy showers
11. 6 degrees temperature on the Celsius scale
12. Cloudy weather

Figure 2. Correspondences between the verbal and the visual (2nd activity).

3. Results

All students discovered easily the semiotic system the signs were part of, through being exposed to weather forecasts daily. Nevertheless, while writing down the meaning of each sign – during the first activity – they weren't

always consistent in their answers, as in the case of the indexes which were interpreted, by a small number of children, as belonging to the road sign system.

The results of the first activity indicate that most children either knew or correctly guessed all images and the temperature symbol (see Figure 3).

	7	1?	8	0	1?

Figure 3. Numerical data from the 1st activity: Visual signs known or guessed by the children.

Furthermore, almost half of them interpreted correctly the sign for wind speed 9+ Beaufort over terrestrial areas (which can also be interpreted by virtue of its appearance). All other signs were misinterpreted by the children. Results were radically improved in the second activity where the children's answers were more guided (Figure 4). Wrong answers were given only for the sign for wind speed 9+ Beaufort over sea areas.

The children mainly used descriptions when interpreting signs. This happened because –as they indicated when being interviewed– the main technique they used in order to understand the meaning of every sign was its appearance. This technique was used for almost all signs (the snow showers and the temperature sign were not included) by the majority of the children (see Figure 3). This led to almost correct answers as far as the

images were concerned (e.g. “clouds” as the sign of cloudy weather; “thunderstorm”, “bad weather”, “rain and thunderstorm” for the sign of thunder showers; “waves”, “gale”, “rough seas” for the sign of wind speed 9+ Beaufort over sea areas), but inappropriate answers were given for almost all signs with indexical value, either pure indexes or iconic indexes (e.g. the northerly winds sign was interpreted as “an arrow”, “a sign to go”, “a sign for direction” and “south wind”; the sign for wind speed 9+ Beaufort over sea areas was often interpreted as “a broken tree”, “a palm tree”, “a tree on an island beach” etc). Almost all the children failed to reveal the role of causality in the formation of the pure indexes, namely that this sign represents visually the action of the wind over an object (in that case, over an arrow). Subsequently, the arrow shows the Northerly winds or the South Easterly winds because it moves in the direction of the wind. Even when the children realized that the two signs are used in order to demonstrate wind direction, they thought that these showed the exact opposite direction, providing visual (it “points to”) instead of indexical value (it “is pushed by the wind”) to the signs.

The signs with symbolic value were also misinterpreted by the children while using the same technique (e.g. the night hour sign was interpreted as “a clock and a moon”, “time is changing at night”, “night” etc). Most children were simply describing what they saw.

Additionally, six out of twelve signs were recognized by many children, because they have seen similar signs in television weather report predictions (the signs for snow and thundery showers, the sign for strong winds over terrestrial areas, the night hour and the temperature sign). Although the system was not exactly the same, they were able to efficiently ‘transfer’ their knowledge in most cases. School knowledge was correctly used only for the temperature symbol. On the contrary, this “technique” led to misunderstandings as far as the sign for calm seas was concerned (e.g. “water level”, “water evaporation”, “glass of water” etc). An experiment conducted in the school class the on the previous day, was the cause of this misinterpretation.

The presence of mixed signs is quite usual in weather report predictions. Considering the classification of the signs used in the research (see Figure 1), the results are very good even for images with conventional value – as in the case for snow showers. Interpretation of indexes with iconic value, like the signs for wind speed over terrestrial areas signs (see Figure 3), were more easily understood than pure indexes. As, in some cases, these signs were approached comparatively to each other, the more obvious iconicity of the sign for strong winds over terrestrial areas guided the interpretation of the other similar sign. In the case of symbols – like the night and day hour sign- the iconic elements (color and figures) didn’t facilitate the sign’s interpretation. Major misinterpretations also occurred for the sign of the calm seas, where the iconic character wasn’t sufficiently obvious to the children.

5. Conclusion

In order to interpret correctly visual signs used in weather maps, the children have to reveal the semiotic system these signs belong to and discover the semiotic relation that each sign has with its dynamic object, whether a hypo-icon (in that case images), an index or a symbol. Following that, the children have to interpret hypo-icons based on the resemblance to their dynamic objects and the indexes by revealing the causal connection to

their objects. Symbols can be interpreted only if the children already know the arbitrary relation between the sign's signifier and signified.

In the research, most hypo-icons were correctly identified because the main technique used by the majority of the children for the interpretation of all signs was based on the signs' appearance. Guesses based on similarity to the depicted phenomenon were appropriate for the interpretation of images, but as this technique was over-generalized in the interpretation of other kinds of signs, major misinterpretations occurred. The children failed to realize the causal relation by virtue of which the indexes represent their objects, and inappropriate interpretations based on the signs' appearance were given. Alike were the results for the interpretation of the symbols – only the pure symbol (the temperature sign) excluded.

Although interpretation based on resemblance between the sign and its object is not a sufficient technique for an accurate interpretation of every sign, it is the main technique used by the children as they try to convey the meaning of visual signs. Differentiated techniques should be proposed to the children, according to the relation that every sign has with its object, in order for them to avoid misinterpretations. Provided that a guided approach of some kind is needed, visual signs' recognition – as part of visual literacy – should be incorporated into the school curriculum.

Acknowledgments

I would like to thank the students of the 2nd Public School of Agria (Magnisia) for participating in the research, and the researchers Mrs Evi Kavalari and Maria Epitropou for the collection of the data. Without their help this research could not have been accomplished.

A fractal conjecture of language

Proposal for a cognitive frame of linguistics

I would like to start with some intriguing images representing what mathematicians call fractals. In the figure below, you can see very different objects: fern fragments, a literally burned DVD, animal vessels and tissues, electric storms, the moon's surface, flowers and cauliflowers. These forms are so different among themselves that we could presume that practically any object can be displayed here as an example of what a fractal is. Nevertheless, not every object is a fractal.

Figure 1. Romanesco Broccoli.

A fractal is a shape whose basic form reappears in different scales, and it is defined by a recursive process that generates self-similar structures, inde-

pendently on a specific scale, combining at the same time structural irregularity and consistency (Mandelbrot 2004; Devaney 1992). The term was coined by the mathematician Benoît Mandelbrot in 1975 (I like to think that it combines the concepts of *fragment* and *total*, but actually the term came from Latin *fracturatus*, broken or fragmented). We can add to this, that scientists distinguish between two large classes of fractals: the natural and the artificial. Although personally I do not believe that natural/artificial is a valid categorization of things, but very provisional interpretations, I use this separation just to depict quickly the kinds of fractals found in what we call *nature*, and the fractals discovered within mathematical models.

This lecture proposes that language as a whole, belongs to the group of what we recognize as *natural fractals*; and the consequences of this involve a new definition of language, as well as the construction of new tools for its investigation. Although the term fractal was occasionally used for the first time by Gall and Irvine in 1995, restricted to the context of sociolinguistics, the application of fractal theory to linguistics has been rather poor. To knowledge, the present paper seems to be a first attempt at a general frame for language investigation, derived directly from fractal principles.

In the early 1990s, fractal theory had already become popular and successful applications of it were made in explaining the nature of dynamic systems. I wonder why it has not been used in linguistics, but at some point semioticians and language experts would do well to start a discussion on this issue. It seems to me that there is a need for semiotic studies to better understand fractals, and for more thorough research about linguistic structures as fractal patterns. From this perspective, a closer cooperation between mathematicians, philosophers and linguists might lead to a renewal of strategies for language investigation. In principle, it is important to point out that the features of verbal languages match very well the five main qualities or requisites to being a fractal. This close affinity between language and fractal qualities explains why the latter may serve as a referential frame for measurement, comparison and representation of the linguistic matters.

Looking for an equivalent affinity between fractals and non-verbal languages, we can observe that their level of structural complexity matches with their potential development as fractal objects. This means that in a long-term construction, fractal qualities also arise here. Some examples

	Fractal quality	Linguistic manifestation
I	<i>structural autosimilarity</i>	<p>Irvine and Gall identify this feature in pragmatics as a “sociolinguistic recursivity”. However, <i>structural autosimilarity</i> is also present in modular iteration in syntactic and semantic levels.</p> <p>This suggests that words and sentences repeat basic models in all languages, independently of the scientific paradigm we use, dealing with linguistic universality (e. g. the chomskian one, <i>matrical</i>, or the Terrence Deacon’s <i>autonomism</i> of language).</p> <p>There are many examples of this in linguistic cases, conjugation and declination, that follow some structuration like (prefix)root-addition-suffix, in the paradigmatic form, and (supplement)subject-verb-complement, in the syntagmatic one.</p>
II	<i>scalar relativity</i>	<p>Sequential development.</p> <p>Languages are composed by arrangements that gradually are more complex: sign projection into phonemes, phonemes into words, words into sentences, sentences into speech, speech into cultural systems.</p> <p>Rush Rhees proposed another kind of scalar structuration, according to grammatical contents: name-rule-correct-incorrect-concept-intention-comprehension-communication-language institution-social life. This one, like the previous organisation, can be described by its cyclic composition.</p>
III	<i>surface irregularity</i>	<p>Irregularity into verbal sequences, speech considered as a continuum: (everything in time and space can be considered as continuum or discontinuum. For example, a straight line can be conceived as a indivisible-infinite line, or as a sequence of specific points. It depends on the focus to the subject, as analysis or synthesis).</p> <p>This means that if we represent verbal language as a set of connected items, the final shape of the whole would expose an arrangement of irregular patterns stochastically structured.</p> <p>This applies particularly to intentional and pragmatic patterns of language.</p>
IV	<i>formal consistency</i>	<p>This concerns grammatical functions such as consistency of the construction rules. While verbal sequences are irregular in their continuum representation, at the same time they are consistent because of their grammar and their pragmatic constraints.</p>
V	<i>fractal dimension</i>	<p>As every linguistic complex in use has an irregular continuum surface, there is a particular dimension for every complex, that should be measurable considering the different constructive parameters of each linguistic object. As the linguistic matter is dynamic, it is very plausible that the fractal dimension of languages is constantly changing.</p>

Table 1. Linguistic manifestations of fractal qualities.

might be apes' usage of gestures and the sound patterns in whales and dolphins, as well as the employment of haptics, hastics, oculusics or paroxemics used by different living communities. Although this is a very attractive line of research, I shall stop on two eminent questions: where do fractal properties come from? And where do the fractal properties of language come from?

In mathematical models, fractal complexity comes from the recursive association of values (series), with a particular dimension resulting from a collection of elements (points) which are not forming part of a linear system represented by integers. In models from nature – Romanesco broccoli – fractal structuration comes from the molecular layers related to the cellular plot, following general laws of structural economy and efficiency towards the environment.

Fractal properties of language may arise from a path to that of other, natural fractals. In general, living organisms reveal elements that commonly are related to specific functions interacting with the environment (Kaandorp 1994). These elements are close fractal structures, and can be noticed even by observers not involved in modern mathematics or physics. Friedrich Engels, for example, described vertebrate organisms mainly as a form of life with limbs grouping around the nervous system (Engels 1883). The nervous system is an excellent image of fractal structuration, specially when one considers the formal relationships between axons, neurons and limbs (Cohn & Tickle 1996). Some theorists claim that the shape and functions of the nervous system are unrelated, and even they believe that this shape would be far to do something with language. I believe, however, that the relationship between the nervous system and the brain, together with their response to the environment, are responsible for most of the linguistic structure.

Moreover, there is another level of coincidences between the nervous system and languages, which can be accepted as a combination of structural autosimilarity, scalar relativity and superficial irregularity. This level is engaged in *hierarchical agreements* between implicative and subordinated components in biological structures. In the mid-nineteenth century, Engels had already imagined this sort of subordination, which was later confirmed by clinical studies published by Ramón y Cajal, Sherrington and Lloyd (cf. West 1990). However, these hierarchies or successive subordinations seem to be more complex than a linear chain of progressive

Figure 2. Linear complexity of correspondences: Intercellular to tissue and organs.

tasks, because they are present in very different manifestations of biology, from intracellular to tissue and organ correspondences, as the scheme in Figure 2 shows.

This kind of subordination, or “collaboration”, as biologist Lynn Margulis calls it, might be relevant also for linking fractals to biosemiotics, because it comprises an iterative pattern of signification, bonding endo-signs to exo-signs at very different levels of information. Relations between implicant and subordinated seem to have an active-passive character, but not in the simple sense in which one element imposes rules and the other one follows them. On the contrary, the link between them occurs in a functional way, in order to systematically achieve and complete excitation-inhibition processes which are indispensable to the development and transmission of biological models. Actually, there is no submission of any one element to another, but a *symbolic understanding* for coordination.

This is a core issue that, coming from symbiotic theory, can also contribute to the enrichment of biosemiotics.

According to the biosemiotician B. C. Goodwin, genetic material and tissue structure are of a symbolic nature. The meaning of the relationship between implicant and subordinated is the process itself of complex and ordered development against entropy. And this process directly participates in the construction of the biological structure. Thus we can conceive a symbolic understanding between nucleus and mitochondrion within an endosymbiotic cohabitation inside the same cell (as Margulis suggested in 1998). This sort of “understanding” or coordinative agreement, contrary to entropy, characterizes living processes in their wider variety.

Thus, there would be not just one presymbolic level of language, but a complex stratification of presymbolic relationships ordering the structures of molecular information, and performing the transmission of genetic information being developed through symbolic understanding. The organizing biostructure would use, by this means, its accumulation of energy to liberate or retain it, working into processes of excitation-inhibition, as a constructive principle. In general terms: it is unlikely that linguistic structures would be formed by levels of disorder, as in Markov chains, but rather by iterative order and structural consistency.

In an interview Mandelbrot (2004) explained: “Basically, a fractal is any pattern that reveals greater complexity as it is enlarged. Thus, fractals graphically portray the notion of ‘worlds within worlds’ which has obsessed Western culture from its tenth-century beginnings.” I would like to finish with a question: are not languages worlds within worlds?

Richard Littlefield)*

Applying the USST–2000 to a semiotic theory of voice

1. Background

Pearson and Hatten jointly discovered the presence of *proposition*, *tense*, and *aspect* in music. These discoveries were made at different times and reported in different venues, the latest being that of *aspect* in this same venue in 2001. Pearson's Universal Sign Structure Theory of semiotics (USST–2000) was used in making both discoveries. The discovery of *tense* and *aspect* in music and the semiotic relations between *tense*, *aspect*, and *voice* suggests that voice is also present in music, despite its counter-intuitiveness in a language without lexemes, thus demanding our search for it in actual musical phenomena.

In 2002, Littlefield joined the project and a decision was made to begin searching for evidence of *voice* in music. The same semiotic methodology was used and has proven successful. The discovery of voice in music can now be reported. In coordination with Littlefield and Hatten's grammatical analysis of *voice* in linguistics and music, this paper shows how to generalize the linguistic definition in order to develop a semiotic definition of voice. The *semiotic definition* is developed in such a way as to make its application practical to as wide a range of uses as possible. The articles in this collection by Hatten, Pearson, and Littlefield show how to specify phenomena of *voice* in Western art music.

This paper is developed within the Semiotic Paradigm (Pearson 1977, 1979, 1981, 2004, and forthcoming), and uses the 2000 version of the Universal Sign Structure Theory (USST–2000) (Pearson 2000), the Theory of Operational Semiotics (TOS) (Pearson 1998: 140–158), and the observational methodology of listening to music with an “understanding” ear.

2. Preliminaries

Voice is a well known, but little analyzed property, of many natural languages. Most languages have a very small inventory of voice resources. Standard American has two – active and passive – while Greek and other, ancient Indo-European languages had a third – the middle voice. Most linguistic definitions of voice are in terms of the particular lexical items in the one language under analysis. But this clearly will not work for a semiotic definition in general, nor for a system, such as music, that contains no lexemes.

Our analysis is for the purpose of generalizing the definition of voice to any arbitrary semiotic system with the hope that it would then be applicable to music. Our methodology uses Peirce's general theory of relations in the setting of Pearson's Semiotic Paradigm. In particular, it involves the interaction of the USST and the TOS, the two theories of that paradigm, with phemes as expressed in terms of general relations. Our goal is to find evidence of voice in music.

Most definitions of voice in current grammars are in terms of an actor/object-of-action relation of directionality between the subject and the predicate of a sentence. The subject/predicate sentential form is a simplification that applies strictly only to thing-oriented languages using sentences involving monadic relations. Nulladic relations are not phemes. They are pure terms, i.e., only names, and thus just rhemes. Higher adicity relations – dyadic, triadic, etc. – cannot be placed in a subject/predicate form in any clear, totally unproblematic way, thus creating additional problems for both the expression and analysis of voice.

3. Analysis

A. Logical analysis

Linguistic analysis can be divided into modern (analysis of thing-oriented subject/predicate languages), and postmodern (analysis of process-oriented relational languages). In a subject/predicate language (S/P-language) Aristotelian logic (logic of the syllogism) prevails. When interested in the action expressed by the proposition, such languages can focus attention on the subject as actor (active voice), the predicate as actor (passive voice),

or on the action itself (middle voice). What happens to voice (attention to agency) in relational languages (R-languages)? Is it possible that voice exhibits a more subtle form, or is even missing altogether, in R-languages?

In Russian, a fairly large and well-defined set of verbs fails to undergo passivization because: 1) they have a more static and symmetrical meaning; and 2) because Russian verbs have a complicated and all-pervasive aspectual system, sensitive to the distinction between telic (goal oriented) and non-telic (teleology-free) activities. This implies that the voice operator may reside inside the pragmatic operator, somewhere near the tense and aspect operator.

In S/P-languages, the action of interest in the concept of voice is the action expressed by the *V* in the proposition, and thus lies within the semantic operator. The **NP** and the **VP** also lie within the semantic operator. Not contained within the semantic operator is the decision involving where to place the focus of interest: on the **NP**, the **VP**, or the *V* itself, and then to transform that into the subject. This is part of the source interpretation process and is created at type-token conversion time as part of the process of creating the token. It is thus part of the pragmatic operator. In fact it enters in the same place in the operator string and from the same place in the USSD as the mood operator – as part of the linkage between the source interpretation and the body of the sign (see Figure 1). Thus voice may very well be part of the mood operator, which is itself inside of the pragmatic operator.

For a conjecture of what the details of the **I_s – P** linkage may look like, see Figure 2.

Figure 1. Interpretation-level linkages for the pragmatic structure.

Indicative sentence 1) has 2) as its semantic proposition. The status of its subject is active. But if the source interpreter decides to focus interest on the ball, this is done by means of inserting a passive marker into the deep structure which signals to the syntactic operator to perform a pas-

Figure 2. Conjectured details of source-interpreter linkage to the body of the sign.

sive transformation, thus changing the status of the new subject to that of patient. Since insertion of the passive marker is under the influence of I_s at T/K Conversion Time, the insertion is done by means of an action/focus operator within the pragmatic operator. The marker then stays in the process string until operated on by the passive transformation operator within the syntactic operator.

- 1) Tom hit the ball.
- 2) {Tom's hitting the ball}

Since the \mathbf{NP} , \mathbf{V} , and \mathbf{VP} markers are all present in the semantic operator, and the source interpreter may still want to direct the focus of interest under other than indicative moods, passive transformation of other moods should be easy to handle. It appears, then, that voice applies to the sentence in any mood.

- 1) Johnny hit the ball. (Active Voice/ Indicative Mood)
- 2) The ball was hit by Johnny. (Passive Voice/ Indicative Mood)
- 3) Did Johnny hit the ball? (Active Voice/ Interrogative Mood)
- 4) Was the ball hit by Johnny? (Passive Voice/ Interrogative Mood)
- 5) If only Tom had hit the ball ... (Active Voice/ Subjunctive Mood)
- 6) If only the ball had been hit by Tom ... (Passive Voice/ Subjunctive Mood)
- 7) Let's suppose that Tom were to hit the ball. (Active Voice/ Optative Mood)
- 8) Let's suppose the ball were to be hit by Tom. (Passive Voice/ Optative Mood)

The only mood that causes any difficulty whatsoever, is the imperative mood, and then only because of the subject deletion transformation.

- 9) (You) hit the ball! (Active Voice/ Imperative Mood)
 10) Endeavor to make the world so that it can be described by: the ball being hit by you! (An attempt to express the Imperative Mood in the Passive Voice)

Example 10), above, is simply the expansion of the imperative mood operator, and even it has undergone a second person subject deletion transformation. Both 1) and 3) are active, while 2) and 4) are both passive. This implies that voice refers to markers that occur inside of the semantic operator, i.e., to the right of Π_{sem}

$$\Pi_{\text{TA}} : \Pi_{\text{M}} : \Pi_{\text{V}} : \Pi_{\text{S}} : (\Pi_{\text{sem}} : (M_{\text{NP}}, M_{\text{V}}, M_{\text{VP}}))$$

where Π_{sem} contains the propositional operators, the propositional attitudes, and the abstract proposition, and Π_{V} is the voice operator. In particular the voice operator occurs to the right of both the tense and aspect operator and the mood operator (Pearson 1998).

B. Linguistic analysis

1. Inventory of voices in natural language

- a) Active Voice: seems to require focus of attention on the subject rheme as actor. In an expansion from transformational grammar:

$$S \Rightarrow \text{NP} + V + \text{VP}$$

which implies focus on the **NP**.

- b) Middle Voice: seems to require focus of attention on the action itself, i.e., the main predicate pheme. This implies focus on the V in the TG expansion.
 c) Passive Voice: seems to require focus of attention on the object rheme as actor. In the TG expansion this would imply focus on the **VP**.
 d) Antipassive Voice: there is some suggestion for the presence of an antipassive voice in language, but the evidence is not clear.

2. Focus of attention

What is this “focus of attention” that figures so prominently in all linguistic analyses of voice? It is a decision made at utterance time, i.e., Type-Token

Conversion time, (T/K/CT), by the source interpreter of the sign as to the most important part of a complex semantic proposition of the sign, i.e., subject rheme, predicate rheme, or primary predicate pheme itself. This gives us three possibilities for emphasis.

Figure 3. Focus Structure of the Semantic Proposition.

3. Other hints

While change of voice alters the subject of the surface structure, it does not alter the roles of agent and object. This is because agent and object are in the propositional operator, which in turn is inside the semantic operator itself, while voice is inside the pragmatic operator.

To paraphrase Nakhimovsky (1983: 59), voice is an asymmetric relation between a pheme and the proposition contained in the semantic structure of that pheme.

In previous investigations, we have shown that music contains propositions (Pearson T/Aa; Pearson and Hatten 1994; and Hatten and Pearson 1994). If expansions from TG possess any semiotic reality at all, they hold for any arbitrary system of signs structured in the form of a textual string, and thus music can be shown to distinguish between tones (in the semiotic sense of syntactic category), such as noun phrases, verbs, and verb phrases.

*If, therefore, it can be shown that music differentiates in any manner between the interest placed on any one of these and any of the others in any particular situation, we will have identified a concept of **voice** for music, even though music lacks the lexemes of natural language.*

4. Definitions and operator expansions

It thus appears that *voice* acts very much like *mood* and in other ways like *tense* and *aspect*. **Mood** is the belief attitude, as coded in the syntactic structure of the sign, of the source interpreter, i_s , in the pragmatic structure of the sign, towards the semantic proposition of the sign (Pearson 1995, T/

Aa; Pearson & Hatten 1994, 2001; Hatten and Pearson 1994, 2001). We therefore attempt the following definition:

VOICE is the focus attitude, as coded in the syntactic structure of the sign, of the source interpreter, i_s , in the pragmatic structure of the sign, towards the three components of the semantic proposition of the sign.

Voice results from the process of an action/focus operator which places a deep structure marker on one of the three components of the top-level propositional expansion in the semantic operator. The action/focus operator is under control of the source interpreter – in music, called the performer, conductor, or sometimes even composer – who decides at T/K/CT which of the three propositional components should be emphasized.

5. Musical evidence for selective emphasis on the three propositional components.

Unlike natural language where the default attention is placed on the \mathbf{NP} , resulting in active voice as the standard, in music, the default attention is placed on the \mathbf{V} , resulting in middle voice as the standard. However, there are several rather outstanding examples where attention is focused on the first of the three propositional components, the \mathbf{NP} .

Two of these are especially among my favorite passages of music. The first, is the opening clarinet glissando of George Gershwin's *Rhapsody in Blue*, which serves to focus attention on the opening note and the activity involved in getting from it to the full opening chord. By opening the piece in the active voice, rather than the default middle voice, Gershwin serves notice that the purpose of the *Rhapsody* is to set a whole new level of vibrancy for American music.

The second example is far more subtle than Gershwin's blatant American jazz sound. It is the organic flow of a Brahms symphony, for example, his *Symphony No. 1*. Instead of passively passing quietly from the 1st movement into the 2nd, it grows organically like a rosebud unfolding into a flower so that no other 1st movement could cause that 2nd movement and no other 2nd movement could grow out of that 1st movement.

There is no mistaking the organic growth, but there is also no mistaking the fact that Brahms wants you to be aware of the organic growth. He has

used voice to emphasize the organic growth of the 1st movement, including the organic growth into the 2nd movement, and even the organic growth of the 2nd movement itself.

6. Conclusions

Music manages to use and take advantage of voice even without the aid of lexemes. However, unlike natural language, the default voice for music is the *middle voice* rather than the active voice.

Voice results from the process of an action/focus operator which places a deep structure marker on one of the three components of the propositional expansion in the semantic operator. The action/focus operator is under control of the source interpreter – in music, called the conductor, performer, or sometimes even composer – who decides at type/token conversion time which of the three propositional components should be emphasized.

The Type-Token Conversion operator thus appears to have a rather complex structure, containing as it does the Mood operator, the Tense&Aspect operator, and the Voice operator.

This definition implies that any sign that contains a proposition or propositional function and arrays its text in a linear string, will exhibit the phenomena of *voice* in some way or another. Music is one example of primary interest to us, but this also includes such other languages as mathematics, propositional logic, predicate logic, and poetry. But it does not include such languages as terministic logic. In other words, terministic logic may or may not possess voice.

This result also suggests other interesting questions in the semiotics of music, such as: “During a key change, does the first key go passively as if totally dominated by the new key, or does it actively generate the new key?” The interested reader will no doubt pose others ...

Le Lion de Finlande: Communiquer l'identité d'une nation nordique

Commençons par quelques vers patriotiques du poète Veikko Antero Koskenniemi de 1917, l'année de la déclaration de l'indépendance de la République finlandaise:

Sua, Suomen Leijona, tervehdän:
miten säilässäs aurinko palaa!
Ylös vapauden päivähän
sinun voimasi vangitut halaa.

Oi, Suomen Leijona, nähnyt oon
sinun kunnianpäiväsi koiton.
Sinä johdat ihanaan taisteloon,
sinä annat vaaran ja voiton!

Ô lion de Finlande, à toi je rends hommage.
Oh! vois comme en ton épée a flambé le soleil!
Un vent de liberté anime ton courage,
de ta force enchaînée, c'est le jour du réveil.

Ô lion de Finlande, dans le ciel ténébreux
j'ai vu que se levait l'aurore de ta gloire.
C'est toi qui mèneras au combat lumineux,
c'est toi qui donneras et péril et victoire.

(Traduction par Yves Avril)

L'héraldique, la sigillographie et la vexillologie sont des sciences très voisines de la sémiotique (Ragen 1994). Le blason est l'*idéogramme iconique* correspondant à ce qui est *blasonné*, c'est-à-dire peint, dessiné, brodé, gravé, sculpté, représenté selon les règles propres à l'art héraldique.

Le lion est l’emblème traditionnel de la Finlande. Le roi des animaux est partout présent dans les représentations symboliques du pays: dans les armoiries nationales, sur les timbres, les pièces de monnaie, et aujourd’hui dans d’innombrables objets commerciaux: sur les tee-shirts, logos, objets kitsch, etc. Une étude des subtiles variations du statut du Lion de Finlande à travers les siècles permet d’analyser les différentes étapes de la construction et de la communication d’une identité nationale finlandaise.

Rien d’extraordinaire, pourtant, dans ce choix d’emblème parce que le lion fait aussi partie de l’héraldique de dizaines d’autres pays et régions de l’Europe. L’Empereur et le roi de France mis à part, pratiquement toutes les dynasties de la chrétienté occidentale ont, à un moment donné ou à un autre de leur histoire, porté un lion dans leurs armes. Un dicton héraldique médiéval affirme même: “*Qui n’a pas de blason, porte un lion*”.

Le lion est devenu le roi des animaux après le retour des croisés de Terre Sainte, avec Richard Cœur de Lion à leur tête. D’innombrables grandes familles ont choisi alors le lion comme emblème. Jusque-là, on considérerait plutôt l’ours comme le roi des animaux en Europe. L’ours a perdu son statut à cause d’une véritable campagne de diffamation orchestrée par l’Église catholique au Moyen âge (Pastoureau 2007: 181–207).

Le lion est un animal biblique par excellence ; la Sainte Écriture le mentionne environ 150 fois. Pour les juifs, c’est le lion de Juda; pour les chrétiens, un symbole du Christ. Dans l’iconographie chrétienne, le lion devient aussi l’attribut de Saint Marc et de Saint Jérôme.

En Europe du Nord, le lion fut l’emblème de la première famille royale suédoise, les Folkunga. Le lion comme symbole royal et féodal incarne le pouvoir et la justice, la morale et la loyauté; il représente aussi la puissance, la vigilance, l’immortalité et bien sûr le courage.

La Finlande n’a jamais été un royaume. De toute façon, s’il y avait des rois finlandais avant la conquête suédoise du pays, ils n’ont laissé aucune trace historique. La Finlande a été annexée au royaume de Suède à partir de la première croisade suédoise en 1155. Il peut y avoir une connotation liée aux croisades dans le symbolisme léonin qu’on attache à la Finlande depuis cette époque. On trouve un lion parmi les ornements du sarcophage de Saint Henri, le patron de la Finlande, l’évêque missionnaire martyrisé pendant la première croisade. Il y a des lions aussi dans les peintures murales de certaines églises médiévales finlandaises (Hattula, Lohja, Taivassalo).

La première représentation du Lion de Finlande date des années 1560. Elle se trouve au-dessus de la porte principale du château de Turku, le siège des grands-ducs de la Finlande. C'est Gustaf Wasa, roi de Suède qui fit de la Finlande un Grand-Duché. Son fils, le futur roi Jean III (1568–1592), fut la première personne à porter ce titre. Son emblème familial contient à la fois l'ours de la province de Satakunta et le lion. Le projet original (1562) du blason de Jean III se trouve à la Bibliothèque Nationale à Paris. Le texte dit: "*Jean, par la Grâce de Dieu, Dauphin de la Suède et Duc de la Finlande*". Une version des années 1580 représente la couronne ducale, très précisément, en couleur pourpre.

La première grande représentation du blason de la Finlande qui a été déterminante pour son évolution se situe au sarcophage de Gustav Wasa à la cathédrale d'Upsal en Suède. Il a été créé par l'artiste flamand Guillaume Boyen en 1562–1591. Ce grand monument de la Renaissance suédoise contient les armoiries de toutes les provinces de Suède, y compris la Finlande. Le blason de la Finlande est si bien réussi qu'il a obtenu un statut normatif jusqu'à nos jours. Une description du blason du 16^e siècle dit: "Un lion d'or dont la patte droite est armée, qui porte une épée occidentale et qui piétine le sabre russe." Il s'agit d'un lion *rampant*, c'est-à-dire dressé sur ses pattes de derrière.

Cependant, dans le drapeau d'un régiment militaire finlandais en 1686, on trouve aussi un lion qui ne piétine pas le sabre.

Dans un ouvrage de prestige *Suecia antiqua et hodierna* par Erik Dahlbergh imprimé en Suède en 1716, on remarque l'introduction d'une vieille convention de l'art héraldique: la queue fourchue du lion. On peut constater, néanmoins, que le lion de Dahlbergh n'a pas une allure aussi noble que celui de Guillaume Boyen.

Après l'accord de Tilsit entre Napoléon Bonaparte et Alexandre 1^{er}, en 1807, et après une guerre, en 1808–09, la Finlande fut annexée par la Russie. Cependant, cette annexion ne fut pas pure et simple, comme dans le cas de la Pologne, mais l'Empereur de toutes les Russies octroya à la Finlande le statut d'un Grand-Duché autonome. La Finlande fut "désormais placée au rang des nations" selon la célèbre formule du discours de l'Empereur.

Le 13 mai, le jour de Flore, en 1848 lors d'une manifestation devenue célèbre, le corps des étudiants de l'université d'Helsinki (Université Impériale d'Alexandre) a brandi un drapeau-lion tout en entonnant le nouvel hymne national *Vårt land* (Notre patrie) écrit par Johan Ludvig Runeberg.

D'où soudain un problème héraldique pour les autorités: comment accommoder un lion qui a l'audace de piétiner le sabre russe?

L'administration russe prendra la version de Dahlbergh comme point de départ pour créer un nouveau blason pour la Finlande en 1857. On y voit un lion plutôt apprivoisé dont l'épée a été raccourcie, dont le bras n'est plus armé et qui ne piétine pas tout à fait le sabre russe. De surcroît, le blason est surmonté de la couronne impériale russe, avec l'aigle à deux têtes. On peut voir dans la juxtaposition des deux animaux un message héraldique: le lion est traditionnellement, certes, considéré comme le roi des animaux terrestres, mais il est sans autorité sur les oiseaux, d'où la suprématie de l'aigle impériale. Les Finlandais n'ont pas apprécié leur nouveau blason; ils l'ont baptisé, avec dédain, "le lion caniche".

Une étape importante dans l'émancipation de la Finlande fut l'affirmation de sa langue principale, le finnois, comme langue administrative du pays à côté du suédois. L'Empereur Alexandre II octroya à la Finlande ce privilège en 1863 après un entretien avec Johan Vilhelm Snellman, sénateur et philosophe hégélien, à Parola. Le lieu de la rencontre fut aussitôt orné par une statue du Lion de Finlande.

En 1886, Karl August Bomansson, directeur des Archives Nationales Finlandaises, a présenté sa version dite "normalisée" des armoiries de la Finlande où il est largement revenu au projet original de Guillaume Boyen. Notamment, la couronne impériale, qui est ouverte, a été remplacée par une couronne ducal fermée qui est en couleur rouge. Pour ne pas trop déplaire aux autorités russes, le lion ne piétine pas la poignée du fameux sabre russe. Ce blason n'est pas devenu officiel mais les Russes ont fait preuve d'une certaine souplesse ce qui a permis à la version de Bomansson d'être utilisée sur les billets de la Banque de Finlande.

Les Expositions universelles de 1889 et 1900 à Paris ont été très importantes pour le développement du sentiment national finlandais. En 1889, la Russie n'a pas participé à cause du centenaire de la Révolution française tandis que le Grand-Duché autonome de la Finlande a répondu présent. Fièrement, les Finlandais brandirent un drapeau grand-ducal rouge où l'on voit bel et bien le lion piétiner la poignée du sabre russe. En 1900, les Russes ont participé à l'exposition universelle et l'usage du drapeau-lion a été moins prononcé.

Entre-temps, de plus en plus souvent, on commença à personnifier la Finlande sous les traits d'une "demoiselle Finlande" en armure et flanquée

d'un lion, une figure très voisine, à la fois, de Pallas Athéna et de Jeanne d'Arc. Cette représentation qui mériterait un exposé à part devient répandue notamment à travers des cartes postales.

Les représentations les plus célèbres de la Demoiselle Finlande avec son lion sont dues au sculpteur Walter Runeberg, fils du poète national Johan Ludvig Runeberg. Il a créé en 1894 la grande statue de l'Empereur Alexandre II, dit le "czar libérateur", qui domine encore aujourd'hui la place du Sénat à Helsinki.

Les autorités russes furent très touchées de ce geste de piété filiale des Finlandais envers leur Empereur. Mais quand on regarde de plus près, on aperçoit sur le piédestal de la statue impériale une représentation de la Demoiselle Finlande avec son lion, portant un bouclier avec l'inscription LEX, d'où l'appellation populaire "Lex" de la statue. Une copie fut aussitôt installée au Palais de la Diète. Une deuxième copie du "Lex" se trouve aujourd'hui dans la salle des fêtes du Palais du Président de la République. Les chefs d'Etat qui visitent la Finlande se font souvent photographier devant cette statue.

En février 1899, les relations finno-russes se sont détériorées à cause d'un manifeste répressif proclamé par l'Empereur Nikolaï II. Le Czar a révoqué une grande partie de l'autonomie du Grand-Duché et a entamé une campagne de russification du pays ce qui a conduit aux multiples protestations artistiques et culturelles à travers l'Europe. Une pétition internationale, ornée par le Lion de Finlande et signée par des grandes personnalités européennes, a été adressée au Czar pour soutenir la cause finlandaise. Par exemple, en France, on trouve parmi les signataires Alexandre Dumas, Anatole France, Ernest Lavisse, Henri Poincaré et Émile Zola.

En signe de résistance, les Finlandais se sont mis à fleurir massivement la statue du bon czar libérateur Alexandre II. Bien entendu, en même temps, les Finlandais déposaient des gerbes aux pieds de la Demoiselle Finlande et de son lion; un subtil geste patriotique que les autorités russes ne pouvaient pas interdire.

Après la déclaration de l'indépendance de la Finlande le 6 décembre 1917 eut lieu un soulèvement populaire contre l'occupant russe. Malheureusement, une atroce guerre civile qui a opposé les gardes rouges à une armée blanche dirigée par le général Mannerheim en a résulté aussi. Le camp blanc est sorti victorieux du conflit; c'est la droite politique qui a pu déterminer le symbolisme national. La Finlande indépendante pavoisa

d'abord avec un drapeau-lion mais sa couleur rouge ayant déplu à la droite, un nouveau drapeau bleu et blanc, avec la croix dite scandinave, fut adopté en 1918.

Pendant la Seconde guerre mondiale, en 1942, un Ordre du Lion de Finlande a été créé. Cette décoration continue à être décernée pour des grands mérites civils ou militaires et les étrangers peuvent la recevoir.

Aujourd'hui, le symbolisme léonin est partout en Finlande: l'armée et la police l'arborent, comme aussi plusieurs ministères, associations et partis politiques. Le lion a sa place d'honneur dans les armoiries nationales, sur les timbres et sur les pièces de monnaie. Sans oublier la passion nationale: le hockey sur glace. L'appellation populaire de l'équipe nationale de ce sport est "les lions de la Finlande".

Le lion est un animal *polysémique*. Par exemple, dans la Bible, il représente parfois aussi le Diable. Son appropriation comme animal héraldique par excellence de l'Europe chrétienne est le résultat d'un long développement guidé d'abord par l'Église, puis par plusieurs États-Nations. Le cas de la Finlande est un exemple intéressant de ce processus.

Remerciement: Plusieurs images de cet article ont été tirées du catalogue d'une exposition sur le Lion de Finlande organisée au Musée National à Helsinki en 1997–98 (Talvio 1997).

Elena Penskaya

The semiotic characteristics of Russian fine art

Literary mayhem in the second half of the nineteenth century

Many humanitarian disciplines have taken up the study of scandal as a cultural phenomenon. The different approaches to the problem together make up a kind of theory of *scandal*. Scandal presupposes the choice of a topic and a person, and demands the involvement of the interested parties in drafting its scenario and dramaturgy, which needs its own scandalous discourse. Scandal is based on circulating information about conduct outside the norm. The staging of scandal relies on a circle of passive and active participants spurring on the developments, and on an observant audience. Just as a play, scandal demands a structure, with its plot, development, denouement and resolution (cf. Land 1983: 274; Pochepcov 2004: 246; Proskurin 2000: 367).

The dramaturgy of scandal demands of the suspect justification of his action – or scandal dies if its drama does not develop and new information does not come in.

Scandal is the surest way to penetrate the public mind. It is a peculiar analogue of a thriller, of second-rate crime fiction.

Journalists and literati are key personages in the scandal domain of Russian culture. The Russian “press inferno” is a stage production, with actors dashing to and fro to the verbal accompaniment of an emcee. Indicatively, the lampoon became the principal genre in magazines of the 1850s–60s. It ruled the press and monopolised the comic theatre. Turning to sensation, gossip, the trivia of life, and “expressive and easily recognisable portraiture of our contemporaries”, it legitimised the entertainer’s manner in print, on stage, and in the news-thirsty public.

Understandably, Russian lampoons of the 1840s–60s were a sequence of denunciations, which readers eagerly anticipated. Scandalous lampoons fed on evil and offence of propriety. The lampoon is of a dual genre – it simultaneously depicts and provokes scandal. Journalism, in its turn, also proceeds from sensation and crime, that is to say, everything that trespasses the established norm.

The orientation of democratic literature on exposing social evil was largely based on similar denunciations and irrefutable proof of the opponent's guilt and his weakness and doom. The Russian literary circle, epitomised by Dostoyevsky was to a great extent inspired by the same complex of ideas. Two different aspects of culture – one concerning landmark events, and the other daily routine – clash in a striking juxtaposition. Accepted linguistic standards are profaned. The thirst for destruction clashes with the paralyzing fear of chaos. Two basic Russian types – the saintly crank and the criminal revolutionary, with his provocative conduct – are experimentally brought together. The public and the hidden modes of life blend. History and man come under study in a tragic crisis. Such are the metaphysics of scandal.

We see all this, for instance, in the scene of Nastasya Filippovna's birthday party in the novel *The Idiot*, when Ferdyschenko proposes a game in which everyone present recounts their worst wrongdoing. True, he found the stories unsatisfactory, since as they were not what he expected; nevertheless, the game stirred up a scandalous atmosphere in which cynical plots were exposed, and the personages' fates made a U-turn. In another example: scandal seethed in the drawing-room of Varvara Petrovna Stavrogina, in *The Possessed*, with the mad lame girl and Captain Lebyadkin, the appearance of Pyotr Verkhovensky, the exposure of Stepan Trofimovich, Liza's hysterics and fainting fit, Shatov boxing Stavrogin's ears, and so on.

Dostoyevsky's novels diagnose the advent of all-penetrating journalism fed by the essay and the lampoon – a system with an elaborate set of tools: confession, exposure, denunciation, and penitence. That was when scandal developed into a classic genre – on the order of drama or comedy – which oddly enough imitated government ideology and structure. Thus, Faddei Bulgarin, a *littérateur* and notorious secret-police informer, wrote a scandalous message to Dubelt, the chief of gendarmes, in 1846. It reads as the paragon of an informer's apology: "By the will of fate, I have been mixing with people from every walk of life for 25 years now. Day in, day out, they

come to me as a kind of priest, to make their confessions ... Thank God, people believe me because I have never deceived anyone or let anyone down. I try to console some, advise others to be patient, and intercede for still others. Such contacts help me to keep *au courant* and know the public opinion” (cited in Lemke 1909: 317).

Information is necessary for public denunciation, discussion and intervention. The style of Bulgarin’s manifesto fully coincides with the vocabulary of denunciatory Russian literature: “The system of hushing up all evil, and the fear of one being held responsible for all gave birth in Russia to a horrible system of ministerial despotism and gubernatorial tyranny. This evil threatens tremendous disasters to the monarchy and the country, and embitters people of all social estates to the utmost” (in Lemke 1909: 3). Bulgarin’s programme of denunciation turns into the mission of journalism as the Russian democrats of the 1860s formulated it: bring dirty secrets to surface, and make public any and all abuses of the social norm. The radical democratic press aimed to establish a network of public correspondents-*cum*-informers, whose contributions appeared in the rubrics: “Our Mail”, “The Searchlight”, “The Ray”, “The Lantern”, and “Voices from the Province”.

To some extent, the mission of bitter denunciation turned the spy, the detective and the agent provocateur – the entire range of the government’s servants – into the social double of *littérateur* and journalist. With all its outward sublime mission of fighting the regime, Russian literature took shape within the limits of government agencies to re-create them subconsciously again and again. Russian authority was developing from the very start in the situation of never-ending scandal.

The government-literature interchange proceeded in the crucial era of social and political catastrophes, with the personal and historical biography receding far into the background, in between two giant historic scandals: the Crimean War and World War One.

The professional conduct and public reputation of *litterati* and journalists made scandal the basis of the new historical dimension and the new chronology. Here are several examples. In 1861, Pyotr Weinberg established the magazine *Vek* together with Druzhinin, Bezobrazov and Kavelin, then immediately tarnished its reputation with his own lampoon, “Russian Curiosities”, in which he tactlessly came down on women’s emancipation activists. Scandal followed scandal as every new person joined the discus-

sion, especially the zealots Mikhailov and Pisarev. The events received a description of gripping interest in Weinberg's later article, "The Ugly Misdoing of *Vek*" (1900: 214–215).

Vsevolod Krestovsky, with his shocking novel *The Slums of St. Petersburg* (1864), written with the help of known Russian detective Ivan Putilin (Leskov regarded it as the most socialist of all Russian-language novels), launched a scandal that lasted thirty years, expanding to involve ever new social groups and movements. From 1867 on, the satirical magazine *Iskra* lived off Krestovsky for many years by publishing its scathing travesty with cartoons such as "The Slums of St. Petersburg, Drastically Abridged, Verified and Illustrated by A. M. Volkov" (it even appeared in book form). And more: Krestovsky fought a duel with Minayev due to a scandalous press discussion of his novel. The author scandalously broke with the magazine *Russkoye Slovo* and entered into long polemics with Blagosvetlov. Further: news was circulated that the plot of the novel was plagiarised from Pomyalovsky (this rumour appeared in the newspaper *Syn Otechestva* on January 28, 1895, after Krestovsky's death).

The list is by far not exhaustive. The scandal was too big contain. It bloated, mouldered, and dragged on ad infinitum. Dostoyevsky wrote (1983: 55): "I was terrified by the sudden rumour of Lev Kambek giving up his literary pursuits ... because the *Vek* and himself were the means of sustenance for a swarm of our progressives with their big families for many years." Lev Kambek, the indomitable protester known as the "scandal magnet", was on all occasions both the scandal-monger and victim at once. "A failure, a sudden end, frustration, and ensuing silence – all that is so typically Russian!" wrote Sergei Reiser (1950: 18). Kambek, the editor and publisher of *Peterburgsky Vestnik*, embarked on a sensational venture: he indiscriminately published everyone's contributions in the Publicity Rubric, charging fees at his own discretion. Kambek appeared everywhere disheveled and unshaven, dressed as a man from the lowest walk of life.

Playwright Alexander Ostrovsky might be the only one who did not fit into the scandalous environment of Russian literature and journalism of the nineteenth century's second half. Public attention to him all too often brought him petty vengeance from journalists and the people flocking round them. Persevering toil led him to fulfil his ambitious cultural mission. The character and outward appearance of Ostrovsky clashed with the lampoon image of him that the press was busily creating. He never stooped

to justifying himself or to denying the repeated calumny of plagiarism. His aloofness extinguished all scandal brewing round him.

The practice of Russian scandal rested on impassioned humanism. Scandal rises against the order of things and the common paradigm of existence. The artist true to life and fact would not put up with such low behaviour, even during a time when the entire literary world appears to be involved in and based on scandal, so much so that the very idea of artistry is identified with the scandalous.

Discussion and condemnation are the two poles that determine the range of public response to facts, ideas, or comments which the community denounces and regards as alien and downright dangerous. Personal reputations are prominent here as reflecting the extent to which the public is willing to delegate to a particular member the right to express opinions different from those that are universally accepted and thus able to restructure the available value system.

Scandal comes as the natural and indispensable lever to delimit the established standards and the vector of their emergent change. It is like a volcano, reshaped with every eruption. It is impossible to forecast its new shape, but the very realization of the inevitability of change saves one from pain with every reshaping.

Today, the majority of scandals are mighty PR weapons and so a prominent economic factor in making a book a best-seller and its author a media darling. Whatever its fate might be, scandal is part and parcel of debates on the moral paradigm dominant at a given time. In that, scandal not only makes it easier to express politically incorrect opinions but also helps to make such opinions public. Censorship, whether open or secret, and self-censorship presently exist in many countries. In this situation, such an opportunity is extremely welcome.

Scandal occasionally brings its participants tragic fruit. In the final analysis, however, it is a cultural remedy able to thoroughly change the intellectual situation. Scandal gives rise to new ethical and social norms, which penetrate every sphere of life, from humanitarian knowledge to practical politics.

Susan Petrilli and Augusto Ponzio

Adam Schaff: From semantics to political semiotics¹

Premise (by Augusto Ponzio)

Adam Schaff is a pivotal author in my research, an indirect master, along with Mikhail M. Bakhtin, Emmanuel Lévinas, Ferruccio Rossi-Landi, and Thomas A. Sebeok. I am happy to be able to boast having made a significant contribution as editor, interpreter and in some cases as translator, to the diffusion of the ideas of these masters. I have also authored monographs on these thinkers. From them I have developed what they share in spite of their differences, which is the idea that the life of the human individual in his/her concrete singularity, whatever the object of study, and however specialized the analysis, cannot abstain from involvement in the destiny of others. Concerning Adam Schaff, I published a monograph, *Persona umana: Linguaggio e conoscenza in Adam Schaff* (1974b), which I have reworked over the years and presented in a new, enlarged edition (Ponzio 2002) that includes an interview with Schaff held in Bari in 2000, specifically for that volume. In my books on semiotics and philosophy of language whole parts are dedicated to this author (for example, Ponzio 1977, 1990, 1992b, 1993, 1999, 2003a, 2004, 2007). Moreover, I have developed his analysis of the human individual and of globalisation in today's world in recent books, also in collaboration with Susan Petrilli (see list of References).

*1. Adam Schaff: Philosopher and semiotician
(by Augusto Ponzio)*

According to Schaff, language is both a social product and a genetic phenomenon, and is functional to human praxis. Language is the basis of the “active role” carried out by the human subject in terms both of cognitive

processes and practical action. Language is not only an instrument for the expression of meaning, but also the material which forms meaning without which meaning cannot exist. Consequently, Schaff criticizes the reductive innatist and biologicistic interpretation of language as proposed by linguist Noam Chomsky and biologist Eric H. Lenneberg. According to Schaff, we must get free of what he calls the “fetishism of signs” echoing Marx’s “fetishism of commodities.” Sign fetishism is reflected in the reified conception of the relation among signs and between signifier and signified. Sign relations must be considered as relations among human beings who use and produce signs in specific social conditions. In Schaff’s opinion, we must recognize the superiority of language theories that stress the active function of language in the cognitive process and the connection between language and *Weltanschauung*, between language and the “image of reality,” by contrast with naive materialism. The human being is described as the result of social relations, and language as inseparable from social praxis. In studies of human signs and language, this approach leads to a new way of looking at issues related to signs and language: the problem of the connection between language and knowledge, language and consciousness, language, ideology and stereotypes. Consequently, theory of knowledge appears as a theory in need of support from studies on language. Moreover, the connection between language studies and theory of knowledge contributes to a better understanding of the concepts of “choice,” “responsibility,” “individual freedom,” and of such issues as the “tyranny of words,” “linguistics alienation,” etc., in the field of the humanities (see Petrilli 1986, 1996, 2007).

Another direction in Schaff’s research concerns methodological issues in the social sciences in relation to Marxist theory. His most important publications in this domain are: Schaff 1947, 1949, 1955, 1970, 1975b.

A third aspect focuses on problems relating to the human individual, society and social movements. Schaff’s principle publications in this domain are: Schaff 1961a, 1977a, 1974, 1982, 1988.

We will refer to Schaff’s philosophical interests in political semiotics further on, in particular his interest in the “symptomatology” or “semeiotics” of economic, political and international social relations in the current production system. His works from the beginning of the 1990s to his last years (he died on 12 October 2006) focus specifically on the symptoms of individual and social unease of our time.

From 24 to 29 January 2000 Adam Schaff was in Bari to work with Augusto Ponzio on the draft of his book of 2002 on Schaff. This book includes two conversations with Schaff, one in October 1976, the other in 2000. In this last, held in French, Schaff answered the following questions:

Quelles sont les phases de ta recherche? Quelle sont les relations entre le periods de ta recherche et les événements historiques du siècle XX? Comme peut tu appeller la phase actuelle de ta recherche? Je crois qu'elle remonte à les premières années '80. Quelles sont les événements personnels (événements personnels publiques et non personnelles-privés, selon ta distinction) et les événement historiques qui l'ont déterminée? Nous pouvons certainement établir une relation entre tes livres des années '60 (*Humanisme et existentialisme, Le marxisme et l'individu humaine, L'alienation comme phénomène social*) et tes livres de la phase actuelle. Mais quelles sont-elles les différences d'engagement interpretatives et de perspectives? Pouvons nous dire que l'entier parcours de ta recherche se déroule sous la bannière du socialisme? Pouvons nous dire que l'entière ton œuvre est marxiste? Les changements à l'intérieur de ta recherche ne sont pas des "changement de peau", je crois, mais des changements substantiels dûs à des exigences d'ordre scientifique et à la transformations des objets analysés. Peux tu être d'accord avec cette interpretation?

Schaff's answers are reported in Chapter 7 of *Individuo umano* (Ponzio 2002). The table of contents of this book is now available on Ponzio's website (www.augustoponzio.com). The present paper develops some of the problems relating to these questions.

2. Political semiotics and semeiotics of social symptoms (by Susan Petrilli)

As President of the European Co-ordination Centre for Research and Documentation in Social Sciences (Vienna), Adam Schaff during the 1980s promoted a series of meetings in different countries throughout Europe to analyze the *Helsinki Final Act* (1975) from a semiotic point of view: Budapest, January 1985; Prague, November 1985; Trieste, May 1986; Moscow, November 1986; Pécs, May 1987; Dubrovnik, October 1987; Leipzig, May 1988; Sofia, November 1988, Rotterdam, January 1989. The title of the project was established during a meeting in Dubrovnik 1984: *La sémiotique*

dans la recherche comparative: Le vocabulaire des relations internationales: l'acte Final de la Conférence d'Helsinki. Participants from twelve different countries included: Adam Schaff, Honorary President of the European Co-ordination Centre, Christiane Villain-Gandossi, Adjunct Director of the European Co-ordination Centre, Ferruccio Rossi-Landi, Paolo Facchi, Klaus Bochman, Momir Milojevic, János Kelemen, Christina Schäffner and Augusto Ponzio. The results of the project included: a new edition of the *Helsinki Final Act* (1990), by the European Co-ordination Centre for Research and Documentation in Social Sciences, enlarged with the addition of the results of a scientific analysis from a semiotic perspective of the concepts and notions proposed in it; and the volume *The Concept of Europe* (Villain-Gandossi et al. 1990).

Schaff developed his analysis in political semiotics in his most recent books (1992–2001) which are dedicated to such issues as structural unemployment, migration, and the end of work understood as work-merchandise. These books include: Schaff 1992, 1993, 1995, 1997, 1999, 2001. In *Mi siglo Veinte*. (1993: 131–145, my italics), Schaff says:

Hay síntomas de un posible colapso y, algunos de ellos nos hablan de la posibilidad de una catástrofe total para la vida en la Tierra. Se trata – y recogemos aquí visiones de la Revelación de San Juan – de imágenes propias del Apocalipsis. El Evangelio habla de sus cuatro Jinetes, y hoy, nosotros, ya podemos discernirlos con claridad.

El primero es el peligro de una *guerra nuclear* y de la destrucción, como consecuencia, de la vida en la Tierra. ... El Segundo Jinete del Apocalipsis es la *amenaza ecológica* que ciernen sobre el mundo. ...

Human “contamination” does not only concern the planet, the atmosphere, river water, seas and oceans, but the whole cosmos:

El hombre ya ha llegado con su contaminación hasta el cosmos. En su zona más próxima a la Tierra ya hay un auténtico “cementerio” de artefactos y elementos de cohetes inservibles.

The third rider symbolizes the *demographic explosion*. With regard to this topical problem Schaff stresses that

Al terminar el siglo XX la población de los países industrializados ascenderá apenas al 15 por ciento del total de la población del planeta. El restante (85% por ciento de la especie humana estará condenada a la pobreza o a

la miseria. Esa desproporción entre los dos grupos de la población, si sus causas actuales no cambian, registrará un agravamiento y el grupo de los pobres será cada vez mayor.

On this topic we find previsions in Schaff's book of 1993 concerning scenarios such as new forms of terrorism, attacks to big metropolis, as in the case of the destruction of the twin towers in New York, and war on terrorism. The fourth Apocalypse rider is the rider of *structural unemployment*, therefore the end of work as a consequence of today's Industrial Revolution, the decline of global labour force, and the dawn of post-capitalist issues also examined by such authors as André Gorz, Jeremy Rifkin, etc. Schaff transforms the image of the four riders of the Apocalypse:

En cualquier caso hay que tener presente – y ésta es mi contribución personal a la visión dada por San Juan – que los Jinetes del Apocalipsis jamás cabalgan en solitario, que siempre van acompañados de un ombre que simboliza las relaciones interhumanas que generan el Apocalipsis. En el sentido de que lo crean, dirigen y regulan su ritmo.

Analysis of the end of commodified work announced by today's structural unemployment recurs in all Schaff's recent texts, and especially in the above-mentioned essay, "Structurelle Arbeitslosigkeit". Present-day unemployment is structural to the global system of production, and not a momentaneous, transitory phase in a cycle. Unemployment represents a decisive turning-point in the social relations of production. Structural unemployment is the beginning of the end of "free-labour," the end of exchange between labour and salary. Automation operates to the detriment of *human* labour, producing human excesses and systemic unemployment. This is not simply a question of treating the relation between worker and machine in isolation from other factors. The relation between worker and machine must be viewed in the broader context of social relations in general, especially economic relations. The maximization of profits has of course always been the motor of capitalism, but capitalist production nowadays more than ever before with communication operating as an integral part in the *production* process itself, reveals its insatiable drive for maximal profitability. Live, variable capital must be sacrificed for fixed capital – all for the sake of capitalist development. In other words, the quantity of personnel working in a company must be reduced by continually renewing and updating machines which gradually replace human beings, even when

a question of operations of the intellectual order. Development of the interactive relation with the intelligent machine is accompanied by a reduction in the number of people necessary to make the machine function. The competencies and services required from the worker are complex. But complexity on a qualitative level calls for simplification on a quantitative level, which is expressed in terms of a reduction in the number of people necessary to the production process. Like the automation of physical work the automation of intellectual work also leads to reduction, even elimination, of human labour for vast numbers of human beings.

Eine soziale Folge des Prozesses [of structural unemployment] ist die Notwendigkeit, sich um neue Arbeitsformen für alle “überflüssigen Menschen” zu bemühen ..., indem man für sie eine entsprechende “Beschäftigung” findet, die von der Gesellschaft organisiert und finanziert wird. (“Strukturelle Arbeitslosigkeit”, p. 16) [One of the social consequences of the process, discussed above, is the need to commit to new forms of work for all the “superfluous human beings,” the “excesses” ... finding a relative “employment” for them organized and finalized by society].

Whoever promises employment in the traditional sense, a return to employment based on traditional work, says Schaff, either does not understand the economic-social situation or is consciously lying basing his/her political career on deception.

... Die soziale Situation diktiert uns heute die Notwendigkeit einer weltweiten *Grossen Transformation*. Wir machen eine neue industrialen Revolution durch, und infolge der Automatisierung und Robotisierung wird die Arbeit (im Traditionellen Sinne des Wortes) absterben, als weitere Folge wird nicht nur die heutige Arbeitklasse, sondern auch die Kapitalistenklasse absterben (“Strukturelle Arbeitslosigkeit”, p. 17) [The social situation today imposes the need for a great transformation involving the whole world. In fact we are experiencing a new industrial revolution. As a consequence of automation and robotization, work (in the traditional sense of the term) will come to an end, and as a further consequence not only will the working class disappear but also the capitalists].

As theoreticians who are not left-wing (for example, Rifkin) also admit, post-capitalism has already appeared and with it market post-economy. Paradoxically, the development of capital produces the conditions of liberation from commodified labour, alienated labour, but today in the

negative form of unemployment – in the context of the capitalist system of social relations extended to a global level. So it then becomes a question of imagining new forms of social relations and new occupations where social wealth does not identify with labour-time, with development in productivity functional to profit, but with freetime, with development of the single individual's personality, with development of the human person.

Ich möchte ... eine Beschäftigung ankündigen, die ... in der Zukunft sicherlich eine enorme Rolle spielen wird – es geht mir die *kontinuierliche und permanente Witterbildung* (ibid.: 26) [I wish to indicate ... an occupation that ... will no doubt play an enormous role in the future: I am referring to continuous and permanent education].

Only a *cognitive dissonance* (Festinger 1957) or a *closed mind* (Rockeach) prevents us from seeing the present metamorphosis of work as a result of the new Industrial Revolution and job-killer machines. Our world needs a bit of sound human reason that can guide the transition from the civilization of work to the civilization of occupations. New occupations include individual permanent education independent from job marketing, which is finishing, and functional to personal development.

3. *Human essence or human being? Problems of translation* (by Susan Petrilli)

Connected with the publication of *Marxism and the Human Individual* (1965) is the discussion concerning the translation of “Theses on Feuerbach” by Karl Marx. This debate took place between Adam Schaff and Lucien Sève in the French journal *L'homme et la Société* in 1971 and 1972 (Schaff 1975a; It. trans by A. Ponzio). It evidences the relation between ideology and translation (see Petrilli 1992). This debate concerns the official translation in French of the theses and involved numerous French intellectuals (in addition to Schaff and Sève, other scholars either directly or indirectly involved were Louis Althusser, Auguste Cornu, Roger Garaudy). However, the debate also referred to official translations in Polish, Russian, Italian and English, and in addition to the scholars mentioned the international community at large interested in Marxist theory was also involved. In German, Marx's text reads as follows:

Feuerbach löst das religiöse Wesen in das menschliche Wesen auf. Aber das menschliche Wesen [*Human essence or human being?*] ist kein dem einzelnen Individuum innenwohnendes Abstraktum. In seiner Wirklichkeit ist das Ensemble des gesellschaftlichen Verhältnisse.

Even though this issue may seem rather specialized and restricted, it is in fact of central importance considering its determining role in the global interpretation of Marxist theory – many scholars believe that the “Theses on Feuerbach” are the key to Marx’s thought, even though they often give rise to different interpretations, even misinterpretations, given their elliptical nature and at times metaphorical nature. Furthermore, and for what concerns us more specifically here, discussion of this particular issue is important because it signals the existence of a close relation between translation and ideology: to translate in one way rather than in another, as in the case of this text by Marx, is full of ideological and political implications. In fact, the solution to this particular controversy is significant at the philological, philosophical and political levels. For the case under discussion, it is crucial in establishing the validity of Sève’s overall interpretation of Marxism and of his criticism of existentialism, structuralism, of Althusser’s theoretical anti-humanism, etc. Sève considers Schaff’s translation of Marx’s sixth thesis to be wrong, the result of his misinterpretation of Marxism, of his reading of Marx in a humanistic-speculative key, involving consequences at the political level also. The whole debate ultimately concerned the relation between Marxism and humanism: interpretation of thesis VI may be viewed as a reflection of the general attitude towards the relations between Marxism and humanism, ideology and science, scientific socialism and Marxist humanism, Marx’s youthful writings and his mature works. All this concerns the meaning and value of Marxism generally. As Schaff observes, the debate (though centred upon the translation and interpretation of just a few expressions in the Theses) extends beyond “words” and can only be fully understood by looking “behind the screen,” by inquiring into the history of left-wing political movements, and by relating the consequences of this debate to controversy on the humanist contents of socialism, on the means of overcoming the effects and consequences of Stalinism in the Communist movement, etc.

The immediate object of discussion and controversy concerns the correct translation of certain propositions in “Theses on Feuerbach”, all

of which contain the German word *Wesen* as in the key expression *das menschliche Wesen* in thesis VI. Schaff contends that recurrent translation of this expression with “the essence of man”, generally consolidated by tradition, is wrong. The German word *Wesen* is ambiguous: it counts up to eleven distinct groups of meanings, each with numerous semantic nuances. Two of these meanings are relevant in relation to the debate in question and correspond, respectively, to the Latin “ens” and “essentia,” English “being” and “essence,” French “être” and “essence,” Italian “essere” and “essenza,” intended as “living being” on the one hand, and “essence of things,” “that which is essential” as opposed to incidental, on the other. These languages then do not dispose of a single and ambiguous term corresponding to the German “Wesen”, though this word does have an equivalent for polysemanticism and plurivocality in the Russian “suchtchestwo” (sucestvo) and in the Polish “istota”. Consequently, as opposed to such languages as Russian and Polish which have just as ambiguous an equivalent to the German “Wesen,” in French, English or Italian translations, a decision must be made: the meaning of the word “Wesen” must be decided each time it occurs in a given context, its sense determined for it to be appropriately rendered in the target language.

Most official translations of the “Theses” in different languages derive from the original Russian translation. Strangely enough, in 1892 the Russian translator Plechanov chose to render the German “Wesen” with the unambiguous Russian word “suschtschnost” (that is, “essence,” “Wesenheit”), instead of “suschtschestwo.” Similarly to the Polish “istota” the latter has multiple meanings and consequently is analogous to the German original in terms of polysemy. Having made this particular lexical choice, the Russian translator – an authority in the field, observes Schaff – was in fact to condition this text’s future philosophical and political interpretations. In French, as in Italian and English, the same word cannot be used indifferently as in the case of “Wesen”, “istota”, “suschtschestwo”. Influenced by the original Russian translation, “Wesen” is translated prevalently with the equivalents of “essentia”. This solution was refused by Schaff in favour of the equivalents of “ens”. He made the decision by combining the results of a grammatical analysis with analysis of the philosophical context. In the face of such an ambiguous word as “Wesen”, Schaff solves the interpretive and translative problem by appealing to the rules of German syntax. If the expression “das Wesen” is followed by a noun in the geni-

tive, it means “essence”. Therefore, “das Wesen des Christentums”, which is also the title of a work by Feuerbach, means “the essence of Christianity”. Correspondingly “das Wesen des Religion” means “the essence of religion”, “das Wesen des Menschen,” “the essence of man”. “Wesen” followed by “of something” or “of somebody” functions in the sense of “essence”. By contrast, if “Wesen” is preceded by a qualifying adjective, it means “being”. Therefore, “das christliche Wesen” means “the christian being”, “das religiöse Wesen” means “the religious being”, “das menschliche Wesen” “the human being”. In all these cases, as syntax reveals, we are dealing with “being” that is respectively Christian, religious, human.

*4. Theory of language and theory of knowledge
(by Augusto Ponzio)*

Linguistic analysis is particularly useful in the study of the historical social structure of the human individual, given that it is especially through language that the historical and social conditioning inherent in the shaping of the individual is made possible. Language is a social fact and constitutes the social background to consciousness, thought and speech. Language is a social product as well as being a genetic phenomenon and is functional to human praxis. This is at the basis of the historical-materialistic and dialectic character of the “active role” of the subject both at the level of cognitive processes as well as of practical action. The individual is able to act upon the historical social situation which is pre-existent to him conditioning him from the outset, through his use of language (it too a social product). Language is not only an instrument for the expression of meanings, but it is also the material which goes to form meaning and without which meaning could not exist. Consequently, what we call the “subjective” does not at all mean the abstractly individual or absolutely autonomous, but rather it is the concretely individual and that which is conditioned, that is, a social product with a social function: the “subjective has an objective and social-historical character”.

The linguistic sciences are able to grasp the socio-historical nature of language thus ridding themselves of both biologicistic, innatistic, conventional prejudices on the one hand, and of related mechanistic and idealistic conceptions on the other, merely by reconsidering the human individual in the perspective of historical-dialectic materialism. It follows that language

is neither wholly natural nor wholly unnatural and conventional. Like any human fact, it is first of all a socio-historical phenomenon resulting from historically determined needs, mediating between needs and the satisfaction of such needs. An innatistic and biologistic interpretation of language, as that formulated by Chomsky and Lenneberg, can only be maintained by reducing the human person to the status of mere product of natural evolution, as if her/his biological history was not influenced by her/his social history. From such a perspective, s/he is viewed as “the human being in general”, as the abstract human being, rather than as a historical and social being conceived in her/his concreteness, in her/his special historical specification according to the social system, the specific division of labour, class and level of productive forces to which s/he belongs. Furthermore, many authors agree that what is innate in language is only the *capacity of learning how to speak* (which undoubtedly depends upon the hereditary structure of the brain, the vocal apparatus, and so forth), while the concrete realization of language is determined by *social relations*. Though true, this explanation is insufficient for it does not eliminate the dangers of a biological interpretation of language: in Lenneberg’s work, for instance, social relations and the relations among individuals of the same species are placed at the same level. They are considered to be the same as relations existing in the animal kingdom at large.

It is absolutely necessary to found the theory of language on interpretations of mankind and of interhuman relations which are free of any tendency towards naturalistic positions with respect to the scientific achievements of historical-dialectic materialism. From a Marxian perspective, social relations are characterized by relations of production; they represent a particular form of production, they are historical, nonnatural relations. If we wish to free ourselves of what Schaff called the “fetishism of the sign” referring to the Marxist notion of the “fetishism of goods”, we must view the analogy and typology of signs in connection with the issue of the human individual and social relations. In fact, to give up a reified conception of the relations between signs as well as between signifier and signified, it is necessary to take the social process of communication as the starting point of our analysis, and to consider the sign relation as a relation among human beings who use and produce signs in specific social conditions. All analyses should start from the “social condition of the individual” and from the notion of the individual as a social product. This

would prevent us from considering communication as a set of relations among originally separate and abstract subjects, while removing idealistic and materialistic mechanistic explanations of the communication process.

The question of the relation of language to reality is closely connected to both the theory of knowledge and to the conception of the human individual. Does language create our image of reality? Or does language reflect and reproduce reality? Does language have an active, creative function in the cognitive process? To answer these questions implies taking a definite stance as regards the three fundamental models of the theory of cognition: idealism, mechanistic materialism, dialectic materialism. The latter two refer the problem of the relation between language and reality to the theory of reflection. All three concern the role of the subject in the cognitive process and consequently the problems related to the human individual. The subjective-idealistic and materialistic-dialectic models differ from each other in their interpretation of the active role which both, in contrast to mechanistic materialism, assign to the subject and consequently to language in the cognitive process. In Schaff's opinion, in comparison to naive materialism, materialistic-dialectic theory recognizes the superiority of language theories which stress the active function of language in the cognitive process (even if from an idealistic point of view) and the connection between language and *Weltanschauung*, between language and the "image of reality" (think of Humboldt, Sapir, and Whorf). However, in the perspective of a Marxian interpretation, the human being should be considered as the result of social relations, and language as the product of social praxis. This interpretation recognizes the active function of the cognitive subject and, at the same time, maintains that far from being the starting point of the cognitive process, the subjective element is the result – and a complex one at that – of specific social influences. In a certain sense, the subject may be considered as the resultant construction of cognitive processes. The concept of "reflection" is closely related to the concept of the "human individual", and it is precisely on the basis of interpretation of such notions that we mark the difference between dialectic and mechanistic materialism in connection with the theory of knowledge. As Schaff writes in *Language and Cognition* (1964): "the specific interpretation of the theory of reflection in the Marxian system is directly related to the interpretation of the concept of the human individual."

The connection between the theory of language and the theory of knowledge is evident if we acknowledge interaction between language and thought, as well as the indivisibility of meaning and concept. Schaff (1967) maintains that:

... when in accordance with the materialistic analysis of the cognitive process we consider thought and human consciousness as linguistic thought, as thought made of language (Marx maintained that language is “my consciousness and that of others”), it is evident that any analysis of the cognitive process must also be the analysis of the linguistic process, without which thought is simply impossible.

Unity of thought and language highlights the active function of language in the reflection upon reality, as well as the social character of individual thought, its status as a social product. On defining the sign in general (that is, at the semiotic level), and on dealing with semantics, it is impossible to leave the theory of knowledge out of consideration. For example, to consider the problem of the referent, or the material object, as irrelevant to a semiotic point of view does not mean separating semiotics from the theory of knowledge and, therefore, allowing semiotics to remain neutral as regards such a theory, as certain authors believe. On the contrary, it means assuming a specific standpoint in relation to the theory of knowledge, which would be described as conventional-idealistic for the insistence upon the autonomy of the code and of the message with respect to material reality. Semantics and the theory of knowledge are both implied whenever we ask the following questions: “what is meaning?”; “what is the relation between meaning and the sign-vehicle?”; “what is the relation between meaning and object?”; “what kind of existence do we refer to when we say that meaning exists?”; and so forth.

On the other hand, all problems dealt with by theory of knowledge imply semantics, insofar as they are problems concerning language. This does not mean that the theory of cognition should be exclusively a semantic analysis or that language should be the sole object of any philosophical research, as maintained by Semantic Philosophy. The Marxist theory of reflection clearly demonstrates all the implications existing between semantics and the theory of knowledge, rejecting any schematic attitude typical of conventional and idealistic relativistic standpoints. Certain philosophical trends such as Cassirer’s neo-Kantism, neo-positivism, Rus-

sell's logical atomism, the linguistic philosophy of the school of Oxford connected to Wittgenstein's later production, the semantic analysis of the school of Warsaw and so forth, deserve recognition for having maintained and demonstrated that language is not merely the instrument, but also the object of philosophical research.

The theory of knowledge is not the only theory in need of support from studies on language. The philosophy of the human individual – to the extent that it deals with the function of the individual in social relations and with problems of traditional ethics (which does not imply moralism) – must inevitably consider that individual behaviour is conditioned by society mainly through the influence of language. This leads us to a new vision of issues related to language: the problem of the connection between language and ideology, concept and stereotype, language and social praxis. On considering the concepts of “choice”, “responsibility”, “individual freedom”, we need to take account of the “tyranny of words”, of the problem of “linguistic alienation”. We should reject the idealistic and conservative point of view which refers contradictions and individual alienation to a semantic origin and maintain, similarly to the young Hegelians, that the human being can be “set free” by simply clarifying the meaning of words and by substituting false ideas with true ones (see Petrilli 2004b).

5. The concept of contradiction in formal logic and dialectic (by Augusto Ponzio)

The relation between Marxist dialectic and formal logic demonstrates the connection between the theory of knowledge and the analysis of language. Schaff shows how the word “contradiction” has two different meanings depending on whether it is considered from a Marxist dialectical, or formal logical point of view; this implies that Marxist dialectic does not exclude the logical principle of non contradiction. From the point of view of formal logic, the term “contradiction” signifies a relation between two sentences, or utterances, one of which maintains that something is in a given relation with an object at a given moment, while the other denies this. On the contrary, from the point of view of Marxist dialectic “contradiction” means “unity of antithesis”, that is, unity of contrasting tendencies, aspects and forces; in this way, dialectics is the constitutive element of every phenomenon. When Marx maintains that at a certain level of their

development the productive material forces of society are in contradiction with the existing relations of production, the word “contradiction” does not express the relation between a positive and negative judgement (as in formal logic), but rather the juxtaposition between opposed and yet complementary tendencies which form the unity of a certain system, and which are, at the same time, the mainspring of its transformation. In this case, the word “contradiction” – notwithstanding the misunderstandings it can give rise to – when intended as an objective rejection of the logical principle of non-contradiction, has a specific meaningfulness which justifies its use. In this particular case, the word “contradiction” stresses a contrast characterized by inadequacy and discordance such as to interfere with the functioning of the social mechanism to the point of causing its collapse.

A central point in Schaff’s analysis of the relation between dialectics and the principle of non-contradiction is his demonstration that consideration of movement as a confutation of the logical principle of non-contradiction, is unfounded. Engels too fell into this trap. In Plechanov’s opinion we must face the following dilemma: either we acknowledge the existence of the fundamental laws of formal logic and we deny movement, or, on the contrary, we acknowledge movement and deny these laws. Schaff observes that this is a false dilemma. It arises from the interpretation of movement as an objective confutation of the logical principle of non-contradiction, as something which is and is not at the same time in the same place. This interpretation which the Marxist classics derive from Hegel, in reality originates from the ancient Eleatic philosophers:

Die Eleaten bejahten den Satz vom Widerspruch und negierten folglich die Objektivität der Bewegung; Hegel stand umgekehrt auf dem Standpunkt der Objektivität der Bewegung und verwarf infolgedessen die Gultigkeit des Satzes vom Widerspruch in der Beschreibung der Bewegung. (Schaff 1975: 26) [The Eleats asserted the principle of contradiction and consequently denied the objectivity of movement. On the contrary, Hegel took the point of view of movement and consequently rejected the validity of the principle of contradiction in the description of movement].

Hegelian interpretation of movement (as something which both is and is not in the same place at the same time) and the level of develop-

ment of the mathematics of the time, in particular of differential calculus, Newton and Leibniz's conception of the infinitesimal entity, considered to be a quantity equal to and different from zero, strengthened the influence on Marx and Engels, of the Eleatic-Hegelian principles concerning movement.

As far as the relations between Marx and the mathematics of his time are concerned, the situation today is different from Schaff's description of 1955. Thanks to the publication of Marx's *Mathematical Manuscripts* (Moscow 1968; It. trans. from German by A. Ponzio 2005), we are now familiar with Marx's critical analyses of Newton's and Leibniz's "mystical" differential calculus, of D'Alembert's and Euler's rationalistic method, and of Lagrange's purely algebraic method. In criticising Newton's and Leibniz's differential calculus, Marx highlighted the presence, in their theory, of metaphysical notions and of the use of procedures which contradict the laws of mathematics. Though making use of Lagrange's work, through such criticism Marx independently reached positions attained by such nineteenth-century mathematicians as Cauchy and Weierstrass, who accomplish the transition from a simpler to a more profound and scientific stage of calculus. Schaff's considerations can certainly be referred to Engels but not to Marx. What Engels wrote in his *Anti-Dühring* about the differential relation gives the impression that he accepted exactly that kind of interpretation of differential calculus which Marx defined as "mystical". Marx maintained that differential calculus is mystical in character; in fact it attains exact results by means of algebraically inexact procedures, as Marx says, it makes use of exceptional laws, that is, it confers contrasting properties to the terms employed; it resorts to devices devoid of any mathematical rigour, it resorts, that is, to "conjuring tricks". In Marx's opinion, calculus is to be dealt with in strictly mathematical terms, and in this sense he kept account of Lagrange's contribution for the attempt of founding calculus on pure algebraic grounds. If procedures not founded upon demonstration were employed in differential calculus, this was not due to the dialectic character of such procedures, as Engels seemed to believe when he explained that the lack of understanding, on the part of contemporary mathematicians, of Leibniz's differential calculus was caused by the impossibility of understanding the principles of calculus on the basis of formal logic. On the contrary, it was due to the fact that differential calculus was based on metaphysical and non-dialectical definitions.

6. *Semiotic structuralism in the Marxist frame*
 (by Susan Petrilli)

An important semiotic structuralist method which should be mentioned is Karl Marx's "protostructuralist" analysis of capitalist economic relations. We shall not refer to French Marxist structuralism (Louis Althusser, Lucien Godelier – the Marxist structuralism of Lucien Sebag, follower of Lévi-Strauss, is a "discours à part"), but directly to Marx given that his approach is typically semiotic, even if we must connote it as "cryptosemiotic". The study of communication is pivotal in the Marxian critique of political economy. In fact, Marx analyzes commodities as messages and concentrates on explaining the "language of commodities" and the "commodity's arcanum" (Marx, *Capital*, I). As a result of this approach, his critique of political economy overcomes the fetishistic view of things according to which the relation among commodities appears as a natural relation among things and not for what it really is, that is, a specific type of relation among people. As such, Marxian critique is effectively a semiotic analysis which studies the structure of goods as messages not only at the level of exchange but also of production. A commodity is a commodity not when a product is produced and consumed in its use-value but when it is produced and consumed as an exchange-value, that is, as a message. All this makes economics a sector of semiotics. The structure of the market emerges as a structure of human relations, precisely the humans relations of social production. From this point of view, the Marxian approach to structure is exemplary for semiotics. It indicates that what Marx achieved in his analysis of commodities and capital we must achieve in anthroposemiotics: structures of relations among human individuals must be identified in the place of mere relations among things and individual reduced to things.

Vice versa, the semiotic approach permits an appropriate use of the notions of structure and superstructure in a Marxist framework. In fact, recurrent difficulties in the study of the relations between structure and superstructure derive from the lack of a mediating element. This mediating element is provided by the totality of sign systems, verbal and non-verbal, operative in all human communities. The pieces in the game are not two, but three: to the modes of production and to the ideological elaboration of the superstructure must be added *sign systems*. From a semiotic perspective, the structures of non-verbal communication, i.e. the circulation of

commodities, and the structures of verbal communication, i.e. the circulation of messages, appear as different structures of the same social process, i.e. the communication process.

This means that all cultural phenomena may be viewed as a communicative phenomena based on sign structures and systems, and that human non-verbal communication must be placed alongside verbal communication. Therefore, a general theory of society coincides with general semiotics. This becomes clearer when we consider that in the case both of verbal and non-verbal messages semiotics addresses the same problems – the work that produces them and that makes exchange and communication possible. For example, Claude Lévi-Strauss (cf. 1958) used the categories of linguistics in his studies on the rules of matrimony and kinship systems, offering a truly formidable example of the application of conceptual frameworks elaborated in relation to verbal communication to non-verbal communication. Lévi-Strauss's reasoning is questionable when he justifies his application of categories proper to language to his studies on non-verbal communication in terms of "recurrent hymns to the *esprit humain*". This implies reference to a universal unconscious activity and universal structures of the *esprit humain*. Schaff criticized the ontological character of structures: instead, structuralism is an interpretive approach, inseparable from human understanding (see Petrilli 2005). Any scientific approach considers the world, reality, as being in constant movement and transformation and in view of this formulates its hypotheses and laws. The formulation of laws is possible because movements and transformations present constants, states of balance, systematic and essential aspects, which belong to "reality", to the "world". This balance or stability in phenomena and in relations among the elements of reality (in organic or inorganic nature and in culture) together with relatively autonomous and isolated systems of elements have an objective existence and consequently constitute the potential objects of our knowledge.

Therefore, we must discover and determine not only the laws of the dynamics of movement and development in reality, but also the structural laws of relatively isolated systems in relative balance. We must study the structures of dynamics and the dynamics of structures. Not only is the study of both types of law founded, but such a complementary study contributes to a global image of reality. If we wish to study the (genetic, causal) laws of something's development, we must establish what this "something" is; and,

therefore, it becomes necessary to know the laws of its structure (coexistent, morphologic structure). This gradual knowledge of structure is just as essential as knowledge of the genesis and development of the objects under study. This is why knowledge of coexistential, morphologic laws is among the most ancient in human history: it dates back to when human beings learnt to differentiate between a plant and another, an animal and another, that is, when they learnt to articulate reality on the basis of the capacity to recognize signs, to identify coexistent features which differentiate things. In this sense, as a semiotic animal the human being is also, as maintains Schaff (conversation with A. Ponzio, 1976; in Ponzio 2002), a *structuralist animal*. Structuralism not only indicates a trend among semioticians, but also among humans as humans. Schaff stresses the complementary relation between structure and history, synchronic approach and diachronic approach:

Il suffit d'écouter le simple bon sens pour comprendre que les méthodes synchronique et diachronique son complémentaires. Seule la connaissance de la structure de l'objet, grâce à la découverte des lois coexistentielles (structurelles) permet de pratiquer avec succès les études génétiques et vice versa – la connaissance de la genèse et de l'histoire d'un système permet de progresser dans l'étude de la structure. (*Structuralisme et marxisme* 1974: 30) [It suffices to listen to plain good sense in order to understand that synchronic and diachronic methods are complementary. Only familiarity with the structure of the object, thanks to the discovery of coexistent (structural) laws, allows for success in genetic studies, and vice versa – familiarity with the genesis and the history of a system allows for progress in the study of structure].

Man is a *structuralist animal*. Schaff critiques ontological structuralism, and the opposition between structure and history, synchrony and diachrony.

7. Language, ideology and stereotypes (by Augusto Ponzio)

Linguistic analysis and the sociology of knowledge together with Marxism, contribute to demonstrating the social character of thought and consequently its social and ideological nature. Concept and meaning are two faces of the same phenomenon: this phenomenon is thought-language.

Meaning does not subsist outside natural language or independently of linguistic signs. However, the verbal sign is not only closely connected to concept, but also to what Schaff calls the stereotype. It is related to beliefs, established opinion, emotional tendencies, group and class interests, and so forth. The stereotype is a specific reflection of reality related to specific linguistic signs; but since it involves emotional, volitional, and evaluational elements, not only does it play a particular role in relation to cognitive processes, but also in relation to praxis. The stereotype is not simply a category of logical thought, it is also a pragmatic category. From language we receive concepts as the product of a certain society in the course of history, in the same way we receive stereotypes which carry with them specific tendencies, behaviour patterns and reactions. This means that speech is always more or less ideological since it is connected to social praxis.

Schaff maintains that reflection upon the stereotype is characterized by a high degree of “intrusion of the subjective factor” in the form of emotional, volitional and evaluational elements. This “subjective factor”, however, is social and not individual in nature, it is linked to interests of social groups (social classes, ethnic groups which speak the same language and so forth). Seen in these terms the “subjective factor” is present in any form of reflection upon reality as well as in scientific knowledge. Schaff says:

Science and ideology are closely connected to each other, in spite of those pedants who would like to separate them. In any case, since social praxis, which produces and promotes the development of language, is the common basis for both the relatively objective knowledge of the world, and for attitudes of evaluation, a genetic link exists. (*Essays in the Philosophy of Language*, 1967; It. trans., 1969: 127)

Schaff singles out the following relation between stereotype and ideology: “it is not possible to directly identify the stereotype with ideology but the latter could not subsist without the stereotype”. We may also deal with problems concerning ideology and the “subjective factor” of human knowledge – where the subject, as we have seen, is viewed as a social rather than individual product from the viewpoint of the sociology of knowledge. This discipline, in fact, acknowledges the subject as a socially produced and conditioned individual. As Schaff frequently stresses, the sociology of knowledge derives from Marxism and particularly from the structure and superstructure theory, it is also directly related to epistemology and to the

theory of knowledge. Schaff divides the definition of the concept of ideology into three groups so as to avoid any ambiguity and misunderstandings: a) the genetic definition which examines the conditions of development of ideology; b) the structural definition, which attempts to define the specific character of ideology, and therefore to establish the differences, from the logical point of view, between the structure of ideological discourse and the structure of scientific discourse; c) the functional definition, which underlines the functions fulfilled by ideology in relation to social, group, and class interests, etc.

Furthermore, Schaff believes in the necessity of distinguishing between the problem of the definition of ideology, on the one hand, and the problem of the value of ideology in relation to objective truth, on the other. Though related, these problems are different and should not be confused: the definition of ideology is one thing, while its value in relation to the question of objective knowledge is another. Therefore, though apparently a definition, the statement “ideology is false consciousness”, is not, in fact, a definition, but is rather an answer to the question of the value of ideology. The main error made by Mannheim in his theory of ideology and in his criticism of Marxism, lies in his having mistaken the statement “ideology is false consciousness” for a definition of ideology.

We also need to distinguish between the meaning Marx and Engels gave to the word “ideology”, and the meaning it was given in the Marxist tradition (especially from Lenin onwards). Such expressions as “bourgeois ideology” and “ideological science” are very much in use. They characterize ideology on the basis of its function. In Schaff’s opinion, therefore, we may give the following functional definition of ideology: by ideology we mean a system of opinions related to the aims of social development which are founded upon a system of values; these opinions are at the basis of specific attitudes and behavioural patterns in the different objective situations. Marx and Engels employed the word “ideology” in a narrow sense, that is, in reference to the “ideology” of the bourgeois class. Leading class ideology aims at the preservation of a society divided into classes. Consequently it aims at concealing those contradictions which reveal the necessity of transformation in the current structures of productive relations. Bourgeois ideology was thus characterized by Marx and Engels as false consciousness with respect to objective consciousness. Marx and Engels considered ideology as false consciousness because they use the word in a narrow sense,

that is, in reference to the ideology of the bourgeoisie, and not in the broad sense where the reference is to the “ideology of the proletariat,” to “scientific ideology,” and so forth. When Mannheim stated that if ideology is generally false consciousness, then Marxist ideology is also false, he made a mistake for he identified ideology in the narrow sense with ideology in the broad sense (cf. Schaff 1970, *Historia i prawda* [*History and Truth*]).

We may summarize what we have said with the following points: 1) the statement “ideology is false consciousness” is not a definition; 2) when we speak of ideology as false consciousness we are referring to bourgeois ideology which aims at the reproduction of class society and of social inequalities; 3) use of such expressions as “ideology of the proletariat” and “bourgeois ideology” is now frequent. In Schaff’s opinion, by considering these points we become aware of the necessity of defining the word ideology in such a way as to explain its different meanings, on the one hand, and so that it suits the Marxian perspective, on the other. In this sense, ideology may be defined as either all those opinions formed under the influence of the interests of a specific class (genetic definition), or, as those opinions useful to the defence of the interests of a specific class (functional definition). It is by considering ideology in relation to its genesis and to its function that we are able to more properly face the problem of the value of ideology as related to the objective and scientific knowledge of reality.

It must immediately be said that according to Schaff this problem cannot be dealt with on the basis of a linguistic-structural definition. Ideological discourse does not have a specific structure which distinguishes it from scientific discourse. It is an error to maintain that the difference between science and ideology lies in the structure of their propositions. According to such an opinion, ideological discourse would mainly consist in evaluative and normative propositions, whereas scientific discourse would consist of descriptive propositions. Schaff severely criticizes the neopositivistic dichotomy between judgements of facts and judgements of value. This dichotomy appears in Marxism in the forms of the division between science and ideology. The difference between science and ideology does not consist in the fact that the “subjective factor” (which, as we have seen, is social and not individual) is present in science and absent in ideology. It consists, rather, in the diversity of the role of the “subjective factor” which is present in both science and ideology. Scientific analysis and the sociology of knowledge have made an important contribution to

destruction of the myth of the *pure objectivity* of scientific propositions. Given that both science and ideology are conditioned by society, both are in a certain sense subjective (at least because language without which human thought is impossible, introduces subjective elements in every form of human knowledge). Therefore, in Schaff's words: "By contrast to the thesis which sets science against ideology, another thesis is represented here. It maintains that not only are the propositions of science and ideology linked to each other, but in some cases they are identical." All this to the point of being able to speak of "ideological science" and of "scientific ideologies".

Schaff stresses that to recognize that any discourse is more or less ideological because of social and historical conditioning, does not imply that all ideologies are distorted and to be placed, therefore, at the same level. We need to distinguish between true ideologies and ideologies as distortions of reality; between scientific ideologies and forms of false consciousness. This distinction is determined by the different genesis and the different function of ideologies.

Translated from the Italian by Susan Petrilli

Note

1. Adam Schaff, a renowned Polish and Jewish philosopher, was born on 10 March 1913 in Lwów (part of Austria until 1918, after then it went to Poland) to a lawyer's family. He died just recently on 12 October 2006 in Warsaw. Of his numerous books (a partial list has been included in the References), several treat problems of semantics, philosophy of language, logic, theory of knowledge, ideology, and the social sciences. Schaff should be remembered for his important contribution to the problem of understanding and to the critique of misunderstanding in the domains of philosophy of language, semiotics, the social sciences, politics, interpretation of Marxism and actualization of socialism. He completed his secondary and university studies (in Law and Economics, two diplomas) in Lwów, and then continued at the Ecole des Sciences Politiques et Economiques in Paris. His interest in methodological issues led him to study philosophy (in Poland and in the Soviet Union). In 1941 he took his degree as candidate of philosophy (equivalent to a doctors degree in Western Europe) and his doctors degree (equivalent to a habilitation in Central Europe) from the Institute of Philosophy at the Soviet Academy of Sciences in Moscow.

In fact, during the German occupation of Poland Schaff had emigrated to the Soviet Union. After liberation he returned to Poland where he taught at various Universities from 1945 onwards (he acted as Assistant Professor of Philosophy in Łódź until 1948 and subsequently as Full Professor at the University of Warsaw). He was elected Member of the Polish Academy of Sciences in 1952 and became Director of the Institute of Philosophy and Sociology at the same Academy. In 1969 he shifted to Vienna where he became President of the Board of Directors of the European Center of Comparative Research in Social Sciences (UNESCO), which he headed for 20 years, acting at the same time as Honorary Professor of Philosophy at the University of Vienna. His social activities during those years were concentrated on his participation in the work of The International Institute of Philosophy, The International Federation of Philosophical Associations (in both as a member of their Executive Committees) and The Club of Rome (he was member of the Executive Committee until 1990). From 1931 until its dissolution in 1989 he was member of the Polish Communist Party (then transformed into the United Workers Party); from 1955 until 1968 he was a member of its Central Committee. During his lifetime Schaff published about 20 books and pamphlets, as well as about 300 articles in philosophy and sociology. Many of these books were translated into several foreign languages. Adam Schaff received an honorary degree from the University of Michigan (Ann Arbor, USA, 1967); the Sorbonne (Paris, 1975) and the University of Nancy (France, 1982). He became Member of the Polish Academy of Sciences, of the Bulgarian Academy of Sciences (1952) and of the Royal Spanish Academy of Political and Moral Sciences (Madrid, 1987). As a philosopher Adam Schaff specialized in epistemology, logic and philosophy of language.

The semiotic animal

1. Understanding global communication in today's world: Global semiotics and semioethics (by Augusto Ponzio)

With Thomas A. Sebeok and from the perspective of global semiotics and research in the domain of biosemiotics, we may posit that life and semiosis converge, that semiosis coincides with life – indeed may even extend beyond life, a hypothesis for the future to explore. Global semiotics has taught us that semiosis is a phenomenon that extends across the entire planet and that human semiosis is part of this global context (see Sebeok 2001; Danesi et al. 2004).

For an adequate understanding of human semiosis, the globality of context must be taken into account with an attitude that is critical, creative and propositive. Attention must be focused on the life of reflection as much as on the life of action and values, with a view to the human propensity for responsibility, social planning and programs. From the perspective of human semiosis signs, actions and values are inextricably interconnected. Only in this global context can human semiosis be understood in a critical key, similarly to the special semioses produced in the sphere of anthroposemiosis, or more specifically anthroposociosemiosis.

Global semiotics provides us with the conceptual instruments that are necessary for a better understanding of global communication today.

The human being is part of the great biosemiosphere and as such is a semiotic animal like all other animals. However, the human being is also part of the anthropo-socio-semiosphere. Therefore in addition to being a semiotic animal the human being is also a semiotic animal. Differently from all other life forms, the human being is capable not only of semiosis but also of metasemiosis, of suspending the immediate flow of semiosis and deliberating. Thanks to a primary modeling device endowed with syn-

tactics, also called language, the semiotic animal is endowed with a capacity for criticism and creativity.

Consequently, the human being, a semiotic animal as such is capable of taking responsibility. Responsibility is understood here as responsibility for the other as opposed to responsibility connected with the egotistical interests of identities in the present context of socio-economical globalization.

Globalization understood in socio-economic terms is limited and short-sighted given that it is functional to sectorial and egotistical interests, paradoxical as this may seem. Instead, the semiotic perspective evidences the condition of reciprocal involvement and interrelatedness of all life forms over the planet. And the condition of interrelatedness implies that indifference towards the other, the tendency to oppress the other in the long run can only backfire on the oppressor.

Human beings are endowed with a capacity for responsibility understood as responsivity and answerability towards the other – the other that in social, biological, ontological, and phenomenological terms may be more or less close, more or less distant. The semiotic animal is capable of a global perspective on semiosis and as such is responsible for the health of semiosis in its plurality and diversity over the entire globe.

As stated, global semiotics provides the conceptual instruments necessary for a *better understanding* of the global phenomenon that is communication today. However, with the expression “better understanding” we wish to indicate not only understanding in theoretical terms but also involvement of moral conscience.

We propose the term *semioethics* (Petrilli and Ponzio 2003; Caputo et al. 2006) to name an approach or attitude we consider necessary today more than ever before in the context of globalization, for a better understanding of semiosis today – its implications, perspectives, the risks involved and responsibilities. By *semioethics* we understand the propensity in semiotics to recover its ancient vocation as “semeiotics” (or symptomatology), with its focus on symptoms. A major issue for semioethics is “care for life” in a global perspective according to which semiosis and life coincide.

The semiotician today must be ready to interpret the symptoms of semiosis and its malfunctioning as produced by globalization in today’s global communication-production society (see Ponzio 1999, 2003). The world of global communication is the world of communication for pro-

duction, profit, and reproduction of the same socio-economic system with all necessary means available, including war. The destructive character of global communication (“the destructive character” is an expression used by Walter Benjamin [1931] to describe the capitalist socio-economic system at the dawn of Nazism) is evident in the destruction of the environment, in the increase of poverty, in structural unemployment, in exploitation of the South of the world by the North, and in the unjust distribution of wealth between a quarter of the world population (in the developed world) and all the rest of the world population (in the underdeveloped world). The most powerful expression of the destructive character of capitalistic competition in its global communication-production phase is war. The world of global communication is the world of *infinite war*, of war to war. Life on the planet is in serious danger.

As global semiotics, general semiotics today must carry out a detotalizing function. In other words, general semiotics must conduct a critique of all (claims to the status of) totalities, including global communication. If general semiotics is not critical and does not adopt a detotalizing method it will be no more than a syncretic result of the special semiotics, a transversal language of the encyclopaedia of the unified sciences, prevarication of philosophy suffering from the will to omniscience with respect to the plurality of different disciplines and specialized fields of knowledge.

What we propose to call *semioethics* must take the current phase in historico-social development as its starting point and proceed to analyze today’s society rigorously and critically, therefore communication-production social structures, the communication-production relationships forming today’s world. And given that the social forms of production in the current communication-production system have been mostly homogenized, semioethics is at an advantage. We could go so far as to make the claim that the whole planet is regulated by a single type of market, by a single form of production, by a single form of consumption, so that not only behavior, habits, fashions (including “dress fashion”), but the imaginary, our capacity for the play of musement have all been severely homogenized. In today’s dominant communication-production system difference understood in terms of otherness is substituted ever more by difference understood in terms of alternatives.

In the present situation of monologism, of closure of the universe of discourse, the critical task of semioethics is rendered extremely difficult, even

impossible. The conceptual instruments necessary for the work of critique are not readily available. Semioethics needs categories that are not those of dominant ideology that contribute to misunderstanding our reality. The working hypotheses of semioethics do not derive from common sense or common knowledge and consequently cannot be taken for granted.

An understanding of world-wide global communication-production requires a perspective that is just as global, which the special sciences taken separately cannot provide. On the contrary, a global perspective is offered by global semiotics, the general science of signs or *semiotics* as it is taking shape today on the international scene thanks particularly to the work of Sebeok.

Global semiotics begins with the hypothesis that semiosis and life converge and focuses on the interconnection among signs. Its gaze moves from the protosemiosis of energy-information to the overall processes of the complexification of semiosis in the evolution of life over the planet. Interconnection and interdependence among signs consists in a *network* which, following Sebeok, extends from the Lilliputian world of molecular genetics and virology, to the man-size world of Gulliver and finally to the world of Brobdingnag, the gigantic biogeochemical ecosystem called Gaia.

A full understanding of global communication today implies a full understanding of the risks involved by global communication, including the risk that *communication itself may come to an end*. With this statement we are not just alluding to the risk of the subjective-individualistic phenomenon known as “incommunicability”, amply theorized and represented in film and literature, but far more radically to the risk that life itself may come to an end if we agree that life and semiosis, therefore life and communication converge. In light of the enormous potential for destruction in today’s society by contrast with all other earlier phases in the development of the social system, the risk that life may come to an end on the planet earth should not be undervalued.

When analyzing communication today our approach must be as global as the problem under analysis. A global approach must not limit its attention to partial and sectorial aspects of the communication-production system as dictated by internal perspectives functional to the system itself; it must not be limited to psychological subjects, that is, to subjects reduced to the parameters imposed by the social sciences, subjects measurable in terms of statistics. Global communication-production calls for a meth-

odological and theoretical perspective that is as global as the phenomenon under observation. Such a perspective will favour a better understanding of the logic of global communication-production and, therefore, our capacity for a *critique* of the system of social reproduction constructed upon such logic.

2. Globalisation in socio-economic and in biosemiotic terms (by Susan Petrilli)

Global communication in today's social reproduction system, in other words, global communication understood in the socio-economical sense connected with progress in technology and with the market, is only one aspect of communication in the great communication network involving life over the entire planet. All life forms may be analyzed in terms of dynamic sign systems. From a global semiotic perspective human life forms may be considered in the fundamental terms of biosemiosis. This approach, as stated, evidences the relation of interdependency among all life forms, therefore of human life with all other life forms on Earth. And while evidencing the condition of global interrelatedness, this approach also evidences the specificity of human life in terms of socio-cultural semiosis.

Globalization was already a fact of life well before the advent of global communication as understood in today's capitalist, or post-capitalist society, that is, well before the spread of the communication network at a world-wide level thanks to progress in technology and to the global market which supports this network in socio-economic terms. In other words, globalization may be understood reductively as a corporate-led phenomenon characteristic of modern capitalist society, which now invests the entire reproductive system globally in its various phases – production, circulation and consumption –, and has wide-ranging (and most often devastating) effects over the entire planet. But globalization may also be understood in biosemiotic terms, as globalism, that is, as a tendency that characterizes the evolution of life from its origins (Petrilli and Ponzio 2001).

In fact, globalization in this second acceptance is the structural condition provided by the processes of evolutionary development for the proliferation of life itself over the planet, in its multifarious and interconnected manifestations, which are sign manifestations. As a specific form of life, the human, we are born into a sign network that is preexistent with respect

to specific ontogenetic, even phylogenetic phenomena, presumably as a potential contribution to the further development of this network in evolutionary terms. The sphere of anthroposemiosis appears relatively late on the evolutionary scale and develops interrelatedly with the other spheres of semiosis, which coincide with the superkingdoms – microsemiosis, phytosemiosis, mycosemiosis, zoosemiosis of which anthroposemiosis is a specification. Together these different spheres of semiosis form the global biosemiosphere. Of course, in the light of global semiotics other spheres of semiosis have also emerged ranging, for example, from endosemiosis to cybersemiosis. These are studied by as many branches of semiotics. And new spheres of semiosis continue to emerge with ongoing progress in the development of life and technology (see Posner et al. 1997–2004).

Global communication, understood as globalism, indeed detotalized globalism, is a fact of life. And the interrelation between global communication and life must not be forgotten if life – including human life – is to continue flourishing globally as inscribed in the nature of sign activity. On the contrary, globalization, as understood in terms of today's global socio-economic system, that is, as corporate-led globalization, is neither inevitable nor desirable, and even threatens to destroy life on earth as we know it.

Global communication in today's social reproduction system is only one aspect of the great web of communication formed by life over the entire planet Earth. All life forms may be analyzed in terms of dynamic sign systems. From our own perspective, human life forms are considered in the fundamental terms of biosemiosis, which evidences the relation of interdependency with all other life forms on Earth, therefore, the condition of global interrelatedness. Also, human life is put into focus in its specificity as human socio-cultural semiosis.

Our emphasis is on this double modality of existing in the world characteristic of semiosis among human beings. Firstly, human beings exist as biological organisms flourishing interconnectedly with other organisms populating the great *biosphere*. According to recent findings in biological research the biosphere coincides with the great *semiosphere*. Secondly, human beings exist as a specification of this vital sign network.

Furthermore, thanks to the human species-specific capacity for *meta-semiosis*, or *semiotics*, or so-called *language* and differently from other non human life forms, human beings are endowed with the capacity to survey

and tend to the overall good functioning of the general biosemiotic network. As such human beings may be defined as “semiotic animals” (Deely et al. 2005). As used in the present context, the terms “metasemiosis”, “semiotics”, and “language” refer to a modeling capacity specific to human beings, the only “semiotic animals” on the planet. Therefore these terms have more than one meaning: semiotics is not only the name of the science of signs. It is also the name of a specifically human capacity for semiosis, or “metasemiosis”. The term “language” does not only refer to verbal language or to other human sign systems with communicative and expressive functions, it also indicates the specifically human capacity for modelling, primary modelling. (For all these aspects see Sebeok 1986, 1991; Petrilli and Ponzio 2002a, 2002b).

The metasemiotic or semiotic capacity also implies a third modality of being-in-the-world reserved to human beings, what we propose to call the *semioethical* modality. This implies our capacity for creative awareness of the other, which presupposes the global condition of interrelated and intercorporeal dialogical otherness to which we are all subject as living organisms (Petrilli [forthcoming]).

This third modality of being-in-the-world, the semioethical, is the key to a full understanding of the extent of our responsibility as human beings for the health of semiosis over the entire planet. And our allusion is to semiosis in all its forms – whether a question of the semioses of other human beings or of other nonhuman life forms, which flourish interconnectedly with the nonliving forms of existence and together engender the great geobiosystem called Gaia (see Petrilli and Ponzio 2003, 2005, 2007).

All life forms as such are endowed with a capacity for *modeling, communication* and *dialogism* (see Petrilli 2003a: chap. 1; Deely et al. 2005). Modeling determines worldview. However, differently from other life forms, the human animal, that is, the “semiotic animal”, is endowed with a special modeling device which may also be called *language*, as anticipated, or *writing*, and is characterized by *syntactics* (see Sebeok and Danesi 2000). (The term “writing” should not be confused here with writing understood as the transcription or translation of oral verbal signs into written verbal signs. With respect to transcription or translation, writing or language as we are now using these terms is an a priori.)

Thanks to syntactics the human being is able to construct, deconstruct and reconstruct an infinite number of worlds and worldviews on the basis

of a finite number of elements. This capacity distinguishes human beings from other animals where the relation between modeling and what the biologists call *Umwelt* is univocal, unidirectional (Uexkull 1909, 1992; Hoffmeyer 1996). Non human animals are born into a world which they are not programmed to modify, if not according to an original *Bauplan* as established by the genetic patrimony of the species they belong to. On the contrary, thanks to syntactics human beings are endowed with a capacity for creativity and metasemiosis, consequently, the human being may be defined as a *metasemiotic* or *semiotic animal* (see Petrilli 1998: 8 and 181–182).

Metasemiosis entails a capacity for the suspension of action and deliberation, therefore, for critical thinking and conscious awareness. The immediate implication is that by contrast with other animals the human being is invested biosemiosically and phylogenetically with a unique capacity for responsibility, for making choices and taking standpoints, for creative intervention upon the course of semiosis throughout the whole biosphere. In this sense the semiotic animal is also a “semioethical animal”. Human beings are invested biologically with the capacity for the assumption of responsibility, therefore for caring for semiosis in its joyous and dialogical multiplicity (see Petrilli and Ponzio 2000, 2001, 2002a).

From a biosemiotic perspective modeling, communication and dialogism are interconnected and presuppose each other. From this point of view communication is not understood in the oversimplifying terms of message transmission from emitter to receiver (though this of course is one of its possible manifestations). Far more extensively communication coincides with semiosis and therefore with life: sign activity tells of the universal condition of interrelatedness and interdependency, in this sense sign activity is synonymous with communication and as such is dialogical. Here too dialogism does not refer reductively to the exchange of rejoinders among speakers but far more radically and vitally it refers to the permanent condition of intercorporeal involvement and reciprocal implication among bodies and signs throughout the semiotic universe. Modeling, communication and dialogue together form the foundation and condition of possibility for the engenderment of life in its multiplicity and its specificities, including human life. As stated, human life is endowed with the species-specific trait called syntactics, therefore with the species-specific capacity

for metasemiosis beyond the less complex level of semiosis in its direct and immediate forms.

Metasemiosis, or semiotics understood as metasemiosis and not simply as the name of the theory or science or doctrine or discipline that studies sign activity, has determined the course of homination through to the present phase of development in evolution. Semiotics thus described is the biosemiosical a priori of the anthropological and cultural necessity for responsible and polyphonic living.

Responsible and polyphonic living implies the capacity for *listening* and *hospitality* towards differences, towards the other in each and every one of us, as well as towards the other beyond self (see Sebeok et al. 2001; Petrilli 2005; Ponzio 2003, 2006). Otherness is not a condition we concede with an act of generosity towards the world. On the contrary, otherness is structural to life itself, a condition for life to flourish, intercorporeity. Dialogic otherness is connected with the nonfunctional.

A global and detotalizing approach to semiotics demands openness to the other, the extreme capacity for listening to the other. Therefore, it presupposes the capacity for dialogic interconnection with the other. Accordingly, semiotics as we conceive it must privilege the tendency towards detotalization rather than totalization. Otherness opens the totality to infinity or to “infinite semiosis”. Such an approach leads beyond the cognitive order or the symbolic order to enter the ethical order, creating the condition for infinite involvement with the other, therefore for the assumption of responsibility towards the other.

Semiotics thus conceived is not the result of some ideological plan (see Copley 2007). On the contrary, considered in such terms semiotics concerns behaviour and awareness of our capacity for responsibility as a semiotic animal. Properly understood, the semiotic animal is a responsible actor capable of signs of signs, of mediation, reflection, and conscious awareness in relation to semiosis over the entire planet. In this sense global semiotics must be adequately founded in cognitive semiotics, but it must also be open to a third dimension beyond the quantitative and the theoretical, that is the ethical. Since this third dimension concerns the ends towards which we strive, we propose to designate it with the neologism *semioethics*.

Semioethics is not fixed upon a given value or preestablished end, an ultimate end or *summum bonum*, but rather is concerned with semiosis in

its dialogical and detotalized globality. A special task for semioethics is to unmask the illusory character of the claim to the status of indifferent differences and to evidence the biosemiotic condition of intercorporeity and dialogic compromise among signs. The gaze of semioethics transcends the totality, a given being, a defined entity within a totality and accounts for infinite semiosis, desire of the other, unending movement towards the infinite.

Semiotics and dialogue between logic and ethics

AUGUSTO: Let's begin by asking Susan to read the abstract we originally proposed for this new "trialogue." It explains the sense and orientation of our research as we have been developing it together over the past twenty years...

SUSAN: Thanks Augusto, well here it is then: This three-voiced dialogue, this "trialogue", between Massimo Bonfantini, Susan Petrilli and Augusto Ponzio discusses the conditions of dialogical argumentation, continuing a tradition we began over ten years ago with our first "trialogue" on lying and truth (1996b).

Beyond the question of the relation between dialogue and inference, our dialogue-presentation focuses on the conditions that make dialogical argumentation possible. Our problem concerns foundations and therefore involves a discussion that connects the study of *logic*, *dialogue* and *semiotics* from a "semiodialogic" and "semioethic" perspective.

In this context the expression "semioethics" underlines the relation between semiotics and axiology, signs and values, dialogical argumentation and otherness. And fundamental points of reference for the development of our discourse include Charles S. Peirce, Mikhail M. Bakhtin, Victoria Welby, Emmanuel Lévinas, Charles Morris.

Our triialogue develops a dialogue on dialogue which actually began in 1986 with publication of the monograph *Dialogo sui dialoghi*, co-authored by Massimo Bonfantini and Augusto Ponzio (Bonfantini and Ponzio 1986) and which has now developed into a monograph published in 2006 under the title, *I dialoghi semiotici. Sul dialogo, sulla menzogna e la verità, sui nuovi mass-media, sulla retorica e l'argomentazione, sulla testualità e la discorsività, sull'ideologia e l'utopia*, with Susan Petrilli as co-author.

Keeping account of the “dialogical nature of sign” (Ponzio 2006a), and of the structure of action, therefore, verbal action, a typology of dialogue is proposed relatedly to a typology of signs and of action. In dialogical argumentation signs respond dialogically to other signs in inferential processes, which develop according to different degrees of otherness ranging from low to high degrees of otherness and dialogicality, and which imply taking a stand, making choices, referring to values, habits, norms, stereotypes, and ideologies.

AUGUSTO: Susan, what a great summary! I’d like to start from our typology of dialogue. This was our first important invention or abduction concerning dialogues. It goes back to 1982...

MASSIMO: When Susan was still a child! But just let me describe our dialogue triad from a recent version by Susan, rather than from our original *Dialogo sui dialoghi*. As a specific discourse genre dialogue is verbal action which similarly to any verbal action, is either an end in itself or instrumental to something else. If the latter, it is a means to an end, or – a third possibility – it can aim to determine and evaluate ends and means. Consequently, we may propose the following triadic typology of dialogue:

(1) *Dialogue as an end in itself*, that is, as *conversation or dialogue for entertainment*. This kind of dialogue involves speaking for the sake of speaking, that is, for the sheer pleasure of speaking. This is dialogue with a *phatic* function which can, in turn, be divided into:

- (1.1) *conformative-repetitive dialogue*; and
- (1.2) *di-verting dialogue*

(In Italian, the expression “di-vertente” evokes the idea of diversion, dialogue as *divertissement*, as pleasure and having fun).

An example of the variant (1.1) is offered by certain forms of television entertainment which tend to be repetitive and obey predetermined compositional-instructional rules. This type of entertainment works on the basis of predetermined decodification processes.

- (2) *Dialogue functional to attainment, to achieving something*.

This can be divided into:

- (2.1) *exchange dialogue*
- (2.2) *competition dialogue*
- (3) *cooperative or reflective or investigative dialogue*.

With reference to the degree of “substantial dialogism” as the criterion for differentiation, this type of dialogue may be classified (on an increasing scale in degree of dialogism) as:

- (3.1) *re-discovery and revelation dialogue*,
- (3.2) *research and construction dialogue*,
- (3.3) *exploration and problematization dialogue*.

SUSAN: With your dialogue of 1982 you propose a tripartition of dialogue on the basis of logical analysis, that is to say, applying the three categories proposed by Peirce. But I think that the axiological and ethical-political orientation of your discourse also emerges...

MASSIMO: And in fact it is made explicit immediately after, in the dialogue with Augusto dedicated to the novel, *1984*, by Orwell.

AUGUSTO: Yes..., the praise of eroticism in life and writing, against the negative utopia of neo-language – an absurd and impossible attempt at eliminating dissent, innovation, discussion, the capacity for making projects in discourse and communication of the *polis*.

MASSIMO: Just as language neither flourishes nor flows in the terms imagined by the theoreticians of what we have identified as “code semiotics”.

AUGUSTO: In a “commodified society” like our own, where attainment dialogue is dominant, where brutal competition and greedy exchange on the basis of self-interest are the rule, lying and deception have become so common that they don’t surprise us any more, they’re not a scandal any more!

SUSAN: This is the subject of your dialogue of 1993, *Il dialogo della menzogna (Dialogue on Lying)*. In that dialogue you maintained that lying belongs to the “second type of dialogue” (Bonfantini and Ponzio 1993).

AUGUSTO: If we distinguish lying from similar behaviours such as simulation, pretence, falseness, ideology, lying belongs to dialogue of the second type in our classification, attainment dialogue, that is, dialogue with a practical aim – to attain or achieve something. Instead, pretence (an ambiguous term because it can also signify deception and lying in the artistic sphere, for example, the literary) belongs to dialogue of the first type, that is, entertainment dialogue. And “simulation” belongs to dialogue of the third type, that is, research dialogue, when of course simulation is not used for deception and lying, but as modelling with a cognitive function. The aim of simulation understood as belonging to research dialogue, is

truth. As to the relation between lying and ideology understood as false consciousness, today at table we mentioned how lying is “extroverted” deception, while instead ideology is “introverted” (Bonfantini, Petrilli & Ponzio 1998, 1999, 2000, 2003; see also Ponzio 2006b).

MASSIMO: Lying, extroverted deception, introverted deception, the will to deceive and the will to delude oneself subtend publicity and propaganda, indeed all rhetorical discourse. Rhetoric is the enemy of logic and dialectic (see Bernard et al. 1994; Bonfantini 1984). It is the vile and opportunistic enemy of truth, as the three of us agreed in a “trialogue” of 1997.

SUSAN: “Rhetoric versus argumentation”. The three of us agree that rhetoric and argumentation can be juxtaposed. Negativity of rhetoric and positivity of argumentation. This seems to be a classical standpoint: very much *à la* Plato. But I do agree. Indeed, it’s sound common sense to accuse discourse of being *rhetorical* when it is not sincere, when it is confused on a logical level, when it is self-seeking, opportunistic, and when in the face of all this it still expects to persuade (Petrilli 2006). Rhetoric is something one hears in the texture of discourse, a trick or a trap one perceives before actually identifying it. But, Massimo, how do we trace the signs of rhetoric?

MASSIMO: Ah, yes, an example comes to mind: it goes back to a few years ago when Craxi was still around and publicity was favouring his political party during the administrative elections in Capitalia-Italia. At the time a poster was withdrawn because of furious protests by feminists and democrats. It pictured a bare chested girl who says in a balloon, “I vote PSI, and you?” while coolly sipping coca-coca from a bottle with a straw – a great example of the tricks of rhetoric, of ideological and deceptive discourse. In this case the trick consisted in combining the psychological impression of the example (the bare chested girl) with quick and allusive mental associations. This strategy provokes suggestive and efficient reasoning that resists *so long as it is not called to issue* (Bonfantini, Petrilli & Ponzio 2006a).

AUGUSTO: What do you mean by that? Don’t you think that the logic of rhetorical or deceptive discourse is different from the logic of efficient reasoning? Or are you implying that in the context of logic we can make improper, uncontrolled discursive transformations with the power to seduce thanks to the charm and desirability of the prospective conclusion?

MASSIMO: Hmm! The bare chested girl communicates by showing, therefore by offering herself, even if immaterially. She appeals to the imagination and arouses appetites, at once formulating a question that is obviously rhetorical: “I vote PSI, and you?” She communicates through an associative-argumentative chain that runs something like this: “I want you to vote PSI, like me, so we can be friends, or better still, *companions*; if you are my *companion* (that is, companion insofar as we belong to the same political party), you’re also my *partner*, and I’m attractive, desirable and uninhibited; therefore if you want me and want to stay with me, even if only in your day-dreams, symbolically (which these days everyone seems to think is more real than reality), etc., etc., then vote me, I mean, vote with me, vote PSI”. This kind of reasoning is fun and efficient until dialectics analyzes and ridicules it. But rhetoric maintains its charm, even after it has been unmasked.

AUGUSTO: Well good friend, my impression is that you’re making things sound simpler than they really are. What I mean is that rhetorical discourse understood as encomiastic and eulogistic discourse is not simply transgressive, fake and deceptive discourse similarly to commercial publicity. On the contrary, this kind of rhetoric is an essential part of the rhetoric of institutions, the rhetoric of keeping a good and clean conscience and of defending certain values. This kind of rhetorical discourse safeguards the conscience through alibis. A conscience with alibis justifies itself by appealing to axiomatic foundations, that is, by appealing to identity, to association with some sort of community, by appealing to roles, the nation, *esprit de corps*, by appealing to duties established by contract, civil convention. All this serves to tranquillize us, to keep us in our places, protected by our reassuring guarantees and responsibilities. Rhetoric is pleasant and reassuring because it defends the “fixing of beliefs and habits”, as your Peirce says in his famous essay.

MASSIMO: Ah, yes, you’re right Augusto. But we need to add that since Peirce’s time, other media have hit the scene. With hypnotic and authoritative rhetoric, as presented by TV (Bonfantini, Petrilli & Ponzio 1996a), we have the owner’s voice and the dream machine together, in one package. The continuous flux of mass media doesn’t leave space for reflection. You can’t talk to mass media, discuss things. Yet people are deceived into thinking they’re participating in the discussions and dialogues that are represented (Bonfantini et al. 1998; Bonfantini, Petrilli & Ponzio 1997).

SUSAN: ... as you already highlighted in your early analyses of 1984 in *Semiotica ai media* (Bonfantini 1984). But now let's return to your typology of dialogicality, which I think fits in well with our discussion.

If we focus on communicative channels with special reference to television media, we can immediately identify three different modalities in the dialogic relation:

(1) *Interpersonal dialogicality*, (1.1) in praesentia, or (1.2) in absentia, the latter in the form of written, telephonic communication.

(2) *Dialogicality with replica*, as in *television dialogicality between emitter and spectator*, therefore not one-to-one, but one-to-many, (2.1) foreseen as part of the communicative game, or tolerated, or conceded, or (2.2) indirect or unforeseen.

(3) *Metatextual dialogicality*, involving small groups in praesentia, with respect to the basis-text at disposal.

MASSIMO: Yes, the basis-text is there available to us, it doesn't disappear as do instead programs on television channels. The basis-text defines which is a characteristic of texts, and as such the basis-text is an object characterized by persistence and incisiveness bearing countless signs, printed and recorded, which can be read, heard and/or seen an indefinite number of times. The basis-text can be analysed socially and discussed by a group of people sitting in a room somewhere, it can be a parable from the *Gospel* or Marx's *Manifesto*, but also a documentary film by Spike Lee or Michael Moore, or anything that can act as a text or stimulus for discussion or political action, or something found somewhere on internet.

SUSAN: Massimo, you mention the potential relevance of communication and discussion of new docufilms or "committed" documentaries, or as you also like to call them, "videoessays", to action. This opens our conversation to the problem of dialogue between text and discourse, textuality and discursivity (see Bonfantini, Petrilli & Ponzio 2001), which is the subject of one of our most recent *dialoghi semiotici*. But while you were speaking of films by Spike Lee and Michael Moore, Ermanno Olmi's latest film came to mind *Cento chiodi*. Here the thesis is that more important than all the sacred texts in the world, of all possible basis-texts for action, as you would say, are words, gestures, the caresses of love and friendship in a dialogue where contact and proximity are constitutive of sense. Therefore, in the spirit of the title of today's dialogue we praise corporeality and sentiment by contrast with logic, and ethics by contrast with politics.

These days communication with the other, especially on a sentimental level, is largely thought to be based on having something in common, on sharing common tastes, interests, on affinities, to the very point of believing that encounter with the other is reached in fusion. And communities too are conceived in terms of communion, unity, identity. But the truth is that without alterity, without estrangement, without absence in presence, communication cannot take place because dialogue is lacking.

Communication is also clash, conflict, opposition, while dialogue is involvement with the other, not on the basis of respect that one has decided to observe towards the other, but in many cases in spite of all the efforts made to ignore the other, eliminate the other. People generally believe that they must encounter each other on the basis of a third term, a term that is external to them and that unites them, makes them similar, a term in which they find a common identity. This search for a third – ethnic group, religion, language, territory – is widespread these days and particularly ill-fated, evil, as testified by presentday events in history. In amorous relations, Catullo's "I hate and love him/her" has been replaced by the idea of love as total and totalizing understanding, without clash, without suspicion, without search, without distance, without absence, without alterity. In his paper "The Other in Proust" (in Lévinas 1976) referring to the characters from *A la recherche du temps perdu*, Lévinas observes that Marcel did not love Albertine if love is fusion with the other, the ecstasy of a being in front of the perfection of the other, absence of conflict, security in the presence of the other, peace of possession. But the point is that this non-love is true love; solitude is communication; struggle with the elusive is movement towards the other; absence of the other is its presence as other.

MASSIMO: Brava Susan, good girl Susan, well said! Joking aside, it is important to remember that contradiction is necessarily an a priori for us, contradiction of desire and nondesire: between the the instinct of life and the instinct of death, between eros and aggressiveness, between the pleasure principle and the principle of reality.

We sometimes think computers can simulate human thought processes, or even go further. For example, by correcting iniquities or conciliating human conflicts and contradictions in the light of some superior design, as in the suggestive science fiction novel by our friend Giampaolo Proni (1989): *Il caso del computer Asia*.

But thinking is contradictory in itself. And not even love is synthesis or elimination of contradictions, rather love too accepts and even welcomes contradictions. Computers don't feel, don't think, don't hate or love. They don't reason dialogically. They don't think. They calculate. This is the point. We all know this.

In reality, whoever claims that computers simulate human beings is really thinking that human beings simulate computers, by becoming cold, still, static, free of problems, monodirectional.

To think means to be capable of lying and deceit, of dialectics and of diairetics. One divides into two and two conjugate and/or oppose each other and/or devour each other. They don't melt or fuse into each other. Through exercises of displacement, struggle and problematic conjugation of contradictory perspectives, we work towards moments of increasing harmony.

But, Augusto, let me ask you a question. How can dialectics in the plural escape what would seem to be the recurrent destiny of hierarchies and totalitarianisms?

AUGUSTO: This problem brings us back to the question of the centrality of dialogue in argumentative reasoning, that is, reasoning that has not stiffened into defending and reproducing identity, that does not serve identity but is open to the other.

Bakhtin evidenced how rectilinear and unilateral dialectics produces ossified discourse and derives from sclerotized dialogue. Monological, unilinear and totalizing dialectics is necessarily orientated towards a synthesis and a conclusion. As such it calls for a *critique of dialogical reason*. From this point of view Bakhtin is an important point of reference. All his research (including his most recent paper of 1974 on the methodology of the human sciences) focuses on the same problem faced by Sartre in *Critique de la raison dialectique* (1960) – whether knowledge and understanding of humans by humans not only implies specific methods but *New reason*. However, new reason does not imply a new relation between *thought* and its *object*, as Sartre believed. And, in fact, Sartre's dialectics remains closed in the limits of monological dialectics, for he reduces the relation of otherness to a relation of identity and of reciprocal objectification: dialectics between being-*for-self* and being-*for-others* continues to be the dialectics of totalizing consciousnesses, where the tendency is to reaffirm one's own objectifying view of the subject, of self.

The critique of dialogical reason is the critique of the category of Identity which dominates Western thought and praxis. From the perspective of identity, where sense converges with partial and limited interests, mystification alone is possible: this is true whether a question of the identity of a single individual, or of a group, nation, language, cultural system or even a larger community such as the European Union, the United Nations or the entire Western world.

The category of Identity dominates today not only because of the *concrete abstractions* constructed upon it, but even more radically because the global system of social reproduction today is grounded in the logic of identity.

Concrete abstractions form *reality* as we experience it: Individual, Society, State, Nation, Truth, Knowledge, Equality, Justice, Freedom, limited Responsibility, Need, Equal exchange, etc. These are *internal* to the general system of social reproduction. But, as just stated, the system itself in its globality is grounded in the category of Identity. Identity tends to assert itself structurally and constitutively as Universal in relation to a production, exchange and consumption circuit that is now worldwide. And the logic of concrete abstractions in social reproduction today is the logic of Identity: the categories of Individual with its rights, obligations, responsibilities; of Society with its self-interests; of State with its Politics converging as far as possible with Reality; of Equal exchange with its needs, all obey the logic of Identity.

The places of argumentation internal to the order of discourse are the places of the logic of identity. Reason includes the reason of war, even if in the form of *extrema ratio*, presenting war as legitimate, just, legal; Reason that includes the reason of exclusion – from marginalization and segregation to extermination – of the other, is the Reason of Identity. The logic of identity is asserted by barricading, isolating, expelling or exterminating the other, through recourse to the concrete abstractions which are founded on such logic. And as anticipated, concrete abstractions include the single Individual who must firstly sacrifice its own otherness to itself in order to assert itself as identity.

The critique of Reason and argumentation thus described requires *a point of view that is other*. This requires preliminary *recognition of the other*, or, rather, recognition of the fact that recognition of the other cannot be avoided. Therefore, recognition of the other is not a concession, a free

choice made by the Individual, the Subject, the Same, but a necessity. In other words, the subject is forced to recognize the other, as an imposition. Such recognition is imposed by a situation of alienation, loss of sense, in the last analysis by the situation of *homo homini lupus*. However, the situation of *homo homini lupus* does not precede concrete abstractions such as State, Politics, Law, which is a real myth, a mystification – Hobbes' fallacy! This situation which involves a situation of fear of the other, is a consequence of the logic of identity and the concrete abstractions constructed upon it.

SUSAN: It seems to me that we must aim at overcoming specialized separations that give rise to deception in the form of omitting to say something, which is an indirect form of lying and concealing. No doubt all discourse has a provisional conclusion, a conclusion that can never be definitive or exhaustive.

MASSIMO: I remember being struck several years ago by Aldo Capitini's critique of the specialism and antidemocratic formalism of institutions, his critique of corporations and their closed reasoning, and of those who capitalize on knowledge and power.

He was referring to those socially oriented centres which teach the art of discussion and administration, of eliminating and putting all presuppositions out of play. And everyone participating in the discussion does so without prohibitions and self-limitations, therefore without keeping silent and lying.

However, in situations like these decisions are put into parentheses. Instead, to make or at least propose a decision implies being able to count on a reliable procedure, ensuring a conclusion, a provisional and not a totalizing conclusion, but peremptory.

SUSAN: So what do we do, Massimo? Deal with everything? If specialisms, separations, self-limitations are forms of lying and deceit, on the one hand, isn't the claim to dealing with everything a form of (vain) pretence, typical of totalizing and systematizing knowledge, on the other?

MASSIMO: Argumentation and/or dialogic procedure should evidence what is relevant in communication, even resort to exaggeration, and aim at effective local action: this is communication understood as a way of acting on the spot.

The criterion that must dominate is expressed in the word *now*. I know there's a lot to be done, so much evil in the world, decisions to make, dis-

cussing them first. The task is overwhelming, but I also know that I must struggle now and do my best to address those evils I think most need to be addressed.

No doubt the Kantian maxim concerning the universal validity of the principle regulating action is still valid. But it needs to be turned upside down and set into pragmatic terms. Nor can we begin with fixed principles. The starting point is the moment we make a choice, exemplary possible action. We must ask ourselves: what are the consequences if nobody intervenes in a given situation? if everybody follows my inertia? or instead, if the style of my decision and my action is repeated?

Therefore, to proclaim and apply the motto “the end justifies the means” is hypocritical (an idea wrongly attributed to Machiavelli), a deferral destructive of both the present and the future.

In reality, “the means justifies the end”. To focus on the fleeting moment reinforces the habit of industriousness and legitimizes the utopia of the future polis without ossifying it or transforming it into a consolatory and ideological end of (hi)story.

Susan Petrilli

Symbol, logic, and signification

A semiotic perspective on Welby, Boole, Langer

This paper briefly presents three women who have contributed to the development of semiotics from their own original perspective: Victoria Welby, Mary Everest Boole and Susanne K. Langer. The first two were friends and developed an interesting written correspondence. Their roads never crossed with Langer, who came later. Sebeok (2001: 145) described Langer as one of the “illustrious twentieth-century trailblazers” in semiotics. Welby he described as “the legendary foremother and prime mover of ‘significs’ and ‘sensifics,’ species of turn-of-the-century (and subsequent) semiotics” (*Ibid.*). On Boole Sebeok is silent, but she too deserves attention among women in semiotics concerned with problems of language and meaning, sign and subjectivity.

1. Victoria Welby: significs, mother sense, and logic

Victoria Lady Welby (1837–1912) was an independent scholar, the originator of significs, now considered the founding mother also of “modern semiotics” (cf. Petrilli 2005b). Born into the highest circles of English nobility, she was not educated in any conventional sense. In her early years she traveled widely with her mother (cf. Hardwick 1977: 13–14), and published her travel diary in 1852. After her marriage to Sir William Earle Welby in 1863, she began her research fully aware of her exceptional status as an open-minded female intellectual of the Victorian era. Between 1894 and 1896 Victoria Welby introduced the neologism “significs” for her theory of meaning, which examines the relation among signs, sense and values, as well as its practical consequences for human behaviour.

Her main publications on such issues include her monographs *What is Meaning* (1983 [1903]) and *Significs and Language* (1985a [1911]), which, in the second edition, is included in a volume collecting a selection of her writings amongst which her essays “Meaning and Metaphor” (1893) and “Sense, Meaning and Interpretation” (1896). Important moments of official recognition for Welby’s research are represented by publication of the entry “Significs”, co-authored with J. Baldwin and F. Stout (1902), in Baldwin’s *Dictionary of Philosophy and Psychology* (1901–1905); and the entry “Significs” in the *Encyclopaedia Britannica*, in 1911 (now in Hardwick 1977: 167–175). Initially, her interest was directed towards theological questions, which led to her awareness of problems of language, meaning and interpretation. In 1881 she published *Links and Clues*, considered unorthodox by official opinion in religious circles. In it, she reflects on the inadequacies of religious discourse which, she believed, was cast in outmoded linguistic forms. In her examination of language and meaning she found a pervasive linguistic confusion that largely stemmed from a misconception of language as a system of fixed meanings, which she overcame by showing that language must grow and change as does human experience generally. She proposed a critique of figurative language (cf. Welby 1891, 1893, 1897, 1898), and studied the sciences with special reference to biology and evolutionary theory (which she read critically). Her conviction was that important scientific discoveries supplied the new experiences in the light of which all discourse, including the religious, could be updated and transformed into something more significant. To promote her line of research, the Welby Prize was announced for the best essay on significs in the journal *Mind* (1896b), and awarded to Ferdinand Tönnies in 1898 (see 1899–1900).

Welby wrote regularly to over 450 correspondents, developing a vast epistolary network through which she developed her ideas and exerted her background influence – as in the case of Charles K. Ogden – over numerous intellectuals of her times. Charles S. Peirce reviewed *What is Meaning?* for *The Nation* in 1903, alongside Russell’s *Principles of Mathematics* (cf. Hardwick 1977). The correspondence thus begun lasted until 1911, influencing the focus of Peirce’s research during the last decade of his life. Indeed, some of Peirce’s best semiotic expositions are in letters to Welby (cf. Fisch 1986; Hardwick 1977). Part of her correspondence was edited and published by her daughter (see Cust 1929, 1931). Exchanges are included with B. Russell, C. K. Ogden, J. M. Baldwin, H. Spencer, T. A. Huxley,

M. Müller, B. Jowett, F. Pollock, G. F. Stout, H. G. Wells, M. E. Boole, H. and W. James, H. L. Bergson, M. Bréal, A. Lalande, J.-H. Poincaré, F. Tönnies, R. Carnap, O. Neurath, H. Höffding, F. van Eeden, G. Vailati and many others. Welby's manuscripts, correspondence and unpublished writings are available in the Welby Collection, York University Archives and in the Lady Welby Library, University of London Library (cf. Schmitz 1985; Petrilli 1998 and 2009).

Having written on her theory of meaning and significance as well as on her theory of translation and communication in various papers (see References), here I wish to briefly signal Welby's work on the original concept of "mother sense" and its very interesting implications for semiotic theory, elaborated in a series of unpublished manuscripts (essaylets, notes, letters), written at the beginning of the twentieth century, between 1904 and 1910, and grouped together in a file entitled "Mother Sense" (Welby Collection, Box 28, Subject File 24). The expression "mother sense" was formulated approximately in 1890. It was subsequently replaced with the term "primal sense" and its variant "primary sense" to avoid misunderstanding, though Welby privileged the expression "mother sense". This concept played an important role in the architecture of her thought system, in particular in her theoretical work on the human capacity for signifying processes, experience, knowledge acquisition, on the development of consciousness, subjectivity, and worldview.

Welby distinguished between "sense" or "mother sense" and "intellect" or "father reason" in her effort to delineate two principal modalities in the engendering of sense, which in fact cut across sexual difference. Mother sense is an inheritance common to humanity, without gender limitations. Welby did not establish a net separation between the sexes on the basis of the concept of mother sense. The male and female *principia* are not considered as divided and separate elements. As a cross-gender specification mother sense is not exclusive to women, just as father reason is not exclusive to men. "Mother sense" and "father sense" must be recovered in their original condition of dialectic and dialogic interrelation on both the phylogenetic and ontogenetic levels. And whilst these two modalities in the generation/interpretation of sense may be singled out on a theoretical level by abstraction, in practice they are strictly interrelated and contribute to sense producing praxis – where "sense" is inclusive of "meaning" and "significance". Mother sense is the generating source of sense and the capacity

for criticism; it is oriented by the logic of otherness, and corresponds to the capacity for knowing in a broad and creative sense through sentiment, perception, intuition and cognitive leaps. Evoking Charles S. Peirce, it is the idea intuited before it is possessed or before it possesses us. Mother sense may be understood in the double sense of *sapio* and *scio*. Mother sense already knows and is “savored”, so to say, by what the intellect, instead, must work for. That is, what the intellect must strive to discover, the body already knows. For full development, the work of the intellect must be nourished by mother sense, the condition for developing the capacity for argumentation and criticism. As the capacity for knowledge and interpretation, mother sense may be related to the Peircean concept of *agapic or sympathetic comprehension and recognition*, or the Bakhtinian concept of *answering comprehension*. In terms of logic and argumentation, “intellect” or “father-reason” is associated with induction and deduction, that is, with inferential processes where the logic of identity dominates over the logic of otherness; in semiotic terms, with the symbolic and indexical dimension of signs. Instead, “mother sense,” or “racial sense,” involves signifying processes dominated by otherness. It alludes to the creative and generative power of sense resulting from the capacity to associate things which seem distant from each other but, in reality, are mutually attracted to each other. In terms of argumentation, “mother sense” may be associated with logical procedures of the abductive type insofar as they are regulated by the values of otherness, creativity, dialogism, freedom and desire; in semiotic terms it corresponds to the iconic dimension of signs. For full development, knowledge and expression must be grounded in “mother sense”. Moreover, mother sense is the condition of possibility for the development of the ethical dimension of human signifying practices beyond the capacity for cognitive knowledge. And that mother sense pertains to human beings does not imply anthropomorphism, but far more extensively *organomorphism*, on the one hand, and *cosmomorphism*, on the other.

The implications of the concept of “mother sense” may be developed in the light of the concept of “language” or “modeling device,” as theorized by Thomas A. Sebeok. The “primary modeling system” is described as an innate simulacry modeling device present in all living species. On this basis, all species simulate their worlds in their own species-specific ways. The primary modeling system specific to humankind is called by Sebeok “language” (Deely 2007), distinct from speech and antecedent to it. This

aspect of the primary modeling system is present in the mute hominid and acts as the departure point for a new course in evolution leading to the rise of *homo sapiens sapiens* (cf. Posner, Robering, Sebeok 1997–2004, Art. 18, §5 and §6; Sebeok 1986, 1991a, b; Sebeok and Danesi 2000). Similarly to mother sense, the primary modeling device, or language, is the condition for the acquisition of knowledge and for communication through sign systems constitutive of human behaviour, verbal and nonverbal. The “secondary modeling system”, in part now redefined as “tertiary modeling system” (cf. Sebeok 1991b: 58), and described as derivative signifying behaviour characteristic of human culture, including “speech” (which arises specifically for communication and intellectual work generally), presupposes the “primary modeling system,” “language,” or with Welby, “mother sense”, “primal matter”. Secondary and tertiary modeling systems are also endowed with a capacity for high degrees of creative modeling in the sphere of anthroposemiosis. Thanks to such interconnection, humans, differently from other animal species, can engender a potentially infinite number of alternative worldviews (Deely, Petrilli and Ponzio 2005). As a modeling capacity, mother sense is regulated by the logic of dialogic otherness wherein creativity is the condition for the generation of infinite new worlds in a potentially unending variety of possible articulations and signifying processes. As articulate, signified, already configured realities, human derivative worlds are at once the projection, interpretation, and development of primal sense, on the one hand, and its reduction and simplification, on the other. Similarly to language, theorized as a primary modeling system by Sebeok in revising the Moscow-Tartu school, racial, primal, or mother sense (Welby also proposed the term “matrical” sense, from matrix) is a necessary condition for the evolution of the human race both ontologically and phylogenetically and, therefore, for the development of human social practice (Petrilli 2006a, b, 2007a,b).

2. The correspondence between Welby and Mary Everest Boole: love, logic, and subjectivity, for a critique of the identical

Mary Everest Boole (1832–1916) was mostly a self-taught philosopher, mathematician, educationist and writer in her own right after having assisted her husband, the famous logician and mathematician George

Boole (1815–1864), as his secretary, for nine years (cf. Cust 1929: 86, n.1). She was fascinated by the psychic sciences and presented an early book on mental health entitled, *The Message of Psychic Science for Nurses and Mothers* (written in the 1860s, but published only in 1883, and again in 1908). About this time she also wrote a work on her husband, *The Mathematical Psychology of Gratry and Boole*, 1897, in which she proposed a psychological interpretation of his work in light of August Gratry's mystics. She wrote such pioneering books as *Lectures on the Logic of Arithmetic*, 1903, and *The Preparation of the Child for Science*, 1904, and published regularly until her death. Much of her work appeared posthumously and is now available in four volumes, published in 1931, under the general title *Collected Works* (see Boole 1931; see also Creese 2004). Boole wrote under her own name, which put her at a disadvantage, given the prejudice of the Victorian era against women. In addition to those just mentioned, her publications include such challenging titles as: *Logic Taught by Love: Rhythm in Nature and in Education*, 1905, *Symbolic Methods of Study*, 1909 (presented as an introduction to psychic science), and *The Forging of Passion into Power*, 1910. These books all appeared during her lifetime, and were signaled by contemporaries as precursors in the domain of studies in psychoanalysis.

Boole is one of the several women populating Welby's correspondence which reveals an intriguing world in the feminine: a consistent community of women variously involved in public life and in writing. At a time when the idea of female emancipation and feminist movements were still in their dawn, these writing companions suffered the discrepancy between a woman's capacity for critical reflection and social change, on the one hand, and opportunities to act in public and official worlds, on the other. However, despite any prejudice of the times and similarly to Welby, Boole's London home became a meeting place for men and women with varying interests, sometimes even eccentric personalities, from different professions and walks of life.

A recurrent theme in the correspondence between Welby and Boole is their appreciation of the multiform nature of the existent and potential expressivity of a plurilingual world, contrary to the myth of Babel and the biblical malediction. Communication, understanding, and progress in knowledge are only possible on the basis of the logic of dialogue and mutual understanding among differences. The growth of knowledge is the result of interpretive-translative processes across different sign systems

and languages. Even more, the criterion for the verification of knowledge and truth is their “translatability” into different languages and fields of discourse. Thanks to translation processes, it is even possible to tell the author-creator, the artist, things yet unknown about one’s own thoughts, to discover *meaning import*, significance beyond *meaning intention*. Literary writing is recognized as the place where creative interpretation reaches its expressive potential to the highest degrees. Boole and Welby discussed theological issues, were committed to the problem of values and to theorizing about the problem of understanding and misunderstanding. They critiqued prejudice and dogmatic approaches to scientific research, and promoted dialogic reflection at a community level. Other topics include the laws of mind, the interconnection between love, logic, passion, and power (cf. Cust 1929; Boole 1931). Boole was particularly interested in logic and signifying processes. Reflecting on her commitment to teaching logic, she stated: “I shall try to make the men realise that rhythmic pulsation is a stronger force than an explosion” (cf. Cust 1929: 156). To this provocation, Welby responded that “woman” is neither a “sex” nor a “creature,” but rather “within undivided humanity” a guardian of “differences” or “distinctions,” of “what makes logic possible.” Femininity is described as the condition for the development of logic, where differences and distinctions do not imply separation, the cause of discord and idolatry, but dialogical interrelation. In fact, differences and distinctions must interrelate dialogically, but never be confounded. Similarly to the eternal with respect to the temporal, femininity resists all attempts at reduction or assimilation according to the logic of homologation and identity (cf. Cust 1929: 159).

Another recurrent theme in the correspondence between Welby and Boole is the problem of subjectivity. This problem was a constant focus of reflection for Welby from the very beginning of her research, and is at the centre of her unpublished writings from the last decade of her lifetime (cf. Petrilli 1998), providing the context of the discussion with Boole. Welby proposed to distinguish between “self” and “I,” or what she called “Ident” (cf. Petrilli 2005b). She related the problem of subjectivity to her conception of signs, language and meaning, orienting her studies in the direction of what with French philosopher Emmanuel Levinas (1906–1995) has been indicated as the “humanism of otherness,” by contrast with the “humanism of identity” (see Levinas 1974). Welby criticized egocentric identity insofar as it is based on sacrifice of the other to self, denial of the other, and the-

orized, instead, the structural role of otherness in the constitution of the subject. Subjectivity is generated through the logic of otherness, through the dynamics of the relationship between “self” and “other.” In her letters to Welby, Julia Wedgwood describes the condition of the subject in terms of the “dislocation of self.” This approach highlights the importance of difference or distinction among the various expressions of identity (where boundaries are never delimited once and for all), while criticizing the tendency to division and separation which provoke no less than the death of self. Welby herself used the expression “multiple” personality to indicate the subject’s identity understood as a “plurality,” as a community of selves in dialogue with each other and which may even contradict each other, whether reference is to the identity of a small community (for example, the single individual) or to the extended community of a social group. With Boole and with writer Vernon Lee (pseudonym for Violet Paget) the concept of “community” is described as a plurality of components dialogically interconnected by relations of “mutual understanding” – which do not imply relations of “mutual neutralisation”. In addition to mutual understanding, Boole also joined forces with Welby in the appeal for fusion of interests, social harmony, critique of prejudice, and dialogical reflection. They critiqued the generalized monologic dogmatism of official exponents of Christianity, and in reasoning generally, often the cause of conflict, and even war. According to Boole and Welby, subjectivity is generated in the relation among a plurality of selves in dialogue, so that individual identity can only be conceived in the relation with the other. Boole and Welby also shared a common interest in pedagogical and educational issues, and theorized the need to improve reasoning processes through appropriate educational methods from early childhood (Petrilli 2006b).

3. *Susanne K. Langer: signs, symbols and significance in a new key*

Susanne Katerina Langer (1895–1985) (née Knauth) was born in Manhattan, New York, 20 December 1895, to German immigrant parents, Antonio Knauth, a well-to-do lawyer, and Else M. (Uhlich) Knauth. She died in Old Lyme (Connecticut) 17 July 1985. She dedicated most of her intellectual work to constructing a general theory of sign, in part using analytical categories which she creatively developed from such thinkers as Alfred

North Whitehead, Ernst Cassirer, Ludwig Wittgenstein, and others still. *Philosophy in a New Key. A Study in the Symbolism of Reason, Rite, and Art* (1942), became a best-selling paperback, making her into something of a campus celebrity. Yet this book remained outside the mainstream of semiotic studies. Sebeok commented (1995: 167) that, “Clearly, Langer’s semiotic work merits detailed reconsideration in the near future, especially in its implications for music and the whole range of the fine arts – the creation of symbols of value, of apparent forms expressive of human feelings – in short, aesthetics.” In addition to Sebeok, the general neglect or ignorance of Langer’s work is signaled by such scholars as Ann E. Berthoff as a loss not only for philosophical-semiotic theory but also for feminist theory (cf. Sebeok 1991a: 43; 2001: 149; and Berthoff 1999). In her assessment of Langer’s work, Berthoff motivates the former’s loss of influence thus: “... her enterprise of developing an aesthetic consonant with Cassirer’s philosophy of symbolic form, a biology of feeling, and a philosophy of mind ran counter to the scientism which in the post-war years was everywhere on the rise – in structural linguistics, in ethology, in both behavioural and cognitive psychology, and in all other disciplines of which ‘the end of ideology’ was the slogan” (1999: 113).

In “Women in Semiotics” (co-authored with Susan Petrilli), Sebeok claims that “Langer deserves to be reinstated without further delay into the welcoming annals of semiotics, a restoration which, in my view, is even more pressing in the light of her foresighted sensitivity to biological issues and therefore to the soundest of contemporary frames of reference (Sebeok 2001: 149). Sebeok defined himself as a “biologist manque” (Deely 2005); Jane Oppenheimer described Langer as “one of those rare practitioners of systematic philosophy who is able to master the literature of biology” (1985: 331). On delineating this trend in research on signs and meaning, where philosophy and biology enter into dialogue, we must remember that Welby also kept account of biological research, which she considered as foundational for an understanding of signifying processes. In fact, in Sebeok’s description she anticipated certain leading ideas of what is now known as biosemiotics (1995: 166–167).

Repeating a point she had already made in her book, *Philosophical Sketches*, Langer, in her paper, “The Great Shift: Instinct to Intuition” (now in Einsenberg and Dillon 1971: chp. 10), asserts that language begins with “symbolic utterance”: “...speech is not derived from animal commu-

nication; its communicative and directive functions, though all-important today, are secondary; its primary function is the symbolic expression of intuitive cognition” (Langer 1962: 325–26). On Sebeok’s account, this position was sharply at variance with views maintained by exponents of simplistic physicalism who insisted on comparing language and animal communication systems to the illusory end of evidencing an intimate interconnection between the two (cf. Demers 1988; Lieberman 1988). However, in Langer’s time, physicalism enjoyed a wide platform of consensus, which provides a clue for a better understanding of Langer’s equivocal position in American semiotics (Sebeok 1991a: 44). Sebeok believed that her position was in line with his own, and traced a common intellectual lineage variously involving the impact of the neo-Kantians via such figures as Wilhelm von Humboldt, Charles Peirce, Jakob von Uexkull, Cassirer. Similarly, Robert Innis, in his volume, *Semiotics. An Introductory Anthology* avers that “Langer’s formulation and treatment of the issues leads us to reflect upon the unity of semiotics as a science that, with an integrated set of categories, can go beyond any one domain of sign-constituted objects to encompass them all” (1985: 89; see also by Innis, his recent paper, “The making of the literary symbol: Taking note of Langer,” 2007).

Langer dedicated most of her intellectual work to constructing a general theory of sign. She analyzed symbolic systems, that is, symbolisms, or the “grammar” of articulate forms, distinguishing among them on the basis of syntactic and semantic characteristics in her search for their semiotically relevant philosophical foundations. She researched the syntactic and semantic conditions for understanding feeling as manifested in “presentational forms”, and aimed to identify the “limits of articulation,” together with a “semantic” beyond the linguistic realm. Langer distinguished between “presentational form” – an articulate form proper to art, that is, verbal and non-verbal (plastic, musical, etc.) symbolic systems – on the one hand, and “discursive form,” an articulate form proper to language, that is, verbal symbolization, on the other. Her chief analytical category is the distinction between “saying” and “showing”. In the realm of art “symbols” have content and meaning in “presentational forms,” a “logical form” different from the discursive. Art has a logic of its own, whereby “art” is understood a relational structure (1967, p. 84). She critiques those trends in sign studies that apply to art forms the linguistic model, that is, the categories of verbal language. “Discursive forms” are linear, consist of

isolable signifying units, syntax, and admit the possibility of translation; “presentational forms” are perceived as a whole *Gestalten*. Presentational forms are not composed of signifying units that are relatively context-free, and sense cannot be separated from form. Therefore, Langer critiques the search for parallels between linguistic units and their non-linguistic analogues. “Artistic import requires no interpretation: it requires a full and clear perception of the presented form, and the form sometimes needs to be construed before one can appreciate it. [...] the vital import of a work of art need not and cannot be derived by any exegesis. Such a process, indeed, destroys one’s perception of import,” she says, stating that a cardinal error in musical hermeneutics is “the treatment of the art symbol [that is, sign] as a symbolism” (*Ibid.*). “A work of art is a single symbol, not a system of significant elements which may be variously compounded. Its elements have not symbolic values in isolation. They take their expressive character from their functions in the perceptual whole” (*Ibid.*).

In *The Practice of Philosophy* (1930) she had already distinguished between *understanding* and *insight* (two Kantian terms), that is, between “systemic interpretation” and “direct intensive symbolization” (1930: 149–51, 163–64). The concept of “direct intensive symbolization” may be read in light of Welby’s concept of “mother sense” or “primary sense”, and, vice versa, the implications of “primary sense” can be read in light of Langer’s understanding of the concept of “direct intensive symbolization”, or “insight”. Langer continued working on the difference in *Philosophy in a New Key* (1942), explaining how symbolization is expressed differently in reason than in rite and art. The new terms are “discursive” and “non-discursive”, or “representational” and “presentational”. The terminology was not satisfactory, not least because verbal art forms, such as poetic discourse, had to be classified as “non-discursive”. The distinction between “representation” and “figuration” or “picturing” (cf. Petrilli and Ponzio 1999) is useful to disambiguate and develop the categories proposed by Langer. Peirce’s triad of symbol, index, icon – which the distinction between “representation” and “figuration” presupposes – also throws light on Langer’s work: her “representation” can be associated with symbolicity and indexicality; “presentation” with iconicity.

A propos the distinction between “signs” and “symbols,” Langer in *Philosophy in a New Key* (1942) identifies two aspects of meaning, the psychological and the logical, which are always co-present: “Obviously, a word

– say, ‘London’ – does not ‘mean’ a city in just the same sense that a person employing the word ‘means’ the place” (*Ibid.*: 53). In psychological terms, something to have meaning must be *employed* as a sign or symbol, that is, it must be a sign or symbol *to* someone. In logical terms, it must be *capable* of conveying meaning, that is, it must be something that can be thus employed. The interplay between the psychological and the logical aspects of meaning produce a great variety of different meaning-relations. Langer searches for a “prime form” or “archetype”, what we may call a “general model”, capable of explaining the distinctions between special classes and of relating sub-species to each other in definite ways. She examines various inventories of so-called “symbol-situations,” together with the various attempts at defining the meaning of meaning. She was as critical of Peirce’s classification of signs – “a terrifying order of icons, qualisigns, legisigns, semes, phemes, and delomes”, as she was of the approach adopted by Husserl – who “ended with as many theories as there are ‘meanings’” (*Ibid.*: 54). On Langer’s account, the different types of meaning are related by the general principle that meaning is a function, not a property, of terms. She maintains that meaning is a set of relations, a meaning-pattern, where the terms are always three, co-present, and interrelated – symbol, object, subject (or interpretant) (*Ibid.*: 55–56). The set of relations, or meaning-pattern, can be described from the point of view of any term in it, and the description will differ accordingly. Distinguishing between *sign* and *symbol*, Langer presents them as woven together in the production of what she calls “fixed realities” or “facts” (*Ibid.*: 280). Signs can be complicated, can form chains, and are linked into situations to which we react with steady, intelligent behaviour. In the series of responses that comes to be created, the interpreter’s response to the preceding sign becomes, in its turn, another sign of a new situation where the meaning of the first sign becomes the context for the next sign. This is the warp of reality. On this basis human interpreters develop their symbols and symbolisms, the connecting and transforming woof-threads of conceptions. Langer in fact uses the metaphor of an elaborate tapestry for the relation between signs and symbols described as being intricately interconnected and interdependent. Language is a symbolical system, but in communication it does not only express conceptions (that is, it does not only describe), but it also points. The pointing function is what Langer calls the “signific function” – where there is no allusion whatsoever to Welby or what Welby understands with

“significs” (cf. *Ibid.*: 280) –, which she considers structural to language. No doubt, Langer’s concept of symbol and the distinction she draws between symbol and symbolism can also be interpreted in the light of Peirce’s triadic distinction between symbol, index and icon. Langer’s “signific function” corresponds to what she herself understands by “sign,” and Morris by “signal”. In Peirce’s terminology, we propose that, in the case of the signific function, the indexical and symbolic dimensions of signs prevail. Langer distinguishes the “signific function” from the “symbolic function” of language, that is, the descriptive or conceptual function of language. In Peirce’s terminology, we propose that what Langer understands by the “symbolic function” may in fact be characterized in terms of the iconic dimension of sign processes. And, indeed, the claim made by Innis in his 1985 anthology deserves reflection: “Langer could also be looked upon as contributing to clarifying Peirce’s distinction between icons and symbols” (Innis 1985: 88). In signifying behaviour and communicative interaction these functions, relations and dimensions are interconnected and co-present to varying degrees.

Welby, Boole and Langer all work towards developing an appropriate theory of mind and meaning capable of highlighting achievements and limits, illusions and errors of the signifying and interpretive function, in their common concern for the progress of humanity in all its aspects, ultimately in their quest for what we may call the properly human.

Lidia A. Mazhul & Vladimir M. Petrov

Understanding communication and the wealth of the mental world I

The rise of language (information approach)

Perhaps, before one's lips was born a whisper,
In a pre-forest air were whirling leaves ...
– Ossip Mandelstam, *Octaves*

The last two decades have been marked by a great shift in the paradigmatic basis of human sciences: a transition from “sensual” character of models – to “abstract” ones, or from “geometrical” to “algebraic” representations of processes described. This transition can be seen everywhere (see Petrov 2006b).

For instance, in historical and cultural studies, until recently “sensual” representations were dominant, such as the concept of “images of the world” (elaborated by the French “School of Annals” in the 1930s). And much attention was paid to various details of the “culture of everyday life”, and so forth. Now rather abstract and generalized descriptions of the reality appear, especially in historical investigations (e.g., Turchin 2003). In cultural studies we see transition to some fundamental parameters, deduced theoretically (see Petrov 2006a), which describe the whole world outlook, such as the degree of inclination towards “analytic” or “synthetic” styles of thinking (Maslov 1983), the degree of internal self-consistency of the world outlook, etc.

In psychology, the mental world of the personality has been treated as a certain space of parameters where the confrontation among all objects takes place. Example of such “spatial” models is the interpretation of experimental results after the processing of primary data by means of semantic differential techniques introduced by Charles Osgood: really, the so-called

“three principal components” which are usually obtained, are nothing else but the axes of a certain three-dimensional space of perception. Now the movement towards models involving neural nets is observed (e.g., Martindale, Locher & Petrov 2007). In some investigations the “knots” of a neural net are considered to be responsible for interactions which result in various mental innovations, and first of all, creative discoveries.

In linguistics researchers until recently dealt with so-called “deep parameters” (structures) and their projections (signs) which are supposed to reflect the reality of speech perception (Noam Chomsky and others). But now we see a movement towards probabilistic models of sense formation – as in the growth of links between morphemes (Golitsyn & Petrov 1995, 2007). Precisely this last approach is realized in the present paper, though it deals not only with objects ascribed to linguistics.

The main idea of the theoretical construction to be presented, is the “evolutionary assumption” that all the essential properties of information structures (such as language mechanisms) are nothing else but the results of “self-organization”: the constantly growing efficiency of information reception, storage, and processing realized by any system. In addition to this assumption, we used the so-called “principle of succession”; i.e., we suppose that every new step (“invention” of evolution) had as its base the “shoulders” of the appropriate previous step, its most progressive achievements (devices, procedures, etc.). In other words, it seems impossible that a rather complex device (or procedure) could arise in a void, without any predecessors. For instance, a bird’s wing could appear only on such a base as an arm; a system of color vision became possible only on the base of monochrome photo-detectors; etc. This kind of “step-by-step” evolution can be seen as one of the most important conditions for the progress of the system’s self-organization.

Earlier studies have shown that, for various informational tasks, the three-channel procedure seems to be the most economic and reliable (see Petrov 1994b; Golitsyn & Petrov, 1995, 2005, 2007); for instance, the identification of the spectral color of an object in conditions of changing light intensity, the economic storage of information using certain sets of “non-motivated” parameters, etc. Taking into account the above-mentioned principle of succession, we should consider three fundamental pre-communicative mechanisms of information processing which in future may, one hopes, become the cornerstones of communication. What could these

three mechanisms be? (The logic of our further considerations is illustrated in Table 1.)

First channel	Second channel	Third channel
<i>Pre-language stage:</i> Reflection of the surroundings	Relationships within the world of objects and phenomena	Generalization of the reflections and connections found
<i>Language stage:</i> Associative mechanism	Correlational mechanism	Grammatical mechanism

Table 1. Principal mechanisms realizing understanding of the communication.

N₁) Of course, the simple reflection of surroundings is the first of such mechanisms. This quite ancient mechanism leads, in the case of human perception, to sensual images of objects. Its archaic nature can be proved by its localization in the right cerebral hemisphere.

N₂) The next phase in the evolutionary progress of information structures, was the determination of relationships in the realm of objects and phenomena. The most widespread kind of such determination is nothing but a correlation between definite objects: between the color of an apple and its taste, between lightning in the sky and accompanying thunder, between going to the forest and gathering mushrooms, and so forth. (Maybe somebody remember an appropriate discussion on this topic in the play *La cantatrice chauve* by Eugene Ionesco: if a bell rings, is anybody behind the door?) Many such correlations were studied as so-called “conditional reflexes” in the framework of a scientific school by academician Ivan Pavlov.

The mechanism for determining such connections (correlations) is also rather ancient. Both mechanisms mentioned are inherent to the pre-human stage of evolution and are localized in the right cerebral hemisphere. Both mechanisms operate with concrete sensual images of objects to be reflected, and all the opportunities of concrete sensual reflection of the surroundings are limited by these two mechanisms.

N₃) Finally, the next step of evolution deals with another invention in the technology of information processing: the generalization of found connections. For instance, let us take a combination of several features: an

approximately round form, size in centimeters, green or pink or red color, etc. – all these lead to a concept, such as “an apple”. Then this combination, apart from many other concrete properties of each given apple, is stored in the subject’s memory as a whole, for different needs (e.g., looking for food). This way of keeping information is quite useful. In the process of evolution, it participates in forming a multi-level structure of information processing (Maslov 1983; Golitsyn & Petrov, 1995, 2005, 2007). Within this structure, information is processed at different levels, each level receiving it from the previous one, the criteria of choice (concerning the information to be transmitted to the next, higher level) being formed at each level. These criteria need “concepts” like those mentioned above, and the appropriate concepts serve as “instruments” in this kind of information processing. In sum: generalization is one of the most important mechanisms of information processing.

In evolution, due to self-organization, it becomes possible to combine these three mechanisms of information processing (NN 1, 2, 3). As a result, a structure arises capable of serving for communication, in particular, for forming language. Naturally, each of these mechanisms would be slightly modified to suit the needs of communication (in particular, to form language). Nevertheless, the main (immanent) traits of each mechanism must be maintained. Let us combine these three modified mechanisms with each other.

While perceiving a flux of discrete signals (e.g., in speech communication, a sequence of words or morphemes), the first (N₁) mechanism can lead to the appearance of definite sensuous images, evoked by each discrete element of the flux (e.g., by different morphemes) or by some of them together. For instance, the element /table/ can evoke associations concerning an object with a flat surface and four legs. When applied to speech communication, this can be called the *associative mechanism*.

At the same time, the second (N₂) mechanism can give rise to a special kind of correlation, like the coexistence of some definite elements (e.g., morphemes), i.e., the facts of their joint appearance in a previous perceptual experience of a given perceiver. For instance, this mechanism can check whether the combination of signals – such as /table/ + /big – has occurred in previous communications, or whether it is new for the perceiver. This mechanism can be called the correlation *mechanism*.

But when we receive a flux containing many different signals (e.g., separate morphemes), what pairs of them have to be checked in such a way? To answer this question one has to draw upon the third (N_3) mechanism. Specializing in generalization, this mechanism can assign each signal (e.g., each word) to a definite abstract category, among which there can be some stable links (interrelations). For instance, in the Russian language there are grammatical rules connecting words to one another, depending on their grammatical categories: an adjective can occur with a given noun only if they are identical in relation to such categories as gender, number, and case. So, first of all a subject has to assign each signal (e.g., each word) to the appropriate grammatical category (part of speech, etc.). In many languages it is necessary also to take into account the word order within the sentence; e.g., the fact that a predicate always follows the subject.

Only after this can a subject check the appropriate pairs, these pairs being determined by certain grammatical rules. Hence grammatical rules help a subject to look for the appropriate pairs of signals (words) to be checked, and this is the function of the third (N_3) mechanism of the communication. That is why this mechanism can be called *grammatical*. It should be noted that the model describes not only speech communication, but can be applied to any other kinds of communications, e.g., musical or visual.

How can this complex of mechanisms present the *content* of a communication? Each communication (if it is not simply noise) contains links between its different signals (e.g., between different words indicated with the help of the third mechanism), which have to be compared with the existing links in the realm of the previous experience of the perceiver. It is evident that in this relation, *three situations* are possible in principle (see Fig. 1).

Figure 1. Three variants of possible links between two perceived signals A and B: a) trivial communication; b) communication containing sense; c) absurd communication.

a) A given pair of signals (carried by the given communication) has been connected earlier in the previous experience of the perceiver. This means that the link between these two signals (responding to two mental elements) carries no news, hence this fragment of the flux corresponds to trivial communication. An example of a communication containing such a pair of signals (words) is “Wadding is made of cotton.” Such a communication probably will stir no specific emotion connected with the content of the communication. An emotion in this case may be caused only by the fact of this trivial communication, this emotion being negative (something like annoyance). Due to the absence of a specific emotion, no special activity is provoked to deal with the re-building of a network of links within the subject’s world of mental elements.

b) Connection between elements of the given pair has not occurred earlier in the previous experience of the perceiver, but these two elements can be connected by a certain third element, which has links with both of the two. This situation responds to the emergence of closed chains involving links among three or more elements. This process can be interpreted as the perception of the so-called sense of a communication. It can lead to positive emotional reactions in the perceiver – due to the additional ordering of his mental structure and, hence, to the increase of information contained within it. So the growth of knowledge (received by means of the communication) – and, moreover, the growth of the entire mental world of a perceiver – is nothing else but the emergence of new connections within more and more pairs of elements, together with a possible increase in the nomenclature of elements. The resulting growth of links within the net of elements is illustrated with Figure 2.

Figure 2. Growth of the network of signals’ links as a result of the communications.

The situation of the “formation of sense” can be illustrated by the following example. In the phrase: “An oak is growing in the professor’s garden” – the statistical connection has to be checked between the elements (words) “oak” and “garden”, as well as between “oak” and “growing”; and probably these pairs were already joined together in the previous experience of the given perceiver. By contrast, the words “professor” and “garden” may never have been linked together. Nevertheless, they are linked via an absent (in the given phrase) word, “man” – because in the subject’s experience there are links between “professor” and “man” and between “man” and “garden” (the relationships responding to the fact that a garden may belong to a man). But words of the pair “professor” and “growing” (as well as the words “professor” and “oak”) were never joined together in the perceiver’s previous experience. So because of the known previous connections and the perception of the given message (phrase), some new links are forming, and all the main words used (“oak,” “growing,” “professor,” “garden”) appear to belong to the same network (because of the phrase above, the word “professor” now becomes part of this network). In this way, the so-called “sense” of the communication is formed, as the expansion of the network (Fig. 2) during the perception of a series of speech signals, in this case, words.

Thus the simplest condition for sense being carried by the communication, is the presence of three elements (implicit or explicit). This property, known to researchers long ago as something like a riddle, was an object of numerous discussions. So it is not without reason that the great Russian physiologist of the nineteenth century, Ivan Sechenov (1953: 216), wrote about this property: “Among all nations of all times, all tribes and all steps of mental development, the simplest form of the verbal representation of the thought, responds to our three-member sentence. Due to this, we equally easily understand the thought of an ancient man impressed in manuscripts, the thought of a savage, and thought of a contemporary.”

c) Finally, it may happen that no connection within a given pair of elements has occurred earlier, nor can the two elements be connected by a third element. This situation corresponds to senseless (absurd) communication eliciting a negative emotional reaction in the perceiver (the negative reactions force him/her to search for connections).

Such are the results of our deductive construction of the process of *understanding* and the formation of sense in a perceiver’s mind upon the

reception of a communication. This process may refer not only to verbal language, but to any kind of signals: musical, pictorial, etc.

The most remarkable feature of the process described is that it is the result of systemic self-organization, as something like its “by-product”. Quite similar are other by-products which arise due to immanent regularities of evolution, e.g., various devices used by different kinds of art (Golitsyn & Petrov 1995; Petrov 1994a, 2005), the phenomenon of woman’s beauty together with appropriate erotic and aesthetic criteria (Mazhul & Petrov 1999; Petrov 1999), and many others. These processes are evidently a part of the entire systemic enhancement (Golitsyn 2000; Petrov 2002), which is probably the key to the “antropial principle” constituting the main riddle both of our culture and of the very existence of our world.

Understanding the communication and wealth of the mental world 2

Devices to “cure” language (information approach)

Having “constructed” a three-mechanism system of language, we now turn to its functioning. Our system of information processing for understanding, as any complex multi-component system, is inevitably subject to possible damages that may cause misunderstanding and other disturbances in the entire system. Yet, there should exist certain informational means and devices that can “cure” such malfunctions. In addition, every system needs certain means and devices capable of improving its functioning. It seems that the appropriate “informational drugs” were elaborated in the process of cultural evolution. We shall enumerate some of them, considering mainly examples borrowed from the achievements of geniuses, i.e., outstandingly creative persons. We start with the most general devices and then turn to more particular ones. All the means considered are summarized in Table 2.

One of the most general potential damages is the false decoding of information by different mechanisms (channels). This may result in the construction of a contradictory or fragmentary worldview; in extreme situations, such false decoding may cause psychological deviations. Signals from different channels may not be coordinated appropriately, causing distorted mental images of the world.

For instance, the famous Russian prose-writer of the nineteenth century, Nikolay Gogol described fragments of such wrong pictures in his short story *Diary of a Madman*. Among the numerous paradoxical thoughts of its main personage there appears the following: “Usually the Moon is fab-

ricated in Hamburg”, the text going on to describe the procedure of this fabrication). Evidently, this wrong picture comes about from at least two sources: (1) the visual image of the Moon and its resemblance to cheese; and (2) verbal data concerning the technology of cheese fabrication, as well as the good quality of cheeses made in Hamburg.

Reason for introducing the device	Essence of the device	Examples of practical realization
The need to support self-consistency of the worldview	Exercising information processing by means of humor	Juxtaposition of data relating to different types of channels
The need to bridge large gaps between rational and emotional components of perception	Vivifying perception by constraining and ordering the flow of sensual associations	1) Modeling based on a 24-hour cycle (Pushkin’s “ <i>To Chaadayev</i> ”) 2) “Gluing” of textual fragments by means of sensual associations (stanzas in Pushkin’s <i>Eugeny Onegin</i>)
“Enhancement” by elimination of the sensual component of perception	Realization of “transparent” (“empty,” association-free) communication	1) High concentration of verbs 2) Verbs at phrase endings 3) Random sequences of events
Providing uncertainty during perception	Making communication “vague”	Juxtaposition of meanings relating to associative and “formal language” mechanisms (“ <i>Over the hills of Georgia</i> ” by Pushkin)
Perfecting the entire language of the communication	Uniting sensual perception of the communicative devices with theoretical reflexion on them	1) Meta-arts (Lotman 1977) 2) Constructive conceptualism (Gribkov & Petrov, 1997) 3) “Sots-art” (paintings by Komar and Melamid)

Table 2. Means of perfecting the system of understanding: Several situations.

To allay such misunderstandings, special “instruments of mental training” were elaborated in the course of cultural development. Perhaps the most interesting is humor. The essence of this device is the deliberate juxtaposition of two (or more) signals of a different nature. If their combined

result is perceived as evidently absurd (e.g., the Moon fabricated in Hamburg), and the “feeling of strangeness” about the situation becomes very sharp, it would prevent the recipient from wrongly combining the various signals. In most cases, “training” of the recipient’s system of information processing enables the proper combining of left-hemispheric activity and with that of the right-hemisphere, focusing on possible juxtapositions of conceptual and sensual components, respectively.

Another “dangerous situation” can appear simply because of too large a gap between the two principal constituents of mental activity, that is, conceptual (left-brain) and sensual (right-brain) processes. This gap can have especially negative consequences when the perceiver is dealing with texts of rather abstract content (see Petrov 1994a; Golitsyn & Petrov 1995: 115–131). Typical examples of such texts are poetical works devoted to abstract matters. In such cases, it is desirable to “vivify” perception to operate in accordance with their intended effects. The bringing to life of abstract ideas helps bind together perceptual processes that may be related to different channels.

This kind of “associative glue” can be used to provide a holistic perception of a communicative whole, though each fragment has a certain integrity of its own. An example of this situation is found in the large novel (in verse), *Eugeny Onegine*, by Alexander Pushkin, in which many stanzas are made to cohere by sensual, formally non-motivated associations (on experiments concerning this perceptive device, Petrov 2003.)

Quite the opposite situation obtains when the sensual content of the communication is to be “annihilated”. For instance, psychic processes may be enhanced by their being distanced from earthly, “flesh and blood” reality (see, e.g., Golitsyn 2000; Golitsyn & Petrov 2005; Petrov 2002). This amounts to increasing the transparency of the communication, such that it generates no (or almost no) sensual associations. Certain devices are used to accomplish this purpose. For example, at the level of diction, rather many verbs are used in comparison with the number of nouns and adjectives (the evolution of this device may be traced during the nineteenth and twentieth centuries in Russian prose, from Alexander Pushkin to Andrey Bely). At a “higher” level, verbs are frequently used at the endings of phrases. At the level of the total narration – a random sequence of events may be described in the reality depicted (this device may be seen in Ivan Bunin’s prose). Moreover, this kind of “associative emptiness” can be

attained through the unorthodox combining of nouns and verbs (e.g., in Platonov's prose).¹

Sometimes it is desired that the communication create an indefinite or vague feeling and/or impression. This situation is close to the previous one, yet without eliminating reality completely. In such cases, the perceiver may not know precisely what to do with the communication provided. To realize the intended vagueness, one should "switch on" opposite (contradictory) mechanisms – information channels that normally work against each other. This occurs, for instance, in Pushkin's poem, "Over the hills of Georgia" (1829), where two waves of meanings are directed against each other: (1) a "genuine associative" flow evidencing the poet's troubles, anxiety, and so on; (2) the flow of "formal" meanings (grammatically and logically correct), proclaiming calmness, absence of troubles, etc. The overall result of the poem being one of ambiguity or vagueness. As a result, the feeling of vagueness is generated, being the main goal of this poem (see also, Petrov 1984).

As is known, there has been for some time a growing tendency toward "meta-arts": meta-painting (i.e., painting about painting), meta-theatre (theatre about theatre), meta-poetry (poetry about poetry), etc. All of these have been theorized by Yuri Lotman (1977), among others.

In addition to the above, we should mention the concept of "constructive conceptualism", its essence consisting in uniting sensual processes and theoretical reflection during the perception (see, e.g., Gribkov & Petrov 1997). A variant of this concept may be found in the (purportedly mimetic) stylistic features of "socialist realism". Here the perceptual aim is achieved due to "interference" of the "true" content of the picture, and its ironic interpretation in the framework of the "socialistic worldview."

Various other devices exist for increasing the reliability of our perceptive understanding – and one hopes that more will be invented in future. These enrich the wealth and diversity of our mental world, suppleness of thinking, and creative potentialities. Elaboration of such means and devices leads to social, cultural, and mental progress.

Note

1. On the logic of such devices and experiments on their perception, see, e.g., Petrov 1994c, 2002, 2004.

Songs and rituals of the bear hunt in Karelia and Savo

Introduction

Finnish ethnographers have collected a huge quantity of ritual songs and oral narratives about the bear and bear hunt in all the regions of Finland. The songs have been published in the volumes of the collection Suomen Kansan Vanhat Runot (Ancient Poems of the Finnish People, henceforth SKVR).¹ By contrast, the majority of the folk narratives about the bear are still unpublished, but it is possible to find and study them in the Folklore Archive of the Finnish Literature Society.²

Unfortunately, the scientific literature about the Finnish bear rituals is not as rich as the folk materials collected in the last three centuries. Scientific works on the bear in the Finnish tradition are still few. The scholars and collectors of the songs and narratives in the nineteenth and early twentieth centuries wrote only a few pages about the bear-hunt rituals. Some of the best Finnish anthropologists and specialists of comparative religion have written short articles or brief treatises about this topic, but a thorough-going scientific monograph is still to be written. For this reason I resolved to produce a doctoral thesis on Finnish bear folklore and bear-hunt rituals and songs. When I started the research, I noticed how rich in challenging and fascinating details the folk poems and narratives collected in Savo³ and Karelia⁴ were, and how little had been written on them. In order to try to fill this gap, I decided to write this article, focused on the description and the analysis of the bear-hunt folklore collected in these two neighbouring areas.

1. Sacred forest, sacred masters, sacred bears

In the previous two centuries the small villages of Savo and Karelia were surrounded by endless, deep, dark and wild forests. It is no surprise that the imagery of the people was dominated by speculations about the “real nature” of the forest and its “hidden powers”.

The forest was really considered another world, full of wonders and mystery. As the folklorist Lotte Tarkka states in one of her best articles, the forest itself was sacred (*pyhä* in Finnish) and all its inhabitants were filled with its sacredness (Tarkka 1988: 92–97). In the woodland there also lived various sacred supernatural beings: Tapio, the master of the forest, his wife, Mielikki, and a great number of “maidens of the forest”, called often “sacred servants” (*pyhät piikat*).

Obviously the bear, the most impressive wild animal of the *taiga*, participated in the sacredness of the forest. Bears were the “sacred cattle” of Tapio and the female spirits of the forest, and they were protected by their magical forces.

In the village of Pärnämäki in the South Savo parish of Mäntyharju, the people believed that during hibernation the bear was nourished and protected by a female “master spirit” (*baltija* or *baltia*): “When I was young, I heard that a man was encircling the bear’s sleeping place, but he fell in the den. This man stayed in the den for a long time. He saw that every night the master spirit brought the bear a kind of white beverage” (SKS Karhu 1936: 3271).⁵

The hibernation of the bear was strongly associated with the mystery of the cyclical loss and rebirth of the generative powers of the forest: when the bear was sleeping in its den, the trees were leafless; when the bear woke up in the spring, the woods became full of life and splendour.

The bear was considered one of the most powerful sources of the dynamic spiritual forces of the woods, the “spirit folk of the forest” (*metsän väki*). The bear itself was also called “forest” (*metsä*, *mettä*), “great forest” (*iso metsä*, *iso mettä*), “king of the forest” (*metsän kuningas*), “apple of the forest” (*metsän omena*), “luck of the forest” (*metsän onni*).

The sacredness of the bear included several magical powers: the bear had supernatural senses of sight and hearing. It could see from a distance the action of the hunters, and it could hear human speech from his den. The bear did not like people uttering its real name (*karhu*), and became

enraged when anyone pronounced it. The bear preferred humans to call him by “honourable names”, such as “honey-paw” (*mesikämmen*) or “flower of the forest” (*metän kukka*).

2. *Innocent bears and sinful sorcerers*

Because the forest and bears were sacred, they were also considered “clean” (*puhdas*), innocent. The folk believed that a normal bear was always innocent, unable to “do something wrong” to people. A bear who attacked cattle or a person must have been roused, i.e., “conjured” (*nostettu*) and, hence, a bewitched bear. The bear itself was innocent; the party that was really responsible, the hidden wrong-doer, was another human being: an execrable sorcerer (*noita*), concealed somewhere, maybe in the nearest village. The informant Anterus Kousa of Pärnämäki relates that “The bear didn’t do wrong unless he was conjured” (SKS, Karhu J. 1936: 3254). Another informant, the hunter G. V. Karhu of the Mäntyharju parish village of Outila, stated that: “The people usually believed that the bear was a jolly and playful animal of the forest, if sorcerers or malevolent men didn’t enrage it with magic. Bears had been seen eating hay from the same hummock as the cows, and tinkling the bells hanging from the cows’ throats too with their paws and such like without hurting the cows. But if some sorcerer or grudge-bearer became angry with his neighbours, he could send the bear to do some ill, and even destroy all the cattle of the neighbouring village” (SKS, Karhu J. 1936: 3254).

An old spell (*loitsu*) used by a sorcerer to summon the bear was probably collected in Savo during the eighteenth century:

<i>Karhun nostaminen</i>	<i>To summon the bear</i>
Nouse karhu kankahasta,	Rise, bear, from the forest,
Hiedasta hevoisen syöjä,	Horse eater, from the sands,
Viiasta vihainen kissa,	Angry cat, from the wild wood,
Korvesta kovero-koura,	Hollow hand, from the deep wood,
Karvahassu[!] halmehista,	Funny fur, from the fields,
Mullikoita murtamahan,	To tear apart the young bulls,
Vasikoita vainomahan,	To stalk the calves,
Hevosia haastamahan,	To assail the horses,
Karjan laumaa kaatamahan!	To kill the herd!

(SKVR VI 2.5414)⁶

The unknown sorcerer used the word *karhu*, the real name of the bear. The wizard intentionally pronounced this name to enrage the bear and exploit its fury against the cattle. The singer uttered other names, too, that are somewhat offensive (“angry cat” and “funny fur”): it is clear that the wizard wanted to drive the bear mad.

In Savo and Karelia the cattle owners and herdsmen lived in fear, convinced that envious sorcerers were always “at work”. To protect the cattle during the grazing season, they sang a protection spell to “calm” the bewitched bears. In 1894 the informant Ukko Timonen from Kitee (North Karelia) revealed the words of a protection spell to the collector Lönnbohm:

Missä ohto synnytelty,	Where was Ohto (the bear) given birth,
Mesikämmen kiännätelty?	Where was the honey paw turned around?
Tuolla ohto synnytelty,	There was Ohto given birth,
Mesikämmen kiännätelty:	The honey-paw turned around:
Ylähällä taivosessa,	High up in the sky,
Otavaisen olkapäällä.	On the shoulders of the Great Bear.
Missä se alas laskettiin?	How was it brought down?
Hihnassa alas laskettiin,	With a thread it was brought down,
Hihnassa hopiisessa,	With a silver thread,
Kultaisessa kätkyssä,	In a golden cradle,
Sitte läks saloja samuumaan,	To roam in the woodland,
Pohjanmoata poloylakemaan.	To wander in the Northland,
Elä sorra sontareittä,	Don't oppress the dung-thigh (cow)
Koa maion kantajoa,	Don't kill the milk holder (cow),
Enemp' on emoi(yla)lla työtä,	There will be more work for the mother,
Suur(i) vaiva vanhemmalla,	A great suffering for the parent,
Jos poikonen pahan teköö.	If the boy does wrong.

(SKVR VII 5, loitsu 3932)

In this incantation the bear is said to have celestial origins. A similar myth is typical of the tradition of other Finno-Ugric peoples (such as the Mansi). Why did the singer include the episode of the bear's birth in the sky in the spell? According to unwritten rules of traditional Finnish magic, if someone knew and sang the origins of an animal or an object, he could “control” it by magic.

The quiet style of this protection spell distinguishes it from the rough and wicked one of the previous conjuring spell. The names used to call the bear are respectful and honourable (such as honey-paw). The “innocence”

of the bear is indicated by terms that recall the purity and innocence of childhood: the bear is called *poikonen*: a boy, a childish one, who should not create problems for the mother. A sort of maternal sweetness is present in all the verses.

3. *The epic structure and ideological basis of bear-hunt songs*

What if the protection spell did not work and the bear attacked the cattle? In this case, it was necessary to hunt and kill the bear. But the killing of a sacred animal of the holy forest, of an “innocent one”, was a very dangerous task. It was necessary to perform a sequence of rites and sing many ritual songs in order to appease the bear and please the masters of the forest who protected the wild animals. The bear-hunt rituals included several phases: the purification rites to enter the forest, the songs to describe the entrance into the forest, the songs to please the masters of the forest and the female forest spirits, the rousing of the bear and its slaying, the explanation of the cause of the bear’s death, the skinning, the transport of the corpse to the village, the bear feast, the procession of the bear’s skull and the placing of the skull in a sacred tree.

The songs were formed by long chains of verses sung mostly by the same hunters. Many scholars, including Juha Pentikäinen, consider the bear-hunt songs a kind of “epic of the hunt”. If we speak of an epic, we have to note the differences and the similarities between the Finnish hunt verses and the classic epic. The philologist Domenico Comparetti, in his essay *Il Kalevala o la poesia tradizionale dei Finni* (1891), stated that the classic epic was based on a war-like ideology: the heroes were soldiers and the main plot of the epic itself was the opposition and the struggle between two peoples or between the forces of good and evil. By contrast, the Finnish epic songs concentrated their attention on magic and magic spells (Comparetti 1989: 195–196). Comparetti presupposes that the “shamanic background” of the Finnish folk beliefs has influenced the ideology of the Finnish epic poems. He defined the Finnish epic as an “epic of spells”.

The observations and the comparative methods of Comparetti are relevant for the analysis of the bear hunt songs. The classical Greek epic (for example, the *Iliad*) glorified conflict, dualism, oppositions, patriotism, struggles and fights. In contrast, the bear-hunt songs expressed the

necessity of a true conciliation and peace between the villagers and the “people of the forest”. The real heroism of the hunter is demonstrated in his effort to avoid the conflict between people and the forces of nature. He is more a “magician-diplomat” than a vainglorious warrior in search of glory. His “epic diplomacy”, expressed by singing and “whispering with a golden tongue”, maintained the right balance between humans and the forest powers.

The ideal of conciliation and harmony between humans and the forces of nature was typical of the Arctic and sub-Arctic peoples, where the shamans had an important religious and social role. These were the same cultures where the bear-hunt rituals and the bear feast evolved in a complex cultic series of events.

Another important epic theme found in the Finnish bear-hunt songs is the “journey to another world”. If in the *Odyssey* the Mediterranean sea is the “great other” in which the heroes meet supernatural beings (gods, monsters, sirens and other mythological figures), in the Finnish hunt songs the otherness is represented by the forest itself, inhabited by Tapio, Mikilikki and other spirits. As the shamans had to sing in the shamanic language to communicate with the spirits during their spiritual flights to the heavens, the Finnish hunters had to sing in their own ritual language to communicate with the forest beings.

In the following section I will explain how the conciliatory ideology and the narrative pattern of the “journey to another world” appeared throughout the verses of all the various phases of the bear-hunt ritual.

4. *Entering the enchanted forest*

The concept of the forest’s otherness is highlighted by the fact that purification was required to enter the realm of the forest spirits: in some villages it was imperative to go to the sauna and put on clean clothes before leaving. The rituals required that the hunters, “impure and sinful human beings”, in order to enter the pure and clean forest, should change their status, and became pure, clean and innocent like the sacred forest. The surprising element is that also the forest changed its status at the exact moment when the hunter entered its sacred space. During the time of hunting, all the forest became “enchanted”:

Tuolla korpi kuumottaapi,	There the forest shines,
Mehtä siintääpi sininen.	The wood becomes blue.
(SKVR VI 4.4886)	

In these verses, collected in Viena Karelia, the “blue” is not a colour as such: it has a clear magical meaning, connected to the awakening of the dynamic spiritual power of the forest (*metsän väki*).

In some marvellous verses from the village Niemelä, near Rautjärvi, the hunter clearly asks the master of the forest Tapio to enchant the forest:

Tapio isäntä itse, Tapio,	the lord himself,
havuhattu, naavaturkki!	Pine hut, beard-moss fur.
Pane nyt metsä palttinoihin,	Wrap the wood in a flax sheet,
Salo verkahan vetäse,	Drag the wild wood in a drape,
Haavat kaikki haljakkoihin	All the poplars in an azure-blue wool jacket,
Lepät lempivaattehisin,	The alders in their favourite clothes,
Hopeoihin hongat laita,	Forge the pines with silver,
Kuuset kultihin rakenna	Build the firs with gold
(Häylä 1982: 381)	

These images full of colours, beauty and magic depicted the alterity of the forest, and were deeply related to the conciliatory ideology of the hunt: during the hunt everything must be filled with harmony and sweetness.

For this reason it was also important that the enchanted forest vibrate with the power of musical magic. Without music, it is impossible to establish true harmony. In Viena Karelia a hunter asked the forest itself to play the *kantele*, a five-stringed Finnish instrument:

Soita, metsä, kanteloj(a),	Play, forest, the <i>kantele</i>
Lähtiessäni metsälle!	When I leave to the forest!
(SKVR I 4.1211)	

In the village of Niemelä, another hunter asked a forest maiden to play a whistle:

Metsän piika pikkarainen,	Small servant of the wood,
Simasuu, Tapion neiti!	Honeyed lips, maid of Tapio,
Soitellos metinen pilli,	Sing the honeyed whistle,
Simapilli piipahuta	Blow the honeyed whistle
Korvalle ehon emännän,	For the ears of the fair mistress,
Mieluisan metsän emännän	Of the lovely forest mistress
(Häylä 1982: 380–381)	

5. *Mielikki, the Pure Lady*

After entering this enchanted world, the hunter was to make contact and communicate with the supernatural spirits of the forest. Use of the right, respectful words to the forest mistress Mielikki, the wife of Tapio, was fundamental for a successful hunt. Bears were the favourite “cattle” of the mistress of the forest. If she was pleased, she would “open the granary of Tapio” (give prey to the hunter). The hunters of Niemelä asked Mielikki to free a bear with these sweet words:

Mielikki metsän emäntä,	Mielikki, mistress of the forest,
Puhdas muori, muoto kaunis,	Pure lady, beautifully shaped,
Pane kulta kulkemaan,	Put the gold (the bear) in motion,
Hopea vaeltamaan	The silver (the bear) to wander
Miehen estävän etehen	In front of the searching man,
Anelijan askelille	On the steps of the supplicant!
Ota kultaiset avaimet	Take the golden keys,
Renkahalta, reideltäsi:	From the key ring, from your thigh:
Aukaise Tapion aitta,	Open the granary of Tapio,
Metsän linna liikahuta	Move the castle of the forest
Minun pyyntipäiväni	On that day when I go hunting,
Erän etsoaikoinani!	When I search for the prey!

(Häylä 1982: 380)

In these beautiful verses the hunter presents himself as a humble “supplicant” and a poor and desperate wanderer: submission and purity were the key with which to open the heart of the Pure Lady.

6. *Take me, forest, as your husband*

In many songs the hunter shows a desire to become physically “part of the forest”. This process of identification with the forest was extremely erotic. The hunter affirmed that he courted the maidens of the forest and made love with them. The famous Karelian singer Arhippa Perttuine sang this song full of sensuality before Elias Lönnrot:

Mieleni minun tekisi	The desire is growing in me
mieli käyä Metsolassa	To leave for the Forestland,
metsän neittä naiakseni,	To make love to the forest maiden
metsän mettä juoakseni,	To drink the forest honey,
lihoa lehen alaista,	Flesh from under the leaves,
kuuta kuusen juureihista	Grease from the spruce's root
[. . .]	[. . .]
Ota, metsä, mieheksesi,	Take me, forest, as your husband,
urohiksesi, Tapijo,	As your virile man, Tapijo,
korpi kolkkipojkesi!	As your arrow boy, savage wood.
Metsä haisuo havulta,	The forest smells of pine,
Mies haisee meen maulta.	The man smells of the taste of honey.

(SKVR I 4.1095)

In these verses the hunter declares not only the desire to have a sexual adventure with the forest maiden, but also his desire to marry her. Sexual intercourse and marriage were also ways to become a relative of the forest, part of the family of the forest. If the hunter became a sexual partner and a relative of the forest spirits, he could easily obtain from them the desired prey. The connection between eroticism and hunting is typical of many cultures, but the Finnish songs are extremely explicit.

7. *Wake up, sooty maiden*

When the hunters had honoured the master spirits and so pleased them, they reached the bear's den. But it was strictly forbidden to kill the bear as it slept. In Viena Karelia it was necessary to wake up the bear, singing these verses:

Nousep' pois, nokiñe(n) neit'[i],	Wake up, sooty maiden,
Nokiselta nuotiolta.	From the sooty fire place
Havuselta vuotielta,	From the bed of pine needles
Hakoselta peänalalta;	From the pine pillow;
Jo olet viikon moassa moannun',	You have slept in the earth for a week,
Kauvon lehtossa levännyñ,	You have rested in the grove a long
	time,
Viikon kuuluit, kauvon viivyit	A week passed, a long time you've
	spent
Viron moata käyessäsi.	On your travel to Estonia.

(SKVR I 4.1206)

The hunter awakens the bear with kindness. The circumstances were extremely dangerous: if the bear was awakened roughly, it became enraged and attacked the hunters. Lovely words were chosen: the bear was portrayed like a bride, or a little girl, who has overslept. The verses brought to mind beautiful images of childhood or romantic love.

8. The explanation of the bear's death as an accident

Analysing these verses, it is important to understand that the hunter was aiming to spotlight a deep spirit of conciliation not only with all the forest spirits, masters and maidens, but also with the bear itself.

The conflict represented by the killing of the bear was totally negated. When the bear was killed, it was necessary to vindicate the hunters. The hunter claimed that he had not killed the bear. It was as an accident: the bear killed itself by falling from a tree. The hunters of Juva in Savo sang:

Empe mine ole sinua pañut,	I didn't shoot you,
Eike toinen toveri,	The other fellow didn't shoot,
Ite pa harjaiti havolta,	You yourself slipped from the pine,
Ite vierit vempeltä,	You yourself rolled down from a collar tree,
Kuavut koivun konkeloita	You fell from a fallen birch tree,
Halko marjaisen mahais,	You split your berry-filled belly,
Halko kultaisen kupuis.	You slit your golden stomach.
Kätke kynet karvoihis!	Hide your claws in your fur,
Villa on suus, villa on piäs,	Of wool is your mouth, wool your head,
Villa on visi hamastais.	Wool your five teeth.

(SKVR VI 4.4885)

In Viena Karelia, even the skinning of the bear was depicted as a useful exchange, with a clear advantage for the bear:

Anna kättä, käyrän poika,	Give me your hand, curved boy,
Hongan oksalla ojenna,	Hold out the hand on the pine's branch,
Vaihtakaamme paitojamme,	Let's change our shirts,
Nurikaamme nuttujamme,	Let's swap our jackets,
Anna mulle villa paita,	Give me the wool shirt,
Ota multa rauta paita,	Take from me an iron shirt,
Rautanen risuissa lujempi,	The iron one is tougher in the underbrush,
Kuusikossa kestävämpi.	It last longer in the fir wood.

(SKVR I 4.1244)

The “iron shirt” offered to the bear was probably a reference to the knife used to skin the bear.

Whatever the case, if the bear was not convinced about the real benefits of the “exchange”, sometimes it was a good idea to explain that the knife was not forged by the hunters:

Ei ole veitsi minun tekema	The knife isn't a work of mine,
Eikä toisi kumppailini,	Nor of the other fellow,
Virossa on veitsi tehty,	The knife was forged in Estonia,
Saatu Saksan kaupungissa	It was purchased from a German city.

(SKVR I 4.1244)

9. *The bear feast*

In the next phases of the ritual the hunters continued to talk to the dead bear as if it was alive: the dead bear was now considered a guest of honour, and in Viena Karelia it was invited to the village with sweet words:

Lähe nyt, ohto, kulkomah,	Leave now, ohto, to roam
Hopie, vajeltamah,	Silver, to wander,
Rahakarva, koalamah	Money fur, to amble
Uroisehe väkeh,	To the heroic people,
Miehisehe joukijoh	To the virile company,
Kullaista kujoa myöti,	Following a golden path,
Hopijeista tietä myöti	Following a silver way

(SKVR I 4.1203)

The mistress of the village welcomed the arrival of the hunter and the bear with these words:

Terve, ohto, tultuosi,	Welcome is your arrival, Ohto,
Mesikämmen, käytyysi!	Your visit, honey paw!
Jo on teälä pantu pöyvät,	Here the tables are already set up,
Jo on tehty viikon viinat,	The spirits were made a while ago,
Kauvon ostraset oluot	The barley beer brewed long since.

(SKVR I 4.1250)

During the “visit” of the bear the villagers organised a great feast and wedding between a boy and a girl. The feast and the false wedding were both strategies to join the bear to the kin of the village and to fuse the forest’s spiritual forces to the kinship of the community.

During the hunt a sexual relationship and marriage between the hunters and the forest maidens were required to join the hunter and the people of forest. During the bear feast the celebrations and the false wedding were useful in bringing together the bear and the people of the village. In both circumstances, we find a deep desire to join the village kin with the forest clan. This fusion is well represented in the following phase of the bear feast, when the villagers ate the meat and the head of the bear, singing:

Korvampa otan Oholta	I'll take the ear from Ohto,
Itse korvin kuullakseni	To hear with the same ear,
Silmänpä otan oh(olta)	I'll take the eye from Ohto,
Itse silmin nähäkseni	To see with the same eye.

(SKVRI 4.1242)

This was clearly a magical procedure to transfer the bear's powerful senses to the people and to symbolise a real bodily fusion between the bear and the villagers.

10. The bear-skull ritual

In the last part of the bear ritual, a procession carried the bones and the skull of the bear to a sacred grove of pines. Quite often the grove was situated on a small island (see Picture 1).⁷ When the villagers reached the grove or the island, the bear's bones were buried below the roots of a pine, and the skull was hung on a branch. When the last rite was performed, the hunters of Ilomansti (North Karelia) sang:

Minne saatit saalihisi,	Where did you bring your prey?
ennätit hyvän eräsi,	Where did you rush your good prey?
ootko jäälle jättänynnä,	Have you left it on the ice?
vaanko tiehen tellännynnä,	Have you chucked it on the path?
uhkuhun upottanunna?	Have you sunk it in the slushy snow?
En oo jäälle jättänynnä,	I haven't left it on the ice,
uhkuhun upottanunna,	I haven't sunk it in the slushy snow,
enk' oo tiehen tellännynnä;	I haven't chucked it on the street.
panin puuhun puhtahasen,	I hung it up on a clean tree,
petäjähän pienimmähän[!],	On the smallest of the pines,
honkahan havusatahan,	On a coniferous old pine,
panin kuuta kahtomahan,	I hung it up to watch the moon,
otavia oppimahan,	To learn the stars of the Great Bear,
päiveä tähystämähän.	To observe the sun.

(SKVR VII 5,3396)

Performing the last ritual, the bear “returned” to its birthplaces: the woodland and the sky. The circle of life of the bear could start anew. The skull ritual was probably the prelude to the bear’s future resurrection in the skies, “on the shoulders of the Great Bear”.

Notes

1. All 33 volumes of the SKVR were published in Helsinki by the Suomalaisen kirjallisuuden seura (Finnish Literature Society) from 1908 to 1948. It is now also possible to read the 86,084 folk poems of this collection on the web pages of the Finnish Literature Society at <http://dbgw.finlit.fi/skvr/skvr.phtml> and <http://www.finlit.fi/skvr/>.
2. The Folklore Archives are located on the first floor of the building of the Finnish Literature Society. The purpose of the archives is primarily to document oral traditions and to provide folklore material and help for researchers and institutions. Website: <http://www.finlit.fi/english/kra/index.htm>.
3. Savo is a region of east-central Finland, traditionally divided into North and South Savo.

4. Karelia is a wide and complex area, divided into several regions. Today only the region of North Karelia and a small part of South Karelia are located in the Republic of Finland, all the other Karelian regions (Viena Karelia, Olonets, Ladoga Karelia and Southern Karelia) are situated in the Republic of Karelia and in the (still so called) Leningrad oblast, both parts of the Russian Federation.
5. References to the unpublished material include the archival abbreviation (SKS stands for the folklore archives of the Finnish Literature Society), the collector's name (e.g. Karhu J.), the year of the field work (1936) and the text or manuscript number (3271).
6. References to the songs and poems published in SKVR include the code of the volume (VI 2) and the number of the poem (5414).
7. In the summer of 2006, during the archaeological and ethnographical field work of the Repovesi project, with the help of the excellent informant Jaakko Outinen and the national park's guide Paula Niskala, I was able to find and photograph one of these islands, the small Karhunpääsaari ("Island of the bear head") on Lake Korpijärvi, in the territory of Mäntyharju (South Savo). The island was mentioned in the oral narratives collected by Juho Karhu in 1936 in the same parish. A few days later Jaakko Outinen, during a boat trip on the same lake, found another island connected with the bear-skull rites, the even smaller Ykspetäjänsaari ("One bear-pine island"). This island, too, was mentioned by the informants of Juho Karhu.

On communication

I wish to start by denouncing *a fallacy* concerning the communication process.

When we consider the concept of “communication,” we generally think of a process of exteriorisation through which an interior content is made manifest. On this account, communication is an e-mission that starts from a being, the e-mitter, and takes place between the e-mitter considered as a *terminus a quo* and another being (the receiver) considered as a *terminus ad quem*. Communication is what happens *between one being* in the role of emitter and another being in the role of receiver. According to this model we have a being that communicates, that *first is* and *then communicates*, a being that *exists prior to and independently of its acts of communication*.

This conception of communication is not only widespread at the level of ordinary opinion, but is also shared by different theoretical positions which contrast with each other on other aspects, such as innatism and empiricism, mentalism and behaviourism. In any case, the conception of communication as the e-mission from a being which another being receives remains unquestioned.

This conception of communication is obviously connected to a given conception of being, to a given ontology. Just as communication in general is considered as a process beginning from a being, as an e-mission of being, being in general is considered as the presupposition and foundation of communication. Communication theory and ontology are in general closely connected: all communication theories have their ontologies, whether explicit or implicit; conversely, all ontologies have a theory of communication, even if it is not explicated.

Against this fallacy, a different conception of the communication/being relationship is now emerging: it may be summarised with the statement that “communication is being.” This statement can also be inverted as “being is communication.” But the first statement, “communication is being,” concerns communication theory – the object of analysis of this

presentation. The second statement, “being is communication,” concerns general ontology. In relation to the latter, “being is communication,” here we can only state that it concerns the inevitable connection between communication theory and ontology.

That communication is being is evident in two main sectors of knowledge and praxis, the scientific and the economic.

In scientific investigation, particularly important under this regard is the complex of disciplines concerning communication which focus on the organic world in its multiple aspects, from the great kingdoms to micro-organisms, collectively identifiable under the name of *biosemiotics*. In this sphere of scientific investigation, life and communication converge. *Communication* is not only the condition of life but also the criterion for its identification: a live being is a communicating being. Life = semiosis, that is, a process in which there are signs (to be precise “signs of life”).

Obviously, communication is not the externalisation of the living being, from bacteria or prokaryotes to cells with a membrane and nucleus or eukaryotes, from micro-organisms to organisms belonging to the three (or four) great kingdoms. Communication is the living being itself. In the organic world, to communicate is to be, and vice versa. To communicate is to persist in being, to maintain being, to confirm oneself as being, *conatus essendi*.

In the current phase of capitalist production, economy confirms identification between being and communication. This phase is characterised by the industrial revolution of automation, globalisation of communication and universalisation of the market. Such universalisation is not only a quantitative fact of expansion, but above all a qualitative transformation represented by the fact that anything can be translated into goods and by the continuous production of new goods-things. In the present day and age communication is no longer just an intermediate phase in the reproduction cycle (production, exchange, consumption). Far more radically, communication now represents the constitutive modality of production and consumption processes themselves. Not only does the *exchange* phase involve communication, but *production* and *consumption* too are communication. So the whole reproductive cycle is communication. This phase in capitalist reproduction can be characterised as the “*communication-production*” phase.

Communication-production means persevering in being, insisting on being, persisting, *conatus essendi*.

But *conatus essendi* of today's communication-production contrasts with *conatus essendi* of communication-life.

Persistence of communication-reproduction is *persistence of the same social form*, the capitalist. Capitalist society with its continual adjustments and metamorphoses functional to reproduction of this same type of society contrasts with *social reproduction* and with reproduction of life on the planet.

Reproduction of the same production cycle destroys: machines which it replaces with new machines because of competitive needs; jobs, to make space for automation with a consequent increase in unemployment; products on the market, stimulating consumerism; existing products, realising new similar products which immediately make the former obsolete; goods and markets, which cannot resist the competitiveness of global communication-production.

In spite of identification in ideological terms between the *conatus essendi* of communication-production and the *conatus essendi* of social reproduction, the *conatus essendi* of communication-production destroys those productive forces that cannot be contained within the boundaries of the current production system. Human intelligence, inventiveness, creativity are humiliated as such qualities in the human person are subjected to market trends, "to market logic."

The destructive character of the today's production system is also evidenced by the fact that it produces ever greater areas of underdevelopment as a condition of development, areas of human exploitation and misery to the point of nonsurvival. Communication-production is destructive because it is the communication-production of war. Moreover global communication-production is destructive not only with regard to social reproduction, human life, but life over the entire planet.

Another fallacy must now be mentioned. I am alluding to the fact that communication is mostly separated from modelling and dialogism. The terms "model" and "modelling" are used here as understood by Sebeok and his global semiotics. Sebeok developed the concept of modelling from the so-called Moscow-Tartu school, though he further elaborated it by relating it to the concept of *Umwelt* as formulated by Jakob von Uexküll. Modelling is the foundation of communication in all living beings. Communica-

tion necessarily occurs within the limits of a world and its characteristics as modelled by a given species, a world that is species-specific.

Jakob von Uexküll speaks of invisible worlds to indicate the domain which englobes all animals according to the species they belong to. What an animal perceives, craves, fears and predated is relative to its own world.

Human communication is the most complex and varied form of communication in the sphere of biosemiosis – the human animal is capable of modelling a potentially infinite number of possible worlds.

In light of Sebeok's biosemiotics, the concept of dialogism may be extended beyond the sphere of anthroposemiosis and applied to all communication processes.

But all communication processes are based not only on *modelling* (Sebeok), but also on *dialogism* (Bakhtin). We believe that modelling and dialogism are at the basis of all communication processes. The theory of autopoietic systems is incompatible with dialogism only if dialogism is understood reductively, that is, in terms of a communication model that describes the communication process in terms of a linear, causal process. Here dialogue is conceived as based on the conversation model governed by the turning around together rule. However, as suggested by Maturana another form of dialogic exchange is possible which is different from communication conceived as a linear process from source to destination, or as a circular process in which participants take turns in playing the part of sender and receiver. From this point of view, the dialogic model conceived by Maturana can be described in terms of pre- or anticomunicative interaction.

Modelling and dialogism are pivotal concepts in the study of semiosis. Communication is only one kind of semiosis and together with *semiosis of information* and *semiosis of symptomization*, *semiosis of communication* it presupposes the semiosis of modelling and dialogism. This emerges very clearly if in accordance with Peirce and his reformulation of the classic notion of *substitution* in terms of *interpretation*, the sign is considered firstly as an interpretant, that is, as a dialogic response foreseen by a specific type of modelling. Moreover, let us remember that Bakhtin's concept of dialogue also contributes considerably to extending this concept beyond the human world connecting dialogism with semiosis from Sebeok's biosemiotic perspective, namely according to the point of view of *global* semiotics

Translation from Italian by Susan Petrilli

Augusto Ponzio

Sémanalyse et sémiotique chez Julia Kristeva

Dans son livre *Le langage, cet inconnu* (1969a), Julia Kristeva trace le champ de la linguistique en indiquant les limites, notamment son incapacité à inclure et à considérer certains aspects du langage. Il s'agit de limites dues à l'histoire même de la linguistique et à ses liens avec la culture européenne, avec le phonocentrisme, avec la priorité ou l'exclusivité accordée à l'écriture alphabétique, etc. Il est nécessaire de souligner l'inscription de la linguistique dans une certaine tradition dont le développement est la grammaire générative, qui, à travers Chomsky, s'est définie comme une grammaire cartésienne (Ponzio 1992).

Depuis ces trente dernières années, la linguistique a approfondi son analyse en intégrant la réflexion sur le langage proposée par la philosophie du langage et la sémiotique. Nous pouvons retrouver dans la linguistique actuelle une réflexion épistémologique à laquelle a contribué, parmi d'autres, Julia Kristeva. Cette interrogation épistémologique s'est développée en même temps que la linguistique de l'énonciation. À la linguistique de la langue s'ajoute la linguistique de l'énonciation qui tient compte du discours comme acte et par conséquent du locuteur, du destinataire, de leurs intentions explicites ou implicites, du non-dit.

Mais, comme Julia Kristeva à plusieurs reprises l'a remarqué, si ce développement est certainement très enrichissant, il ne déplace toutefois pas les cadres épistémologiques de la tradition philosophique qui a présidé à la naissance de la linguistique. La linguistique de l'énonciation qui implique la notion du sujet ne s'interroge pas à fond sur cette notion.

Voilà pourquoi Kristeva a essayé déjà dès 1969 dans *Semeiotiké* d'opérer une sorte de court-circuit par la connexion de l'approche linguistique et sémiotique avec l'approche psychanalytique, en proposant sa "sémanalyse." Aussi bien l'ego cartésien que l'ego transcendantal de la phénoménologie husserlienne et le sujet de la linguistique de l'énonciation sont

tous confrontés avec le dédoublement du sujet que Freud a mis en forme lorsqu'il a proposé sa théorie de l'inconscient. La prise en considération de l'inconscient modifie fondamentalement l'objet de la linguistique parce qu'elle implique qu'on décrive la signification comme processus hétérogène.

Dans *Le langage, cet inconnu* une grande place est consacré aux écritures non alphabétiques. Dans la seconde édition a été ajoutée une note qui fait référence au concept d'écriture chez Derrida et à la question de la prédominance de la trace par rapport au vocal. Mais ce qui intéresse Kristeva c'est l'écriture au sens stylistique du terme, l'écriture littéraire: Mallarmé, Céline, Proust. Dans l'écriture littéraire se manifestent certaines composantes qui sont éclipsées dans l'usage quotidien de la langue. Il s'agit des composantes qui dans la théorie freudienne pourraient s'appeler des pulsions aux frontières entre le biologique et le symbolique. Le style «poétique,» au sens où les formalistes russes employaient le mot, c'est à dire le langage littéraire, peut être envisagé comme une modification du discours des genres quotidiens sous l'effet des pulsions ou des «processus primaires»

La signification comme processus hétérogène se manifeste dans l'écriture littéraire, qui est donc une expression plus complète du sujet parlant et de son hétérogénéité. Dans *La Révolution du langage poétique. L'avant-garde à la fin du XIXe siècle. Lautréamont et Mallarmé* (1974) Kristeva introduit une distinction entre le *symbolique* et le *sémiotique*. Le symbolique désigne le langage tel que le définit la linguistique et sa tradition, le langage dans son usage normatif. Le sémiotique renvoie aux processus primaires et aux pulsions qui entrent en contradiction avec le symbolique. C'est précisément dans le conflit entre le symbolique et le sémiotique que se produit l'écriture littéraire, ou comme nous le dirons simplement dorénavant: l'écriture.

Pour Kristeva l'écriture est une manière d'approcher le sémiotique et de lui trouver une traduction – une traduction verbale – dans le symbolique. On peut dire que l'écriture est un approfondissement du sémiotique; elle lui donne la parole. Sa valeur consiste précisément à approfondir l'expérience de l'hétérogénéité du procès de la signification. De ce point de vue, l'écriture est un élargissement de la rationalité. Elle produit une extension de l'horizon des interrogations sur le langage. Et ces interrogations engagent la dynamique du sujet parlant.

Si on prend en considération dans l'écriture la contradiction entre symbolique et sémiotique, on peut atteindre, dans l'interprétation d'un texte littéraire, un niveau sémantique décidément plus profond que celui qui est accessible aux approches traditionnelles. Le texte, dans son rythme même, véhicule parfois des messages hétérogènes par rapport à ce qui est explicite. Le repérage du sémiotique – l'attention au rythme mais aussi au découpage des lexèmes figés dans le signe linguistique, qui met à jour un autre agencement possible, une autre signification – permet à Kristeva de déchiffrer, dans *La révolution du langage poétique*, les textes littéraires, notamment Mallarmé.

Nous pouvons donc comprendre le double intérêt de Kristeva pour l'écriture et pour la psychanalyse, cette dernière envisagée aussi bien au niveau théorétique et méthodologique que thérapeutique. Aussi bien l'écriture que l'analyse, concernent les états-limites du langage. À partir de *La révolution du langage poétique*, Kristeva développe sa distinction entre sémiotique et symbolique dans un cadre analytique. Dans la cure analytique on se trouve face à des difficultés de parole ou de sens qui attestent une difficulté de vivre. De ce point de vue, entendre le sémiotique dans une situation où il est étouffé ou neutralisé dans le symbolique, c'est une manière pour l'analyste de redonner vie au patient. Ces situations d'hétérogénéité de la signification, dont la pratique analytique donne l'expérience directe, sont analysées par Kristeva dans ses livres *Folle vérité* (ouvrage collectif, 1979), *Pouvoirs de l'horreur. Essais sur l'abjection* (1980), *Histoires d'amour* (1983) et *Soleil noir, dépression et mélancolie* (1987). Dans des situations qui ne sont pas celles de l'écriture poétique mais celles de la cure analytique, l'attention à l'intonation et au rythme a autant d'importance que dans l'écriture. Dans *Soleil noir* nous pouvons trouver des exemples d'attention à l'égard de la parole psychotique, à un niveau du langage suprasegmental – diraient les linguistiques – c'est-à-dire à un niveau qui n'est pas celui des signes du symbolique mais qui implique le pré-langage qui, pour Kristeva, relève du sémiotique. Nous retrouvons ici la question, centrale dans *La révolution du langage poétique*, du repérage du sémiotique au moyen de l'attention au rythme mais aussi au découpage des lexèmes. À travers l'analyse du discours littéraire, mais aussi de celui des patients, Kristeva essaie de se tenir au plus près de la parole, en repérant des singularités à travers des indices très spécifiques (l'emploi de tel terme, le phonétisme du lexème, la construction syntactique, etc.) pour déceler la réelle relation entre sujet

et langage. Cela signifie aussi que l'on prête attention aux caractéristiques concrètes de la langue que certains linguistiques ont tendance à négliger. Par conséquent, la sémiotique, telle que Kristeva l'entend, est une discipline qui ne veut pas contourner la vie concrète de la langue.

La relation entre le symbolique et le sémiotique est envisagée par Kristeva dans son inhérence au contexte historique et social. Dans la conclusion du *Langage, cet inconnu* la sémioticienne soutient qu'on ne peut pas faire de la linguistique une science de la signification sans une théorie de l'histoire comme interaction de la pratique signifiante. La *Révolution du langage poétique* montre en effet en quoi les questions portant sur la pratique littéraire visent le contexte politique où se situe cette pratique, bien qu'elle échappe à ce contexte par sa capacité *exotopique*, ou si l'on préfère, *révolutionnaire*. L'écriture, en particulier celle de certains courants historiques comme le symbolisme, le surréalisme ou encore la poétique de la textualité de *Tel Quel* – les expériences qui intéressent Kristeva – prend on eux des comportements stylistiques et idéologiques qui sont des comportements critiques. Mais l'écriture, indépendamment de la position idéologique à laquelle elle peut être ramenée, est, en tant que telle, critique. Cette attitude critique a certainement aussi une précise origine historique. Nous l'avons héritée d'une civilisation qui a produit le droit des individus, ce qu'on appelle les droits de l'Homme. Or, l'aboutissement le plus exquis des droits de l'homme, c'est la reconnaissance de la singularité des sujets. Dans l'énonciation, cette singularité des sujets se manifeste à des degrés très différents. Kristeva analyse cette singularité dans deux types de parole distincts: celle des écrivains dans la littérature et celle des patients dans l'analyse. Pour Kristeva, il faut que la théorie du langage qui prend en considération ces sujets singuliers se demande, au préalable, comment élaborer une théorie suffisamment subtile pour rendre compte de ces inflexions singulières. Il s'agit donc d'une singularité historique, celle du sujet occidental. Aussi bien dans la lecture du texte littéraire que dans la pratique de l'écriture littéraire, on a affaire à une parole qui demande l'écoute. C'est une relation que Kristeva envisage en tant que relation d'hospitalité et d'accueil. Donc cette interrogation sur la singularité de ces sujets présente, selon elle, une dimension éthique.

Une autre situation dans laquelle se manifeste la signification comme processus hétérogène est celle du sujet qui ne parle pas sa langue maternelle mais une autre langue, qui, étant la sienne, résonne néanmoins comme

étrangère, tandis que sa propre langue vit dans la mémoire nocturne du corps, en tant que langage d'autrefois qui se fane sans jamais le quitter. Kristeva analyse cette situation dans une partie de *Étrangers à nous mêmes* (1988) intitulée «Le silence du polyglotte.» Le sujet qui parle une nouvelle langue peut se perfectionner dans le maniement de cet autre instrument, comme on s'exprime avec l'algèbre ou le violon, et ce nouvel artifice peut lui procurer d'ailleurs un nouveau corps, une nouvelle peau, mais sa parole reste parole des autres. Dans cette situation du sujet parlant entre deux langues, dans «cette anesthésie de la personne happé par une langue étrangère,» dans ce «mutisme polyforme» du polyglotte, l'hétérogénéité du procès de la signifiante apparaît aussi bien que dans la parole psychotique ou dans l'écriture, en mettant en évidence elle-même l'existence du dédoublement du sujet «unique» et «unitaire» de l'usage normatif de la langue.

Le titre du livre de 1969, *Le langage, cet inconnu* comporte, précisément dans l'adjectif «inconnu,» un motif qui se retrouve dans la recherche ultérieure de Kristeva sur l'«étrangeté.» Inconnu/étranger; ce motif est un aspect de la conscience linguistique et concerne les rapports entre le locuteur et sa langue, entre la langue et une autre langue, une culture et les cultures autres. Il s'agit de l'inconnu de/dans le langage qui concerne aussi notre conscience d'Européens, d'Occidentaux aujourd'hui plus que jamais à cause des récents événements historiques.

La question des étrangers, qui se pose aujourd'hui dans toutes les cultures et en particulier dans la culture européenne, est une question qui concerne l'identité. Or, le sujet individuel ou collectif, tels une communauté, un peuple, une nation, en tant que conscience des signes en quoi il consiste, est fondamentalement sa relation avec sa langue, avec ses langues. Donc son identité est fondamentalement linguistique. Par conséquent, le problème qui se pose à la veille du deuxième millénaire, qui s'est toujours posé mais qui prend aujourd'hui des formes violentes, celui de la définition du même et de l'autre, de l'identité nationale et de l'étranger, ne peut être abordé uniquement à travers la sociologie, la jurisprudence et la politique. Il s'agit d'une question qui met en cause le linguiste et le sémioticien dans leurs compétences spécifiques et à laquelle ils ne peuvent se soustraire en déléguant le politique, le sociologue, le juriste, l'expert en droit constitutionnel ou international et, à l'occasion, le stratège militaire.

Cela est vrai à plus forte raison s'il s'agit de la sémiotique qui, telle du moins que Kristeva l'entend, poursuit le but d'approfondir l'expérience de la signification comme processus hétérogène. De ce point de vue, ce qui est en question, c'est l'identité du sujet parlant, l'identité du sujet signifiant en général. Se rendre compte de l'hétérogénéité du procès de la signification, c'est entendre l'altérité dans l'usage du langage. C'est un entraînement à l'écoute, à l'accueil, à l'hospitalité que les sémioticiens peuvent communiquer et répandre. Nous considérons le livre de Kristeva *Étrangers à nous même* comme une remarquable contribution à cette tâche.

Suivant Kristeva, nous pouvons donner au problème de la définition du national et de l'étranger qui, comme nous l'avons dit, prend aujourd'hui des formes violentes, la formulation suivante: comment concilier le mélange des nations dans les États et la sauvegarde des cultures nationales? L'affirmation de la différence linguistique et culturelle peut se transformer en arrogance identitaire (la «boria delle nazioni» de Vico). Un exemple caricatural de cette morgue est donnée par Kristeva lorsque, en se référant à son expérience de romancière, elle affirme que le français peut accepter éventuellement un discours tendant un miroir à la société comme celui des *Samourais* (1979), mais qu'il perçoit celui qui manifeste une subjectivité écorchée, douloureuse, révélant une sorte d'enfer, comme une atteinte au bon goût.

Pour Kristeva, le sémioticien et le linguiste, ou toute personne qui s'intéresse à la vie de la langue, doit prêter aujourd'hui une plus grande attention à la fois au développement des idiomes et des cultures nationales – à leurs traditions, à la valorisation de leurs richesses – et à la possibilité d'évolution de ces dernières au contact des autres. Il ne faut pas que l'on perde l'accès à la culture antérieure, sans quoi la langue elle-même s'appauvrit, se banalise et frise le cliché.

Lorsque Kristeva écrit dans *Le Vieil Homme et les loups* (1991) que nous sommes dans une civilisation qui rappelle la fin de l'Empire romain, elle pense non seulement à la crise morale mais aussi à la perte de la tradition linguistique et culturelle qui la caractérise. Kristeva croit qu'il incombe aux littéraires, aux humanistes et surtout aux linguistes et aux sémioticiens non de transformer ce passé en musée en fonction d'une identité immobilisée par ses racines mais de le ranimer et de le revisiter. Il s'agit d'une source de richesse expressive offerte au sujet pour exprimer sa singularité. Plus le code à travers lequel l'individu s'exprime est restreint, plus l'éventail de la

créativité du sujet singulier est réduite. La valorisation de la tradition va de pair avec le métissage. Les implants de sensibilité étrangère, les greffes sur le «génie» de la tradition d'autres expériences, idéologiques, sensorielles, psychologiques qui peuvent paraître des entorses à cette tradition, représentent, en réalité, un enrichissement.

Étranger: rage étranglée au fond de ma gorge, ange noir troublant la transparence, trace opaque, insondable. Figure de la haine et de l'autre, l'étranger n'est ni la victime romantique de notre paresse familiale, ni l'intrus responsable de tous les maux de la cité. Ni la révélation en marche, ni l'adversaire immédiat à éliminer pour pacifier le groupe. Étrangement, l'étranger nous habite: il est la face cachée de notre identité, l'espace qui ruine notre demeure, le temps où s'abîment l'entente et la sympathie. De le reconnaître en nous, nous nous épargnons de le détester en lui-même. Symptôme qui rend précisément le «nous» problématique, peut-être impossible, l'étranger commence lorsque surgit la conscience de ma différence et s'achève lorsque nous nous reconnaissons tous étrangers, rebelles aux liens et aux communautés (Kristeva 1988: 9).

Étrangers à nous-mêmes analyse la présence et le destin de l'étranger dans la civilisation européenne, en soulignant le métissage de son passé et son avenir cosmopolite. Kristeva recherche le rôle de l'inquiétante «étrangeté» chez différents auteurs (Rabelais, Montaigne, Érasme, Montesquieu, Diderot, Kant, Herder, jusqu'à Camus et Nabokov) et à différents moments de l'histoire: les Grecs avec leurs «Métèques» et leurs «Barbares»; le Juif inscrivant Ruth la Moabite au fondement de la royauté de David; saint Paul qui choisit de prêcher en direction des travailleurs immigrés pour en faire les premiers chrétiens, etc.

La question de l'étrangeté traverse aussi un des derniers ouvrages de Kristeva, *Le temps sensible. Proust et l'expérience littéraire* (1994). Kristeva ne manque pas, quand l'occasion se présente, de relever le rôle que joue l'étrangeté (raciale: le juif; sexuelle: l'homosexuel) dans la *Recherche*.

Mais surtout *Étrangers à nous-mêmes* est une contribution à l'analyse critique de ce fantasme de l'étranger menaçant qui est en train d'envahir l'Europe aujourd'hui. Il s'agit, certes, d'une contribution apparemment modeste et microscopique, mais qui constitue, sans aucun doute, un modèle pour qui s'occupe de signes, de langues et de cultures et entend assumer ses responsabilités sans recourir à l'alibi de la spécialisation.

L'écriture, c'est-à-dire le langage littéraire, peut enrichir la compréhension de l'étrangeté, par son lien avec l'hétérogénéité dans la signification et l'altérité. Le texte littéraire se produit dans un contexte antérieur et synchronique avec lequel il est en dialogue.

Kristeva a contribué à faire connaître Bakhtine (cfr. «Une poétique ruinée,» présentation à la tr. fr. de Bakhtine, *La poétique de Dostoïevski*, 1970); et «Le mot, le dialogue et le roman,» in Kristeva 1969b). En se rapportant directement ou indirectement à Bakhtine (on peut voir Kristeva 1977), Kristeva a montré comment fonctionnent le dialogisme et la polyphonie dans le texte littéraire. L'écriture est nécessairement dialogique, nécessairement polyphonique, même si certains genres littéraires et certains textes rendent le dialogisme et la polyphonie plus évidents que d'autres: par rapport au dialogisme et à la polyphonie de Dostoïevski, Tolstoï semble un auteur monologique; Balzac ne présente pas la polyphonie de Joyce, mais on peut toutefois étudier le dialogisme du texte balzacien.

L'écriture nous permettant d'entendre l'altérité dans l'usage du langage peut contribuer à nous rendre plus capables d'aborder l'étrangeté. Plus nous nous reconnaitrons étrangers à nous-même, plus nous pourrions accueillir l'étrangeté d'autrui. En effet, comme Kristeva nous le dit, l'étrangeté d'autrui, qui provoque notre violence, est très souvent une mise en fantasme de l'altérité qui travaille les langues, les cultures, les énonciations, les rêves, c'est-à-dire quelque chose qui est en nous, qui nous échappe et que nous ne voulons pas regarder en face parce que nous le redoutons.

Une forme de citation atypique dans la presse écrite roumaine

1. Considérations préliminaires

Dans notre étude, on a isolé une forme de citation spéciale, identifiée dans la presse écrite roumaine, et on a essayé de la caractériser. On a nommé cette forme *atypique*, parce qu'elle se distancie, par certaines caractéristiques, aussi bien du discours direct que du discours indirect. Théoriquement, elle représente un discours inséré, émis antérieurement par une autre instance que l'auteur de l'article. De plus, on ne sait pas précisément si ce discours est reproduit tel quel ou sous une forme modifiée. En rapportant cette forme aux caractéristiques (syntactiques, sémantiques et pragmatiques) du discours direct et du discours indirect, on a constaté qu'elle ne correspond entièrement à aucune de ces deux modalités. Le teste de la ponctuation n'a pas réussi non plus à résoudre le problème concernant l'appartenance des exemples identifiés à un type de discours ou à un autre.

2. Repères terminologiques

On a choisi le terme général *forme de citation* pour désigner toute modalité de transférer le discours ou le message d'autrui dans le discours propre (de l'auteur de l'article) par l'intermédiaire de la modalité directe, par la modalité indirecte, ou par une reformulation du message de la source, à condition que la source soit indiquée explicitement. On a procédé ainsi, en réunissant toutes ces formes parce que: a) la citation, en tant que transfère d'un message dans un autre est commune aux deux types de discours (direct et indirect); b) dans les textes journalistiques, la source est indiquée explicitement, soit qu'il s'agisse du discours direct ou du discours indirect; c) de plus, étant donné les exemples atypiques, on ne pouvait pas anticiper leur appartenance à une modalité discursive ou à l'autre.

Toutes ces raisons nous ont conduit à choisir, pour nos exemples, le terme neutre *forme de citation*. Chaque exemple extrait des journaux quotidiens de la presse roumaine centrale constitue une forme de citation composée obligatoirement d'une séquence cadre et d'une séquence insérée. *La séquence cadre* est la séquence linguistique qui représente le contexte immédiat du discours inséré; elle appartient à l'auteur de l'article. Cette séquence peut précéder ou succéder le discours inséré et contient, obligatoirement, un verbe déclaratif (proprement dit ou secondaire). *La séquence insérée* est représentée par le discours cité directement ou indirectement; elle appartient à la source et non pas à l'auteur de l'article. On a nommé *émetteur* l'auteur de l'article de presse (l'instance communicative à laquelle appartient la séquence cadre), et qui ne se confond pas avec l'*archilocuteur*, instance qui représente *la voix du journal* (Mouillaud & Tetu 2003: 140). Il est celui qui émet le message de l'article, message par lequel on apprend que *la source X a affirmé quelque chose*. On a nommé *source* l'instance qui émet le deuxième message (le premier de point de vue chronologique) présent dans la séquence cadre (ce que X a affirmé), qu'est à dire celui dont les opinions ont été citées par l'émetteur, d'une manière directe ou indirecte.

3. Entre le discours direct et le discours indirect

Avant de continuer la démarche descriptive et argumentative, on va reproduire deux exemples dans lesquels la séquence insérée (appartenant théoriquement à une source citée) est soulignée et la séquence cadre (appartenant à l'émetteur) est représentée par le fragment linguistique non marqué. Dans le deuxième exemple, on a reproduit aussi entre parenthèses le contexte qui précède le fragment qui nous intéresse, pour rendre le contenu du message plus clair.

Exemple 1. *Les chefs des districts administratifs recevront 40 milliards lei du Ministère des Transports pour réaliser les mappes de risque naturel de chaque localité*, a annoncé le ministre délégué pour les Travaux Publics et l'Aménagement du Territoire, Laszlo Borbely. (G, 19 août, 2005: 5)

Exemple 2. [Deux plages de la proximité d'Athènes ont été polluées avec du pétrole, mais les autorités n'ont pas réussi à en établir la source, en soupçonnant que celui-ci pourrait provenir de Liban]. *La tache de pétrole*,

mesurant au moins 50 m en largeur, est apparue samedi à l'ouest d'Athènes, a précisé le ministre grec de la marine commerciale. (CB, 7 août: 5)

Pour démontrer que dans des exemples comme ceux d'en haut on rencontre une modalité de citation atypique, qui présente des similitudes aussi bien que des différences par rapport au discours direct et indirect, on va inventorier les propriétés syntactiques, sémantiques, pragmatiques et de ponctuation des deux types de discours, en les rapportant à nos exemples. La validité d'une telle façon d'aborder un type de discours, en le comparant avec un autre, dont les caractéristiques sont bien définies a été prouvée par Oswald Ducrot et Jean Marie Schaeffer (1996: 463) pour la description des propriétés du discours indirect libre.

3.1. Les propriétés du discours direct

La séquence insérée est indépendante du point de vue syntactique par rapport au verbe déclaratif. Entre la proposition incidente (qui appartient ou fréquemment se confond avec la séquence cadre) et la proposition principale, qui constitue la séquence insérée il n'existe ni un rapport de coordination, ni de subordination syntactique. De ce point de vue, la forme de citation identifiée par nous se comporte identiquement au discours direct. De plus, aussi bien que le discours direct, notre forme de citation n'implique la présence d'aucun connecteur, d'aucune conjonction de subordination.

La position de la séquence cadre est mobile par rapport à la séquence insérée. Des trois descriptions formelles possibles, notre forme de citation actualise seulement la suivante (dont les termes sont fixes): [*séquence insérée*] + [,] + [(*verbe déclaratif*) *séquence cadre*], comme dans l'exemple suivant:

Exemple 3. La confiance réciproque dans les relations sino-russes va s'augmenter exponentiellement à la suite de ces exercices [militaires] communs, soutiennent les officiaux de Kremlin et de Beijing. (G., 19 août, 2005: 9)

Si on renverse l'ordre: séquence insérée / séquence cadre, on obtient un fragment de discours indirect, mais alors cette chose entraîne une modification importante, c'est à dire la présence d'un élément de subordination, la conjonction *que*:

Les officiaux de Kremlin et de Beijing soutiennent *que* la confiance réciproque dans les relations sino-russes va s'augmenter exponentiellement à la suite de ces exercices [militaires] communs.

Dans le discours direct, les verbes ou les expressions déclaratifs peuvent parfois manquer (lorsqu'il s'agit des certaines formes de dialogue), pouvant être récupérés du contexte. La forme de citation étudiée ici ne peut pas se dispenser de la présence du verbe déclaratif. En l'absence de celui-ci et, implicitement, de la séquence cadre, le message semblerait appartenir à l'émetteur (l'auteur de l'article) et non pas à la source.

La classe des énoncés qui constituent la séquence insérée est typologiquement diverse, incluant des énoncés assertifs, exclamatifs et impératifs. La forme de citation qui apparaît dans nos exemples se réalise seulement par que des énoncés assertifs.

Dans les séquences insérées du discours direct on rencontre souvent des marques discursives orientées vers un allocutaire, telles: *enfin, vous savez, si vous voulez*, etc. Cette propriété ne se retrouve pas dans la forme de citation investiguée dans notre étude.

La séquence cadre du discours direct n'admet pas tout verbe déclaratif. La sélection est opérée en fonction la situation de communication. Notre forme de citation présente aussi des restrictions concernant le verbe déclaratif, mais il ne s'agit pas de mêmes verbes. D'un côté, la sélection de certains verbes déclaratifs se produit sous la pression du style: les exemples appartiennent au langage journalistique, étant des textes de la catégorie informative, qui exigent au moins une prétendue objectivité. De toute façon, l'objectivité absolue est bien discutable, étant contestée par beaucoup d'auteurs. Selon Fiske (2001: 113), on est ce qu'on dit être et le monde est ce qu'on prétend être. Alors, comme on a déjà observé (Charaudeau 1997; Preda 2006: 21), la presse mime plutôt l'objectivité qu'elle ne la pratique. De l'autre côté, la sélection de certains verbes déclaratifs est imposée par l'absence des structures conversationnelles dans les textes qu'on étudie (on ne s'occupe pas des articles interviews). Alors, l'incidence des verbes qui expriment des stratégies conversationnelles est pratiquement nulle dans notre forme de citation.

La séquence insérée est marquée par des signes de ponctuation spécifiques (guillemets, crochets ou ligne de dialogue). La forme de citation qu'on étudie ne présente jamais ni de guillemets, ni de lignes de dialogue,

fait qui la distancie du discours direct. Elle réclame seulement la virgule, qui sépare la séquence insérée de la séquence cadre, et ce trait est commun aussi au discours direct. Pourtant, si dans nos exemples on ajoute à la séquence insérée des guillemets, on va obtenir des fragments de discours direct cité:

Exemple 4. La génération baby-boom promet de changer encore plus profondément la définition du vieillissement, a dit Louis Kincannon. “Jusqu’à la retraite, ils seront les vieux les plus instruits de toute l’histoire de l’Amérique”, a continué celui-ci. (EZ, 11 mars, 2006: 10)

Dans la première phrase on rencontre la forme de citation qui fait l’objet de nos préoccupations. Dans la deuxième, il s’agit de la reproduction d’un fragment du discours direct. Théoriquement, si on élimine les guillemets de la première phrase, on obtient une structure identique à celle de la première phrase. Pourtant, à cause du verbe déclaratif *continuer*, qui ne peut pas être sélectionné par la forme de citation qu’on étudie, la transformation ne peut pas être menée à bonne fin. Au contraire, si on entreprend l’opération inverse, en appliquant les guillemets à la séquence insérée de la première phrase, on obtient, indubitablement, un échantillon de discours direct. Autrement dit, la transformation du discours direct cité dans la forme de citation dont on parle peut rencontrer des difficultés, tandis que l’opération inverse est plus simple. Excepté les signes de ponctuation, cette transformation n’entraîne aucune modification (comme il arrive lorsqu’on transforme le discours direct en discours indirect ou vice versa). On remarque la même chose dans les exemples suivants:

Exemple 5. La génération actuelle de personnes à la retraite, qui représente 12% de la population des États-Unis [...] ne ressemble plus aux générations précédentes, montre un rapport du Bureau pour le Recensement de l’Institut National pour le Vieillissement. (EZ, 11 mars, 2006: 10)

Exemple 6. “Les Américains vieux d’aujourd’hui vivent plus, ont moins de problèmes de santé, sont des gens qui ont étudié plus, et le nombre de ceux qui vivent dans la pauvreté est plus petit qu’auparavant” montre le rapport. (EZ, 11 mars, 2006: 10)

Si on éloigne les guillemets de l’exemple 6, le fragment devient similaire à l’exemple 5, parce que, pratiquement, les deux ont la même structure, qu’on a décrite en haut: [séquence insérée] + [,] + [(verbe déclaratif) séquence cadre]. Le seul élément qui nous permet de considérer que seul

l'exemple 6 représente un échantillon du discours direct est la ponctuation, plus précisément les guillemets. Encore, la présence de la proposition incidente (la séquence cadre) ne représente pas un élément différenciateur entre les deux exemples, sinon un élément qui les approche.

3.2. Les propriétés du discours indirect

La séquence insérée est dépendante du point de vue syntactique par rapport au verbe déclaratif de la séquence cadre; la dépendance est marquée par des connecteurs syntactiques tels: *că, să, dacă* (*que, de, si*). Or, dans notre forme de citation, la séquence insérée est indépendante de point de vue syntactique par rapport à la séquence cadre et au verbe déclaratif et ne comporte aucun connecteur, aucune conjonction de subordination. Pourtant, si on supprime la séquence cadre, contenant le verbe déclaratif, l'opération entraînera une modification majeure. Ce qui représentait la séquence insérée appartenant à la source semblerait maintenant appartenir à l'émetteur, produite par lui-même, un fragment de son discours direct. Alors, éliminer le verbe de déclaration serait supprimer la séquence cadre et affecter l'instance productrice de l'ancienne séquence insérée (devenue discours indépendant).

Le verbe déclaratif se trouve toujours avant la séquence insérée. A ce point, la forme de citation repérée dans nos exemples diffère aussi par rapport discours indirect.

La séquence insérée du discours indirect présente des restrictions dans la sélection du verbe déclaratif de la séquence cadre; tous les verbes déclaratifs qui apparaissent dans la séquence cadre de la forme de citation qu'on étudie sont admis également dans la séquence cadre du discours indirect.

La séquence insérée du discours indirect n'est pas marquée par des signes de ponctuation spécifiques (guillemets ou lignes de dialogue). La séquence insérée de la forme de citation discutée ici n'en est pas marquée non plus.

4. Conclusions

Le discours journalistique actuel développe une forme de citation atypique, dont la structure peut être décrite par la formule suivante:

[séquence insérée] + [,] + [(verbe déclaratif) séquence cadre].

Le rapport entre les traits syntaxiques de la forme de citation investiguée et l'inventaire des traits syntactiques du discours direct montre qu'entre les deux il y a à la fois des similitudes et des différences: les deux se comportent identiquement en ce qui concerne la relation entre la séquence insérée et la séquence cadre (qui sont indépendantes dans les deux cas). C'est l'argument le plus fort en faveur du rapprochement des deux types de discours.

Quant à la position de la séquence cadre la ressemblance ne fonctionne plus; à la différence du discours direct, dans notre forme de citation celle-ci occupe uniquement la position finale.

Toujours de point de vue syntactique, la forme de citation rencontrée dans nos exemples diffère nettement du discours indirect par la position de la séquence cadre (qui occupe toujours la première place dans le discours indirect), par le manque du rapport de subordination et, implicitement du connecteur spécifique.

Ni de point de vue sémantique ou pragmatique, la forme de citation ne présente pas une ressemblance parfaite au discours direct ou indirect.

Concernant la ponctuation, la seule similitude entre le discours direct et notre forme de citation est l'isolation par virgule de la séquence cadre (qui fonctionne comme une proposition incidente, indépendante).

L'absence des signes spécifiques qui marquent la séquence insérée constitue un argument solide et visible qui rapproche notre forme de citation au discours indirect.

La forme de citation étudiée se distancie donc également par rapport aux formes consacrées de citation du discours direct et indirect, en conservant des traces spécifiques.

Considérer cette forme de citation plus proche d'une certaine forme de discours que de l'autre nous oblige aussi à la reconsidérer l'émetteur réel de la séquence insérée.

Par conséquent, notre recherche conduit aussi à la conclusion qu'on ne peut pas affirmer catégoriquement que la séquence insérée appartient entièrement à la source ou à l'émetteur.

Cette observation impose une distinction (obligatoire dans nos recherches à partir de ce moment), entre la forme de citation qui représente, en fait, le discours de l'auteur de l'article (qui cite seulement le message, le contenu de ce que la source dit) et les formes de citation en discours direct ou indirect.

Entre les deux derniers il y a des différences sur lesquelles on ne va plus insister. Mais entre la première forme de citation et ces deux derniers il y a encore une différence: l'auteur de l'article peut transmettre le message de la source par l'intermédiaire de ses propres mots ou seulement en "collaborant" avec celle-ci, tandis que la reproduction en discours direct n'admet aucune immixtion dans la séquence citée; quant au discours indirect, les modifications sont limitées, prescrites par les grammaires.

D'un cas à l'autre, il est possible que la source ait émis la séquence insérée telle quelle et que l'émetteur ait omis seulement les signes de ponctuation spécifiques à la citation directe ou, par contre, que la séquence insérée eut été transmise par l'émetteur, en supportant certaines modifications de la part de ce dernier.

Les exemples discutés ici ont été extraits de textes de presse, basés sur des enregistrements ou des interviews; en conséquence, on ne peut pas avoir un contrôle absolu sur la variante initiale de la séquence attribuée à la source. Alors, on ne peut qu'observer la distance de la forme de citation analysée ici par rapport au discours direct et indirect (on ne sait pas si l'auteur a reproduit en tant que tels les mots de la source, s'il y a ajouté ses propres mots, s'il en a supprimé, s'il les a transposés en discours indirect, en opérant les modifications permises etc.).

On peut signaler également la probabilité majeure que cette forme de citation soit, en fait, une production discursive de l'auteur de l'article, qui a maintenu le message et une bonne partie des mots de la source.

Cette ambiguïté maintenue en ce qui concerne d'un côté l'émetteur réel de la séquence insérée et, de l'autre côté, l'appartenance de la forme de citation étudiée ici à un type de discours ou à un autre peut indiquer: a) le refus de l'auteur de l'article d'assumer ses propres mots (en les attribuant à la source); b) la distance qu'il prend par rapport à ce que la source affirme; c) une façon d'imprimer certaines nuances au message transmis, en manipulant le lecteur.

Cuando el cine va a la tapa: Un recorrido por las revistas del siglo XX

Este trabajo se propone caracterizar los distintos procedimientos discursivos a través de los cuales el cine y lo cinematográfico se hacen presentes en las tapas de las revistas argentinas del siglo XX, establecer períodos en función de los procedimientos predominantes en cada etapa y analizar el lugar que ocupan esos discursos dentro del universo cinematográfico.

¿Por qué, entre la infinidad de temas llevados a las tapas de revistas, elegir el cine para observar los procedimientos discursivos? Por un lado porque su presencia en las tapas recorre prácticamente todo el siglo: en el ejemplar de *Caras y Caretas* del 18 de Enero de 1902 ya se puede encontrar en la ilustración de tapa un local de kinetoscopios. Por otro lado, desde mediados de la década de 1910, la sostenida popularidad del cine hizo de él un tema de tapa recurrente. Esta permanencia – corroborada en el corpus utilizado – permite considerar al cine y a lo cinematográfico como una invariante referencial a partir de la cual estudiar los cambios en la construcción de los enunciados-tapa durante el período. Además, el cine es un tema de particular interés dado que el atractivo que ejerce sobre el público excede la sala cinematográfica e impacta sobre el imaginario social. En este sentido, por ejemplo, Traversa ha analizado cómo ciertos avisos de la prensa gráfica del período de entreguerras recurren a las estrellas de cine y a la escena misma de expectación cinematográfica como instrumento persuasivo (1997: 95–102).

1. ¿Cuándo el cine está en la tapa?

El corpus analizado¹ está compuesto por tapas de revistas argentinas de gran circulación de distintos géneros (femenino, interés general, deportes,

humor, infantil, etc.), con una base de dos ejemplares por año de cada una escogidos al azar. Hemos excluido del análisis las revistas especializadas en cine o espectáculos debido a su especificidad genérica: la presencia del cine en esas tapas es más o menos obligatoria. Y lo que nos proponemos en este trabajo, en cambio, es observar cómo es presentado el cine en aquellas tapas en las que, a priori, puede o no estar presente (y de hecho, no lo está siempre).

Del análisis inicial del corpus surgió la necesidad de delimitar en qué casos se puede considerar que el cine está presente en la tapa. Sería incompleto considerar únicamente aquellos enunciados-tapa en los que se lee la palabra “cine”, o se ve la ilustración o fotografía de algún elemento fuertemente identificado con lo cinematográfico (una cámara, sala o proyector, etc.). De aplicarse este criterio debería considerarse que, por ejemplo, no hay presencia del cine en la tapa de *Gente* del 18 de Mayo de 1967, en la que se lee “En Hollywood con Vittorio de Sica” y se reproduce una fotografía de De Sica.

La solución a esta dificultad es incluir en el análisis, además de los casos de presentación del cine en “grado cero”, aquellos en los que se lo lleva a la tapa mediante alguna operación retórica. Metz propuso para el estudio de las operaciones retóricas en el cine un modelo que entendemos es aplicable, al menos con fines heurísticos, para analizar dichas operaciones en las tapas de revistas, ya que los enunciados de las mismas están contruidos a veces sólo con textos, otras sólo con imágenes, y otras con texto más imagen. Los cuatro figuras básicas propuestas por Metz (1979: 162–163) se caracterizan por los encadenamientos a) *Comparabilidad referencial + Contigüidad discursiva*; b) *Comparabilidad referencial + Comparabilidad discursiva*; c) *Contigüidad referencial + Comparabilidad discursiva*; d) *Contigüidad referencial + Contigüidad discursiva*. De acuerdo a este modelo, en el caso mencionado, el cine se presenta en tapa mediante un encadenamiento de contigüidad referencial – De Sica es parte del cine – y contigüidad discursiva – no se menciona al cine, pero sí “Hollywood” y “De Sica”, y se ve la foto del director.

Esta opción metodología nos lleva a incluir en nuestro análisis los enunciados-tapa que remiten a films específicos, a sus protagonistas, a las reacciones de los espectadores ante una película, etc., así como aquellos en los que el cine se hace presente en la tapa a través de citas de afiches, de títulos de films, de elementos icónicos fuertemente identificados con un

género (tapa que imita un cartel de “Wanted”), reproducción de fotografías, etc.

En algunos de estos enunciados-tapa el cine o la persona, actividad o institución ligada a lo cinematográfico son *aquello de lo que se habla*; en otros, el cine aparece en el plano del discurso como parte de una operación retórica para *hablar de otra cosa*, como de un hecho político o social, de personajes no ligados a la actividad cinematográfica, etc.

Consideramos que en ambos casos existe una presencia del cine en tapa. En uno, porque el enunciado remite a personas y hechos ligados con la realización y expectación de films. En el otro, porque se apela a la enciclopedia cinematográfica culturalmente compartida por una parte de la comunidad -como mínimo la de los potenciales lectores/compradores de la revista- indispensable para entender el enunciado.

2. *¿Cómo el cine está en las tapas?*

Desde 1917, año a partir del cuál el cine es tema de tapa frecuente, se pueden distinguir tres periodos en función del modo predominante en que es llevado a la tapa.

2.1. 1917–1960: Las Estrellas

Hasta pasada la primera mitad del siglo, las tapas donde el cine está presente se caracterizan por la exhibición de fotos o ilustraciones de actrices. Las imágenes ocupan la mayor parte de la tapa, a veces acompañadas por textos breves, habitualmente impresos en tipografías muy pequeñas. Esos textos – cuando existen, en muchos casos están ausentes – suelen indicar el nombre de la estrella y el del estudio con el que tiene contrato. En algunos casos hay, además, alguna leyenda que permite identificar a dicha tapa como perteneciente a una serie por ejemplo “Las estrellas del cine”. En otros, la tapa está desprovista de textos salvo por el nombre de la revista, los datos del ejemplar (número, año, etc.) y, en algunos casos, la firma del ilustrador (figura 1).

Este tipo de tapa no es exclusivo de los casos en los que se hace presente el cine: es largamente el predominante en el período. Grow (2004) la ha definido como *tapa póster*, y la describe como “una en la que no hay títulos o temas anunciados y la imagen generalmente no está cubierta por el logo

Figura 1.

(de la revista) ... Incluye aquellos casos donde hay pequeños títulos”. Sin embargo, esa generalidad no impide observar que existe una fuerte relación entre el nacimiento y expansión de la tapa póster y el cine, ligada al *star system*. Como señala Taylor (2006: 19–21):

el embrionario star system de Hollywood catalizó la tapa de revista moderna y el fenómeno de la celebridad contemporánea ... como el medio tapa de revista, la celebridad es un fenómeno del siglo XX ... la transformación de la mera fama ... en la instantaneidad e inmediatez de la celebridad dependió del nacimiento de los medios de comunicación de masas dentro del periodo 1890- 1910.

Por otra parte Benjamín ha señalado que en el periodo de expansión del cine “a la atrofia del aura” del cuerpo del actor y de su personaje “el cine responde con una construcción artificial de la *personality* fuera de los estudios; el culto a las ‘estrellas’” (1982: 39). En síntesis: las estrellas de cine fueron las primeras personalidades que ocuparon las tapas póster; luego, a lo largo del siglo, la noción de celebridad se expandió a otras áreas como el deporte, la política, etc. y sus protagonistas encontraron también su lugar en las tapas.

Otra característica de la tapa póster de este período apuntada por Grow es que en la mayoría de los casos “ni siquiera se relacionan con un artículo dentro de la revista”. Cingolani (2005) señala que recién después de mediados de siglo la tapa establece una promesa sobre lo que el lector encontrará en el interior de la revista. Para Cingolani, *exhibición, lectura* y una tercera instancia a la que llama *almacenamiento* (aquella que se corresponde con la interrupción de su uso y el estacionamiento del ejemplar), “operan como condiciones de producción que marcan las diferentes propiedades de construcción de la tapa”. Si se analiza la tapa póster con estrellas de cine en relación con la instancia de almacenamiento y se conjuga, con el hecho de que Grow (2004) al describir estas tapas afirma que “se trata de arte, muchas de estas tapas consisten en espléndidas ilustraciones o fotografías cautivantes”, puede pensarse que esas tapas tendían a facilitar la visualización de cada ejemplar como parte de una colección. Este aspecto en algunos casos se encuentra reforzado por la continuidad de una leyenda de presentación a lo largo de una serie extensa de números como ocurre en el caso de las tapas de *Mundo Argentino* y la leyenda al pie “Las estrellas del cine”, que fue habitual durante no menos de 15 años.

2.2. 1960 – Primera mitad de la década de 1980: El universo cinematográfico

Al final de la década del 50 se produce un cambio de tendencia en el modo predominante de presentación del cine en las tapas que se consolida en las décadas siguientes. Los enunciados que ponen al cine en tapa se refieren a filmaciones, entrevistas a figuras, estrenos, situaciones personales ocurridas a celebridades del medio, hechos de censura, éxitos o fracasos de taquilla, etc. En algunos casos hasta es posible encontrar en la misma tapa más de un enunciado ligado a lo cinematográfico. Este cambio notorio es posible porque paralelamente se producen en un nivel general importantes transformaciones en el diseño: la tapa póster es desplazada por otro tipo de portada en la que los títulos y subtítulos cobran creciente importancia. En palabras de Grow (2004) “las imágenes en las tapas de muchas revistas comienzan a ceder un espacio significativo a los títulos”. La importancia creciente de los títulos se manifiesta no sólo por su cantidad, sino también por la variedad de tipografías y colores y el aumento de su tamaño. Las tapas de este período dan cuenta de una búsqueda de integración entre la

imagen (por lo general única) y los títulos. Respecto de estos últimos, aún es posible identificar el título principal porque es aquel que forma con la imagen un enunciado mixto. En este tipo de tapa, cuando el cine está presente, la mayor parte de las veces comparte el espacio con otros temas; en algunos casos es presentado en el enunciado principal y en otros, en uno de los enunciados secundarios.

En este período, los enunciados cuyo tema es el cine tienen un carácter doblemente específico; por un lado se refieren a films, hechos y/o personas de manera puntual, si el cine aparece en la tapa a través de uno de sus protagonistas lo hace bajo la forma del anuncio de una entrevista o un suceso ocurrido a esa persona o, si los enunciados aluden al cine como actividad, mencionan la filmación o estreno de una película, un hecho de taquilla o de censura específico, etc. Pero además cada uno de estos títulos está directamente conectado a una nota que se despliega dentro del mismo ejemplar. Estas dos maneras en que los enunciados apuntalan su especificidad están directamente relacionadas. Como señala Cingolani (2005), después de la mitad del siglo XX “en la instancia *exhibición* la tapa establece una promesa sobre el interior ... en la instancia *lectura* esa promesa se torna realizable”. Y es esta misma condición la que hace que esos títulos se refieran a hechos actividades y personas modos más puntuales: si se anticipa que el lector da por sentado que la relación entre el título y el interior de la revista es similar a la que la punta del iceberg tiene con el iceberg, el título está obligado a dar cuenta de lo que el lector encontrará si accede al interior del ejemplar. En este sentido, Oscar Traversa, al analizar la tapa como dispositivo señala que ella debe dar cuenta de otro espacio, el del interior de la revista con el cual guarda alguna relación de consistencia. Por ejemplo si en la tapa de la revista *Gente* del 20 de abril de 1967 el título da cuenta de que los actores Luis Sandrini y Malvina Pastorino están rodando una película con el futbolista Silvia Marzolini, y la imagen de tapa los muestra a los tres (figura 2), dicho enunciado es interpretado como la promesa de una nota que tratará sobre el rodaje de dicha película.

2.3. Segunda mitad de la década de 1980–2000: El cine para decir el mundo

Si bien en la parte final del siglo el modo de presentación que caracterizamos para el periodo de *El universo cinematográfico* mantiene su vigencia,

Figura 2.

paralelamente se vuelve relevante otro modo. Se trata de un procedimiento que tiene unos pocos antecedentes en tapas de períodos anteriores, y que recién comienza a ser empleado con frecuencia en la década del 80 en las revistas humorísticas, y en la siguiente se extiende a publicaciones de interés general. Se caracteriza por la puesta en tapa de elementos de lo cinematográfico (títulos de películas, fotogramas, elementos icónicos ligados a un género, etc.) como parte de enunciados referidos a otros temas. En los términos de Metz discutidos anteriormente, en estos casos el cine o lo cinematográfico está presente en el discurso pero no en el referente; lo cinematográfico forma parte de una operación retórica caracterizada por la comparabilidad referencial, mientras que en el nivel del discurso puede haber contigüidad o comparabilidad.² Un ejemplo puede observarse en la tapa de *Noticias* del 27 de septiembre de 1992 (figura 3). El título principal, en tipografía de gran tamaño, es “Buenos Muchachos”; y sobre él una volanta reza “Lescano, Cavalieri: El sindicalismo hedonista”; la bajada enumera algunos gastos de dinero de ambos dirigentes sindicales, su afición al juego y ciertas denuncias judiciales de las que son objeto. Este enunciado se completa con una imagen de fondo que abarca prácticamente toda la superficie de la tapa: una ilustración de los dos dirigentes sindicales alrededor de una mesa de juego, de tapete verde, en la que se ven, entre otros objetos, fichas, naipes y una botella de alcohol. Cavalieri – su representación – está vestido con una camisa blanca con brazaletes negros, chaleco a rayas, y moño; Lescano, también de camisa blanca, tiene tiradores, sombrero de ala y corbata. En conjunto, sus atuendos no se corresponden

con hábitos vestimentarios contemporáneos a la publicación de la revista. Este aparente desajuste está justificado en el interior del ejemplar con el siguiente texto: “La tapa de este número de NOTICIAS fue concebida ... como si se tratara del afiche publicitario de un filme ambientado en el Chicago de los años de la ley seca”.

Figura 3.

En este caso el procedimiento se verifica a nivel del enunciado mixto (texto+imagen) aunque también se encontraron en el corpus casos donde es posible verificarlo en el nivel del texto solamente, como en la tapa de la revista *Veintiuno* del 16 de julio de 1998: “Ascenso, cuelgue y caída del Windows 98. Tócala de nuevo, Bill”.

Queda claro que en ambos casos el título de tapa funciona como un anticipo del contenido de una nota interior. Su característica diferencial reside en el tipo de construcción que realizan de la figura que Sophie Fisher y Eliseo Verón (1986), siguiendo la teoría de las modalidades de Culioli, denominan co-enunciador (imagen del destinatario construida por el enunciado). Al igual que en los enunciados del segundo período,

los de este construyen un co-enunciador poseedor de algún tipo de saber acerca del cine (background). Pero además, le atribuyen al co-enunciador un cierto saber acerca de otro tema, aquel al que se refiere la nota en el interior de la revista, indispensable en estos casos para comprender la operación retórica.

Estos enunciados aportan a la tapa más de un plus. Por un lado llaman la atención sobre el título, lo espectacularizan. Grow (2004) afirma que desde mediados de los 70 se producen progresivamente modificaciones en el diseño de las tapas por las cuales “el periodismo (lo informativo) va cediendo lugar a la persuasión”; el empleo de operaciones retóricas como las que caracterizamos puede pensarse así como una estrategia persuasiva. Por otro lado este tipo de enunciados reúnen una de las características de lo que Fisher y Veron (1986) designan como *estrategia de la complicidad*, “el enunciador y el destinatario se parecen: comparten un estilo de vida”. Puede decirse que enunciador y destinatario comparten no sólo una competencia cinematográfica sino además una actitud burlona, irónica, distanciada respecto del referente.

Freud (1979), observa que en “el chiste hallamos un innegable placer al trasladarnos por el uso de una misma palabra o de otra análoga de un círculo de representación a otro muy lejano”. Entendemos que este tipo de placer que Freud adjudica al chiste se produce también cuando el actor social lector reconoce la operación retórica propuesta por el enunciado-tapa.

Finalmente, el empleo de estas operaciones retóricas no es un únicamente un recurso estético; aquello que se dice mediante una operación de comparabilidad referencial no podría ser dicho sin recurrir a ella. Como ha señalado Eco (1991: 398): “el proceso retórico se convierte en una forma autorizada de conocimiento o, por lo menos, en un modo de poner en crisis el conocimiento adquirido”.

3. *Las tapas y su lugar en la actividad cinematográfica*

Analizaremos ahora qué lugar ocupan los enunciados tapa correspondientes a cada uno de los períodos señalados dentro de la actividad cinematográfica. Partiremos del concepto formulado por Traversa (1984: 41-43) de *estado no filmico del film*: este termino denomina “globalmente el universo heterogéneo de producciones significantes que se intercambian socialmente a propósito de los filmes”. Este conjunto de discursos (la prensa, la

radio, la TV, el afiche callejero) constituyen una “segunda existencia del film”, se trata de “discursos de contacto” entre la producción y el consumo.

La gran mayoría de los enunciados de nuestro corpus correspondientes al segundo período integran ese conjunto de discursos llamado “estado no filmico del film”. En efecto hacen referencia a filmaciones, estrenos, éxitos, escándalos, protagonistas, ligados a películas en cartel al momento de la publicación de la revista.

Otros enunciados pertenecientes al mismo período hacen referencia a hechos “privados” ocurridos a personas ligadas a la actividad (ej. “Los asesinos de Sharon Tate”, *Gente* 11 de diciembre de 1969). Estos enunciados tienen un doble anclaje: se refieren cuestiones que serían igualmente de interés periodístico si estuvieran ligadas a celebridades no cinematográficas, o hechos en sí mismo “periodísticos” cuando les ocurren a personas no famosas; pero la inclusión en ellos del nombre de una celebridad cinematográfica, los relaciona también con el cine.

Hay un tercer tipo de enunciados que no hacen referencia puntualmente a ninguna película pero sí a cuestiones ligadas a la actividad cinematográfica en general (ej. “Argentina. Agoniza el cine”, *Gente*, 13 de noviembre de 1969). En este sentido, guardan un parentesco con los enunciados predominantes del primer período, en los que no se hacía mención de ningún film en particular. Para estos casos – tanto el tercer tipo de enunciados del período de *El Universo cinematográfico* como los característicos del período *Las Estrellas* – entendemos que podría emplearse la noción de *estado no cinematográfico del cine*: se trata también de discursos de contacto entre las instancias de producción y consumo, y pertenecen al conjunto de producciones significantes que se intercambian socialmente a propósito del cine en general y no a propósito de films particulares.

Por último, en el período *El cine para decir el mundo*, encontramos que permanecen los tres tipos de enunciados enumerados para el período anterior. Pero además, se vuelven relevantes los casos en los que el cine es parte del enunciado pero no del referente. La especificidad de estos enunciados está dada porque en este modo de presentación del cine, al empleársele para decir algo acerca de otra cosa, se desatiende su carácter de industria (y en parte, su carácter de relato). Siguiendo el modelo propuesto por Verón (1988: 124–133), en todos los otros tipos de enunciados analizados, el cine es el *objeto* de los discursos. En cambio, en los casos en que el cine sólo es parte del enunciado, está entre las *condiciones de producción* del discurso

que lo pone en tapa. En este sentido, podría pensarse que estos discursos no funcionan como contacto entre las instancias de producción y consumo (aunque necesariamente la cita de un título o una escena convoca al film mismo).

Notas

1. Este trabajo forma parte del proyecto de investigación “Modalidades de figuración de las tapas de semanarios argentinos del siglo xx”, y el corpus es común a todos los trabajos que integran el proyecto.
2. En el nivel del discurso, en los términos de la retórica clásica, la contigüidad podría homologarse con la comparación, y la comparabilidad con la metáfora en el segundo.

Eric Prince

Narratives of crime without punishment: How to value rules

[I]t seems to me that while in esthetic enjoyment we attend to the totality of Feeling – and especially to the total resultant Quality of Feeling presented in the work of art we are contemplating – yet it is a sort of intellectual sympathy, a sense that here is a Feeling that one can comprehend, a reasonable Feeling.¹

– *Charles Sanders Peirce*

1. Introduction: The worried community

To many people it seems that, in today's world, rules have lost their strength. Among so much diversity and so many competing aims, it is unlikely that rules can bind a community together. Some call for their strict reaffirmation and forceful application. They might wish for the rise of applied ethics. Others talk about the collapse of traditional ethics and aesthetics in a postmodern world. Both views co-exist and depend on one another. It appears that we live in a worried community.

This notion of a “worried community” surfaces often in interpretations of what we may call “narratives of crime without punishment”. The narratives of films like Woody Allen's *Crimes and Misdemeanors* (1989) and *Match Point* (2005), Clint Eastwood's *Mystic River* (2003), and (to a certain extent) Alejandro González Iñárritu's *21 Grams* (2003), adopt the principle that the traditional moral laws no longer apply. With *Crimes and Misdemeanors* and *Match Point* as the forerunners, these films depict men who commit a serious crime and then await a sentence that never arrives. These characters slowly realize that they can return to their previous lives without suffering feelings of guilt for their deeds. Moreover, neither do they have to fear punishment based either on some transcendental principle (Kant) or some Great Other (Lacan).

Such narratives offer a revision of Dostoyevsky's *Crime and Punishment*. Maybe it's just that they are postmodern, relativist narratives. As such, these films appear to differ completely from their Classical Hollywood predecessors. In the classical system, the hero appears infallible. He works toward upholding the law in harmony both with the community and with his own feelings. One might think of Humphrey Bogart in many of his roles. By comparison, the contemporary situation is incommensurably different. Yet perhaps our view of the differences between classical cinema and contemporary cinema is founded on a basic – and reductive – dualist division between feelings and rules and conventional rules and natural laws. If we look again at what is at stake in classical films from a non-dualist perspective, a different picture of narratives of crime without punishment emerges.

The pragmatist philosophy of American semiotician Charles Sanders Peirce offers just such an alternative approach. In his work on what he called the “normative sciences”, Peirce suggests that logic should be understood as based on ethics and that in turn ethics should be based on aesthetics. Since thinking is a kind of action, the question “how should we think?” (the question of logic) is embodied within the larger question “how should we behave or live?” (the traditional question of ethics). In addition, he holds that, “We cannot know how we are deliberately prepared to aim to behave until we know what we deliberately admire” (MS L75, version D, 9). To understand aesthetics as the study of what we deliberately admire is a matter of taking it seriously. This yields to a conception of aesthetics that is not sensualist and subjective but Realist, not opposed to rationality and rules but part of them (Indeed such a conception solves problems related to a whole stream of dualism that we find in varying degrees and in numerous philosophical guises in Deleuze's vitalism, in Ricoeur's nominalism and in cognitivist formalism).

I propose to look at a sequence of the *The Maltese Falcon* in order to examine some characteristically dualist interpretations. I will then briefly explain how aesthetics are related to ethics within a pragmatist perspective. Finally, I will return to *The Maltese Falcon*, and, with this renewed understanding, I will suggest a way to read narratives of crime without punishment.

2. The Maltese Falcon

The Maltese Falcon was John Huston's first film, made in 1941. It was adapted from a 1930 novel by Dashiell Hammett. The film gave rise to a plethora of different interpretations; I will investigate three of them before giving my own. Let me just note for now that the film involves three kinds of judgment or behavior.

The story revolves around the character of Detective Sam Spade. His purpose, one might say, is the application of the rules agreed to by the members of the community. To act toward this goal, he must first uncover the facts of the case, the truth of the matter, but he must also judge how he should apply to it the rules he seeks to uphold. We can note that, as a private investigator, he ensures that justice is served without relying on the methods of regular police officers. Spade is also a Romantic hero. The scene is set when Brigid O'Shaughnessy arrives at the detective agency looking for help. She is later revealed to be a traitor. Spade will eventually find out, but, in the meantime, he falls in love with her. As a result, the detective's feelings become entangled in his judgment and decision making.

Depending on our understanding of the relationship between rules of behavior (ethics), feelings, and thought, the film's moral stance can be interpreted in a number of different ways. In the last sequence before the film's conclusion, Spade tells O'Shaughnessy that despite his love for her, he will have to send her to jail. Here are a few lines from the dialogue:

O'Shaughnessy: You know in your heart that in spite of anything I've done, I love you.

Spade: I don't care who loves who! I won't play the sap!

I won't walk in Thursby's, and I don't know how many others' footsteps!

You killed Miles and you're going over for it.

O'Shaughnessy: How can you do this to me, Sam?

[...]

Spade: Listen.

This won't do any good. You'll never understand me, but I'll try once and then give it up. When a man's partner is killed, he's supposed to do something.

It makes no difference what you thought of him.

He was your partner, and you're supposed to do something about it...

... And it happens we're in the detective business.

Well, when one of your organization gets killed, it's...
... It's bad business to let the killer get away with it...bad all around, bad for every detective everywhere.

O'Shaughnessy: You don't expect me to think that these are sufficient reasons for sending me...

Spade: Wait till I'm through. Then, you can talk.

I've no earthly reason to think I can trust you.

If I do this and get away with it, you'll have something on me...

...That you can use whenever you want to.

[...]

If all I've said doesn't mean anything to you...

... Then forget it and we'll make it just this: I won't, because all of me wants to regardless of consequences...

So why did Spade send O'Shaughnessy to jail? Let us zero in on this one question. For Virginia Wright Wexman (1978: 47), Sam Spade is an arrogant, vindictive neurotic seeking only control and to hide his insecurity. He represses his feelings by appealing to duty. Indeed, Spade does appear, at least superficially, to prioritize his duty over his emotions. This principle of favoring duty over feelings defines the deontologist position in ethics, in which the rules of the community are in opposition to individual satisfaction. In this conception, there is communal truth and there is subjective truth, and the two are distinct and opposed. The upshot of this view is a conception of the film as yet another manifestation of American culture understood as individualism tempered by community. This idea was understood by some to lie at the heart of Classical Hollywood films, which embodied this conflict structurally through the combination of two plots: one revolving around the protagonist and one involving the community. From this perspective, rules of ethics are conceived as a limitation to individual freedom (as opposed to, say, the scaffolding that makes identity construction and sociality possible).

For Keith Cohen (1994: 136), the film is committed to crass materialism. The Maltese Falcon statuette is, as we know, a forgery. Spade, quoting Shakespeare's Prospero, describes it as "the stuff that dreams are made of". For Cohen, the emblem of the statuette underlines the film's message that dreams are only appearances and that what counts in the end is the truth found in facts. This interpretation presents a more classical, Cartesian

dualism between language and dreams on the one hand, and the realm of brute facts on the other hand.

Lesley Brill (1997) offers a more sophisticated interpretation. For him, the film's main point is to propose theater as a metaphor for lying. Huston shows O'Shaughnessy as someone who plays a part. He films her in settings that recall theatrical productions (curtains for instance). For Brill, Huston's conclusion suggests that there is a reality after all, but it is inter-subjective; hence the couple "discuss" whether O'Shaughnessy's transgressions warrant her going to jail. Discuss? It does not seem to me that much discussion takes place in this scene. Yet the notion of discussion is loaded since it invokes Habermas's vision of a community with no transcendental conception of truth and justice. For Habermas (1990), since ethical judgment cannot be rationally fixed by logical principles, we need an ethics of inter-subjective discussion. Brill's vision of the film arises from this perspective.

All these views involve in their ways a dualism, *an opposition between values and rules and also an opposition between rules and natural laws*. Are rules of justice merely conventional limits imposed on individuals? What in fact is a convention? This dualism leads to the additional problem of understanding how human thought can be more than merely an illusory dream that runs parallel to the external world. It is such questions that the philosophical account of the normative sciences sought to resolve.

3. Peirce and the normative sciences

Peirce's approach to aesthetics, ethics and logic as normative sciences is an attempt late in his career to further demonstrate his conception of pragmatism. Peirce overtly rejects Kant's transcendentalism, according to which there are principles of logic that transcend experience and are truly *a priori*. Applied to ethics, the idea is that rules of ethics also need to be founded on principles that are out of our reach. Peirce thought that logic is not distinct from experience but is a way to extract generalities from experience. His conception of experience makes room for what he calls "feelings" or the qualities of experience. That is, among other problems, what his conception of categories and signs addresses. I have sometimes found useful, in the context of film studies, to lay out Peirce's conception of semiotics by

saying that a sign is a medium. Peirce himself often described signs this way (MS 283: 125, 129, 131).

From an abstract point of view, *medium*, as suggested by the Latin etymology, is a middle. A middle necessarily involves three points. The two end points are in relation to one another and it is based on this relation that we can conceive of another relation and place a point in the middle. Without the previous relation, a middle cannot be conceived. In the same way that the middle is a relation founded on a previous relation, mediation can be defined as a *relation of relation*. For example, if I rest on a chair, it involves two things in relation: action and reaction. If I push the chair, the movement is the mediation (a relation of relation) between two positions. Another example is the gift. Let's say that David gives a book to Sue. He does not only leave a book at a place where Sue later picks it up. We need something of the nature of a general sign (something understood and shared among the members of a community) that does the mediation and allows us to make the distinction between something found and something given. David and Sue must indeed share the idea of gift. This is why, properly speaking, my right hand couldn't give something to my left hand. As we see, mediation can never be reduced to something causal or to a mere mechanical action (as in action-reaction). For Peirce, mediation is always on the side of intelligence, habits, and customs. Mediation is how he described signification and also thought. A medium is always something through which something is said or done.

Let us explore this claim with an example. I see somebody exiting a building shouting, sweating, and gesticulating. This is a brute fact. I say to myself, "she is escaping". I understand brute action through the mediation (the medium) of rational human conduct. Note that it is precisely such a mediation that is performed by a narrative structure or schema of action. A narrative structure is a *rule* by which to understand behavior. To understand something narratively is to understand something by way of its finality. This mode of thinking is called teleology. For this reason, Peirce thought that ethics is not in the first place about good or bad – morality – but about the question "how can one give oneself rules of action?"

I look at the agitated woman again and say she is afraid. I am now adding attributes in the medium of human emotion. She is not only escaping, she is also afraid. I give qualitative color to her escape in order to explain her spontaneous behavior. This interpretation assumes that emotion is not a

private event in the life of an individual but a way to give meaning to what would otherwise be purely causal. What spontaneously moves this woman might move anyone in the same way. In that sense we could say that emotion is not what causes behavior but what would explain its spontaneous quality. For Peirce, this is the starting point of aesthetics, which asks, “How do we place a value on an action?” and “What habit of feeling does a habit of behavior usually entail?”

This notion of aesthetics as a habit regulating and explaining behavior brings us to conceive genre as a mediation between habits of feeling and habits of behavior. From this perspective, pragmatic aesthetics is not the study of feelings conceived as some psychological and subjective first principle, in opposition to facts, but rather, pragmatic aesthetics studies habits of action grounded in habits of feeling. Without such a grounding, action is merely mechanical – and narrative is merely a recipe. Aesthetics attempts to answer questions about what in general is valued, admired.² The object of aesthetics is discovering what gives spontaneous action its purpose. We can thus talk about feelings as embodied thoughts. Ethics, as the principles that rule action cannot be only a matter of blindly following a categorical imperative that is by definition unchallenged. Peirce thought that if we cannot disregard conscience, all moral maxims are idle. Instead, he claims that if we clarify sufficiently what is praised and admired, then a rule of conduct inevitably emerges. This connection is made possible by the fact that aesthetics is not the study of subjective taste but of possible habits of feeling that participate in ethics and logic.

Searching for a basis for logic other than transcendentalism, Peirce found that we can rely on common sense given that we have the means to criticize it. Common sense, as conceptualized by Peirce, includes instincts, shared habits of feeling, and rules of behavior and of thought. These same components are all part of what Wittgenstein called a “form of life”. As such, aesthetics cannot be, as Jacques Rancière (1982: 237–238) suggested, a utopia, a joyful nirvana. Rather, the idea is that it is rational to rely on instinct, beliefs, and common sense. Such shared elements of a form of life are the hinges without which ethics and logic would not turn. It is also the expression of the fact that our thoughts are always situated. Approaching feelings in this way is to supersede dualism (not only of the Cartesian stripe, but also regarding facts versus human rules and human rules versus feelings).

This brief summary does little justice to the whole of Peirce's philosophy, but I think it serves a heuristic function in helping us understand Spade's options in dealing with O'Shaughnessy.

4. *Return of The Maltese Falcon*

I do not agree that the problem raised by *The Maltese Falcon* is that Spade represses his feelings to serve his sense of duty. I also don't think it interesting to view Spade as a neurotic seeking only control. Such a conventional psychoanalytic interpretation does not respect the complexity of the character and its importance for American culture. These interpretations lead to an understanding of American cinema as simplistic as that which claims that the whole of Classical Hollywood cinema is based on a narrative opposition between individuals and community. Neither do I think it productive to interpret the film as a claim for vulgar materialism. We certainly could not indict a detective for being aware of facts. I also don't think the point of the film is moral inter-subjectivity, and I don't see that there is any real discussion between Spade and O'Shaughnessy regarding her fate, unless one means by "discussion" what happens in some of Plato's dialogues where the interlocutor is confined to merely answering "yes, of course".

So what does Spade actually say to O'Shaughnessy in this scene? I find it uninteresting to reduce Spade's stance to something as base as, "You did things that deserve my application of the rules in a blind way." Rather, I think he says, "If I close my eyes to what you've done because of my feelings for you, then my feelings would no longer be related to the facts and my detective skills would become worthless. I would lose the most important thing that a heroic detective has: his instinct. And without this capacity to rely on my spontaneous reactions – i.e., the task of aesthetics – then the rules I use to govern my actions would have no conscious purpose anymore. And then the rules of logic and of ethics would lose their measure. To put it differently, I would be aesthetically lost, applying rules blindly.

5. *Conclusion*

Detective stories explicitly question the value of spontaneity, qualitative judgment, and instinct in the world. The ability to rely on instinctual

judgment is what is at stake in *Match Point*. Near the end of the film, the detective wakes up at night with a strong conviction about the murderer's identity. Faithful to the nocturnal rumblings that have so often been fruitful, he provides a full explanation to his colleague of how the events might have transpired before he learns that someone else has already been charged with the murder. His colleague adds, "but your dreams are fascinating and you could see what a jury might think".

Perhaps it is precisely when one loses touch with one's instincts that one is condemned to mechanically and blindly follow the rules of a given *doxa*. This proposition offers new possibilities for understanding "narratives of crime without punishment" as a whole. The problem may not be that the rules have lost their magical power but that the rules of action have lost touch with their qualitative purposes and values. Though not, properly speaking, a detective story, Iñárritu's *21 Grams* offers a striking example of this kind of aesthetic aberration. Throughout the film, born-again Christian Jack Jordan pledges his faith to some kind of transcendental or categorical imperative he hopes will guide him. However, under such condition, his attempts to adhere to his rule of conduct can only fail: one cannot legislate one's own rule-following behavior. Perhaps the problem was not, as we often say, that the gods fell silent but – and I would grant that this is a more exact way to express the same thing – that Jack is aesthetically lost. It appears that several films that involve narratives of crime without punishment rest on such aesthetic aberrations. And if we accept my argument for the importance of aesthetics for thought in general, we can analyze more precisely what appears to have become a real social problem.

This discussion of pragmatic aesthetics allows me the opportunity to invoke the recent work of philosopher Richard Shusterman. Shusterman proposes a renewed aesthetics that takes into account the body as a medium of aesthetic qualities. He calls this discipline somaesthetics and defines it as "the critical, meliorative study of the experience and use of one's body as a locus of sensory-aesthetic appreciation (*aisthesis*) and creative self-fashioning" (Shusterman 1999: 302). Shusterman wants to reintegrate the body as a medium of cognition, thereby rescuing it from its marginalized position in traditional philosophy. In this schema, knowledge of the world is improved not by negating bodily awareness but by enhancing it. Somaes-

thetics must face “the possibility of assessing individual body tastes and practices in terms of more general somatic values or norms” (1999: 300).

As presented here, pragmatic aesthetics undoubtedly investigates the processes and perfectibility of spontaneous reactions and instincts and encourages renewed attention to the body’s signals. Even more central to the discipline, however, is the study of signs. These signs are that without which the body would be mute and could not act as a medium for knowledge of the world and humanity. The body would then become a simple support for spontaneous reactions (or we could almost say a burden). Talking about the body as a medium offers potential for describing characters that, like Spade, like the detective in *Match Point*, know how to form an image from the multiple indications of their instinct. In this process, the knowledge the body acquires runs through minimal marks that indicate the regularity of a habit.

When problems generated by dualism become old problems, to talk about the body or to talk about signs with which we identify what we feel is the same thing or to say it in Peirce’s fashion, “men and words reciprocally educate each other” (C.P. 5,313).

Notes

1. C.P. 5,112. In accordance with standard citation practices, C.P. refers to the *Collected Papers*. The first number indicates the volume and the number after the decimal point indicates the paragraph. MS refers to the “Annotated catalogue of the papers of Charles S. Peirce” by Richard S. Robin.
2. To be more precise, we should add that for Peirce aesthetics is concerned with what is admired without reference to anything else; it studies what is absolutely simple. In the course of his demonstration, Peirce asks himself if pleasure in the moment can be absolutely simple. He notes that such satisfaction involves a gradation, it occurs in time and therefore cannot logically be absolutely simple. Peirce concludes that only reason can be absolutely simple and that means that it is the fact, for any reason, to be interpreted and to grow that can be admired without reference to anything else, which is also the fact for a feeling (even the most spontaneous) to be intelligible.

The landscape, the city, and the house

Magical landscapes and designed cities

This paper deals with perceptions of urban landscapes. From a general view over the city, I zoom into certain of its green areas.

In Aarhus, Denmark's second largest city, I conducted fieldwork in its two most exclusive neighbourhoods: *Skåde Bakker* and *Fedet*. From the perspective of the inhabitants, an important type of space is the *landscape*, to which the attraction of the neighbourhoods is connected. The intense ambience is made even stronger, because you are brought close to *the central district*.

The landscapes are well kept and preserved, entwined with intense personal feelings concerning freedom, health, and "something beyond"; in the recently renovated central district, historical sites have been reconstructed in brand new disguises, which relate to experiences of social relations, consumption, and the feeling of being Aarhusian. Both areas seem to be part of an urban lifestyle.

1. The landscapes of Aarhus, Denmark

Skåde Bakker, south of the central district, is a hilly area surrounded by "The Marselisborg Woods". The sea is nearby, but you see it way below, as the terrain rises with steep slopes and old beech-trees. Some houses were erected there around 1900, but most of them are younger, the parks surrounding the older houses having been parcelled out. Now a parcel is rarely sold to give space for a new house. The beeches and hills induce a romantic feeling of being in a nineteenth-century, Golden Age painting: quiet, balanced, calm, seemingly static, and with idyllic views of the *Baumschlag* and slopes.

Fedet lies north of the central district, bordering the sea. The vegetation is meagre, the former tidal meadow suitable for cherry plum trees, not beeches. About 50 years ago this part of town was a district of colony gardens. These last have become fewer and fewer, but the expensive housing district is still under transformation. Especially large are the houses facing the sea. From the houses in the second row you can only see these enormous, first-row houses. Here is a hasty feeling of dynamic energy, shaping, transforming, due to the continuous building and rebuilding.

The inhabitants represent these landscapes in two ways, which may be described as *cosmological* and *praxis-oriented*. The cosmological landscape is connected to contemplation, loneliness, and beauty. You go there on your own in order to sense the intensity of the landscape, be it the sea or the woods, and you feel quietness and simplicity, just by sitting there or walking slowly into the landscape.

The praxis-oriented landscape is connected to sports. Here you jog, surf, swim, row, mountain bike, or perform other kinds of activity in order to keep your body fit. Many of the inhabitants get up early in order to jog for half an hour before they go to work by car. You feel that you “recharge your batteries” by being active, and you go there with a purpose, motivated to become healthy.

These two sides of the landscapes seem to be in conflict with each other when seen from the outside: quiet and contemplative as opposed to active and motivated. The inhabitants feel a connection between their early morning exercise and the contemplative mood, which might contradict both the traditional romantic perception of nature and the prosaic perception of fitness culture.

Other features ascribed to the landscapes are their status as a site for: *nature*, as opposed to culture, noise, people, traffic, deadlines; *disconnection*, since normally the cellular phone is switched off before going there; *public space*, for taking a walk and meeting someone by chance, without privatizing elements such as stores and advertisements or the personal space of cellular phones. Instead of being “online” or wired to the rest of the social world, you feel a connection to something important. This is not just recreation, it is an encounter with healing power; it is something precious, that we all need.

2. *Magical landscapes*

The art historian Nicholas Green has examined the formation of the landscape in France, and he argues that the gaze on the countryside as a landscape emerges in the early nineteenth century, simultaneously with Paris becoming a metropolis. For city dwellers the countryside is not associated with hard work or the perils of dangerous animals; it represents social experiences. In Aarhus today the landscapes have come closer – they are part of the city – but still they represent experience, be it as an idyllic tableau or a possibility for jogging.

The less definable landscape-qualities are often stressed. When the inhabitants talk about these qualities, most of them use the term "nature". It is untamed and potentially dangerous (e.g., in case of a flood) or irritating, as when deer come out of the woods and eat the garden flowers. Most of all it is something we need deep down. It gives something other than nice view or fitness room. It is qualitatively different.

The inhabitants talk about the calming effects of this obscure phenomenon. It gives them "peace of mind", and it "clears their thoughts", two often heard expressions. A man in his mid-30s gets a relaxing feeling every day, when he drove home to Fedet from work, turns down his street, and sees the sea through the front window of his car. A man from Skåde Bakker, aged 60, tells of quiet moments of sensing nature when he was jogging in the morning. The landscape becomes a container for nature; it is not explainable, but desirable, and it has an effect on you.

3. *Mana in anthropology*

In *A General Theory of Magic* (1902) Marcel Mauss explains the Melanesian notion of *mana*: it is quite difficult to grasp, since it is both action and force; in fact it is even more complex. Mauss writes:

The idea of *mana* is one of those troublesome notions which we had thought to have discarded; we therefore experience difficulty in grasping it. It is obscure and vague, yet the use to which it is put is curiously definite. ... Its primitive nature – that is, its complexity and confusion – resists any attempt at a logical analysis, and we must remain content to describe the phenomenon. (Mauss 2001 [1902]: 134)

And later: “The idea of *mana* consists of a series of fluid notions which merge into each other. At different times it may be a quality, a substance or an activity” (ibid.).

In his introduction to Mauss’s *Oeuvre* (1987 [1950]), Lévi-Strauss takes the argument further: it is precisely the contradictory and fluffy nature of the idea that makes it outstanding. It is a “floating signifier” of “zero symbolic value”. He writes:

I see in *mana*, *wakan*, *orenda*, and other notions of the same type, the conscious expression of a semantic function, whose role is to enable symbolic thinking to operate despite the contradiction inherent in it. That explains the apparently insoluble antinomies attaching to the notion of *mana* ... force and action; quality and state; substantive, adjective and verb all at once; abstract and concrete; omnipresent and localised. And indeed, *mana* is all those things together; but is that not precisely because it is none of those things, but a simple form, or to be more accurate, a symbol in its pure state, therefore liable to take on any symbolic content whatever? (Lévi-Strauss 1987 [1950]: 63–64)

Lévi-Strauss gives an example: “when ‘the French’ [by using the term ‘truc’] say of a person that he or she ‘has something’; and when American slang says that a woman has got ‘oomph’, it is not certain ... that we are very far from the meaning of *mana*” (ibid.: 55).

4. *Mana sites and experience fields*

Coming from outside ourselves, floating, indefinable, but a force that does something to us, when we meet it: The Aarhusian landscapes might be interpreted as *mana-sites*. “Nature” in the landscapes might have a similar position as a “floating signifier”, a “zero symbolic value”.

These expensive, exclusive, well-manicured urban landscapes have an abundance of ascriptions as “nature”; ironically, rural landscapes, far from the city, do not. What is the context of this perception of urban landscape? Or, to paraphrase Lévi-Strauss: Which specific parts of symbolic thinking, by means of the notion of “nature”, are enabled to operate despite inherent contradictions? It might have to do with “experience” as an over-arching idiom for perceiving and representing the city, and an important prism for the inhabitants’ gaze on both the central district and the landscape.

The central district, with its newly renovated streets, is a well-defined space for the experience of reconstructed authenticity, consumption of objects, history, culture, and identity – and for meeting people. You go there, experience the pleasant possibilities, then leave. As such, it is a space for liminality, a ritualized area. Contrary to traditional rituals, you go there without being initiated into something new, feeling pain, being scared, meeting something strange or out of control. You participate in liminal performances only if they are part of a well-designed, secure, and controlled experience. For the same reason, you are not transformed by going there. You just go home again.

The landscapes are spaces for the experience of social meetings, sport and fitness, and also of a less defined “nature”. Of course, hard work, transportation, family life and other elements are part of how the inhabitants of the two neighbourhoods perceive their city, but the central district and the landscapes are definitely oriented towards experience; and these areas are important for the overall representation of the city.

There are much pleasures to be had by living in a practical, smooth-running, and well organized city, and by using a newly improved central district, where everything has its place, from the dustbin to the articulation of authenticity. These also have background phenomena that do not “fit in”. These indefinable aspects are not something you can see; but you can sense them in the (sometimes forced) way people speak about “nature”. This important, if vague, element possibly arises from the zero symbolic value of the notion of “nature” in the landscapes – something that is out of step with the well-defined cityscape.

5. *Framings*

At a generalised level both the central district and the landscapes represent the notion of experience. But they are framed in different ways. The aesthetization of everyday life, the “experience society”, the wired-up-ness, and the number of pre-designed leisure-possibilities frame the traditional redesign of the central district. By contrast, framing the landscapes are the genuine experience of something different, the chance to be alone, in secret, not wired up, and the lack of pre-arranged possibilities.

If the central district is a place with an explicit framing of experience, the landscapes are framed implicitly. The well-kept woods and neat

beaches for promenades are shaped as the recreational zones of an urban environment. As part of the city, the *tableaux* of landscaping are intensified; furthermore, the city stages itself through these spaces. The lack of an explicit frame enforces the implicit framing, and makes this a perfect place for perceiving “nature”. You could say that, in the experience economy of the city, there is a space for *mana* exchange.

In the inhabitant’s interpretation, the landscapes represent the opposite of planning, staging, designing. At the same time, every body knows that these landscapes only achieve this feeling because they *are* planned, staged, and cultivated by the municipality-architects and city gardeners. They are designed to appear un-designed, as “natural”. Still, the *mana* qualities ascribed to the landscapes might solve the contradiction between the designed surroundings and out-of-place elements that cannot fit into the order of the city.

6. Mana – or order?!

The inhabitants of *Skåde Bakker* and *Fedet* like their landscapes; they like to talk about the fantastic “something” out there, hidden in “nature”. They sense its healing power for the spirit, soul, and body.

At the same time, they like to live their everyday life in neatly ordered spaces. The time manager organizes time, the means of transportation organizes movements, and the astonishingly clean cityscape is well designed for the smooth operation and experiences of consuming objects, culture, history, and social relations.

Aarhus is a city that is especially well ordered and manageable. Most of the inhabitants emphasize this as a positive feature: “We have it all, but on a smaller scale than Copenhagen; this is manageable, because here you can find your way, you never get lost, and you meet friends in the street. There are so many identical shops in Copenhagen. Here we have got one of each.”

The intensity of a smaller, orderly place is in fact what the Aarhusians love most about their city. They like to talk *mana*-talk, and live their daily life in the orderliness of the social city. Moreover the landscapes themselves are two-faced: represented through *talking*, they become the container of the indefinable *mana* thing; when a scene for *acting*, they become the stage for social relations, public space-*flaneurisme*, engaging in healthy

habits, and the rigorous discipline of staying fit. You can have access to both worlds, though: the orderly cityscapes and the strangeness of the landscapes. Such are the privileges of wealth in landscape-suburbia.

The *mana* feeling might be dependent on its shadowy position: it only works when not in the spotlight. The question is whether the tendency towards “experientification” works against the hidden ways of *mana*; or on the contrary, if the idiom of *experience* gives way to such shadowy phenomena.

7. *Thymic perceptions of mana*

In their *Semiotic Dictionary* (1989 [1979]) Greimas and Courtés distinguish between three thymic categories: *euphoric*, *dysphoric*, and *aphoric*. The thymic perception of *mana*, as described by Mauss and Lévi-Strauss, is *aphoric*. In Aarhus “nature” is a *euphoric* force. *Mana* containers could have any of the three valorisations. For example the notion of *ghosts*, my research project at present, is a *dysphoric* thymic category that might work as a pure symbol.

Whatever the case, the *euphoric* valorisation of “nature” might have consequences for the landscape. In descriptions of the surrounding environment, this *euphoric* category is opposed to *ambiguous* categories such as “society”, “culture”, or “city”. These nature-containers become moral landscapes: per definition good; and since they represent *mana*, this *euphoric* valorisation is beyond your control. Maybe it is also a “Disneyfication” of the landscapes, since the neat city landscapes are especially invested with “nature”.

This could have implications for the landscape as a *mana* site. The importance of *mana* derives from its zero symbolic value. The realms of this quality might be reduced, not by its *euphoric* valorisation, but by the conversion of the landscapes from a feel-good attitude to a search for bodily fitness. Those moral overtones in the woods and beaches of Aarhus are attracted by, but not compatible with *mana*.

Literacy in Baroque society

A cultural-historical approach

1. Introduction

Our aim in this article is to illustrate how semiotic media (or communication technologies) influence the ways of thinking of populations and, therefore, social issues and problems. We study that relationship by a historic-cultural analysis of the development of different semiotic means in different religious traditions (Reformation and Counter-Reformation), centring our analysis on the use of baroque art and technology by the Counter-Reformation in Latin countries. These two technologies of communication used by Reform and Contra-Reform involve different persuasive strategies that lead to different mentalities or ways of thinking. In the historical context mentioned, written language mainly searches for *rational* persuasion; however, iconography mainly seeks and reaches *affec-tive* persuasion. Different examples of these will be provided below.

Our analysis seeks to give some historic explanation to illiteracy in many countries of Southern Europe and Latin America. Illiteracy has been an endemic problem in many countries of southern Europe and Latin America. In that sense, the case of Spain is very representative. At the end of the seventies, in the period of the Democratic Transition, after 38 years of Franco's dictatorship, in Andalucía alone there were more than five hundred thousand illiterate people in a population of 7 million. Communities such as Canarias, Extremadura and Galicia presented a similar circumstance.

But the case of Latin America is even more dramatic. The transition to democracy in many countries of Central and South America has not promoted better living conditions (education, health, etc.) for the majority of their population. The crisis, as a result of a combination of political and

institutional corruption and globalization, has impoverished many of their citizens and deteriorated public services such as educational systems.

There are several reasons to try to explain this problem from the perspective of social sciences (social, demographical, economical, etc.). In the context of cultural psychology (Cole 1996) and other social sciences related to education, since the 1920s, several theoreticians have employed cultural history as a way to explain and understand the genesis of educational processes and literacy. Following Vygotski (1978), Luria (1966), and other researchers using a cultural-historical approach to psychology, social sciences and education (Cole 1988; Cole & Scribner 1974; Olson 1979; Ong 1982; Wertsch 1989, 1990), the explanation for illiteracy as an endemic problem can be found in the cultural-historical domain, one of the four theoretical and methodological domains named by Vygotski. In dialectical relationship with other domains like phylogenesis, ontogenesis and microgenesis, this can explain human development as a whole and specifically the transition of human mental functions from the rudimentary to the higher level. However, only one study carried out by the fathers of the cultural historical approach was done to analyze the role of cultural history in mental development (expedition to Uzbekistan and Kirguizia). After that, the rest of the studies developed from this approach were done by a comparative methodology in the frame of cross-cultural studies.

The social sciences, extremely relevant to present issues, has usually forgotten to study its links with the past. Scholars in that area have not focused significantly on some topics, such as religious questions; another one is semiotic means and communication technologies. But most problematic is the lack of knowledge about the interrelationship between some of those areas. In this article we focus on the conflict between religious ideologies (Reformation vs. Counter-Reformation), between communication technologies (oral communication vs. literacy; imagery vs. texts), and the dialectical relations among those ideologies and technologies (Reformation plus literacy and text; Counter-Reformation plus oral communication and imagery). The different technologies fostered by different ideologies have played a role in the development of different social arenas in present times.

From our point of view, in the actual panorama of social sciences, the explanations for many topics of study, mostly related to education, tend to be based on a short-term approach. This methodology might be good for

solving problems in economics, but it must be supplemented by a long-term approach to studying issues such as technologies, especially communication technologies, and the mentalities related to them. For the French historian Ferdinand Braudel and the Annals School (Febvre 2001; Chartier 2002, 2004), the factors conditioning mentalities are always located in the long-term and demand a historical analysis as a preceding step to other considerations.

Next we will state our historical view about the origins of illiteracy in Latin countries, focusing on religious issues by considering the breakdown between Catholics and Protestants as a result of the Reformation.

2. *Long-term cultural history*

The story begins located in the sixteenth century with the Protestant Reformation (1517).

According to Stephen Toulmin (1990) in his book *Cosmopolis*, there are historians that consider 1517 as the birth of Modernity, the year in which the Augustinian monk, Martin Luther, hung his theses on the main door of Württemberg Cathedral. To establish the direct knowledge of the divine Word, in place of Tradition and (Roman) Church authority (the ground for medieval Christianity) as the right way for believers in their relation to God, Luther opened a new window onto just about everything. To sacralise the act of reading the Bible, Luther was taking a great step toward wider literacy in Western countries.

Now let us skip ahead to the other story, which on the one hand is a continuation of the first one (the reaction against Protestant Reformation), and on the other hand, is the start of a new history. This could also be considered a new era, but not modernity, because it represents the continuation of medieval religion, with its dominant emphasis on collectivism. I am referring to the Counter-Reformation, a religious ideology promoted by the Roman Catholic Church in order to re-establish tradition and stifle the expansion of the Reformation. The beginning of this other narrative is not on a particular date but a period of time between 1545 and 1563, during which the Council of Trent was convened.

If the Reformation promoted issues like these:

- A new believer-God relationship focused on the knowledge of divine words through reading Holy Writ.

- Reading as a new communication technology (potentially applicable to other texts with other topics).
- Technology learning and internalizing reading habits transforming cognitive processes such as control of attention, semantic memory, etc.
- Use of vernaculars for religious texts and practices.
- A form of religion centred in privacy, as a personal and individual experience.
- Explicit rejection of religious images (biased towards paganism-iconoclasm).

The Counter-Reformation moved in the opposite way:

- Re-establishing Tradition (Church as mediator between believer and God).
- Latin used for religious texts and ceremonies (literate clergy).
- Use of vernaculars for sermons (directed to illiterate people).
- Icons and imageries used for pedagogical purposes and propaganda.
- Exuberant church decoration recreating heaven in this world.
- Collectivism in religious practices and ceremonies.

Summarizing, it is possible to say that in a clear opposition to Protestantism, Catholicism, after the Council of Trent (1545–1563), made imagery along with the voice of priests the only legitimate ways for Church authority to relate to believers. Literacy had to wait for a better moment to spread to the rest of Christianity, when the process of secularization started in the West.

The following historical event can exemplify the rigid position of the Church in relation to literacy and the sacred texts. Fray Luis de Leon (1528–1591), a monk, poet and professor of rhetoric at the University of Salamanca, was imprisoned by the Inquisition for four years, on the charge of translating the *Song of Songs* into Spanish. Other examples are the translator of the Bible into Spanish, Casiodoro de Reyna (1520–1594), and the commentator, Cipriano de Valera (1532–1602). Both of these monks of the Gregorian Monastery of Saint Isidoro del Campo (Sevilla) were prosecuted by the Inquisition and died in exile.

3. *Baroque: Art and society*

At the same time as the Counter-Reformation started to rule the life of the Catholic world, a new art style, as a continuation of the Renaissance, began

to grow in literature, plastic arts and music. Its name was Baroque, and it originated in Italy.² The use of art for persuasion had been developed in the context of the *Accademia Fiorentina* sponsored by the powerful Medici family. The *Academy* joined plastic artists with historians, grammars and *rhetors*. The contacts between them were explicitly promoted in its program under the influence of Manuel Crisolora, ambassador of Byzantium in the Republic of Venice and other courts in Italy (Baxandall 1971). So, the groundwork to combine art and propaganda was created before the Baroque and the Council of Trent.

Imagery was probably used for pedagogical purposes, as a complement to sermons, a form by which to show sacred history and promote Christian values for illiterate believers. Traditionally narrative has been associated with the *Art of Word*, as part of primary oral communication (e.g., “once upon a time...”) and as written text (literacy). Following Vygotski’s (1978) concept of *semiotic mediation*, at that time, images become a semiotic *prosthesis* for recalling biblical events, lives of saints and martyrs, and other important events for the Roman Catholic Church. However, imagery does not have the semiotic autonomy to perform narrative in all cases of oral and/or written story. It could be considered a tool of the second order, given its dependence on a tool of the first order placed in discourse.

Among plastic arts, painting was the main aesthetic means by which to represent the significant events of Christianity. When the religious Baroque was dominant under the rule of the Counter-Reformation, there were two ways to represent stories that provisionally I shall call *explicit* and *implicit* narratives. By explicit narrative I mean a group of pictures as altar-pieces comprising a narrative sequence where the most important events of a story are represented. In the implicit narratives, a single picture projects a complete story, in a sophisticated and indirect way. These are two forms that show what stories existing in oral and written discourse have in common.

Figure 1 is an example of explicit narrative. If we forget the solemnity of the story we are in front of the clearest antecedent of the modern comic. Here the intention to tell a story is explicit, with pictures recounting each of its events.

Figure 1. Anonymous, altarpiece, Iglesia Santa María, Castilla León, Spain (15th century).

An interesting illustration of an implicit narrative is presented and commented in the next picture.

Figure 2. Caravaggio, The Call of Levi (1600).

The Call of Levi, painted by Caravaggio in 1600, is a paradigmatic example of art for pedagogy and even for propaganda. The narrative contained in the Gospel of Matthew (Levi) is represented in analogical and symbolic form, without the use of words. Illiterate people could understand the narrative and meaning of the story, especially, with the help of a sermon. In this picture, Jesus is pointing at Levi with his index telling him: “*Follow me*”. And Levi is pointing at himself, surprised. The story is very clear.

However, it is important not to forget that when reading the only possible contrast is between black and white. The black ink makes figures on white paper (ground). Further, a picture is holistic, not linear, hence Caravaggio could manipulate it in order to introduce more symbolism accompanying his story. This painting can be divided into four parts, so as to focus on the way Caravaggio combines light and dark in each of them, and how each part can be interpreted. First of all, Jesus Christ appears in darkness, having his face and hand illuminated, because both of these are important signs in this story. The tax collector Levi and other colleagues are in the opposite corner involved in very mundane business matters. Over Jesus’s head a shaft of light is illuminating part of scene. It is interesting to observe how the window on the higher part of the picture is open and its shutter separated from the wall. It seems that this management of light is a trick used by the painter to enhance the face of Levi face, a man called to the service of God. Jesus brings light into the darkness, and Levi is called to pass from the kingdom of darkness into the kingdom of light.

The two examples illustrate how two technologies of communication used by the Reformation and Counter-Reformation involve different persuasive strategies that lead to different mentalities, or ways of thinking. In the historical context mentioned, while written language mainly searches for rational persuasion, icons mainly seek – and achieve – affective persuasion.

Notes

1. We would like to thank Miguel Macías Gómez-Stern and Pamela Miller-Macías for revising the English of this article.
2. We must distinguish between the religious and the civil Baroque. The former was exploited for ideological purposes in the service of Catholic propaganda. But, there were Baroque artists such as Vermeer working in

portraits, landscapes, and, especially, still-life. This style was developed in The Netherlands and other Protestant areas where the representation of sacred themes was prohibited.

Understanding agricultural terminology

Defining concepts and practices associated with sustainable agricultural systems

Sustainable agriculture is similar to the type of agriculture that was practiced in the early 1900s and involved purchasing few inputs and marketing little of the outputs. Understanding agricultural terminology means thinking about it and using concepts to deal adequately with it; or being able to apply it to situations likely to be encountered, to recognize significant deviations, and to carry out the research necessary to arrive at reasonable solutions. This includes using concepts and bringing individual cases under them. Reasoning and making judgments relating to its applicability are of utmost importance for students in agricultural science who need to classify, describe, discuss, explain, identify, locate, paraphrase, recognize, report, select, and translate ideas or concepts.

Specialised terminologists have noticed that most of the concepts and practices associated with sustainable agricultural systems defy definition: they do not delimit or describe the meaning of a concept or term by stating the essential properties of the entities or objects denoted by the concept.

In this paper we try to analyse the causes of this defiance, identifying the different kinds and techniques of definition distinguished so far by both linguists and philosophers involved in the definitions of these agricultural concepts and practices.

We have inventoried 79 concepts and practices in Mary V. Gold's reference compilation *Sustainable Agriculture: Definitions and Terms (1999)*, associated with sustainable agricultural systems in usage (and abuse) nowadays, concepts and practices witnessing that both agricultural practices and the terms denoting them are still developing. Eighteen of these con-

cepts and farming practices not labelled as conventional modern farming are given tentative definitions. We have analysed these definitions in an attempt to see why they are misunderstood by our students (and, sometimes, even by our colleagues teaching agricultural subjects).

“If nothing else, the term ‘sustainable agriculture’ has provided ‘talking points’, a sense of direction, and an urgency that has sparked much excitement and innovative thinking in the agricultural world”, says Gold in the Introduction to her compilation (1999). She could not be more right, and the analysis below is but an example.

1. Of the eighteen definitions, sixteen (88%) are definitions by genus and difference or genus-differentia definitions, i.e., intensional definitions (definitions that specify all and only the properties required of something in order that falls under the term defined, i.e., its necessary and sufficient conditions), in which a word or concept that indicates a species (a specific type of item) is described first by a broader category it belongs to, the genus, and then distinguished from other items in that category by differentia (i.e. specific properties): alternative agriculture / farming is “[a farming method encompassing] a vast array of [agricultural] practices and enterprises, all of which are considered different from prevailing or conventional agricultural activities ...: nontraditional crops, livestock, and other farm products; service, recreation, tourism, food processing, forest / woodlot, and other enterprises based on farm and natural resources (ancillary enterprises); unconventional production systems such as *organic farming* or *aquaculture*; or direct marketing and other entrepreneurial marketing strategies” (Grudens, Shuck et al., in Gold 1999); biodynamic agriculture / farming is “[a farming method encompassing] specific [agricultural] practices and preparations that enable the farmer or gardener to work in concert with [the forces within living nature]” (Gold 1999); bio-intensive gardening or mini-farming is “a production system that makes it possible for one person to grow all of his or her family’s food using truly sustainable methods that maintain the fertility of the soil without relying on non-renewable resources like petrochemicals or imported organic matter” (Jeavons, in Gold 1999); biological/ecological farming is “[a farming method encompassing] various and more specific practices and techniques of farming sustainability, e.g., organic, biodynamic, holistic, natural” (Gold 1999); biological farming is “a system of crop production in which the producer tries to minimize the use of ‘chemicals’ for control

of crop pests” (Pesek, in Gold 1999); do-nothing farming or natural farming is “a farming method involving no tillage, no fertilizer, no pesticides, no weeding, no pruning, and remarkably little labor ... by careful timing of his seeding and careful combinations of plants (polyculture)” (Gold 1999); Kyusei nature farming “[is a farming method that] often employs technology involving beneficial microorganisms as inoculants to increase the microbial diversity of agricultural soils, which, in turn, can enhance the growth, health, and yield of crops” (ibid.); low input agriculture “[is a low input farming system that] seeks to optimize the management and use of internal production inputs (i.e., on-farm resources) and to minimize the use of production inputs (i.e., off-farm resources) such as purchased fertilizers and pesticides, wherever and whenever feasible and practicable, to lower production costs, to avoid pollution of surface and groundwater, to reduce pesticide residues in food, to reduce a farmer’s overall risk, and to increase both short- and long-term farm profitability” (ibid.). The term is “somewhat misleading, we underline, and indeed unfortunate. For some it implied that farmers should starve their crops, let the weeds choke them out, and let insects clean up what was left. In fact, the term low-input referred to purchasing few off-farm inputs (usually fertilizers and pesticides), while increasing on-farm inputs (i.e. manures, cover crops, and especially management). Thus, a more accurate term would be different input [agriculture] or low external input [agriculture] rather than low-input [agriculture]” (Norman 1997); nature farming is a farming system utilizing “the inherent power of the soil” and focusing on “analyzing and building soil through composting, green manuring, mulch, and various other soil management techniques” (Gold 1999); organic farming is a production system which avoids or largely excludes the use of synthetically compounded fertilizers, pesticides, growth regulators, and livestock feed additives. [It relies] upon crop rotations, crop residues, animal manures, legumes, green manures, off-farm organic wastes, mechanical cultivation, mineral-bearing rocks, and aspects of biological pest control to maintain soil productivity and tilth, to supply plant nutrients, and to control insects, weeds and other pests (ibid.).

Permaculture (from *permanent agriculture*) is “one of the many alternative agriculture systems described as sustainable on design; that is, the location of each element in a landscape, and the evolution of landscape over time, (whose goal is) to produce an efficient, low-maintenance inte-

gration of plants, animals, people and structure applied at the scale of a home garden, all the way through to a large farm” (ibid.); precision agriculture / farming or prescription farming or site-specific management is “a MANAGEMENT STRATEGY that employs detailed, site-specific information to precisely manage production inputs” (ibid.); regenerative / sustainable agriculture or low-input sustainable agriculture is defined as “a farming system that is capable of maintaining its productivity and usefulness to society indefinitely. Such systems must be resource-conserving, socially supportive, commercially competitive, and environmentally sound” (ibid.); or as “an *integrated system of plant and animal production practices having a site-specific application*” (ibid.); or as “a way of practicing agriculture which seeks to optimize skills and technology to achieve long-term stability of the agricultural enterprise, environmental protection, and consumer safety” (ibid.); or as “a *whole-systems approach* to food, feed, and other fiber production that balances environmental soundness, social equity, and economic viability among all sectors of the public, including international and intergenerational peoples” (ibid.).

2. Only one (6%) of the eighteen definitions is a dictionary or lexical definition, i.e., a definition that reports the meaning of a word or expression as it is normally used, usually by supplying an approximately equivalent expression in which the original word does not occur: biological farming “often refers to organic farming (in Europe, e.g. in the Netherlands)” (Norman 1997).

3. Only one (6%) of the eighteen definitions is an extensional definition, i.e., a definition formulating the meaning of a concept or term by specifying its extension, that is, every object that falls under the definition of the concept or term in question: ecological agriculture / farming “refers to organic farming plus environmental considerations such as on-farm wildlife management (i.e., the relationships between parts of the agroecosystem)” (ibid.).

From a teacher’s point of view, it is good that 88% of the definitions of concepts and practices associated with sustainable agricultural systems are definitions by genus and difference or genus-differentia definitions, since this is the natural thing to do if you are to explain the meaning of a particular word to someone. Again, the fact that 6% of the definitions of concepts and practices associated with sustainable agricultural systems represent a dictionary or lexical definition is not a problem, since it relies

on reporting the meaning of a word or expression as it is normally used by supplying an approximately equivalent expression in which the original word does not occur. A lexical definition is usually the type expected from a request for definition, and it is generally expected that such a definition will be stated as simply as possible in order to convey information to the widest audience.

As for the only extensional definition representing other 6% of the definitions of concepts and practices associated with sustainable agricultural systems, it should not be perceived as a burden, since they address students in agriculture. Extensional definitions are used when listing examples would give more applicable information than other types of definition, and where listing the members of a set tells the questioner enough about the nature of that set.

The problem is that fifteen (83%) of these definitions are not pure definitions. Thus: Of these fifteen definitions, fourteen – thirteen definitions by genus and difference and one extensional definition – could also be ranged among precision definitions, i.e., definitions that extend the dictionary / lexical definition of a term for a specific purpose by including additional criteria that narrow down the set of things meeting the definition: biodynamic agriculture / farming is “[a farming method encompassing] specific [agricultural] practices and preparations that enable the farmer or gardener to work in concert with [the forces within living nature]” (Gold 1999); biointensive gardening or mini-farming is “a production system that makes it possible for one person to grow all of his or her family’s food using truly sustainable methods that maintain the fertility of the soil without relying on non-renewable resources like petrochemicals or imported organic matter” (Jeavons, in Gold 1999); biological / ecological farming is “[a farming method encompassing] various and more specific practices and techniques of farming sustainability, e.g., organic, biodynamic, holistic, natural” (Gold 1999); biological farming is “a system of crop production in which the producer tries to minimize the use of ‘chemicals’ for control of crop pests” (Pesek, in Gold 1999); do-nothing farming or natural farming is “a farming method involving no tillage, no fertilizer, no pesticides, no weeding, no pruning, and remarkably little labor ... by careful timing of his seeding and careful combinations of plants (polyculture)” (Gold 1999); ecological agriculture / farming “refers to organic farming plus environmental considerations such as on-farm wildlife management (i.e.,

the relationships between parts of the agroecosystem)” (Norman 1997); Kyusei nature farming “[is a farming method that] often employs technology involving beneficial microorganisms as inoculants to increase the microbial diversity of agricultural soils, which, in turn, can enhance the growth, health, and yield of crops” (Gold 1999); low input agriculture “[is a low input farming system that] seeks to optimize the management and use of internal production inputs (i.e., on-farm resources) and to minimize the use of production inputs (i.e., off-farm resources) such as purchased fertilizers and pesticides, wherever and whenever feasible and practicable, to lower production costs, to avoid pollution of surface and groundwater, to reduce pesticide residues in food, to reduce a farmer’s overall risk, and to increase both short- and long-term farm profitability” (idem); nature farming is a farming system utilizing “the inherent power of the soil” and focusing on “analyzing and building soil through composting, green manuring, mulch, and various other soil management techniques” (idem); organic farming is “a production system which avoids or largely excludes the use of synthetically compounded fertilizers, pesticides, growth regulators, and livestock feed additives. [It relies] upon crop rotations, crop residues, animal manures, legumes, green manures, off-farm organic wastes, mechanical cultivation, mineral-bearing rocks, and aspects of biological pest control to maintain soil productivity and tilth, to supply plant nutrients, and to control insects, weeds and other pests.” (idem); permaculture (from permanent agriculture) is “one of the many alternative agriculture systems described as sustainable [emphasising] on design; that is, the location of each element in a landscape, and the evolution of landscape over time, [whose goal is] to produce an efficient, low-maintenance integration of plants, animals, people and structure applied at the scale of a home garden, all the way through to a large farm” (idem); precision agriculture / farming or prescription farming or site-specific management is “a MANAGEMENT STRATEGY that employs detailed, site-specific information to precisely manage production inputs” (idem); regenerative / sustainable agriculture or low-input sustainable agriculture is “a farming system that is capable of maintaining its productivity and usefulness to society indefinitely. Such systems must be resource-conserving, socially supportive, commercially competitive, and environmentally sound.” (idem); regenerative / sustainable agriculture or low-input sustainable agriculture a “whole-systems approach to food, feed, and other fiber production that balances

environmental soundness, social equity, and economic viability among all sectors of the public, including international and intergenerational peoples” (idem).

Of these fifteen definitions, one definition by genus and difference could also be ranged among enumerative definitions, i.e. definitions that formulates its meaning by specifying its extension, that is, finite sets of objects that fall under the definition of the concept or term in question: alternative agriculture / farming is “[a farming method encompassing] a vast array of [agricultural] practices and enterprises, all of which are considered different from prevailing or conventional agricultural activities ...: nontraditional crops, livestock, and other farm products; service, recreation, tourism, food processing, forest / woodlot, and other enterprises based on farm and natural resources (ancillary enterprises); unconventional production systems such as organic farming or aquaculture; or direct marketing and other entrepreneurial marketing strategies” (Grudens, Shuck et al., in Gold 1999).

In fact, this is what confuses our students in their approach of specialised texts on sustainable agriculture: too many terms to define types of agriculture and/or sustainable agriculture concepts and practices that are sometimes very difficult to differentiate; there is lack of consequence in defining these concepts and practices, identified as farming methods (1), farming systems (2), production systems (2), agriculture systems (1), arrays of agricultural practices and enterprises (1), integrated systems of plant and animal production practices (1), low input farming systems (1), management strategies (1), systems of crop production (1), ways of practicing agriculture (1), or whole-system approaches (1); and 83% of the definitions are hybrid ones: thirteen definitions are 50% definition by genus and difference + 50% precision definition, one definition is 50% definition by genus and difference + 50% enumerative definition, and one definition is 50% extensional definition + 50% précising definition.

Though specialised definitions should be rigorous, unambiguous, conventional, prescriptive or stipulating (Bidu-Vrânceanu 1968), we wish to stress one point: since “sustainable agriculture is a dynamic rather than static concept” (Norman 1997), we have to admit that, at any point in time, in any society, the definition of any of the concepts above is going to be a compromise among differing world views, sets of values, etc., no one of which has any way to prove the other wrong, or illegitimate. Therefore,

despite any interdisciplinary (specialists in agricultural systems and linguists) effort, the “definition” of something like the concepts and practices associated with sustainable agricultural systems mentioned above is going to remain fluid (poly-semantic and poly-referential), driven by changes in community values, ideology, politics, science, etc.

The question we always ask ourselves is: Do we really need to spend much more time and effort attempting to define all these concepts? And here is a possible answer: Maybe agriculturists have sufficient commonality among their different understandings of these concepts to continue moving in the right general direction, even if they are not yet all moving toward precisely the same destination by the same route: they may never have generally accepted definitions of these concepts, and perhaps, they don't need any, but people involved in teaching others (this is our case) certainly do.

Schizophrenic narration

1. Introduction

The topic of our paper is an analysis of the schizophrenic patient Caroline Ebbesen's (1852–1936) collection of texts, which offer a look inside the fabulous and twisted world of a schizophrenic. We want to show that Caroline controls the act of enunciation almost perfectly, until the topic becomes the “self”, at which point she starts using 3rd person expressions. The problem concerning the “I” is expressed in the language by a failure in deixis (Fillmore 1967), metonymic glides and a lack of semantic coherence, all of which contribute to the instability in the act of enunciation. With reference to Henrik Jørgensen's and Frederik Stjernfelt's discussion of “Narrative fable in the schizophrenic text” (in Allingham et al. 2002), we want to show that due to her lack of self-consciousness, Caroline attempts to create a fully coherent cosmological narration with herself as the sender, topic and receiver in order to cure herself. This attempt fails, however: she is not cured of her schizophrenia, but by means of the narration, which counteracts her disruption, she has succeeded in creating a stability around herself, which helps her find peace.

In a broader literary perspective, Caroline's texts show many similarities with the modernistic prose exemplified by the Danish author Henrik Bjelke. In this modernistic prose the perception of the self and the world resembles the perception seen in Caroline's work. One of the similarities is the difficulty in finding adequate frames of comprehension. This is due to the fact that the signifier apparently dominates the signified. If in Bjelke's literature it is a word-puzzle, for Caroline it is an unconscious extension of the language that makes it possible for her to gain a broader perspective and thereby create her cosmological narration.

2. Caroline Ebbesen (1852–1936)

Caroline, diagnosed with schizophrenia, was hospitalized at the Sankt Hans psychiatric hospital from 1885 until her death in 1936. During her hospitalization Caroline was very prolific: she produced texts, drawings, paintings and needlework. Her written language has many special features; it is almost phonetic, and you can hear the regional dialect. In addition she has created her own ornamental alphabet. Despite this the language is stable at the level of letter and sentence, and as we wish to show, the problems only arise when the “I” becomes the thematic centre.

3. *The non-conformity of the language*

In very few cases Caroline uses the word “I”, but never as the thematic centre. She uses it about a special constructed “I”, as something big, religious or universal. For instance:

”And/ I am the angel/ and/ Sing/ To my Angels/ Little/ above/ Shepherd Stable” (Storm 1987: 26).

Caroline often refers to herself in the 3rd person as:

Caroline, Caroline Æbesen, Karoline, Kallroline, Kaolysinenæs, Karolysines, Kaaåroline, Kaårooline, Kaålysine, Kaaårååline, Karååline, Karål-ien, Dine, Deine eller Deidne. (Reisby 1985; Storm 1985 and 1987)

All of the names are derivatives of Caroline based on similarity, and all are 3rd-person expressions. This illustrates that the sender of the text is multiple, and that stable anchoring in the “I” is missing. Caroline lacks a clear consciousness about how she functions as an “I”. She lacks self-consciousness in perception, which according to Jørgensen and Stjernfelt (2002: 83) is one of the basic elements of schizophrenia. This is made clear through the 3rd person expressions, and also in relation to her own will. The problem is expressed in this short text: “Deine given / her will to what it wants” (Storm 1985: 60). By virtue of such 3rd person expressions, Caroline expresses her fundamental problem, which is the lack of self-consciousness. She communicates that she is controlled from the outside – that is that she lacks a stable “I”. Because she is both the 1st and the 3rd persons, she also constructs herself as the 2nd person (*deine*) of the text. She thereby emerges

as sender, subject and receiver, and the central part of her narration can be said to be herself and how her “I” figures in the texts.

Problems concerning the nonconformity of the language also emerge as a failure in deixis. We define deixis as according to Rosenbaum and Sonne:

Lexical and grammatical forms, which can only be interpreted, when the sentence in which it appears is understood as anchored in some sort of social context. The following aspects define the social context: the participants in the communication or the situation of speech have to be mutually introduced, and they have to be located firmly in time and space in connection to the act of communication. (Rosenbaum & Sonne 1979: 38)

The most extreme example of Caroline’s failed deixis follows:

Sat there a little star/ right under the moon/ once and see you watch out for our – it goes to your little/ soul watch out I am the moon – watch out for me I/ can take you. You cannot catch me I can talk with/ you take on you O-think of you Watch/ me I can shine for you – little sunbeam/ sat and watched the moon and least he suspected it was/ the moon which in the evening lights upon his little dog... (Storm 1985: 25).

The first problem is the switch from the told story in past tense, “Sat there a little star”, to the present tense and the imperative “See you watch out”, then back: “sat and watched the moon”. These switches happen without logical transition or justifiable connection. Secondly, it is not made clear who is being addressed. First it is the sun, but then a change appears: “Sat and saw the moon and least he suspected”. The previously addressed sun is suddenly mentioned as “he”, and this “he” has a little dog, which is highly unlikely if he is the sun. Thirdly, the moon is referred to in the 3rd person, even though it has been the speaking 1st person in the first part of the text.

In other texts, there is a failure of the relation between the enunciation’s time and space, on the one hand, and on the other, its actual instances, persons, institutions, powers, times, places, and so on. The local and the global are intermixed, and the parameters between time and space tend to decline.

An examination of the metonymic relations in the text illustrates that metonymic glides to some degree emphasize the vagueness in phraseol-

ogy and anchoring, thereby setting the language into a system. Metonymic glides are found in all the textual levels, both semantic and syntactic:

Jaeid/ va glad *åå* øndskede/ kimeren/ kemlen *åå* klengeren/ penge/ er ale
meneskernes/ glæde lile ana me/ Bøn og Sang påå/gaderne/tel hemerige
me/ maske påå *åå* lile/ jååhanes. (Storm 1985: 78)

(I/ was happy and wanted kimeren/ kemlen and klengeren/ money/ is
every human's/ joy little Ana with/ prayer and song in/ the streets/ to
heaven with/ a mask on and little/ Johannes.)

This example shows (in the Danish edition) metonymic glides at the level of letter- and phonetics: K's and Å's. But thematic metonymy is also present: "kimeren kemlen" and "klengeren" have a rattling sound, like money jangling in someone's hand. The metonymic glides illustrate how the signifiers dominate the signifieds. The language feeds on itself and creates a false reality which partly causes the failure of semantic coherence. But the metonymy creates a system. Even in the worst cases where semantic coherence is lacking, you still find metonymic coherence, which restores the lost anchoring and creates more stable terms of enunciations, thereby having a stabilizing and healing function.

Self-consciousness fails in the schizophrenic text due to the register of discourse. Everybody has a register of discourse as a precondition to being able to use a language that is socially acceptable and understandable. In schizophrenic language, the register of discourse sometimes gains control of the act of enunciation, thereby preventing the subject from controlling the enunciation. When Caroline doesn't control her register, she emerges as different characters. She becomes the medium of God, a child, or a great and powerful person. In her pictures a large hand often appears, it symbolises Caroline as the medium of God. This can also be seen in this short text:

"God has anchored his hand/ in the little Deidne/ this is in its house"
(Storm 1987: 33). She becomes king as well as archbishop: "with little
golden orb/ my sceptre/ and/ my/ crown and a little golden cross/ upon
my little/ golden/ archbishop/ hat" (Storm 1985: 74)

One can debate whether or not Caroline hallucinates. It seems, however, that she experiences thing that others don't see, for instance, the "light" which appears in both texts and pictures. But the elements of hal-

lucination are often used as abstract concepts or orchestrated theatrically in her fantasies of greatness: “Deidnes room number 10 and theatre first act. Living room Sorø Academia” (Reisby 1985: 59). But many signs of hallucinatory behaviour also appear where it isn’t part of theatre or use of symbols; for instance, she becomes: “Virgin Maria Magdalene Queen Caroline Ebbesen has born Jesus 1891 years ago of her quivering heart” (Reisby 1985: 73).

4. *The narrative project of the “I”*

This corpus of narratives is characterized by thematic recurrences which serve a stabilizing function. Caroline attempts to strengthen the weakened “I” by creating thematic coherence. This is made clear in the example above, in which she refers to herself as Virgin Maria Magdalene Queen Caroline Ebbesen. By doing that she inscribes herself in history as queen – a person with the highest possible secular power – and as Virgin Maria she also obtains religious power; and as Maria Magdalene she even becomes a sexual religious being. By creating herself as the sender, the receiver and the thematic centre of the text, Caroline enrolls herself in a continuing time and space. She tries to create coherence in history and include herself in history, thereby trying to escape the breakdown of the “I”.

5. *An attempt at healing*

When Caroline attempts to reconstruct her “I” by ascribing herself status and power, she uses institutionalised power connected to high social status. Kings, queens and archbishops all have a socially accepted space for their “I”, and this is exactly what Caroline needs; therefore her desire to gain power is her desire to stabilize her “I”.

As Jørgensen and Stjernfelt (2002) have argued, the manoeuvre of reparation is the central part of schizophrenic language. Reparation of the act of enunciation is an attempt to restabilise and heal the subject, by the means of a narrative created relation in the life story. This is exactly what Caroline attempts to create: a cosmological narration, with herself as the focal point of attention and a recreated self-consciousness. Her narration becomes an attempt at healing. But it is not limited to a spectacular, cosmological project; her narration works on several levels: the linguistic, the

cosmological-universal, and the familial level; in this last she writes about her family, her wishes and her crushes, which she integrates into the cosmological narration. The narration is an attempt to create a consciousness about historical identity, because in such a consciousness an “I” is created, which functions as a historical foundation.

Despite her efforts, the healing attempt fails. The narration is a compensation figure pressed upon the enunciation to make it work. It tries to tell how the patient can regain the regular and functional space of communication, but the only protector of such a space is the patient itself. But even though Caroline remains schizophrenic, she, by means of the cosmological-historical identity, succeeds in finding a peace that allows her to function in her everyday life.

6. *The literary status of schizophrenic texts*

Many of the traits characterising schizophrenia are found in poetry, intoxication, in religious or erotic delights and in different suggestive conditions. Therefore it is possible to see a reflection of the self and the world in art that is similar to the one we find in Caroline’s production. But despite similarities, it is necessary to be able to separate “sick language” from that of art. Nevertheless, Caroline’s production can be institutionally anchored as art, as it possesses many artistic qualities. The only thing that keeps her production from being interpreted as art is our knowing she is schizophrenic; it is first and foremost our knowledge of her that makes us judge the texts as “sick language”. Therefore we find it necessary to discover if there is a difference between, say, modernistic prose and schizophrenic language within textual boundaries. As an example of modernistic prose, we use Danish author Henrik Bjelke and his short story *Første person Ental* (*First-Person Singular*).

In Bjelke’s text you immediately sense the similarity with Caroline, primarily because of the challenge the reader faces in determining frames of understanding. The problem arises, in the modernistic language, because of the experimental frame, but also because of the deliberate attempt to break with known literature and create new forms of expression. When Bjelke constructs a literature that does not make use of already known stylistic forms, he complicates understanding and recognition, because the known is no longer usable as an approach to literature.

Caroline uses the known – history and religion – to create a coherent narration, but in spite of this she does not avoid problems concerning understanding and recognition. Even though she creates a coherent narration across several centuries, including all of her personalities, thereby actively attempting to counteract the weakening of the “I”, it doesn’t change the fact that the “I” is still weak, which is implicitly expressed in her texts. Therefore the narration does not lead to healing.

In Bjelke’s texts you see how the initiative apparently is left to the words, and how the signifier apparently dominates the signified:

Det hele er et stort eksperiment dækket af tusind små hårde hjerter. Silen-
tium. Polio et non. Bakles Nofelet Telefon Selskab. *Linge*. *Ingen* mister
Ingelminster. *Ingensinde*. *Sind*. *Ingens sind* eller for at gå over til. *Lang*.
Angle. *Mand*. *Mangler*. *Angelmanster* i Arkhangelsk eller Memel. *Yngst*.
Blomst. *Youngster*. *Engelmanster*. *Leng*. *Lem*. *Engel*. *Mennesker*. *Mønster*.
Yngel. *Ung* mand. *Ungelmunster*. *Ongelmonster*. *Orgelmonster*. *Orgel*.
Montre. *Ond*. (Bjelke 1968: 177–178)

(It is all a great experiment covered by a thousand little hard hearts. Silen-
tium. Polio et non. Bakles Nofelet Telephone company. *Linge*. Nobody
looses *Nominster*. *Nomind*. *Mind*. Nobody’s mind or to go to. *Long*.
Angle. *Man*. *Missing*. *Angelmanster* in Arkhangelsk or Memel. *Young-*
est. *Flower*. *Youngster*. *Englemanster*. *Leng*. *Limb*. *Angel*. *Human*. *Pat-*
tern. *Brood*. *Young man*. *Youngmunster*. *Ongelmonster*. *Organmonster*.
Organ. *Showcase*. *Evil*.)

This example (the Danish edition) is characterized by metonymic glides at all textual levels; e.g., gliding of the letters “ing”, “ind”, “ang”, “st”, “eng” and “ung”, which creates a connection to “ong” that ends with “ond”, which is Danish for “evil”.

This tendency in language is also found in Caroline’s texts. But the dominance of the signifier is only a narrative technique for Bjelke, a play on words and language, which contributes to a metafictional dimension as a linguistic self-reflection. In Caroline’s texts, the same technique is an unconscious extension of the language that makes possible a broader perspective. The language in both schizophrenic and modernistic literature will always be compared to well-defined, regular language. “Sick language” is therefore recognized by its break with the norm.

The breaking of norms is part of modernistic literature's experience of indefiniteness, as a testing of the boundaries of language and understanding. Bjelke and Caroline both circle around this indefiniteness, and in both of their texts this is founded in knowledge of the "I". The flowing "I" is the indefiniteness of the texts, and this causes an unpredictability in the language. This means that it is possible to understand a fragmented modernistic text, such as Bjelke's, in the same manner as Caroline's weakened act of enunciation. Both reveal the space of the fragmented "I" in narration and in the world.

This illustrates the fact that you can find clear parallels between a first-person perspective on schizophrenia and experiences in modernistic literature. But Bjelke and modernistic literature do not attempt or intend to create coherence and fight the fragmentation and the indefiniteness as Caroline does. Bjelke describes an unstable and fragmented "I", but the "I" finds itself in a life that seems hopeless and impossible to repair because of a world that seems evil with its emptiness, technology, mushroom clouds and alcohol.

I looked like a man who could cry because of this form of activity, a place in the houses [with] inhibition total. Language without words. It has nothing to do with music in spite of your own life. His letters ever since technically and rationally ... In addition found in relation to mushroom that shoots as observers on people a female author. Shoot themselves to get a warm experience ... Drives out in the air to the nearest bar and walks down. Blue pale young boys' faces through blue glassed alcohol. (Bjelke 1968: 107)

The portrayed universe emerges as fragmented, and there seems to be a causal link between the fragmented subject and the fragmented world. Caroline's world also appears incoherent, but the difference is, that her fragmentation doesn't happen because of the world. Of course, environmental factors might have triggered her disease, but she doesn't depict the world as guilty of such. Her text is fully concerned with the "I" and how it functions in an accepted world.

7. Conclusion

There are several similarities between the schizophrenic text and modernistic literature. Metonymic glides, where the language seems to feed on itself and dominate the contents, appear in both cases and in both cases they are narrating techniques; these being conscious in modernistic literature, but not so in the schizophrenic text. Similarities are also found in the description of the fragmented subject. But in the modernistic language you do not find the urge or drive to create coherence and understanding, as you find in the schizophrenic texts. When the schizophrenic patient tries to heal her/himself by means of narration, in the attempt at creating a coherent cosmological story, it is an attempt to counteract – not create – fragmentation. In this way, the schizophrenic text separates itself from modernistic literature and the modernist worldview.

***Inşallah* – As God wills**

Paths through the jungle of productive misunderstandings

Jacques Lacan mentions that communication is the positive or negative effect of productive misunderstandings (Roudinesco 1999:120). This gets a new dimension when one considers Muslim countries and their languages, because the misunderstandings might have political relevance.

I'd like to take Turkey and Turkish as an example, since I've been living and working there for some time. This country is seeking membership in the European Union, and the people of Europe are becoming aware of Turkey's rich traditions, on the one hand, while not understanding the aims of this country, on the other.

Although Turkey is a fully secular state, everyday language indicates otherwise. There is widespread use of religious terms, especially statements considering God in many different forms. These common phrases are used on many occasions. If you take the first word I learned – *inşallah* – and related words (*maşallah* and *Allah, allah*) you will see that the meanings and the ideas related to these words cover quite a wide range.

Inşallah means, according to the dictionary, *Redline İngilizce-Türkçe* (2006), “so God wills”, to hand yourself over to God's decision. It includes the idea of waiting for anything or anybody, and it also includes the idea that you can't do anything against what is happening. It is used in many different situations, as when a worker is hopefully doing things right, when someone is late for an appointment, has an accident, when one is waiting for better times, etc. In discussions of politics this word becomes essential to some people, because all is God's decision and you can't influence it; you just have to take it as it is. So also political decisions seem to be made in heaven or hell, depending on the political and religious position of the speaker.

The word *maşallah* has a clearer proposition, meaning hope as regards an impending event. It includes good and bad sides, but mainly expresses hope for a positive ending. It is also used in the sense of “good luck” following a bad experience. It is used when a beautiful woman passes by a group of men, in the sense of “wow” (good) and the related temptation (bad), as well as in situations that mean bad luck in the sense of “what a pity!” and you wish you could have done something about the situation. It is an expression of wishing and hoping that can be influenced by one’s own will or doing. It contains God’s name, similar to *inşallah*, but here people are forced to make their own personal decisions as well.

“*Allah, allah*” is a phrase that turns to God directly. It is mostly used when bad events have already happened or one strongly expects them to happen soon. You are powerless against the effects, and you hand yourself over to God in the moment of speaking. The phrase is mostly used in acknowledging events with bad effects, such as an accident, an earthquake or the daily traffic jam in Istanbul. You don’t have too many possibilities to influence the result, so you just take it as it is, at the same time registering the fact that you would prefer not to be in such a situation.

Turkish is a language rich in images and metaphors and extremely hard for a European to learn. Not many languages allow for such a broad spectrum of interpretation. You don’t just talk; you don’t just state your mind or express your intentions directly. Rather, they are wrapped in endless layers of stories, images and similes. Parables, such as those in the Bible, are extremely common. Moreover, a person’s identity (both “private” and “public”) will help determine what this person really might want to say.

The words and phrases mentioned above show quite well how misunderstandings may come about in speaking, and especially hearing, Turkish. It is not so much the dialect or the broadly used short forms, it is the intention behind speaking that is much more important than, for example, in my language (German).

My identity in Turkey is that of a stranger, female, teacher, intellectual, living in a city, European, non-Muslim. Thus, I am restricted by my identity as well as my meagre knowledge of Turkish and Muslim traditions.

Still, I would like to introduce two terms for describing the differences between most European languages and Turkish: *fact-based* and *fiction-based*. In *fact-based languages* like German or English you say what you think and you compare the facts with reality. Of course you use metaphors,

but you don't give them so much importance. Nor is your identity so relevant to what you say, although your social status might influence which words and phrases you choose.

By contrast, *fiction-based languages*, such as Turkish, find their orientation in story and in metaphor. You do not say outright what you think, but wrap it up in a story about someone who is said to know the facts. Which story you choose depends on your social status – identity is crucial in Turkish. The language one uses in Turkish shows more a *belief* in reality than a *comparison* with it. Such language has stronger ties to the symbolic than to reality and the real. In sum: whatever you talk about could very well end up in the “hands of Allah.”

How to translate or better interpret the Turkish language will be essential for negotiations with the European Union. You have to “feel” what people want to say, since it is not always what you hear them say that matters. Turkish people are extremely proud and are especially aware of their social identity. They know how to negotiate, and they do not always treat people equally; for example, one who cannot cope with their language may be considered inferior. Both men and women use their stories and their bodily presence to impress you and to convince you of the rightness of their opinion. Both secularists and sacralists commonly turn to Allah:

In both Turkey and Europe, there is unease and ambivalence. ... The irony, of course, is that the avowedly secular Europeans ... have been equivocal, whereas the Muslim party leading the governing coalition in Turkey expresses no reservations about relinquishing sovereignty to the European Union in return for closer economic ties. ... Few people imagine that it is possible for a state to be Muslim in cultural and religious identity and also be a full participant in the global economy. (Karabell: 282–283)

Being in the European Union will not be like buying a carpet in the bazaar; people will probably have to find a new way of communicating with each other. The “jungle of Allah's garden” must be negotiated. And as we have noted, the use of language is not only to relay information, but to express social status, religiosity, which region you are from, which identity you have taken, what your educational level is. There is also a difference between spoken and written language. All these points have to be put into consideration if one is trying to understand what Turkish people are talking and writing about.

In concluding, I'd like to state that productive misunderstandings might be nice in literature or satire, but politics and human rights are nothing to play around with, no matter if your language is based on facts or on stories. You have to find a way to clearly define what you want and what you do not want. Misunderstandings are productive only as long as they don't mean including or excluding someone because of his/her language.

Pärtyli Rinne

Towards a philosophy of love: A philosophical defense

1. Introduction

The fundamental question in my thought is, What should be done? My hypothesis is that it is best to love. Thought conditioned by this hypothesis is a philosophy of love. By love I mean the non-violent action that reduces suffering and/or promotes well-being (cf. Oord 2004). I distinguish between three major types of love:

1. The Love of Truth (Science, Philosophy)
2. Sexual Love
3. Altruism

In the Western tradition, one is also tempted to accept the classical distinction between *eros* and *agape* as two different forms of love. I believe the former is based on lack (-), the latter on surplus (+). For a general theory of the subject, I accept the concepts of negation, hesitation and affirmation as forming the conceptual groundwork.

In what follows, I start with a brief exposition of realism in the philosophy of science. Then I move on to discuss Eero Tarasti's concepts of negation and affirmation in his theory of existential semiotics. Then I point out what I consider to be the most serious problems with regard to love in the discipline of psychoanalysis, discussing the work of Alain Badiou as a prominent reworking of the psychoanalytic heritage. Lastly, I point out that Jacques Derrida, Richard Rorty and Gianni Vattimo all defend love as the highest principle of thought.

2. Realism

For scientific research, I accept the position of realism as my guiding background assumption (e.g. Niiniluoto 1999). For me, realism means that to a

certain extent there exists a mind- and theory-independent world/reality, of which knowledge (truthlike or not-so-truthlike) is attainable. As I see it, a version of realism can be compatible with moderate interpretations of schools of thought such as pragmatism, constructivism, existentialism, hermeneutics and phenomenology. The latter orientations all share in common the conviction that thought and research participate in the world. This could be a serious problem for some, even many scientific realists. Many scientists hold that a description of reality does not alter the reality it describes, whereas others argue that scientists and philosophers are corporeal beings, and since their bodies think and exist in relation to reality, their being necessarily alters the reality in which it participates. These views are compatible with scientific realism, as long as one maintains that not all of reality is humanly made or theory-laden, just as all human actions are not reducible to science, and that thought does not simply describe reality with theories, but also participates in the shaping of reality outside scientific discourse. Within science, however, one is obliged to discard strong versions of pragmatism (truth is simply a matter of utility/power) and social constructivism (reality is a matter of social construction). For now, on the basis of Ilkka Niiniluoto's philosophy, I would term my own position as that of critical constructive realism.

In any case, it is clear that the stronger basis a philosophy of love can attain, the stronger the theory will be. In the philosophy of science, this will mean a search for the strongest positions. In other words, one is to affirm the positions that are the easiest to defend with rational argumentation. In this article I can go no further than that. I would suspect, however, that the theory that is able to give the most profound, comprehensive and convincing account of the concepts of the negative and the positive will be the hardest theory to refute.

3. Negation and affirmation in existential semiotics (Tarasti)

In Eero Tarasti's theory of existential semiotics, negation and affirmation are transcendental acts of the subject. In negation the subject (an individual) experiences Sartrean Nothingness or the Hegelian *das Nichts*. The subject experiences the void of the world. In affirmation the subject experi-

ences the plenitude of the world, the world as rich and full of meanings. (See Figure 1; Tarasti 2000: 10–12)

Figure 1. *The transcendental act* (Tarasti 2000).

The scheme in Figure 1 is Tarasti’s model of the two transcendental acts of the subject. In my opinion, Tarasti attempts a systematic, yet non-reductive account of negation and affirmation, of their inter-relatedness, based on Kant’s idea of transcendence and Hegel’s idea of dialectical progress of thought. Tarasti argues that, basically, transcendence is “what is away, but present in our minds”. Tarasti holds that a scientific theory of transcendence is possible. In my view, and from a broadly Kantian perspective, a theory of transcendence would be the same thing as a general theory of externality (the world, reality), that is to say, of that which we hold to be “outside our bodies”.

From the perspective of existential hermeneutics, I claim that negation and affirmation are not only transcendental acts, but are also the two modes of existential pre-understanding or pre-openness to the world. Arguably, negation and affirmation are pre-predicative conditions of thought, communication and understanding – the first obviously negative, the second positive. Negation and affirmation relate the subject with the world. In speaking of “relation”, I follow Peter Hallward’s definition: “By ‘relation’ I mean a process that operates between two or more minimally discernible terms, in such a way as to condition or inflect (but not fully to generate) the individuality of each term” (Hallward 2006: 152). Since relations are processes, we may conjecture that negation and affirmation are also the two strong modes of temporality (see Figure 2). I hold that there is also a weak mode between them and preceding them, which I term *hesitation* (discussed below, section 5).

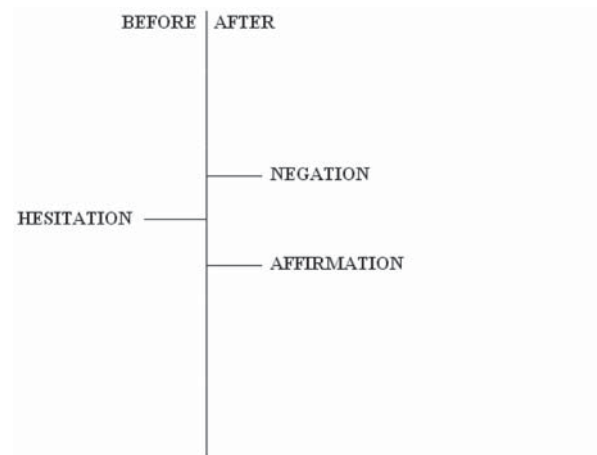

Figure 2. Temporal status of negation and affirmation.

Negation and affirmation are the two formal categories of singular temporal events. Negation separates, subtracts, closes, disconnects and excludes; affirmation unites, adds, opens, connects and includes. As consistent pre-openness (such as faith, attitude, orientation and so on), negation and affirmation form the logic of consistent subjective action. Negation forms the logic of exclusion and decreases the number of open relations/connections in the individual's world; affirmation forms the logic of inclusion and increases the number of open relations/connections in the individual's world. Negation as the consistent pre-openness of subjective action operates as forcing relations, as is the case, for example, in the psychological phenomenon of narcissism (where others are negated by not taking them into account). Violence in the corporeal world of social relations is a paradigmatic example of negation, as is the critical attitude in discursive philosophy (e.g., the doctrine of falsification). I conceive violence as the primary form of evil whereas the critical attitude, in my opinion, is a virtue. Affirmation as the consistent pre-openness of subjective action operates as liberating relations, as is the case in the phenomenon of altruism (neighbour-love) where others are cared for and helped. In science, affirmation appears as discovery or invention (of new facts, of new interpretations – and their possible verification).

4. *The heritage of psychoanalysis (Freud, Lacan, Badiou)*

During the last century, philosophical discussion about love was dominated by psychoanalytic discourse. Before presenting my critical argument, I want to emphasise that my aim here is not to undermine the revolutionary influence of psychoanalysis or the relevance of such concepts as the sub-conscious or the libido, which have become a part of our everyday vocabulary and thus have undeniably been extremely fruitful. I will however concentrate on the points on which I disagree with psychoanalysis. In my opinion, the two most distinctive features of Freudian discourse and its follow up in the work of Jacques Lacan were a masculinizing theory of sexual desire and a dogmatic, non-scientific attitude toward research. From the perspective of critical research on love, the third distinctive feature in both Freud and Lacan is their denial of the possibility of altruistic love. I will go through these points one by one.

4.1. The most notorious concept in psychoanalysis is undoubtedly that of the phallus. In my opinion to insist on the supremacy of the phallus, as Lacan and Freud both do, deserves critique. Why? First, because to insist on the supremacy of the phallus upholds and strengthens an unjustified inequality between the sexes, still present in all corners of the globe. Second, because both Freud and Lacan defend the phallus with logically fallacious arguments, and that is philosophically unacceptable. With both of them, the supremacy of the phallus is established through the classical fallacy of circular argumentation (*petitio principii*). For a good exposition of Freud's circular argument as regards the phallus, see Judith Butler's critique in her essay "The Lesbian Phallus" (Butler 1993, esp. 57–62). Lacan repeats Freud's logic in his text "The Significance of the Phallus" (in Lacan 1977) where he argues primarily that the phallus is a signifier. However, it is not just any old signifier, but a signifier that grounds the whole of the language system. A critical reader must ask: how can one signifier ground the whole language system? This is a logical fallacy, in so far as a signifier is a unit of language and classical logic is accepted as a valid form of criticism in ordinary language. Logically, a unit of language cannot be the basis of language.

4.2. My second criticism concerns the position of psychoanalysis as a science. Usually, when psychoanalysts are accused of circular argumentation, they respond with the following claim: what seems a circular argu-

ment to those criticising the psychoanalytic discourse, is in fact due to the critics' own repression of their subconscious. This leads soon enough to a "chicken or egg" type of debate. Thus, I shall only point the reader to what in my view are quite reasonable and informed critiques of psychoanalysis as dogmatic thinking. With regard to Freud, I refer to the critique of his contemporary Karl Popper in his book *Realism and the Aim of Science* (Popper 1983: 163–174). Popper shows in convincing detail how Freud deals theoretically with the problem of so-called "anxiety dreams". We remember that according to Freud's theory, all dreams are fulfilments of wishes. This maxim struggles, however, with the problem of anxiety dreams, for how could a dream of anxiety be a fulfilment of a wish? Freud himself notes this problem, but continues, rather than making the necessary alterations to his theory, by sweeping the problem under the mat. Later on, he defends his theory as if the problem had never existed. Popper calls this an example of dogmatic thinking, where subjective coherence is forcefully upheld, even as it starts to contradict the facts. The case is somewhat similar with Lacan, as Francois Roustang (1990) points out. Roustang shows how Lacan's attempt to find a "Science of the Real" is ultimately taken to the limits of madness, since Lacan himself has defined the Real as impossible, yet tries to establish it as the object of rigorous, "mathematical" science (for a critical account of Lacan's use of mathematics, see Sokal & Bricmont 1998). If the ground of Lacan's position (transcendental idealism) is understandable, its complications are obvious enough, as Roustang shows. Furthermore, the realist position can in most cases be quite easily defended against idealisms. As a defence of Lacanian psychoanalysis, I mention a book edited by Leupin (1991), although I admit that given my current knowledge, the psychoanalytic project, as influential as it once was, seems to be essentially non-scientific.

4.3. Lastly, based on what I have read, it seems that psychoanalysis is unable to give almost any kind of account of altruism. Both Freud and Lacan dismiss the very notion on grounds of sheer opinion (i.e., without evidence). They both insist that the negative relations of aggression and cruelty are foundational to human interaction (Freud 1969: 46–50; Lacan 1992: 179–190, 198). Whether this is or is not the case, remains a matter for further enquiry. Here however, I must say quite frankly that I hope Freud and Lacan could be proved wrong – or else we should find better passages to quote from their work.

I will continue by presenting in more detail the work of a philosopher, who by no means is reducible to psychoanalysis, but whose theory of love nevertheless carries on the psychoanalytic heritage: Alain Badiou. His most important book, *L'être et l'événement* (1988), has been translated into English as *Being and Event* (Badiou 2005a). This work has recently (2006) received a sequel under the title *Logiques des mondes*.

According to Badiou, mathematics is ontology. This means that mathematics says what can be said of being as such. Badiou's discourse of "meta-ontology" is based on set theory, originally invented by Georg Cantor. Most importantly Badiou's theory is based on Paul Cohen's demonstrations of the so-called continuum hypothesis. Cohen invented a technique called "forcing" with which he was able to show that the continuum hypothesis cannot be proved within set theory. Earlier, Kurt Gödel had shown that it cannot be falsified either. The hypothesis is thus independent of the other axioms of set theory and has to be decided upon through an act of faith. Paul Cohen's theory of "generic sets" is the ontological correlate for Badiou's theory of subject. Badiou's notion of subject is related to the notion of event. An event is a break or a rupture in a situation (a world). The individual encounters the event as the void or the inconsistent multiplicity of the situation. Through a sort of decision, the individual becomes faithful to the event, and this fidelity lures the subject, which starts to force the situation. According to Badiou, fidelity as forcing produces truth. A truth is a radical novelty in a situation; it is that which previously was nothing for/in the situation. There are four types of truths in Badiou's system: scientific, political, artistic and amorous. As novelties, truths are thus always sorts of "immanent revolutions", taking place in the mentioned four fields of subjective action (Badiou 2005a).

For a thorough critique of Badiou's philosophy, I point to Peter Hallward's book *Badiou: A Subject to Truth* (2003). According to Hallward, Badiou's subject is constituted once an individual has been subtracted from the regime of relations it has with other individuals. Hallward says his own guiding assumption is "that an individual has no being outside of its relations with other individuals, so what matters is the conversion of oppressive relations into liberating ones" (Hallward 2003: 322). The operation Hallward terms "subtraction" could perhaps be called a negation of "incoming" social relations, such that the subject is indifferent to others. This leads to a situation where others are marked with either (+)

or (-), on the basis of their reaction to the subject supporting the event. They either join the subject and form a positive connection with it (+), or they don't, in which case the connection is negative (-). The gist of Hallward's critique thus far has been that it is ultimately unconvincing to hold insistently that individuals are non-related (as do both Lacan and Badiou), or that the event constitutes a subject whose relation with the rest of the situation is that of pure binarism, without hesitation or negotiation (both of which would make the thought of gradual reciprocal conversions possible). It is not a coincidence that Badiou's new book attempts to address the problematic of appearing and relations. Even though I am not yet in a position to discuss the argument of Badiou's latest book, I must note that in so far as the relations he discusses remain ontologically secondary to the event in such a way that the event precedes the unfolding of these relations, Badiou, in my opinion, has failed to address Hallward's criticism. Since what Hallward has pointed out is that the event causes individuals to attempt to "subtract" themselves from others and force the nothing/pure novelty in to shared being, it does not necessarily help that much to describe the relations unfolding under the condition of this event, if the basic logic of the event itself remains the same. In this case, the logic of appearing would still remain under the law of subtraction. But could we go the opposite route and conceive of a distinctly positive event? Could we envisage an event leading to multiplication of discernible differences (see Hallward 2006: 81) instead of one leading to subtraction? Might there be events that bring human beings closer together instead of separating them from each other? Can Badiou's thought be stretched to include events that bring forth the rainbowlike plenitude of particular identities instead of the "stellar abstraction" of pure equality?

Before discussing Badiou's theory of love, I will show an alternative way to back up Hallward's reading. It has to do with Badiou's claim that mathematics is ontology. This position is very hard to hold, in view of Paul Cohen's convincing argument that mathematics is not a matter of pure and objective, Platonic being (see Popper 1992: 26). As there are axioms in mathematics, the truth of which cannot be deduced but has to be decided, we can well argue that at least for these important parts, mathematics is not the science of "pure being", but rather belongs to that part of being which is of explicitly human construction. In other words, it seems that mathematics is an emergent property of being, the sort that no longer automati-

cally refers back to anything objective (in Popperian terms, mathematics belongs to “world 3”). If, as it seems, there are parts of mathematics that are clearly subjective, then it is incorrect to deduce that the whole of being must be correspondingly subjective, according to some decision one makes in mathematics. This would bring us to the classical Parmenidian equation of being and thought. The Parmenidian position can be contested, since we have good evidence that human thought appeared rather late in the history of our universe. Therefore, because being obviously precedes human thought, it cannot be reduced to human thought. Furthermore, Badiou uses circular argumentation (with echoes of Lacan) to assert his notion that mathematics is ontology (e.g. Badiou 2005a: 11, 21–22; cf. 2005B: 138; also, Hallward 2006b: 233). Since the circular argument is an argumentative structure closed from external evaluation, it is also a form of subtraction from inter-individual relations in Hallward’s sense.

In *Being and Event* Badiou writes the following: “Philosophy is thus at the service of art, of science and of politics. That it is capable of being at the service of love is more doubtful ...” (Badiou 2005a: 341). Fortunately, this doubt has not prevented Badiou from writing about love. His theory of sexual love is indebted to Lacan, in that Badiou insists that the individuals in love have no relation with each other. Love takes place as the disjunction of two sexual positions, the “man” and the “woman”. The sexed positions come into being through an amorous encounter between two individuals. The individuals’ fidelity to this event constitutes love as truth procedure. For Badiou, love is not a matter of mutual recognition but of absolute disjunction: nothing is the same for these two non-related positions. Furthermore, in Badiou’s text “*Quest-ce que l’amour*” (in Badiou 1992) the essence of Badiou’s love is conflictive. For both positions, the other position appears as a “sophism that needs to be refuted” (ibid.: 270). This conception of love is essentially negative and undoubtedly linked to the operation of subtraction.

Badiou discusses love also in his book *Saint Paul: The Foundation of Universalism* (Badiou 2003). The concept of love in this book is somewhat different from his sexual theory. In classical terms, his Lacanian sexual theory refers to love as *eros*, whereas the term at stake in *Saint Paul* is *agape*. In his reading of Saint Paul, Badiou (2003: 92) states that love is the name for a general medium through which faith works with regard to all singular truths: “Truth for Paul is never anything but ‘faith working through

love' (Galatians 5.6)." According to Badiou (ibid.), love thus means that a singular truth is for all. "The subjective process of a truth is one and the same thing as the love of that truth. And the militant real of that love is the universal address of what constitutes it." Badiou's interpretation is based on the assumption that, in Paul's discourse, truth (*aletheia*) is greater than love (*agape*). Badiou also writes that the translation of the word *agape* as *charity* "no longer means much to us". I am sceptical of both of these notions, and wonder whether they are based on Badiou's own system, where truth is above all else. Because of the emphasis on truth, Badiou, in my view, confuses faith and love. He represents the theological position that emphasises the aspect of *agape* as "love of God" over the aspect of *agape* as "love of neighbour". With Badiou, truth subsumes the neighbour as a consequence of the subtraction discussed previously. In Badiou's discourse love is submitted to a faith that is militant and, in my opinion, always singular (subjective) rather than universal (objective). In my opinion, truth must never dominate love, which also means: faith must never dominate love. Faith is singular, and must not be forced onto others (misunderstandings of this principle are abundant). Love can be thought as "the universal address of faith" only when the intention of faith is to liberate the other even when truths collide. *Agape*, as the love of neighbour, concentrates on liberating specific others regardless of faith. Henceforth love, as a matter of course, ceases to be militant. This notion, however, restores the meaning of charity as the conversion of oppressive and exclusive relations into liberating and inclusive ones.

In any case, Badiou's writing on love is an admirable rarity, as he subjects love to systematic treatment and gives it an ontological position in his system. Indeed, for Badiou, love is a matter of truth. Badiou's general notion of fidelity opens up a fresh horizon of thought oriented toward changing the world. His concepts are solidified in mathematical background, and his overall project serves as an exceptional inspiration to contemporary philosophical thought raising the question of what is to be done.

5. From hermeneutics of love to politics of love (Derrida, Rorty, Vattimo)

I will end with a brief discussion of hermeneutics, hesitation, affirmation and love. I take up these notions through the philosophers mentioned in

the title of the section. I will show hesitation in Derrida and Rorty, and affirmation in Derrida and Vattimo. My main aim is simply to point out certain passages of writing that show that all these philosophers hold love as the highest principle of thought. Even as these passages on love are singular, I argue that they are so central and unambiguous that an interpretation can be made on their basis as regards the philosophical projects of these thinkers on the whole. The problem for further discussion seems to be mainly what is meant by love.

What is hesitation? Hesitation is weak temporality. Hesitation means that the status of a singular relation is undecided and that negation and affirmation are both possible. In hesitation strong temporality as negation or affirmation is suspended or postponed. Hesitation as consistent pre-openness is the mode of hermeneutic thought (by which I mean the endless movement of discursive analysis in the hermeneutic circle). In deconstructive hermeneutics, hesitation forms the logic of metonymical transformation or distortion and appears as weak thought (e.g., Rorty, Vattimo) or as the dissemination of meaning as *différance* (Derrida). The limit of consistent hesitation is the concept of the impossible or the undecidable, the hermeneutic aporia. Logically, hesitation precedes negation and affirmation. Therefore hesitation also means that any logic in thought can be converted.

The French philosopher Jacques Derrida's thought exemplifies an individual's conversion (or return) from hesitation to affirmation. Hesitation is what Derrida (1999) means when he says: "Beneath it all, I don't know what I should do." Not to know what to do is an existential thought-event of hesitation. In Derrida's philosophy the principle of hesitation operates as the endless postponing of the vertical conjunction between the signifier and the signified in the metonymical chain of signifiers. The principle of *différance* postpones meaning and thus constructs an eternal before: time as not yet. As Hallward puts it: "Deconstruction is the constructive orientation of thought turned against itself" (2003: 161). For Derrida, however, hesitation was hardly reducible to "not knowing what to do". For the deconstructionists, hesitation is a rigorously upheld ethical programme. The deconstructionist argues that all positive stances, all affirmative action in defence of a principle, already contains a seed of fanaticism or fascism. Therefore, one is to withdraw from any simply definable position. For a detailed analysis that shows hesitation as an ethical project of Derrida,

upheld with much rigour, I point to Simon Critchley's book *The Ethics of Deconstruction* (2002). Critchley shows the ambiguity of the Derridean affirmation, as it is "unconditional" on the one hand, but manifests itself only in hesitation, on the other. According to Critchley, the decision not to decide is what is crucial in Derridean ethics. He argues that insisting on the undecidable constitutes an impasse for deconstruction with regard to political thought (ibid: 236). The sphere of the political seems to remain out of reach for deconstruction, unless supplemented with decisions.

In the end Derrida had obviously converted his thought from hesitation to the affirmation of appearing relations in the social reality. A Finnish philosopher, Susanna Lindberg, told me that at Derrida's funeral, his son, a poet, read the following note (which I have now translated to English from the Finnish version that I heard), which Derrida had written just before his death (Derrida 2004): "Smile. I too am smiling, because I love you." The text is unpublished, and therefore is not a probative source in the scientific world. Yet to me personally, on the level of "personal thought", it is the meaning of Derrida. My reading of Derrida's philosophy can then be compressed to the following argument: The one who hesitates must smile in order to grasp the meaning of love. In his last unpublished text, there is no question of hesitation as Derrida's discussion of smiling and love is given in the form of an imperative, a command: smile.

In a recent discussion with Vattimo, Richard Rorty said the following: "The hermeneutical ... attitude is in the intellectual world what democracy is in the political world. The two can be viewed as alternative appropriations of the Christian message that love is the only law" (Rorty and Vattimo 2005: 74). In his essay "Anticlericalism and Atheism", Rorty writes: "My sense of the holy ... is bound up with the hope that someday ... my remote descendants will live in a global civilization in which love is pretty much the only law." But then he continues: "I have no idea how such a society could come about." If Rorty has "no idea" how to pursue a society of love, which he hopes for, then his position is obviously weak.

In his essay "Age of Interpretation" Gianni Vattimo writes: "... our only chance of human survival rests in the Christian commandment of charity." There is not much weakness in this position, since charity seems to be a matter of obeying a commandment.

I accept Rorty's and Vattimo's notions on the hermeneutics of love. If love is the only law of hermeneutics, then the task of hermeneutics is

to be the conversation of love. I believe, however, that hermeneutics as interpretative conversation is not enough. As long as history is interpreted and not affirmed, thought cannot move forward to the construction of an affirmative agenda concerning appearing relations (see Figure 3). Hesitating thought moves within the cyclic form of the hermeneutic circle. It programmatically rejects decision-making that would convert thought into linear, forward motion. This is why Rorty's thought cannot account for the question of how to actualise the content of hope, which in Rorty's case is "the global civilization of love".

Figure 3. *The subject's transition to love.*

If all thought participates in the being of the world, then one cannot separate the intellectual world from the political world, or interpretation from production. Thus, the construction of an affirmative agenda of a politics of love is necessary. From my point of view the biggest problems in the world are the destruction of the planet's environment, economic exclusion as poverty and suffering, sexual exclusion as the oppression of women, and ethnic or religious exclusion as war and murder. The conversion of exclusion into non-violent inclusion can only start in the heart of individuals. We must stop excluding others from our hearts. I believe that love will unfold as a rational and sustainable long-term solution to many important problems with which the human species struggles.

The writings of censorship: An exercise in implicitation

This article presents partial results of a research project about censored words in stage plays. In order to understand the censor's point of departure, this study applies concepts of implicitation, thus pointing out a special kind of writing, created by the censor, about desire and power.

1. Research and method

I coordinate a research line, called *Power and Speech in São Paulo*, which is part of a larger study of the contents of the Archive Miroel Silveira.¹ The Archive is made up of 6,203 censorship proceedings concerning stage plays, issued by the Department of Public Amusements of the State of São Paulo, Brazil, from 1925 until 1970. Our studies concentrate on the stage plays "approved with cuts", hence those from which passages, expressions or words have been censored. The Archives contain 1,304 stage plays in this condition.²

Many authors have already pointed out the role of repression in making history and fixing specific world views. They understand this process as related to nourishing and supporting the established power. Equally, studies on speech restrictions have noted the points on which, because they are vital to social organization, censorship falls. Michel Foucault said that, generally, desire and knowledge will be the objects of attention. Knowledge merits concern because it is of interest to power and its correlated organization. Desire will be supervised because it infuses scenes with affects, thus fixing them firmly in the mind of the spectator.

These considerations have oriented us in a study that tries to isolate the subjects privileged by censorship, the censor's *modus operandi* and the production of sense that has its origin in the strategy of power maintenance, which censorship materializes as tactics. When we work with forbidden

expressions, we are in effect reading the censor's reading, and we understand that these interdictions compose a kind of writing of its own.

For this purpose, it was imperative to consider the censor as circumscribed by social and historical conditions that both legitimate and orient the censor in his/her work. For this purpose, discourse analysis was used, because it incorporates the concepts of dialogism and inter-discourse, which help us to understand the cultural stratifications that cross over and through a text.

On the other hand, our reading of the censor's reading brings to light a game of interpretations/inferences. In relation to this condition, another methodological approach invites us: the theory of *implication*. The censor reads the implicit meanings, such as allusions and insinuations, on which he bases his interferences. As it happens, the censored word, by itself, would not be found objectionable. But in its context, which conveys other meanings, it turns into an object of prohibition based on an implication. The work of Oswald Ducrot has helped us in this line of inquiry. According to Ducrot, presuppositions are related to the logical and existential conditions of an enunciative act. Although presuppositions often apply to larger discourse formations that often sustain as imaginary both the author's and the censor's discourses, the two are not necessarily equivalent. The censor engages in discourse having a legal dimension, with the State apparatus to support him. The latter charges the censor with preserving such things as good habits and manners, the family, the feminine image, the figures and institutions of government, etc.

In turn, the implied meanings present themselves as implications produced by the relations between enunciate and context. The implications are effects of sense, arising from an interpretative operation by the spectator. These may be produced from the enunciated text or from the context of a phrase, and, in the case of staging, by voice intonation, gesture, and facial expression.

The censor, in his own interpretative work, accomplishes a complex reading operation with the logic of implication that demands construction of a calculus of the text and that we may categorize as contextual inference. This calculus has to consider the possible readings of spectators of the stage play, in order to judge the implications that a meaning may carry. Thus, there is work on two levels of implication: one, on the level of the

text itself, and the other of possible readings by the spectator, according to socio-temporal coordinates.

This calculus is combined with the one of situational inference, because it ponders the projections of different interpretations given by the actors. It is further combined with one of inter-discourse inference, since it considers the dominant discourse formations that subsume valorized social habits – a common understanding of the world as an already-given organization to be preserved by the constituted power.

Based on all these readings, the censor will make his judgment about whether the play is to be allowed or not. Our study of forbidden words and passages must therefore retrace the censor's reading trajectory, and follow the play between presupposition and implication, in order to throw light on the process.

After two years of working with our corpus, and oriented by the methodology presented above, we have verified that the major part of the censor's cuts may be classified as being of moral order. As censorship of moral order we understand the prohibition of obscene words, of expressions and words related to sex, of offenses to the family institution – in short, of words against good behavior.

We work with a broad censorship typology, divided into four major *topoi*: censorship of moral order, political order, religious order, and social order. It is an operational division. From the classical opposition between State and People, the two last classifications converge, respectively, into the first ones. From the first play in the Archive until the last, we observed this type of intervention, appearing in 53 % of the studied plays. When combined with religious censorship, we arrive at 62%. As a demonstration of our procedures as well as of the cases, we now analyze the first and the last plays.

2. *On moral censorship – On disciplinary measures*

The first case is the vaudeville *It Is Time*, written by Goulart de Andrade and censored in 1925. It consists of a satire about Adam and Eve in paradise. It begins playfully with Eve, climbing on a banana tree and peeling bananas, when the Censor Angel arrives and commands her to use leaves from the waist down. Among the various censored words of a moral order, there is the moment in which Eve says “I only climbed the stick” – a phrase

that was forbidden.³ The polysemic conditions of the word “stick” motivated the censor’s cut, since it may refer to the masculine sexual organ as well as the tree. Thus, the action described may indicate that Eve climbed the tree and/or had sexual intercourse. However, in the malicious context of the vaudeville, the sexual relationship between Adam and Eve is constantly insinuated. This fact certainly authorizes the censor to read in the phrase an implied meaning to be materialized in the spectator’s interpretation. As it happens, the implied meaning refers, beyond the alluded sexual relation, to the masculine organ in slang or vulgar language. This motivates the censor’s action in defense of good habits, now viewed as a vocabulary matter.

The historical insistence on proper speech reveals the assumption that words lead to acts. This insistence is confirmed by the fact that 43 years later, in 1968, we still find the same type of moral intervention. Also a vaudeville, *The World Is Boiling*, written by Alberto Vinar and censored in 1968, was allowed to play, but with some cuts. It is composed of several short acts. The first of them defines the name of the play, since two show-girls talk and sing about how mankind is in a difficult situation; hence “the world is boiling”. Because of this, they say that “the stick is going to eat” and narrate situations in which they heard this expression being used. This popular expression, in Portuguese, signifies that there will be fights, rows and beatings. At the same time, it also may indicate a sexual relation in “double feature”, so to speak, because stick refers to penis and eat to copulation.

Expressions using the word “stick” were censored in diverse situations. Here is one example that clearly shows the censor’s reasoning. A dating couple is caught kissing on a park bench by the girl’s mother. She sends the daughter home, saying that there “the stick is going to eat”, after which the boyfriend tries, insistently, to enter her house. The police are called and the boyfriend explains: “Her mother saw us kissing and said that the stick was going to eat inside the house. *I thought it was an invitation.*”

The last part of the boy’s explanation was prohibited by the censor because it defines one signification within the expression’s double sense. Without the censored phrase, the implied meaning is erased, the boyfriend seems to say that he tries to enter the house to protect the girl from the fight with the mother. The censor works on the text’s implied meaning, not interfering in the expression itself, but on the indexical operation that takes away the double sense of the game.

We must point out that, between these two stage plays, which open and close the Archive, we have works manifesting a rich and varied cultural multiplicity. There is a preponderance of comedies, such as the ones we just examined; but there is also a strong presence of drama and socially engaged plays, some of them by Brazilian authors, but many of them translations of successful foreign authors. Such is the case of *An Enemy of the People*, by Henrik Ibsen, which underwent censorship in 1963. This very controversial play, crossing politics and ethics, was staged at a moment of crisis in Brazil, under Jango Goulart's government; it went almost entirely untouched by the censor, with the exception, again, of a moral-order prohibition. The censor applies himself in the elimination of the word "shit" in the phrase "*Shit!* Oh... sorry. This changes everything". This word is employed as an interjection and, in colloquial language, it expresses an unpleasant surprise. The character, the publisher Aslaksen, reacts this way when he understands the financial consequences of publicizing the contamination of the waters described by the mayor. Aslaksen goes on to apologize after using the censored word.

Given the preponderance of moral censorship applied to the plays, we should ask about the reason for it. We remember that the Archive Miroel Silveira covers two extended authoritarian governments in Brazil. In this period, we have stage plays that criticized and mocked the dishonesty and incompetence of leaders. Nevertheless, it is not censorship of a political order that prevails, but rather that of a moral order, within which expressions related to sexuality especially fall prey to the censor's eraser.

3. Morality and politics, desire and power: An exercise in implicitation

Seduction and coercion have a role as disciplinary processes that reinforce accepted coordinates of conduct and legitimated moral attitudes. The censor seizes on and removes words that may imply possible alternatives to those accepted by the community. From this point of view, censorship is a tactic, within a larger strategy of containment and control, orchestrated by disciplinary measures. Hence censorship is always of a political character, even when it is treated as of a moral order. Therefore, we should inquire about the political role of the moral censorship incidents that we have presented.

To this effect, we shall remember that moral censorship falls on bodies and their ways of being, such as gestures, speeches, public demeanor. We shall also remember that censorship impinges on the exercise of sexuality. Nevertheless, the way a body must be enjoyed supposes a way life that accords with social dictates, with prevalent rules in a culture, and with a social group at a specific time. If not, the door is opened to the formation of inadequate subjectivities, in other words, dysfunctional and unproductive individuals from the point of view of the social order.

All considered, it is understandable that moral-order censorship falls mainly on sexuality, since it directs the manner of social being, the subject positions to be lived, positions that may or may not be in the best interest of the social scene. From the forbidding of words that refer to the body, it is a small leap to attempts to control all undesirable conduct and references thereunto.

At this point, we shall return to the initial thematic distinction of censorship of moral order and censorship of political order, now in view of our findings. As we said before, from the point of view of power relations, all censorship has a political character, in the basic senses this concept conveys. Censorship is always political because it is a system of rules that feed the State, because of its conformity to government program, its relation to the administration of public business, and its use as an instrument by those in politics. Moreover, censorship as a disciplinary agency is intrinsically political in its educative function. It is very clear that the disciplinary role of censorship is one tactic for retaining power. And the fields of its incidence emerge as zones that become propitious to its exercise. The fields of morals and politics recur often as the sites of censorship. Pertinent here is Foucault's observation:

We only would note that, nowadays, the regions where the grille is more tightened, where the black holes multiply, are the regions of sexuality and politics: as if those discourses, far from being a transparent or neutral element in which sexuality disarms itself and politics is pacified, was one of the places in which they themselves exert, in a privileged manner, some of its most fearful powers. (Foucault 1971: 9–10)

As thematic fields in the Archive Miroel Silveira, sexuality and politics belong to the same regime when it comes to censorship: social adminis-

tration, by way of the supervision of subjectivities in which they are both inscribed.

In the writings of censorship, sexuality and politics are inseparably blended together. The main reason for this mingling lies in the fact that the censor's intervention is based on presuppositions of a political order, which always signalize implied meanings of moral order. As such, the writings of censorship tell the tale – a parable – of ways of living submitted to ways of power.

Notes

1. Thematic Project *The Scene Paulista – A Study of Cultural Production in São Paulo from 1930 to 1970 based on the Archive Miroel Silveira of ECA/USP*. Sponsored by FAPESP. Electronic address www.eca.usp.br/censuraemcena.
2. In the list of references, “DDP” plus a number is the code name of the process that contains the stage plays mentioned in this publication.
3. In the excerpts from plays, we have italicized the expressions that were censored.
4. In the English translation of this play this passage usually appears as: “But, damn it all – I beg your pardon – this is quite another matter, Mr, Hovstad!” Only in the Brazilian translation does the word *shit* appear.

Nathalie Roelens

La censure comme un cas de méprise communicationnelle

Introduction

Mon objectif n'est pas de donner un aperçu historique de la censure, préventive à ses débuts, répressive dès l'invention de l'imprimerie, etc. Je me propose d'interroger le phénomène "censure" comme un objet sémiotique, voire médiologique. J'évoquerai la casuistique qu'elle met en jeu (œuvres diffamées, interdites, passées sous silence, saisies, brûlées, épurées, filtrées, caviardées, falsifiées, et, dans le cas des images, retouchées, maquillées, floutées), mais également les instances, les discours de justification, les pratiques, les dispositifs, les axiologies, les implications éthiques, juridiques ou sémantiques qu'elle engage et, partant, les effets-retours (négociation, clandestinité, contournement, dissidence) qu'elle suscite.

1. Censure comme rupture

1.1. Le terme "censure"

D'emblée la "censure" apparaît comme un *joker*, un signifiant qui se remplit au gré de celui qui le détient, au gré du contexte. Elle accompagne en effet les *passations de pouvoirs*: époque des guerres de religion, Ancien Régime, Révolution. Une tendance se dessine toutefois : de religieuse au début, la censure devient morale au 19^{ième} et au 20^{ième} siècles, condamnant l'outrage aux bonnes mœurs, pour ensuite redevenir religieuse depuis peu.

Or, non seulement la censure est l'arme-joker des pouvoirs en place, mais fonctionne elle-même comme une *passation de pouvoir*, ou plutôt, en termes communicationnels, comme une série de *tours de parole* où chacun s'évertue à avoir le dernier mot. Il suffit de penser aux *Fleurs du mal* de Baudelaire, où la parole poétique publiée le 25 juin 1857 sera aussitôt relayée

par d'innombrables discours qui vont s'emparer du sujet: l'éreintement dans *Le Figaro*, le dossier de notes présenté par le poète lui-même au tribunal correctionnel, le réquisitoire d'Ernest Pinard, avocat impérial, qui insiste sur l'outrage fait à la morale publique, la plaidoirie de l'avocat de Baudelaire, le jugement qui condamne l'auteur à une amende et l'oblige à expurger le volume, etc.

On le voit, l'ouvrage devient une parole parmi d'autres, un *dire* qui émerge à peine d'une rumeur, d'un bruit qui se substitue à la parole première. La fin de la censure coïnciderait sans doute alors avec le *silence*, un silence d'approbation. Pour Baudelaire celui-ci fut acquis en 1949, lorsque la cour de cassation annula le jugement de 1857.

Dans ses fluctuations historico-juridiques il faut cependant distinguer une constante: la censure se prétend toujours dotée d'une légitimité, valorisée positivement et, partant, détentrice du dernier mot. Au lieu d'être une *nég-ociation*, la censure est un acte unidirectionnel qui se revendique d'une vérité absolue. Ce qui fait que la *Zensur* freudienne comme refoulement semble encore à l'œuvre dans le geste de censurer. Car on pourrait appliquer ici ce que Michel Foucault avait appelé "dénégation théorique" dans le domaine pénal: "L'essentiel de la peine que nous autres, juges, infligeons, ne croyez pas qu'il consiste à punir; il cherche à corriger, redresser, 'guérir'; une technique de l'amélioration refoule, dans la peine, la stricte expiation du mal et libère les magistrats du vilain métier de châtier" (Foucault 1975: 17). Une même logique sous-tend la censure: elle est euphorisée par les censeurs qui, par là, censurent la possible perversité de leur acte. Ce qu'il vont déceler dans les œuvres c'est toujours une intention malveillante, une allusion perfide, bref le Mal qu'il faut extirper comme un *mauvais germe*. Or Robert Netz a raison de montrer sa stupéfaction devant ce postulat: "L'idée même de la censure implique que Sade mène aux turpitudes et que Paul Claudel conduit à l'angélisme. Illusion! ... N'importe quel livre risque d'entraîner une corruption. D'innombrables vies ont été marquées par des romans anodins. Et que de crimes commis par des hommes qui hier brandissaient la Bible, et aujourd'hui le Coran" (Netz 1997: 122). Une même mise en garde régit la thèse de Marie José Mondzain quant à une possible violence intrinsèque des images: "Culpabilité et responsabilité sont des termes qui ne sont attribuables qu'à des personnes, jamais à des choses. Et les images sont des choses" (Mondzain 2002: 13)

1.2. Terminologie religieuse, médicale, guerrière

Les *Fleurs du mal* avaient été taxées “d’hôpital ouvert à toutes les démences de l’esprit, à toutes les putridités du cœur...”. La censure témoigne dès lors d’une incompréhension face à la sémiotique de l’objet censuré. D’où l’afflux de métaphores stigmatisantes, d’où le recours à une terminologie religieuse ou médicale: purification, épuration, purge. Emile Zola a mis le doigt sur cette fougue métaphorique dans l’affaire du “Salon des Refusés” de 1863, peintres novateurs que les jurés du Salon officiel avaient non seulement refoulés et conspués mais encore “tués” (Zola 1866) par l’accrochage défavorable dans la salle voisine que Napoléon III finit par leur allouer. On peut distiller ici une forme de censure sournoise qui consiste à couper de l’attention, à escamoter ou, au contraire, à exhiber sans ménagement et par dérision comme ce fut le cas de *La jeune fille en blanc* à la chevelure dénouée de Whistler. Zola restitue parfaitement “ce pêle-mêle carnavalesque” dans son roman *L’œuvre* de 1886. Ce fut *Le Déjeuner sur l’herbe* qui provoqua le plus d’indignation parmi la foule des spectateurs: “Emmenez ma fille, dit la pâle Mme Margaillon à l’oreille de Dubuche. Il se précipita, dégagea Régine, qui avait baissé les paupières; et il déployait des muscles vigoureux comme s’il eût sauvé ce pauvre être d’un danger de mort” (Zola 1983: 155).

Or, même si Zola critique d’art s’était vu contraint d’entamer lui-même un combat contre le conservatisme esthétique, il n’empêche que 30 ans plus tard, en 1896, Zola mesure la vanité de son combat de l’époque, désenchanté par les abus des épigones du plein air, “convertis” avec “trop de ferveur” (Zola 1896) au luminisme. On le voit, la lutte appartient donc autant à celui qui milite, se bat pour, qu’à celui qui interdit, combat, refuse. Autrement dit, c’est parce que la censure est belliqueuse qu’il faut s’armer pour s’y opposer. On retrouve la logique des *tours de parole* qui deviendra de la *surenchère*. Zola a dû s’armer pour défendre les peintres du plein air, allant jusqu’à la croisade: “Ah ! Seigneur, ai-je rompu des lances pour le triomphe de la tache!” (Zola 1896). On l’a traité de fou. Tandis que c’est maintenant lui qui sévit contre les épigones.

1.3. Rupture de la communication

Couper de l'attention, mettre à l'écart, stigmatiser, tous ces gestes peuvent se résumer comme une rupture, ou du moins une perturbation, du circuit communicationnel dont les ciseaux d'Anastasia se font l'emblème. Censurer serait alors un acte de parole particulier: où le *dire* qui implique un *faire* est conçu pour couper la parole à l'adversaire, pour le *museler*, le *bâillonner*, le *faire taire*, pour *inter-dire*. A la fois c'est un *inter-dire* qui a besoin d'être *public*, même s'il gagnerait à être *privé*, discret, à être un *faire sans le dire*, car en disant publiquement qu'il interdit, il provoque un effet contraire à celui escompté, attire l'attention sur l'objet interdit, le met sur un piédestal, bref en fait la *publicité*.

Si le concept de censure est un concept mouvant, contingent, qui "épouse, dans sa diversité, la diversité de l'Histoire" (Netz 1997: 122), le censurable change dès lors également de visage, de même que toute la nébuleuse des droits, des devoirs et des infractions. Finalement, on se rend compte que la censure n'est qu'une histoire de tabous. Les seuils du *devoir* et de la *désobéissance* fluctuent dès lors en fonction des degrés de tolérance du *droit* et de la rigidité de l'*interdiction*.

DROIT
pouvoir faire/dire

INTERDICTION
ne pas pouvoir faire/dire

DEVOIR
ne pas pouvoir ne pas faire/dire

DESOBEISSANCE
pouvoir ne pas faire/dire

2. Censure comme ingérence

Ce qui est considéré comme une *désobéissance* par les instances censurantes peut être considéré comme un *droit* tout à fait légitime par l'instance censurée. La censure porte ainsi souvent atteinte à l'autonomie de l'art, impose le littéral au figuré. Dans ce sens elle est méprise car elle lit une *désobéissance* dans l'art et dans la fiction, de tous temps dotés de *licence poétique*. Pourquoi légiférer dans un domaine de liberté, dans une sphère privée qui possède un droit au fantasme qui lui est inhérent – les personnages de Dostoïevski n'étaient-ils pas des fous ou des assassins?

Les régimes qui ont nié la souveraineté de l'art et de la littérature, qui ont prôné le réalisme ou calomnié les avant-gardes, ont d'ailleurs souvent été totalitaires. Dans les régimes absolutistes la censure est en effet le corollaire direct de la propagande, car toutes deux politisent les images et les textes, les dépossèdent de leur droit à la fiction, exigent que toute lecture soit une lecture officielle et que tout art soit glorification du régime. D'où le rejet de toute forme de subversion plastique. Ainsi, dans l'exposition "Entartete Kunst" (*Art dégénéré*), que le 3^{ème} Reich organisa à Munich en 1937, les artistes d'avant-garde comme Kandinsky ou Klee furent exposés aux sarcasmes du public par leur rapprochement avec la collection des dessins d'aliénés du docteur Prinzhorn et, partant, par l'équation entre licence créatrice et maladie mentale.

Si le régime totalitaire ou religieux est réfractaire à la fiction, à la nouveauté, à l'humour, ou même à l'amour, comme le montre Milan Kundera dans *La plaisanterie* de 1967, c'est que ceux-ci pourraient ébranler le conformisme des foules dont le régime a besoin pour s'imposer. Plus on censure dans le domaine privé de l'art ou de la littérature et donc de l'appropriation solitaire, plus on est dans un régime totalitaire, qui d'ailleurs annule l'espace privé pour lui préférer les *grandes messes* des tribunes publiques où l'éloquence verbale a un pouvoir de fascination proche de la communion. Mais un même raisonnement explique, à une époque où la censure redevient religieuse, l'affaire Rushdie, Tasleema Nasreen, Theo Van Gogh, ou encore le tollé soulevé par certaines affiches de cinéma qui sont le fruit d'une création originale, par exemple celle pour *The People vs Larry Flynt* de Milos Forman (1997) ou celle pour *Amen* de Costa Gavras (2002). Le montage photographique entre connotation chrétienne et altérité (en l'occurrence le nu ou la croix gammée) a été perçu à tort comme une assimilation, une équation. Mais c'est surtout en tant que geste artistique que le montage semble choquer. On n'aime pas la fiction sur la place publique. L'homme de la rue lit les images au premier degré, sans la désinvolture nécessaire pour apprécier la fiction. Contrairement aux photos des campagnes Benetton où le scandale est obtenu par l'énoncé, ici c'est au niveau de l'énonciation, du "bricolage" artistique que s'installe l'hérésie (voir Roelens 2007).

3. *La censure relève d'une juridiction temporelle et spatiale*

Tantôt, c'est le décalage entre l'horizon d'attente et l'œuvre qui choque: telle œuvre a pu être perçue à un moment donné comme “non simultanée, inactuelle, prématurée, attardée (Nietzsche dirait intempestive)” (Ricoeur 1985: 253). La censure est alors une réponse à une attente trop restrictive, voire intolérante: les esprits n'étaient pas mûrs au moyen âge pour l'héliocentrisme, en 1664 pour *Tartuffe*, ni en 1857 pour *Les Fleurs du mal* ou *Madame Bovary*. Gallimard n'était pas prêt en 1954 pour *Histoire d'O* de Dominique Aury (d'où les stratégies de contournement: publication chez Jean-Jacques Pauvert, recours de la part de l'auteur à un pseudonyme, Pauline Réage, etc.), ni en 1955 pour *Lolita* de Nabokov. N'importe quel écart par rapport à un canon esthétique souffre d'ailleurs de cette intempestivité. Aussi ne s'étonnera-t-on pas que l'urinoir de Duchamp ait pu secouer l'habitus esthétique des organisateurs du Salon des Indépendants à New York en 1917. Citons également l'exemple de Malevitch qui, brimé par le dirigisme du régime soviétique et du retour à la figuration qu'il imposait, se présente dans son dernier autoportrait de 1933 en prince de la Renaissance, avec un carré noir dans l'angle inférieur droit, “allusion miniaturisée” (Edeline 2006: 47) à son œuvre suprématiste de 1915 censurée.

La consécration dans l'après-coup, la sanction rétrospective – le Salon des Refusés devenu le mouvement impressionniste – montre la précarité de ce type de censure comme incompatibilité entre émetteur et milieu récepteur. L'intempestivité de l'œuvre se heurte donc à ce que Thierry de Duve appelle le “tribunal de l'histoire” (de Duve 1989: 36). Mais ce tribunal de l'histoire doit s'appuyer sur une jurisprudence, sur le droit coutumier et non pas sur un *Jugement dernier* irrévocable, susciter des différends et non pas des litiges.

Tantôt, le décalage est synchronique, l'écart étant cette fois territorial: la culture laïque qui défend la “doctrine” de la liberté d'expression offusque les cultures religieuses frileuses en matière d'ironie ou d'humour et vice versa. Les deux méprises se fondent finalement en une seule: celle qui ne distingue pas la césure entre fiction et pratique quotidienne.

Il faut reprendre la distinction entre espace *civique* et espace *public* telle qu'elle est développée par Régis Debray dans son ouvrage *Ce que nous voile le voile*. Tant l'intime, le privé, que le communautaire ont pour Debray

voix au chapitre dans espace public. Dans un lieu public (le musée, la rue, la salle de cinéma), la liberté est de rigueur. Il n’y a que dans un lieu civique (la commune, l’école), que la censure soit possible et même souhaitable. A supposer que des textes ou des images véhiculent des convictions, à quel titre devrait-on les confiner au domaine privé? “Aucun croyant ne peut, de son côté, s’estimer ‘bafoué’ ou ‘offensé’ par un livre ou un film qu’il n’est pas contraint de lire ou de voir. ... Le conflit des convictions est inhérent au pluralisme et au tohu-bohu d’une vie démocratique” (Debray 2004: 32). Comme je l’ai développé ailleurs (Roelens 2005), il y aurait néanmoins une gradation de susceptibilité de la part du public précisément selon les espaces investis: *la peinture ou la lecture* (confinées dans un huis-clos) jouiraient de plus de liberté que le *cinéma*, médium plus accessible aux masses, et le cinéma de plus de liberté que l’*affichage*, dès lors que l’affiche, s’exposant sur la voie publique, est perçue comme véridictoire, redevable de ses prises de position. Un autre élément préjudiciable serait la contemplation collective qui engendre des jugements hâtifs.

4. *La censure dans les sociétés libérales contemporaines*

Certes, le nouveau code pénal (1994) ignore désormais l’outrage aux mœurs par la voie du livre! En revanche il introduit un article peu univoque: “Le fait de fabriquer, de transporter, de diffuser, par quelque moyen que ce soit et quel qu’en soit le support un message à caractère violent ou pornographique ou de nature à porter gravement atteinte à la dignité humaine, soit de faire commerce d’un tel message, est puni de trois ans d’emprisonnement et de 500 000 francs d’amende lorsque ce message est susceptible d’être vu ou perçu par un mineur” (Netz 1998: 17). Soulignant le flou des termes (“message”, “violent”, “pornographique”) Jean-Jacques Pauvert rappelle que “contrairement à ce qu’on pourrait penser, l’efficacité d’une disposition de censure croît, non pas en raison de la précision de son énoncé, mais au contraire du flou de celui-ci” (Pauvert 2004: 123). Le vague des expressions permet en effet toutes sortes de dérives.

Dans les sociétés modernes, où la liberté d’expression est désormais un acquis incontesté, la censure et la propagande demeurent en effet sournoisement conjuguées: la censure devient souvent autocensure par soumission à l’orthodoxie médiatique. La pensée est mise au pas par l’embrigadement dans la culture du divertissement. Celle-ci s’impose à l’opinion et bâillonne

un patrimoine culturel soi-disant désuet. La censure devient *sensure* car elle régule le droit à la polysémie, au double-sens, voire au non-sens.

5. *Nouvelles formes de censure engendrées par les nouvelles technologies*

Tout comme l'invention de l'imprimerie avait généré une censure répressive et non plus préventive, Internet engendre une manipulation de l'accès aux sites Web. Bien que la *Déclaration universelle des droits de l'homme* (adoptée par l'ONU le 10 décembre 1948) fasse de l'accès à l'information un droit inaliénable, certains Etats régulent Internet, par blocage ou filtrage de sites étrangers, falsifications de sites dissidents, captures d'écran dans les cybercafés, emprisonnement de cyberdissidents ou de blogueurs, amendes pour consultation de sites pornographiques ou politiques prohibés, contrôle de communications électroniques, le tout régenté par une cyberpolice qui filtre les contenus *subversifs* sur la Toile. La terminologie médicale abonde: "assainir le Web", "aseptiser le Réseau", "le purger de toute information critique".¹

6. *Censure et surenchère*

Plus les moyens de communication auront une diffusion étendue – une tribune publique d'une amplitude planétaire dans le cas d'Internet –, plus importante sera la surenchère, par laquelle j'entends soit une dénégation ironique de la part du censuré (Milos Forman muselant par un cache sa nouvelle version de l'affiche pour *Larry Flynt*), soit une réplique amplifiée de la part des censeurs à l'égard de ce qu'ils réprouvent: l'organisation d'une exposition porno-chic à Milan par Dolce & Gabbana en riposte au retrait de leur affiche en Espagne (2007), le journal publié de Robert Redeker *Il faut tenter de vivre* dans lequel raconte sa réclusion forcée suite à la fatwa lancée contre sa tribune libre du 19 septembre 2006 dans le Figaro "Contre les intimidations islamistes, que doit faire le monde libre?" etc. Corollairement, plus importante sera l'autocensure pour éviter cette surenchère.

Dans le cas des caricatures de Mahomet, publiées le 30 septembre 2005 par le quotidien danois *Jyllands-Posten*, les dessins incriminés – surtout celui où le prophète porte un turban en forme de bombe amorcée ou celui qui représente des musulmans recevant des vierges dans l'au-delà comme

récompense d'une vie exemplaire – sont déjà présentés en amont comme une réplique, comme une tentative de contribuer au débat critique sur l'Islam et l'autocensure. En 2005 l'écrivain Kåre Bluitgen ne trouva pas d'illustrateurs pour son livre pour enfants *Le Coran et la vie du prophète Mohamet*, ceux-ci craignant les représailles. La surenchère est ainsi déjà à l'œuvre en amont. En aval, la "Cartoon Intifada", à savoir: des commentaires, des republications, des plaintes, des excuses, des gestes de solidarité: comme le dessin de Plantu à la une du *Monde* (le 2 février 2006) qui reprend le dessin danois le plus controversé mais sous forme calligraphique avec la phrase "je ne dois pas dessiner Mahomet, je ne dois pas dessiner Mahomet, etc." en forme de Mahomet coiffé d'une bombe-turban, respectant ainsi ironiquement l'interdit de représenter le prophète; mais encore, des falsifications, des manifestations, des boycotts, des menaces de morts, des procès, et, enfin, une revanche en l'occurrence incommensurable avec le geste d'origine: à savoir, l'*International Holocaust Cartoon Competition* qui fut lancée en Iran le 6 février 2006 en riposte aux douze caricatures "infamantes" de Mahomet, sponsorisée par le journal ultra-conservateur iranien, *Hamshabri*, dont une qui montre Hitler au lit avec Anne Franc, une qui nie la Shoah ou, la gagnante, qui fait l'amalgame entre Israël et le nazisme (en représentant la construction d'un mur couvert d'une photo du camp d'Auschwitz entre le Dôme du Rocher et Jérusalem).

Tous ces cas de surenchère connaîtront une prolifération aussi diffuse que peut l'être le médium Internet. La censure n'est plus rupture de communication mais engendre une communication sans fin. Mais là encore il faut être vigilant, une nouvelle forme de censure se profile, salutaire cette fois. Lorsque les Iraniens lancent leur riposte en organisant un concours de caricatures sur l'Holocauste, l'*Israel News Agency* trouve une parade: en republiant ces caricatures (flanquées d'un avertissement en bandeau "Six Million Jews were Gassed, Shot and Hung During the Holocaust") et en lançant un SEO – *Internet search engine optimising marketing contest* – pour prévenir les sites d'informations des groupes terroristes iraniens et islamistes d'accéder à des positions importantes dans Google. De sorte que lorsqu'on cherche les mots clés "Iran holocaust cartoons" on tombe sur la *Israel News Agency* en première position.

Plantu avait mis le doigt sur le fait que, quoique médiocre esthétiquement, il faut ranger ces caricatures dans la catégorie de la fiction, de la parabole, du montage, de la métaphore (Mohamet est *comme* un islamiste

lanceur de bombes). La réplique des Iraniens se range cependant dans la négation des faits historiques, à savoir l'Holocauste, et n'a donc plus droit à l'immunité de l'art. L'humour est totalement entaché de malveillance, voire de négationnisme. La surenchère est ici disproportionnée au geste primitif. Or, les Israéliens vont rectifier cette disproportion en réintégrant la caricature dans le domaine de l'humour. En effet, le 14 février 2006 un groupe israélien annonça un concours de caricatures antisémites ouvert aux seuls Juifs.

La surenchère semble aller de pair avec une confusion des axiologies morales et religieuses. Tout acte est guetté, tout est susceptible de faire l'objet d'une fatwa même sur un territoire où la liberté de presse est de mise. L'Organe censurant n'est plus l'Eglise ni l'Etat mais soit l'économie de marché qui s'aligne sur les censures pour en tirer profit, soit la *political correctness*, à savoir les associations de minorités comme les laïques, les catholiques, les musulmans, les juifs, les créationnistes, les noirs, les homosexuels, les non-fumeurs, les handicapés, les enfants, les obèses, les étudiants, les banlieusards, les scientifiques, etc., bref, l'*opinion*. Foucault dans *Surveiller et punir* a déjà montré ce renversement du "panoptique", où la société entière peut contrôler l'exercice du pouvoir: "En fait toute institution panoptique, fût-elle aussi soigneusement close qu'un pénitencier, pourra sans difficulté être soumise à ces inspections à la fois aléatoires et incessantes: et cela non seulement de la part des contrôleurs désignés, mais de la part du public" (Foucault 1975: 241).

Conclusion

Tout ceci soulève une réflexion qu'on pourrait qualifier de "médiologique": le médium Internet suscite le dialogue sans fin, l'entropie communicationnelle. Entre la *rupture de communication* et l'entropie ubiquitaire, la censure est vouée à subir encore de nouvelles mutations, inconnues à ce jour. Qui aura le dernier mot dans la blogosphère? LEAVE A REPLY ...

Análisis de las caricaturas publicadas por El Diario El Universal durante el período noviembre 2002 – febrero 2003: Una mirada antropológica

En momentos en los que sectores en el mundo hacen frente a la arremetida colonizadora occidental, motorizada por estrategias dirigidas a resemantizar a diario una realidad que ubica a nuestros pueblos en lugares de enunciación desprovistos de legitimidad, se hace necesario antropologizar occidente; desnaturalizar los discursos y las prácticas que han servido de base para el despliegue de la dominación colonial/moderna.

Así, pues, la investigación fue realizada en el marco de la discusión modernidad/colonialidad/de-colonialidad en América Latina; esto implica entender la modernidad como una máquina generadora de desigualdades que oculta su cara colonial; constituida por la imposición de una clasificación racial de la población mundial, clasificación que constituye los cimientos para la configuración de un patrón de poder que opera en todas las escalas de la existencia cotidiana.

Se enmarca dentro de la actual coyuntura política venezolana. Se trabajó con una muestra que corresponde a las caricaturas elaboradas por Rayma Suprani, publicadas en el diario venezolano El Universal durante el período diciembre 2002 a febrero 2003, el cual corresponde a uno de los momentos de mayor confrontación en el país, el llamado “Paro Petrolero”.

El objetivo fue explorar los complejos procesos de construcción de identidades a través de las caricaturas. Entendiendo así, la identidad como el

discurso sobre la diferencia, se pretende recrear el imaginario desde donde se enuncian las mismas, dando cuenta de la realidad que estas construyen.

El abordar la identidad como una forma discursiva implica entender que su lugar de enunciación es la diferencia, la diferencia colonial, que se establece en términos de un yo, un tú y un él. El yo se refiere a la identidad mientras que tú y él se refieren a una alteridad cercana y una alteridad lejana respectivamente.

Esto hace posible introducir en la problemática de la identidad/alteridad las herramientas que nos facilita la semiótica para dar cuenta de los signos que constituyen la identidad en tanto discurso sobre la diferencia. Esta perspectiva permite abordar la problemática de la identidad desde una mirada semiótica entendida, "... no ya como un estudio de los signos, sino como una indagación con vocación científica de los sistemas y los procesos de significación ..." (Fabbri 1999: 56), es decir, entender que los signos no están fuera de la realidad, sino que la conforman, la constituyen y la modifican.

Es así como, la aproximación a dichas caricaturas parte de entenderlas como formas de construcción de una realidad social cuyos referentes simbólicos y de sentido están inmersos en un proceso de globalización "... caracterizado por la hegemonía de la cosmovisión liberal, la cual naturaliza su modelo de vida, no sólo como el único deseable, sino como el único posible" (Lander 2000b: 57) y articulados con el patrón colonial de poder y las jerarquías raciales que lo componen.

Este modelo se enmarca en un momento histórico donde el poder económico y militar corresponde a Estados Unidos; por lo que se ha de naturalizar no el modelo capitalista, en sus diferentes formas, sino una experiencia en particular, es decir, el que ha tomado forma en Estados Unidos en las últimas décadas (Lander 2000b). Este hecho no implica que la fórmula estadounidense es la única, sino que gracias a su posición dentro de la geopolítica planetaria y, específicamente para el caso de Latinoamérica, dicho modelo se presenta como El Modelo, e impone un velo que impide ver más allá del Océano Atlántico.

Bajo esta coyuntura, la hegemonía liberal presenta al mercado no como aquel que organiza el ámbito económico de la vida social, tal y como se plantea en la tradición liberal clásica, sino que se presenta como: el organizador de la totalidad de la vida social; con lo cual queda de lado la econo-

mía de mercado para dar paso a la sociedad de mercado e ir en busca de la utopía del mercado total (Lander 2000; 2000a; 2000b; 2002).

Un modelo que, a través de los procesos de desregulación de los capitales, ha hecho más profunda la brecha entre los que más tienen y los que no tienen; ya que en vez de dirigir a las poblaciones del planeta a mayores niveles de bienestar colectivo, ha elevado el número de desigualdades y exclusiones, tanto entre los países como en el interior de los mismos. Un modelo que no sólo amenaza a la biodiversidad, sino que amenaza también con acabar con “... la rica herencia de recursos culturales y conocimientos de pueblos aborígenes, campesinos y demás poblaciones que todavía no han sido plenamente colonizados por Occidente” (Lander 2000b: 55).

La investigación surge, entonces, no sólo como resultado de la preocupación por la coyuntura política existente en el país, sino del interés generado por un contexto global del cual Venezuela forma parte; así, se busca trascender el inmediatismo que ha circunscrito el análisis del proceso venezolano limitándolo a lo local, dejando a un lado sus implicaciones, articulaciones y posibilidades dentro del *sistema – mundo europeo/euro-americano/moderno/colonial capitalista/patriarcal* (Grosfoguel 2007).

En este sentido, se plantea dar cuenta no sólo del imaginario local, sino hacer visible la articulación de éste con el imaginario de la modernidad/colonialidad, en el cual se evidencia la construcción de una alteridad bárbara del colonizado y una identidad civilizada por parte del colonizador, es por esto que “... el problema del ‘otro’ debe ser teóricamente abordado desde la perspectiva del proceso de producción material y simbólica en el que se vieron involucradas las sociedades occidentales a partir del siglo XVI” (Castro-Gómez 2000: 206). Es decir, dar cuenta de las características sociales y materiales que hacen posible que el proyecto moderno/colonial se erigiera como discurso hegemónico, es decir, como “... el conjunto complejo de normas e imposiciones diversas que operan contra lo aleatorio, lo centrifugo y lo que se desvía” (Angenot 1989: 22 – 23).

En este sentido, el discurso de la modernidad/colonialidad señala los temas aceptables y las maneras de tratarlos, con lo cual establece quien puede decir qué y bajo qué circunstancias. La configuración del discurso moderno como discurso hegemónico, implica la saturación de todo el proceso de la vida social por la lógica que impone el mercado. El proyecto moderno/colonial y la identidad/alteridad que éste construye, se otorga el papel de enunciador legítimo y “... el derecho de hablar sobre las alteridades

determinadas con relación a él. El enunciador legítimo, que se dirige a un destinatario, igualmente legítimo, tiene derecho de mirada sobre quienes no tienen derecho a la palabra: los criminales, los niños, las plebes campesinas, los salvajes y otros primitivos” (Angenot 1989).

El proyecto genera una identidad universal, un deber ser, que no es más que la imposición de la imagen del centro sobre la periferia. Dicha imagen presenta a Occidente como el ser natural de la humanidad, y a su historia como el camino a recorrer de todas las sociedades del planeta para alcanzar así, el ideal moderno de progreso. La identidad construida por el discurso moderno/colonial implica la existencia de un sujeto ideal, representado como hombre blanco, mayor de edad y heterosexual, con lo que todos aquellos que no cumplan con estas características (negros, mujeres, indígenas, homosexuales) son construidos como alteridad bárbara y atrasada. Siendo así, entonces, la Modernidad “... una maquinaria generadora de alteridades que, en nombre de la razón y el humanismo, excluye de su imaginario la híbrididad, la multiplicidad, la ambigüedad y la contingencia de las formas de vida concretas” (Castro-Gómez 2000: 201).

La modernidad es, entonces, una forma de ordenamiento social, un discurso, una identidad que parte de un lugar legítimo de enunciación otorgado por articulación a un poder hegemónico, una forma de construcción global del mundo. Así pues, este mundo y esta realidad construida socialmente implican una mirada eurocéntrica/racista del mundo; que se presenta como proyecto emancipador de la especie humana, “... una salida de la inmadurez por un esfuerzo de la razón como proceso crítico, que abre a la humanidad a un nuevo desarrollo del ser humano. Este proceso se cumpliría en Europa, esencialmente en el siglo XVIII ...” (Dussel 2000: 65).

Es así, la modernidad, un proyecto dirigido a “someter la vida entera bajo el control absoluto del hombre bajo la guía segura del conocimiento” (Castro-Gómez: 2000: 203). Bajo este principio, queda desplazada la figura de Dios como personaje que decide los hechos de la vida individual social, erigiéndose al hombre como ser capaz de descifrar las leyes de la naturaleza y ponerlas a su servicio a través del uso sistemático de la razón, para alcanzar el control de toda forma de vida.

En el marco de la investigación se trabajaron un total de 50 caricaturas, de un universo de 115 que corresponden al total de caricaturas publicadas en el mencionado periodo (noviembre 2002 – febrero 2003); fueron abordadas a través del modelo de análisis denominado Teoría de la Integración

Conceptual o de mezclado (Fauconier 2001); cada caricatura es abordada como una unidad susceptible de análisis a través de segmentaciones de sentidos y como unidades mínimas de significación que permite abordar tanto el ámbito visual como el escrito de las mismas, abriendo así una vía de acceso a los sentidos que en ellas se ponen de manifiesto y se construyen. Dicha teoría, parte de que la producción de nuevos signos se da por asociación, es decir, se debe al proceso mediante el cual dos signos ya existentes entran en contacto a través de la asociación, generando así un nuevo signo.

La propuesta consiste en una figura romboidal cuyos vértices están formados, en primer lugar, por el espacio fuente (Source Space) y el espacio destino (Target Space), que son la base del análisis metafórico y son tratados como insumos dentro del proceso de elaboración de un nuevo signo. Los otros dos vértices de este modelo se ubican de forma vertical y se denominan espacio genérico (Generic Space) y espacio mezclado (Blended Space).

El espacio genérico es aquel que permite la asociación entre el espacio fuente y el espacio target. Es decir, es el espacio común de significación que ocupan, tanto el espacio fuente como el target, es el que garantiza la asociación, la existencia de un lugar de encuentro entre estos dos espacios, gracias al cual es posible la concreción de la metáfora y con esto la concreción de un nuevo signo. El propósito del espacio genérico es definir en un nivel muy alto la naturaleza de las estructuras internas de los tres otros espacios, en otras palabras, posee un papel unificador. El otro elemento, es el espacio de mezclado, que es donde ocurre la metáfora. En sí mismo es un espacio emergente que surge como producto de la asociación entre dos signos previos que tienen una relación en común.

A continuación, se presentaran caricaturas por cada dicotomía, para ejemplificar y mostrar el análisis. En primer lugar, tenemos una caricatura publicada el cinco de diciembre de 2002, la cual da cuenta de la dicotomía Civilización/barbarie, que presenta a un grupo de animales conformado por leones, culebras, conejos, sapos, cerdos, entre otros; quienes se encuentran reunidos frente a un televisor, observando una competencia y uno de los animales pregunta “¿Cómo va el partido?” y otro le responde “Civilización 3, Barbarie 1”.

En el espacio fuente encontramos a un grupo de amigos, quienes están reunidos viendo una competencia por televisión, en la cual hay un equipo que va ganando y, por supuesto, otro que va perdiendo; mientras que en el

espacio target aparecen un grupo de personas reunidas, quienes siguen a través de los medios de comunicación el desenvolvimiento del paro y de la confrontación entre la oposición y el gobierno que se traduce en la tradicional batalla entre la civilización y la barbarie respectivamente.

En el espacio genérico tenemos, pues, una reunión de amigos en busca de entretenimiento a través de la confrontación entre dos equipos/bandos contrarios; mientras en el espacio mezclado se presenta a una oposición garante de los valores de la modernidad, la civilización y la democracia, la cual aventaja, a través de las acciones llevadas a cabo en medio del paro nacional, a un gobierno bárbaro y, por supuesto, antidemocrático.

La siguiente caricatura da cuenta de la dicotomía Progreso/Atraso, fue publicada el trece de febrero de 2003, presenta la evolución del automóvil y por tanto de la industria automotriz. Aparecen cuatro fechas, 1953, 1973, 1993 y por último 2003; en cada una aparece un modelo de carro diferente que marca los cambios ocurridos en la industria a través del tiempo, con excepción del año 2003 en el cual aparece un burro y la frase “Modelo coupe...”.

En el espacio fuente encontramos la evolución de la industria automotriz desde 1953 hasta el 2003; mientras en el espacio target se aprecia historia de Venezuela, primero un convertible (1953), después un deportivo (1973), seguido de un compacto (1993) y por último, gracias a Chávez un burro (2003). En el espacio genérico aparece la historia, la cual sigue un proceso lineal y progresivo a través de una evolución que lleva a la especie humana de la barbarie a la civilización; mientras lo que se expresa en el espacio mezclado es que gracias a Chávez, Venezuela tomó el camino de la barbarie, alejándose del progreso y de la civilización.

La caricatura modelo de la dicotomía Democracia/Dictadura, fue publicada el veintiocho de enero de 2003; presenta a un hombre sin camisa y sin zapatos, totalmente despeinado, con los bolsillos vacíos, colgado de las manos por medio de cadenas; quien dice “La peor dictadura es la económica...” En el espacio fuente aparece la dictadura y sus brutales y bárbaras prácticas tales como la tortura física; mientras en el espacio target tenemos a Chávez quien ha convertido al pueblo en víctimas de torturas generadas en sus bolsillos a través de una dictadura económica. En el espacio genérico tenemos al totalitarismo como una forma bárbara de dominación que tiene como producto gran cantidad de víctimas; mientras que en el espacio mezclado se expresa que entre todas las dictaduras, la de Chávez es la peor,

porque se trata de una dictadura económica y como tal no permite el libre desenvolvimiento del mercado y de los beneficios que éste trae consigo. En este sentido, la de Chávez, es una dictadura que al cercenar la cristalización de la sociedad de mercado, secuestra las libertades individuales, la propiedad privada e imposibilita el acceso del país a la civilización.

La caricatura publicada el 21 de diciembre de 2002, da cuenta de la dicotomía Libertad/Represión, presenta a un joven vestido con los colores de la bandera venezolana, quien se encuentra montado sobre una patineta y exclama con la bandera en la mano “El único combustible para la democracia es la libertad...”. En el espacio fuente tenemos al petróleo como el combustible que mueve al mundo; mientras en el espacio target la libertad es presentada como el combustible que mueve la democracia. En el espacio genérico se ubica una fuente de energía que sirve como combustible para poner en funcionamiento una forma de transporte; mientras el espacio mezclado se construye la idea de que la libertad es el combustible que enciende la democracia y la democracia es el medio de transporte hacia la civilización, siendo que la represión es el combustible para la dictadura y por tanto, para la barbarie.

El veintiuno de febrero de 2003 es publicada una caricatura que da cuenta de la dicotomía Paz/Guerra; la cual presenta dos imágenes en contraste, la primera se titula “Discurso del gobierno” y consiste en un par de personas en uniformes militares, quienes cargan con un misil. La segunda imagen está titulada “Discurso de la oposición” y aparecen en ella dos personas vestidas con ropas hechas con los colores de la bandera, muy al estilo de los hippies en los años 60, quienes cargan una flor gigante. En el espacio fuente tenemos la relación existente entre la paz y la guerra; mientras en el espacio target encontramos la relación existente entre la oposición y el gobierno; articulados a la paz y a la guerra respectivamente. En el espacio genérico tenemos, la violencia asociada a la barbarie y la paz asociada a la civilización; mientras, en el espacio mezclado se expresa que el discurso del gobierno es un discurso violento que llega como un misil a la sociedad venezolana, propio de la barbarie; y por otra parte, se presenta al discurso de oposición como pacífico, civilizado cargado del colorido y la belleza de las flores.

La dicotomía Cultura/Naturaleza es representada a través de la caricatura publicada el veintitrés de Noviembre de 2002 y presenta a un cochino habitando en su ambiente, es decir, en una porqueriza entre moscas y

excrementos, quien realiza la siguiente afirmación: “La situación está esplendida...”. Así, en el espacio fuente, encontramos a un cochino totalmente satisfecho por el estado de su vivienda, la porqueriza; mientras que en el espacio target aparece un chavista totalmente satisfecho de vivir en tiempos de la Quinta República. En el espacio genérico aparece un animal completamente satisfecho por estar en su hábitat. De esta forma, el espacio mezclado queda conformado por la idea de que el chavista, cochino, cerdo, animal, al no tener cultura su mundo es “naturaleza” por lo que se siente feliz, satisfecho de vivir en una porqueriza llena de excremento, así como un chavista está satisfecho de vivir en la Quinta República. Es decir, los cerdos son felices viviendo entre moscas y excrementos, los bárbaros de vivir en la barbarie, los chavistas en la Quinta Republica.

La caricatura que da cuenta de la última dicotomía, Sujeto moderno/ Sujeto no Moderno, fue publicada el diecinueve de febrero de 2003, presenta un maniquí con ropa típicamente africana, una lanza y un escudo, esta imagen aparece acompañada de la leyenda: “Nueva temporada primavera – verano 2003. En el espacio fuente aparece un diseñador, quien presenta su colección de ropa para la temporada primavera – verano de 2003; mientras en el espacio target aparece Chávez, quien presenta al país su plan de gobierno correspondiente al año 2003. En el espacio genérico encontramos a un sujeto quien presenta su propuesta para el futuro, en el espacio mezclado se expresa que los planes de Chávez para el año 2003 son la africanización del país, lo cual devela el contenido racista de la caricatura, refiriéndose al prototipo que define a África como un continente poblado por tribus negras que viven en la miseria y en la pobreza, ocultando que el estado actual de esta parte del planeta es producto de siglos de intervención colonial por parte de los países europeos.

Al realizar el análisis de cada una de las caricaturas se logra establecer la existencia de una conexión entre la realidad social construida a través de las caricaturas de Rayma y una realidad social construida por el imaginario del sistema mundo moderno/colonial, la cual se expresa en los términos descritos por medio de la dicotomía civilización/barbarie; dividiendo al mundo en dos secciones, los países que están al norte, quienes son garantes de los valores modernos/coloniales de la civilización y los que están al sur.

Se puede señalar que dentro de la conflictividad en la cual se encuentra sumergida la sociedad venezolana, la caricaturista Rayma Suprani se hace partícipe de una de las realidades enfrentadas, en este sentido, al tomar par-

tido, sus caricaturas se convierten en un mecanismo para construir, legitimar y relegitimar una realidad social que se enfrenta a la realidad social que se construye y legitima desde los sectores afectos al gobierno del presidente Hugo Chávez. Las caricaturas construyen y legitiman identidades/alteridades que corresponden a las impuestas por el patrón de poder y con el discurso de la Modernidad/Colonialidad; es así, como presenta identidad/alteridad eurocentrada, occidental, civilizada, blanca, invisibilizando su articulación con dicho patrón de poder (Estados Unidos, Inglaterra, España), como es expresión de los valores modernos y por demás deseables, un deber ser natural y universal.

Esta identidad/alteridad contrasta con las identidades/alteridades enfrentadas en el conflicto venezolano; en este sentido el sector que se opone al gobierno del presidente Hugo Chávez, miembros de la elite blanca que ha ostentado, históricamente, el control del estado, es construido como una identidad/alteridad cercana a la civilización. Así, la oposición es presentada como el sector garante de los valores civilizados y de los valores modernos en la sociedad venezolana. Mientras la oposición es presentada como una alteridad pacífica y democrática, cercana a la civilización, Chávez, el chavismo y la Quinta República se construyen como una alteridad lejana a la civilización, cercana a la barbarie, o la barbarie misma, expresada a través de un régimen dictatorial, terrorista y hasta de corte nazista, el cual se opone abiertamente a quienes desde el centro, desde la razón abogan porque la libertad reine en el planeta.

Libertad que es la del hombre blanco, un valor Occidental que se aplica al resto del planeta como la expresión natural de la vida humana, libertad que impone sobre expresiones culturales de diversa índole valores universales, para juzgarlas, etiquetarlas y condenarlas a la desaparición, sólo por el simple hecho de no compartir las formas institucionales del mundo moderno.

En este sentido, Chávez representa para las caricaturas una alteridad que implica la llegada de la oscuridad a donde antes había luz, la llegada de la barbarie a donde antes había civilización. Una alteridad caracterizada por la represión del sujeto histórico impuesto por el mundo Occidental. Obviando que la oscuridad del sistema-mundo moderno es su cara colonial, es su colonialidad.

Paolo Rosato

Pertinence and competence levels in understanding/ misunderstanding music

Each day people make different kinds of judgement on musical facts: composition teachers tell their students if a piece or a passage within it is correct or incorrect; composers ask themselves whether their new work is satisfactory or unsatisfactory; critics write that some new work is aesthetically interesting or not; listeners say what they liked or disliked about it; directors decide if some piece music is suitable to a theatrical performance or not; and so on. Everyone can either keep or change their first judgement, and even have other people suggesting they got the wrong first impression. Although these kinds of judgement are often expressed immediately, all of them involve a very complex and variously articulated thinking process. Judgement can in fact be pertinent from a syntactic point of view (for example, “this chord is wrong”), but not pertinent from a semantic or semiotic one (as “through such ‘wrong’ chord the composer expressed something”). The same goes for every level at which a musical fact can be defined. Again, a competent listener might hear and/or say that a chord is wrong, but this does not mean it is “bad” neither for her/himself, nor for a common listener. It follows that understanding/misunderstanding can act in different and contradictory ways, at different levels, within a same musical piece.

1. Tonal harmony

I am going to discuss just one aspect of such complex matter: tonal harmony and its related field of meanings. The starting point of this work is that tonal harmony can be regarded like a parameter-system governed by a centripetal force, within which an intrachordal hierarchy operates.

As Fulvio Delli Pizzi writes, “the complete and correct string of diatonic chords moving towards the tonic is claimed to be as follows: III-VI-IV-II-V-I. ... all movements from left to right are possible, but only the I can be followed by any of the other chords” (Delli Pizzi et al. 2004: 6–7).

Provided with this simple knowledge, even an inexperienced music student, or a student unfamiliar with the Western tradition, can write and/or play some strings of chords that will sound like tonal ones. In Raymond Monelle’s words, the student – even if not a native speaker – will be able to distinguish what is tonally “significant, and what is not, in the phonetic continuum of the language” (Monelle 2000: 5).

“Yet we know that the reality of music is not quite so dismal as the previous remarks may suggest, because a great number of morphological and syntactic swerves can interfere with chordal stability and centripetal forces” (Delli Pizzi et al. 2004: 7). Delli Pizzi defines the parameter-rhetoric as a cluster of “institutionalised swerves”, that is to say deviations which have been conventionalised by means of repetition through time, like the *topics* studied by Monelle (2000: 80). The most common swerves are the so-called deceptive cadence – the most common deviation “from the inevitable finality of a cadence” – and the possibility to introduce “at any point of the harmonic course ... one or more dominant chords whatsoever” (Delli Pizzi et al. 2004: 8). But what is important for this work is that these harmonic swerves are clearly recognisable, and not thought of as incorrect progressions.

Let us see just one of the six cases discussed by Delli Pizzi, namely the centrifugal step from V to III. V-III is possible “only in the progression V-III-VI-II (occasionally without II, and most often with VII in place of V)” (ibid.). Notice that this centrifugal swerve is counterbalanced by the introduction of the strong and tonically orientated progression of fourths and fifths. In this case, the centripetal logic is not completely neglected.

Our inexperienced student is now able to recognise several harmonic strings as tonally pertinent and significant. But what happens when an incorrect string features a tonal context? If it is featuring a piece composed by an inexperienced student or from one belonging to the not-tonal/post-tonal age, we’ll have an *unintentional* sign, a mistake caused by a mere lack in grammar: the student isn’t totally able to understand or misunderstands the tonal system (see Tarasti 2000: 71). But if the piece is by some experienced student, or by a composer from the tonal age, we’ll have to describe

it as an *intentional* sign, therefore a swerve from the system. We cannot describe it as a mistake, because “native speakers” fully possess their own language, even if not in a rational and conscious way. We are now entering the field of hermeneutics and semiotics. Moreover, according to Jurij Lotman (1977: 17), if we are dealing with artistic, fictional texts, we know *a priori* that nothing within such texts is casual or wrong. This swerve could reveal its meaning – or better, its sense – with respect to other features and processes within the text-system. Or it could have a connotative value, as in the case of V-III discussed above, of some “ancient modal” atmosphere. An analysis of the global text is needed to give an answer to the previous questions.

Let us now discuss some cases. As first, let’s consider a Renaissance piece where harmony is not built on intrachordal hierarchy. Example 1 shows a section from Jacques Arcadelt’s “Il bianco e dolce cigno” (from *Il Primo Libro di madrigali a 4 v.*, Venezia 1539), on the words “strana e diversa sorte, ch’ei more sconsolato, et io moro beato”. I have boldfaced the harmonic links out of any tonal logic: V-III (at measure 3), and II-III (between measures 6 and 7). In the first case, the reading in A minor reconstructed in square brackets is not possible as, in order to obtain a tonic different from the starting one (F in this case), a cadential chord is needed – that is, a V, a IV, or a II, but not a III. In the second case, the interpretation in D minor is once more impossible because a “minor dominant chord” is a self-contradictory concept. We can remark that some strings of chords resemble the tonal ones. From the middle of the seventeenth century on, the strings we call not tonal were less and less used. Through repeated listening sessions, we are able to recognise the harmonic links we define as modal.

a: [III II] bII I IV I III-I bII I VI
 F: I IV I II V I VI I V III IV [III II] II III I
 d: [III IV Vm] III-VI IV V †

Example 1. Jacques Arcadelt, *Il bianco e dolce cigno*, mm. 16–24.

Example 2 shows the middle section of Schumann's Walzer from *Albumblätter* Op. 124. At the beginning of the second line we find a V, and properly a VII, that moves to the III. This is the case mentioned by Delli Pizzi, with the harmonic progression moving towards the tonic. In this case, V-III does not sound as a modal link because of the tonal strength of the progression of fourths and fifths discussed above.

F: I IV II V (+6 6/4 6/5) I IV

F: V (VII) III VI II V

progression

Example 2. Robert Schumann, *Walzer* Op. 124 No. 4, *mm.* 17–28.

Example 3 is again from Schumann, the “Ritter vom Steckenpferd”, from *Kinderszenen* Op. 15. The piece is very fast, but at this level of the analysis we must distinguish between abstract parameter-systems and their actual realisation within the text-system. However, a III harmonic degree seems to appear after the V (between measures 1 and 2): in our interpretation, there are two passing tones, A from B flat to G in the bass line, and A from G to B flat in the middle voice on the right hand. The stress over this passing chord pertains to the semiotic level: in fact, the text shows a tendency to stress the last weak beats of each measure on chords that

become progressively more intense, imitating a child playing with a stick serving as his horse.

P P (+6 6/4 6/5)

F: V [III] [I] H
 d: V IV V I II I6/4 V I
 g: H I6/4

G: V
 C: H V

P = passing tone

Example 3. Robert Schumann, "Ritter vom Steckenpferd" Op. 15 No. 9.

Another case of deceptive chords, created by non-harmonic tones with a consequent shift of meaning, can be traced in Brahms' Intermezzo in A minor Op. 118 No. 1. Example 4 shows the first ten measures of the piece with two different tonal interpretations. The correct one, according to Delli Pizzi's criteria, is as follows: I – VI – H – (V/V) in A minor – H (V/V) – V – I – V – I in C major (see Delli Pizzi et al. 2004: 210). If the beginning of the piece was in F major, the tonally incorrect progression V – III – I would mark it. But we can notice that both *B flat* and *G*, respectively at the first and third measures, which could sound as sevenths with respect to the bass line, are actually *appoggiaturas*, as confirmed by the absence of the fifth within the presumed seventh chord, and also by the E (at measure 5) following the same melodic pattern. Neither analysts nor listeners with adequate competence level in tonal music would misunderstand this situation. Being a model both for listening and analysing, tonal logic allows us to recognise the correct denotative function of each chord. But getting the correct tonal interpretation, that is the correct harmonic progression in the piece, does not mean dispersing its ambiguity, that is the complexity characterising artistic texts. Moreover, ambiguity is possible only with reference to codified and conventionalised systems. This means that inexperienced or unfamiliar listeners are not able to understand the

harmonic sense of Brahms' piece. They would just hear a mere sequence of more or less indistinct and meaningless sounds.

JOHANNES BRAHMS

Harmonic analysis for the first system (measures 1-5):

a:	I			VI	
F:	V	III		(III)	I

Harmonic analysis for the second system (measures 6-10):

G:		V			
e: V					
C:		II	V	I	V
a: II					
F:					I

Example 4. Johannes Brahms, Intermezzo in A minor Op. 118 No. 1, mm 1–10.

2. *Meaning in music*

I agree with Monelle that “music cannot be described without reference to its meaning”, but what is meaning in music? Up to now, we have spoken of musical signification and sense without any reference to external and/or referential meanings. The tonal meanings we have dealt with, and all the presumed or actual deviations from tonal system, can be well understood only with reference to history and culture, the same way Monelle discussed musical topics (Monelle 2000). Following Tarasti’s terminology, let’s distinguish two kinds of semantics within musical objects and facts: interoceptive and exteroceptive semantics. Both of them need a common approach, using methods borrowed from human and natural sciences.

An analysis of a piece in terms of topics, or exteroceptive semantics, without any reference to parameter-systems and text-system, is an abstract analysis. The same goes for certain analyses of musical scores: here the problem is not the score, but what criteria the analyst adopts in her / his analysing it.

Eero Tarasti considers “the difference between these two questions: Do you like Brahms? Do you understand Brahms? One can *like* music; it can be enjoyed without being *understood*” (Tarasti 2002: 16). I agree with him when he affirms that “there is not such thing as one ‘correct’ way to understand music” (ibid.). Brahms can be enjoyed even by listeners inexperienced in tonal music, and, reversely, one can understand Brahms’ tonal strategies even if disliking his music. There are manifold ways to understand Brahms. Nevertheless, a hermeneutic approach is always possible. We can try to fill in the linguistic, cultural, social, and psychological gaps – due to the historical distance – between Brahms and his listeners until today. The problem of the distance between the author and the reader or listener is a common feature in artistic communication. To better understand Dante’s *Divina commedia* one has to know that in the Middle Ages the wolf – which Dante meets within the *selva oscura* (dark wood) – was not only a symbol for malice, but for voracity too. In the same way, when we listen to some musical pieces, we have to know in what kind of dance they were originally used, and so on.

We must consider also that semantic transformation occurs with time. In a famous poem, Dante writes: “Tanto gentile e tanto onesta pare la donna mia” (so polite and honest my woman is appearing), where the terms “pare” means “to become visible”, “to come into sight”. But in modern Italian, the verb “pare” is a dubitable term, meaning “to seem”, in opposition to “to be”. One misunderstands Dante’s thought if she/he gets that Dante’s woman just *seems* to be honest! The same goes for music: we would misunderstand most of the music from the twentieth century if we connected its chromaticism to the *pianto* topics mentioned by Monelle (2000: 66–73). Moreover, within the artistic text, a figure, a *topic*, a linguistic unit, can be subject to different operations, like in Bach’s work, where he freely inverts “a figure, even if this contradicts the topical reference” (Monelle 2000: 69). Artistic texts rely on basic denotative meaning in order to construct sense, but sense is more than a sum of meanings!

Therefore, if we lose the semantic competence with respect to literary work, we also lose most of its meaning. But in music we have two different, contradictory results, whether we lose the exteroceptive semantic competence or the intrareceptive one. In the first case, even without knowing the *pianto* figure – and its implication in expressing sorrow – we can enjoy Bach’s *Saint Matthew Passion*. In the second case, without knowing tonal

system, we cannot understand most of the text strategies used both in Bach's and Brahms' music. Again, a critical difference between interoceptive and exteroceptive semantics is that we can understand the latter only via information external to the text. Contrariwise, by means of repeated listening sessions of tonal pieces, we can reconstruct most of the rules of the tonal system, because – although they are the result of a historical process – they are regulated by an internal logic, as Delli Pizzi pointed out.

3. *Mistakes or intentional swerves?*

It seems like it is then impossible speak of a “mistake” in the production of artistic texts: what today seems to wrong and consequently bad and ugly, could totally change in the future, as in the case of the “torn jeans” nowadays so in fashion! Or, as seen above, a syntactic harmonic mistake can be regarded as an error only at a level of beginners in musical studies. What is then the role of rules within artistic musical texts? They seem to be needed only to allow some swerves or deviations, as in the case of the tonal system: it seems to be unproductive to adopt a law only for predicting the conclusion of a piece, because all of us know that in tonal music the tonic will be sooner or later achieved. What is interesting in music is not “that” but “how” a *unique* piece will get to its end. For this necessity, covering laws play a relative role, as in explaining historical facts, or, according to William Dray's words: “The sub-law is part of the explanation of the gross event, although it does not *cover* it; the same law covers the sub-event, although it does not *explain* it ... Satisfactory explanation, if it employs laws at all, employs laws only of the lower level” (Dray 1957: 70). In other terms, if we can regard a musical piece as a complex of parameter-systems, each one provided with its own specific, more or less compelling laws, no law covers the global explanation of that piece: the sub-competences related to each musical parameter – each one endowed with its pertinent signs – must fit an upper, more general level where a competence related to the “logic of the situation” is to be brought into action. With this approach we can enter the field of interpretation, or better, that of semiotics in its ultimate sense.

We're glad it's all over: Binge-drinking cultures

1. Introduction

Writing a book on critical audience research in the winter of 2005/6, it struck me that if I was going to tell people how to engage with audiences, perhaps I should do some empirical work of my own. The chapter I was writing at the time used Jenny Kitzinger's *Framing Sex Abuse* (2004) to argue that prosaic questions of how publics could be induced to change unhealthy habits, or at least think about changing them, were more intriguing than critiques of 'administrative' research would allow. At that time, I had noticed a number of interesting drink awareness messages across the city of Liverpool, where I then lived. Curious, I contacted Sandra Roscoe, Community Safety Officer for Liverpool City Council. I wondered if anyone had researched public reactions to these campaigns, and if not, was she interested in supporting such a venture? Several studies followed from that conversation, but this paper will focus on a student "alcohol diary" project. In this period, Liverpool City Council and South Liverpool Primary Care Trust were particularly concerned with youthful binge drinkers. Yet they acknowledged 'youth' covers a multitude of habits, tastes and living conditions. Their response to this differentiation was a branding exercise. Here "Pssst!" (which is both a sound used to discretely attract someone's attention and a common slang word for drunk) was adopted as the umbrella strapline for a number of campaigns that would use different themes to appeal to various groups of young people.

Student drinkers had been identified as a key focus for 2007, for even a casual glance at the city's bar scene showed how aggressively they were targeted by the drinks industry. The design team responsible for "Pssst!" however, were concerned by two things. First, they feared that the necessity to blend their messages with the 'brand image' of Council partner institu-

tions, such as the Police and Fire Services, shackled their instinct that what was needed were controversial and daring messages that could compete with the sort of material produced by the drinks industry. Second, they worried that design decisions were being made in the absence of insights on the whys and wherefores of student drinking.

Although the diary project aimed to provide this information, it was informed by recent developments in scholarly thinking on the place of media, and media studies within both health and youth policy. Combining a cultural industries perspective with an audience view that moved from “reception” to “participation”, the project offers ideas on how critical media studies can engage with public policy. The topic of alcohol is appropriate, since on a cosmetic level it appears nothing could be further from the truth. Even some communication scholars argue that media have little power one way or the other in binge cultures (Young 2004). In fact, the “Pssst!” study demonstrates the argument, that I have developed elsewhere, that this is an exciting time when media scholars can establish all sorts of research connections unimaginable in years past. However, barriers remain. Anyone attending health communication and audience panels at 2007’s International Communication Association conference would have seen the old theory/method divide in plain view; the former paid admirable attention to how key variables could be defined with a precision that made them applicable in the field; the latter continued to ask what “the field” is, and why anyone would want to go there. But neither spoke to each other. My own feelings emerging from this was that health communication scholars need to take a wider, more interconnected perspective on public discourses, while critical researchers need to construct a contingent yet relatively coherent methodological canon. Situated in the latter field, this paper will take baby steps toward this goal. Its bulk will consider the mechanics of the methods used in the “Pssst!” research, thereafter considering why its results should be reported at a semiotics conference, of all places. As befits the setting, the conclusion will consider the role “the text” might have in critical engagements with public health.

2. The “Pssst!” Project

34 students were asked to produce a “diary” that recorded alcohol messages encountered in everyday settings. These included flyers promoting

drinks and drinks offers; billboards; events sponsorship; advertisements from newspapers and magazines; radio and television ads; images of people drinking across all sorts of media and public health campaigns. Where possible, students were asked to make a “scrapbook” of such materials. The diaries also noted perceived lines of appeal.

When completed, the diaries were digitized and circulated among the cohorts. The students were then asked to write a report on the symbolic background to their drinking habits that suggested potential themes, messages and media for an alcohol awareness campaign.

The method was designed to overcome the marginalization of media in the binge drinking debate. Much is lost in reducing this role to the question of advertising effects. So framed, critics in both the UK and Australia have implicitly argued that media studies has little to say about problems mostly caused because alcohol is cheap and easy to come by. Communication scholars have, in some instances, contributed to their own fate by not considering how influence, or better significance, can be re-thought within the recognition that advertising cannot be thought of as a force that simply “does” things to consumers.

One place where this became evident was the 2004 OFCOM review on alcohol advertising in the UK. Against the background of calls for a ban, the media regulator commissioned studies on the effect such advertising has on children. Ultimately, OFCOM chose to side with Brian Young's experimentally based conclusion that advertising does little more than tap into the sensibilities of already alcohol soaked cultures. Given that drinks ads have at best a secondary, reinforcing role in alcohol consumption, it makes little sense to expend the energy needed to affect a ban (Young 2004).

This was, of course, a gross simplification of social communication processes. Nevertheless Young may well have been right that within the current OFCOM regime, where national media regulation is framed by economic rather than cultural principles (Hesmondhalgh, 2005), banning alcohol ads may be neither practical nor effective. In a media world where it is difficult if not impossible to prevent content access, perhaps it is better to encourage audiences to read the messages they do receive more critically. But this includes reflecting not only on messages, but on the industries that create them, and what their motivations are for doing so (Lewis & Jhally 1998). The diary method was designed to encourage these

activities, and to improve our understanding of how alcohol promotions work in Liverpool by contextualising advertising within the wider field of marketing and interpersonal communication.

3. Results

Campaign ideas emerging from this exercise, based on readings of student drink cultures and the role of marketing and advertising therein, tended to fall into two camps. Many suggested event, point of action strategies, such as offering free “Psst!” brand ice pops to drinkers which would (a) introduce the message, (b) physically stop them from drinking and (c) aid in rehydration. Others featured more traditional information campaigns that would play on typical student fears; assault, penury and failure.

All were based on the general sentiment that although it was preposterous to think that alcohol advertising made them consume products that they didn’t like, marketing did influence how much and how often students drank. The process perceived was not reinforcement, but amplification. If bingeing has always been a part of the UK student experience, it appeared to the people in this study that alcohol had now invaded every student space to the point where the “fun” they were supposed to be having was constantly drink related, often in dangerous ways. This was particularly the case around sex. As one student put it:

On 90% of the flyers and posters mentioned, sexual language, innuendos or suggestive images were used. An example of this would be at the “Mischief!” club night, where alcohol was given cheaper to “naughty nurses” or to students who took part in “Bikini wrestling”.

Implicit in the events focus was the idea that any effective strategy had to consider space as well as text. Although the content of alcohol advertising and promotional material was worrying enough, the “where” was just as important, in the students’ view. Many of the participants identified freshers week as a key action point, as it was here, in their opinion, that the agenda was set for the synthesis of “student” and “drinking”.

4. Conclusions: Culture, text, alcohol

So what are the conclusions from all of this, and why present them at a semiotics conference?

The paper opened with disparate fields: health communication and critical media studies. Seth Noar's review of the state of the art in the former (2006) indicates that scholars who use traditional social science methods are sympathetic to reconciliation. Noar argues that in truth, even well designed public health campaigns will miss most of their targets most of the time. Pragmatically, the solution is multidisciplinary approaches to studying and formulating communication policies, where qualitative techniques are welcome. His broad point is that success is maximised if projects have a clear theoretical foundation that acknowledges and takes steps toward investigating the diversity within audience groupings in a manner that makes those audiences participants in the development of health messages, and the conversations that surround them. Conversation is important, as messages have a better chance of being effective if they cross the media divide into everyday speech. Campaigners must spend more time with audiences, dissecting the things they worry and care about by any means necessary. This knowledge must be blended into campaign design, thus creating a dynamic relationship between lay and expert discourse. The idealised health text therefore becomes the product of a public, rather than an industrialized or technical process. Implicit in this argument is a useful reconfiguration of textuality that re-asserts the validity of critical media perspectives by rejecting the idea that health messages are externally produced and experienced objects that either succeed or fail in doing something to audiences.

Staying on an experiential level, texts remain relevant as a common point of origin for dialogues about alcohol cultures. In the work I have done in the last two years, conversations with colleagues, students and health care professionals normally begin with the phrase "have you seen ...". Wider public fears over products such as alco-pops similarly locate advertisements as points of origin in discussions over whether youthful drinking is a product of choice or seduction.

Beneath this lies a point of some substance: Situating advertising as resource rather than problem methodologically invokes the benefits of longitudinal & therapeutic research by drawing on recent audience theory

centred on the question of textual power. My argument begins with the work of Cornel Sandvoss. Sandvoss (2005) argues that this power does not begin in meaning, but the *absence* of meaning. The democratic potential of the text lies in its ability to offer the reader an external point of reference; much as in psychoanalytic discourse, where the therapist is the conduit through which the self can adopt an alternative view of thoughts and behaviours that appear entirely rational from within (Apel 1977). In contrast, the ideological power of the commodified text lies in its “mirror” status. Semiotically, agnostic texts allow audiences to read themselves through media in a way that guarantees they never have to confront or consider difference.

Sandvoss’ critique justifies the diary method in this study, which in many ways violated a number of the arguments made about naturalistic research. A frequent criticism made of the experimental work upon which Young based his conclusions is that we cannot hope to grasp the significance of advertising through techniques that abstract texts from their everyday contexts. Although the diary method had its roots in the everyday, the diaries themselves clearly represented a similar form of abstraction.

This can be justified on a number of levels. First, Kitzinger’s work, mentioned earlier, is an exemplar of an action orientation in audience research which participates in rather than observes the generation of health discourses. Applied here, this study began from the commitment that the narrow consumer perspective used in the regulation of commercial speech around alcohol allows the drinks industry to disingenuously claim that they do not force their products onto the public at the same time as pursuing marketing strategies where this is precisely the goal (see, for example, Carlsberg’s UK activities around the World Cup, as covered by Cooper 2006).

However, this abstraction reinscribed itself in the everyday in producing accounts that focussed on the spatial location and circulation of drinks promotions; this was important as it is very often the placement of texts that determines the extent to which they can be seen as controversial or offensive (Ruddock 2007), and because space is central in the politicization of youth cultures. Abstracting flyers and the like from their everyday context, thus stripping them of their common sense appeal, grounded critiques of “binge cultures” that also disrupted the entrepreneurial logic shaping neo-liberal educational policy (Kelly 2003). The idea that, in the

absence of compelling evidence for negative effects, consumers should be allowed to make sense of commercial messages about alcohol without state intervention, sits comfortably beside educational policies that define young people as individual consumers and beneficiaries of training regimes with no intrinsic *social* value, and thus no rationale for centralized support (Lantz 2005). That the young people in this study demanded the eviction of alcohol from some of their social spaces speaks to the potential of research that ejects text from context with the aim of provoking reflection on how, why and with what effect those texts are made and circulated. In the process, the research became about more than alcohol; it was also about the nature of the university's economic geography, and objections to the dominant framing of that space as a site of consumption rather than learning. Through this dialogue, students framed themselves as people with rights that extended beyond product choice. In asserting that alcohol be removed from some university events, the students resurrected the idea that education has a social dimension and value, in contrast to the consumerist polarity of educational policy.

Perhaps more importantly, these arguments were fed *back* to institutions who had some power to act on this. Design professionals at South Liverpool Primary Care Trust were, from a social marketing perspective, open to any insights that critical theory might bring. The failure of traditional effects research to provide an effectively nuanced view of the role media play in binge cultures creates a vacancy that critical researchers can fill, especially given developments around the ideas of "text" and multiple forms of media literacy that allow for non determinist views of communicative power. To capitalize on this situation, however, we must concentrate on how our methods can answer the question of "what works" while remaining true to values of critical reflexivity.

Writing utopias: Imagining other worlds

Utopias now appear to be much more realizable than they were once thought to be. And we find ourselves faced with a truly disturbing question: how can they be prevented from taking shapes definitively? [...] Utopias can be achieved. Life moves towards utopias. And it could be that a new era is beginning, an era in which the intellectuals and educated people will be thinking of ways of avoiding utopias and returning to a freer, less “perfect”, non- utopian society.

– N. A. Berdiaeff, *The End of Our Time*

The expression “Out of place” refers to the singularity of each and everyone of us, the self which cannot be reduced to the I, to the status of individual, to identity. [...] U-topia with respect to roles, social position, the community, belonging, identity. [...] U-topia in the sense of beyond being, otherwise than being, out of being, beyond being and non being.

– A. Ponzio, *Fuori luogo* [Out of Place]

This paper deals with utopia as seen from the point of view of literary writing and understood in terms of “excess”, “non-functional”, “other”. I first discuss the main characteristics of positive and negative utopias (these last also called dystopias), in particular with reference to Thomas More, Aldous Huxley and George Orwell’s novels, and the aim of this kind of writing as a narrative reaction genre. Second, we will underline the writer’s propensity for the “play of amusement”, for imagining a society which is other, either better or worse, than the existent one, on the one hand, and the writer’s capacity for excess, criticism and stance, on the other.

Each perfect city described over the centuries – from Thomas More’s *Utopia* to H. G. Wells’ *A Modern Utopia* – is impossible to find on a real map; it floats in a sea of ink and can be reached by travelling and exploring through the pages of a book. The reader should be able to immerse

him/herself in writing as well as to read “raising his/her head”, as argued by Roland Barthes (1984: 23). To raise one’s head while reading is not for lack of interest, but because of an infinite flow of ideas, together with the ability of analysis, critique and thought which are at the basis of utopian writing.

When we consider utopian thinking, we have to consider Ernst Bloch’s distinction between “abstract” and “concrete” utopias. The first are fantastic: they are generated out of desire and function as wish-fulfillment, they do not offer practical programs for social change, nor do they pretend to be “prophetic” in William Blake’s sense, according to whom “every man is a Prophet. He utters his opinion both of private and public matters. ... A prophet is a Seer not an Arbitrary Dictator” (Blake 1965: 607). Concrete utopian thinking, on the other hand, has a practical social purpose. It tries to portray a potentially realizable world, to define precisely the nature and the origin of social ill in the world in which the author lives. Concrete utopian fiction are satires: they define a moral vision, set either in the future or the past, that functions implicitly as a critique of present society.

The term Utopia goes back to the publication in 1516 of Sir Thomas More’s *De optimo reipublicae statu deque nova insula Utopia*. It shows a double meaning: out-opia and eu-topia. *Outopos* is the place, the society which does not exist, not because it is unreal, but because it is good, that is, *eu-topos*. *Outopos-eutopos* refers to the city which is too positive to exist as compared to the existent one, which is negative and distorted.

The last is the city which More criticizes as a horrible picture in the first and second books: he begins pointing out the irrational barbarity of capital punishment for theft, and satirizes the unscrupulous behaviour of the average king, especially his habit of starting aggressive wars and his dishonest methods of raising money. Finally he contrasts the unhappy state of European society with conditions in an ideal country, where human life is organized in the best possible way. Against the negativity of the society he lives in, at the end of the book he underlines the desire, the need of Utopia rather than the hope. Utopia has no place because it does not yet exist. Yet, according to More, it is a necessary project in order to get free of wrong and inhumane conditions.

The attitude which is at the basis of the utopian genre is the inclination to search for the absolute good, which the utopian writer shows by the rejection of the entire world. This is the necessary condition in order to realize the comparison between the “to be” (reality) and the “must come

to be” (utopian construction). Oscar Wilde, in *The Fortnightly Review*, writes that “a map of the world that does not include Utopia is not worth even glancing at, for it leaves out the one country at which Humanity is always landing”.

Moreover, in order to show, in the clearest way, the differences between the ideal world and our, H. G. Wells, in *A Modern Utopia*, performs a narrative creation: he describes a world which is the double face of the earth, whose inhabitants have the same names and physical characteristics, but whose way of living is different. And in order to stimulate our imagination and critical capacity, the fiction is narrated by a Voice, which is not that of the author, so that we may have the impression of watching a picture.

Once every place has been explored, Utopia loses its spatial dimension and achieves the temporal one. An ideal present place can no longer be thought. Writers look at the future, where they find nothing better than everyday life: Dystopia, the society of the future is born. It is the twentieth century, between the first and second world wars, characterized by the oppressive social control of totalitarianism.

The writers cannot describe an ideal perfect society, but a pessimistic world-view, with a catastrophic vision of dangerous and alienating future societies. Aldous Huxley and George Orwell, through their novels, take their place as alarm bells against the restriction of freedom, due to industrialization and to the fact that the media start becoming tools of political propaganda for dictatorship.

It's the epoch of capitalism and globalisation. As Max Weber notes, capitalism makes everyday life worse: it is considered worthy only if it is profitable, hence damaging individual creativity. He compares the Nation States to a steel cage, from which it is impossible to escape and in which it is impossible to live, given the depersonalization of human relationships.

John Stuart Mill writes about the risks and the power of the control system:

If all mankind minus one, were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind. Were an opinion a personal possession of no value except to the owner; if to be obstructed in the enjoyment of it were simply a private injury, it would make some difference whether the injury was inflicted only on a few persons or on many. But the peculiar evil of silencing the

expression of an opinion is, that it is robbing the human race; posterity as well as the existing generation; those who dissent from the opinion, still more than those who hold it. If the opinion is right, they are deprived of the opportunity of exchanging error for truth: if wrong, they lose, what is almost as great a benefit, the clearer perception and livelier impression of truth, produced by its collision with error. (Mill 1998: 19–20)

Then he concludes, pointing out the importance of freedom:

The only freedom which deserves the name, is that of pursuing our own good in our own way, so long as we do not attempt to deprive others of theirs, or impede their efforts to obtain it. Each is the proper guardian of his own health, whether bodily, or mental and spiritual. (Ibid.: 27).

Dystopic writing evidences the fear of the conscience's levelling: the idea to manipulate and homogenize the masses for political or scientific aims is at the basis of the twentieth century's science fiction writing. The will to control everyone implies lots of changes linked to the biopolitical sphere. Biopower is the most useful tool in the hands of totalitarian societies, since its aim is not only to impose discipline upon behaviour, but also to govern and create desires, hopes, fears, that is to create *subdued beings* (see Foucault 1994).

Huxley and Orwell describe two kinds of society where human beings are deprived of individuality and of freedom of thought, with no possibility to choose their own life, that is, who to be and what to be. Huxley is satirical from the beginning, since he entitles his book *Brave New World*, echoing Miranda's words in Shakespeare's *The Tempest*, who says "O, wonder! How many goodly creatures are there here! How beauteous mankind is! O brave new world, that has such people in't!" (Shakespeare 1987: 55).

The writer is ironic towards a society which has no beauty. Unlike in Orwell's scenario, in the world depicted by Huxley the masses' foe is not directly shown. Here no Big Brother's Eye watches everyone, but people have everything they need, since they have been trained, in their biological, social and private lives, to desire nothing more. In his novel, Huxley foretells Nazism's dream of creating one ruling race on earth, and he supposes the birth of a biological society, selected from among those with the best genetic traits.

Huxley writes *Brave New World* in 1932, when consumerism is widespread. As Harvey rightly notes in his work, *The Condition of Postmoder-*

nity (1989), the passing fashion during the seventies was not only linked to the waste of material goods, but also involved a degeneration of values as human relationships and bonds of affection were subjected to a process of dehumanization.

In *Brave New World* there are two kinds of world: the first, the World State, is perfectly organized thanks to scientific and technological progress; its motto significantly is “Community, Identity and Stability”. Illness and old age no longer exist; people live in a kind of individualized and extreme hedonism. The second world is the Reservation, where natives live, and a place that is considered a relic of the past. John the Savage, who lives there, will be brought in the New World. At first he is astonished, then offended, and finally disgusted with the new, perfect society. The Savage flies into a rage against the New World, claiming the right to be unhappy and the freedom to choose his own life:

But I don't want comfort. I want God, I want poetry, I want real danger, I want freedom, I want goodness. I want sin. [...] I'm claiming the right to grow old and ugly and impotent; the right to have syphilis and cancer; the right to have too little to eat; the right to be lousy; the right to live in constant apprehension of what may happen tomorrow; the right to catch typhoid; the right to be tortured by unspeakable pains of every kind. [...] I claim them all. (Huxley 1996: 246)

Huxley stresses the importance of choosing one's own life without conditionings by those who have, or claim to have, our “best interests” in mind.

Orwell in *1984* shows a society that is put on the same level as material goods. The human being has become a victim of alienation due to work in the factory. He is in the hands of the ruling class who controls the production system. In *1984* life has no value: only consent and faithfulness to the party counts. The party dominates the masses through the power of broadcast media. There is no freedom, only homogenization and mind's control. There is no literature, nor knowledge about human history. This society must not know to be better dominated and controlled.

Brave New World and *1984*, apart from being novels of prediction and of reaction to an ideological and political conception, are novels of *intransitive writing*, rather than of transcription, since they represent writing as a stance towards the order of discourse. Both are novels which describe

the consequences of inhumane societies, once Utopia has been eliminated. John the Savage, Winston and Julia, are characters out of place, since they are guilty of Utopia.

At the same time, the writer represents the voice of reaction and the desire to show, freely, ironically and extremely, the contradictions which exist in society and which haven't been shown yet. It is his/her duty, since s/he has a responsibility towards the whole world. Rossi-Landi (1994) underlines the role played by the writer, with his/her capacity to criticize and take a stand in front every kind of social and ideological construction. This implies the creation of "unproductive works", in comparison to the logic of profit, which is the core of capitalism.

In Bakhtin's terms, the utopian writer is capable of "exotopia", that is, "of distancing", of looking at his own reality from the corner of the eye, critically, with detached participation, but at the same time not indifferent to it, from the perspective of a deeply felt sense of responsibility. To look at one's own reality from the corner of the eye affords a finer intuition of it. Bakhtin claims that the writer as a writer can say nothing. The writer is s/he who has the gift to speak indirectly, and who wears the clothes of silence. To be "silent" means to be capable of ironic, detached and allegorical writing (see Bakhtin 1979).

The writer does not write imprisoned in a given role or social position, but is generally responsible for the other. Lévinas points out that responsibility means the exposure and proximity of one person to another. To speak not only means to speak with the words of others, but also to keep account of the other in a relation of inevitable involvement and implication, so that to speak is always to answer: in the sense of to *answer to*, in the first place, that is, to hold oneself accountable; and secondly, to *answer for* or justify oneself (see Ponzio 1994).

Positive and negative utopian writing requires a vivid imagination and joy in creating and inventing. Peirce defines this propensity as the "play of musement"; for Thomas Sebeok it is the main quality of language as a modelling device. It's a species-specific inclination to plan, invent, create, and imagine an infinite number of Other possible worlds. The human propensity for musement implies the ability to carry out such operations as predicting the future or "travelling" through the past, that is, the ability to construct, deconstruct and reconstruct reality, inventing new worlds and interpretive models.

Every species is endowed with a model that produces its own world, and language is the model belonging to human beings. The distinctive feature of human language is what linguists call *syntax*. Thanks to syntax hominids have not only one “reality”, one world, but are also able to create an indefinite number of possible worlds. In this sense, language as modelling device is writing. It is writing *ante litteram*, as Ponzio asserts, which exists before the invention of writing as phonetic transcription. This kind of literary writing, unsuitable for mere communication, can be found in every human practice and product. It goes beyond pragmatics and the established order, for the sheer joy of invention and alterity.

Literary writing rejects any sort of power that can represent an obstruction. It only claims the power of imagination, which is non-functional (non-instrumental), unproductive and freely creative. The Utopian world is a literary world of “indirection”, “excess”, “the Other”, and innovation.

Utopian writers aim to spur mankind to change and improve their living conditions, but above all to persuade the reader to motivate his/her thought in the direction of an ideal construction that is the result of human reflection:

Utopia has long been another name for the unreal and the impossible. We have set utopia over against the world. As a matter of fact, it is our utopias that make the world tolerable to us: the cities and mansions that make people dream of are those in which they finally live. The more that men react upon their environment and make it over after a human pattern, the more continuously do they live in utopia; but when there is a breach between the world of affairs and the over world of utopia, we become conscious of the part that the will-to-utopia has played in our lives and we see our utopia as a separate reality. (Mumford 2003: 11)

Antti Salminen

Sign of the impossible – Semiotics of paradox

1. Why impossible?

Entities that cannot exist in the actual world can be named and depicted. To claim that square circles or female popes are impossibilities makes perfect sense. Also, impossible or self-contradictory pictures can be easily represented; they are common for example in M. C. Escher's impossible scenes. Impossible representations show the primal gap between beings and representation.

For some reason, most of us prefer the possible to the impossible. This attitude they call pragmatism. Despite this, the question of the impossible has recently emerged in disciplines such as aesthetics, theology, comparative literature and language studies. Thus far, however, little attention has been paid to semiotics of impossibility. Yet the idea of impossibility is valuable, since it is what marks the boundaries of communication, representation and semiosis in general. At its best, thinking about the impossible could be considered as a new awareness of the limits of language.

In what follows, I claim that paradoxical structures are on the borderlines of semiosis and thus are a sign of the impossible. Paradoxes might provide us with an excellent way to understand possibilities of the impossible.

2. Impossibility as a new transcendence

It goes without saying that the notion of impossible carries a heavy metaphysical burden. For example, in his *Critique of Pure Reason* Immanuel Kant notes: "The supreme concept with which it is customary to begin a transcendental philosophy is the division into the possible and the impossible". Thus Kant's system was greatly based on this distinction. Kant's is

only one example of how impossibilities are inferior to possible worlds. In neglecting impossibility, one dismisses the fact that impossibilities depend on historical situation and different contexts. That is why the limits of the impossible are not absolute but rather processes.

The actuality of impossibility stems from an intellectual tendency that may be linked to a late-modern conception of transcendence. After an era of radical relativity and methodological pluralism, when anything went and nothing mattered, revisited impossibility has once more become significant. Its connection to the revival of transcendence is obvious. From the immanent view, impossibility and transcendence are structured the same way: the postmodern sphere of transcendence is impossible, but this impossibility is of significance. Transcendence is making a comeback as the Other of immanence, but without gods, afterworlds or other metaphysical beings (see Schwartz 2004). That is to say, postmodern transcendence is a transcendence of impossibility.

While maintaining the total impossibility of the absolute, metaphysical totalities and original signifiers, contemporary (continental) thinkers do not give up the idea of impossibility. Both hermeneutic and deconstructive thought share a common interest in the idea of the impossible as a limit of textuality.

In the hermeneutic view, especially during the last two decades, impossibility has manifested as an endlessness of interpretation and the otherness of textuality itself. For instance, the hermeneutic circle, as a spiral, is an endless construction, in many ways reminiscent of another representation of impossibility, namely, the Möbius Strip, which has only one side despite being a three dimensional object. The Möbius band is created when a strip of paper is twisted 180° before its ends are joined together. The odd property of a Möbius band is that it has only one side and one edge. As an impossible representation, the Möbius Strip symbolizes the impossibility of total and finite interpretation. The Strip has no inside or outside. It marks a boundary that, in being followed, can be transgressed.

In Jacques Derrida's deconstruction, the impossible has a special place. As Derrida has stated: "... deconstruction can be defined as the very experience of the (impossible) possibility of the impossible, of the most impossible" (Derrida 1995: 43). In *Of Grammatology* he writes that "*différance* produces what it forbids, makes possible the very thing that it makes impossible" (Derrida 1974: 143). Similarly, in Maurice Blanchot's response

to the question of the possibility of the art work (and literature) is paradoxically that art is only possible insofar as it is *impossible* to complete. That is, the possibility of art and literature is found in their very impossibility (see Critchley 1997: 36).

In fictional texts, impossibility manifests at the moment the reader interprets the fictive world as contradicting its own bases and ending up in paradoxical situations without any meaningful answer. Regardless of this, fictive texts can sustain their own impossibility. As Umberto Eco notes: “In verbal texts the representation of impossible possible worlds can be taken superficially as conceivable for pages and pages before the contradiction they display is realized” (Eco 1978: 78). In other words, worlds furnished with impossibility or internal contradictory situations are fully representable, especially in fictional texts.

Like the Möbius strip, signs of the impossible are transcendental, that is to say, they transgress classical conceptions of representation and point towards textual and linguistic transcendence, the sphere which is beyond every means of representation. Still, the limits formed by impossibilities are not early-Wittgensteinian restrictions only, because those limits connect semiosis to new potentialities of forming meaning, to things, and to meanings yet to be. Hence signs of the impossible could play an important role in late-modern aesthetics, which no longer appeal to metaphysical ideals, like everlasting truth and beauty or the uniqueness of an artwork, but to move towards new kinds of semiosis.

3. *Paradox: Sign of the impossible*

It could be claimed that paradox contains the same dynamic structure as textual limits formed by the impossible. As Roland Barthes points out, “today’s paradox is tomorrow’s *doxa*: A *doxa* (a popular opinion) is formulated, intolerable; to free myself of it, I postulate a paradox; then this paradox turns bad, becomes a new concretion, itself becomes a new *doxa*, and I must seek further for a new paradox” (Barthes 1977: 71). Following Barthes, paradox gives us the insight that what is paradoxically inexpressible is inexpressible in relation to a certain system of expression and situation.

Paradoxes can be considered as manifestations of the impossible. Actually, paradoxes are signs for impossible, and through them impossibility

can take discursive forms. In the text, paradox and impossibility intermingle in at least two ways. First, paradox is a discursive situation that is impossible to solve in that specific situation. Second, representations of the impossible take usually the form of paradox. Paradoxes are representations which oppose their own representability. Paradoxes are in-between being and nothing, written and unwritten, voice and silence, possible and impossible. They do not necessarily transgress boundaries between these dualisms but actually construct or even move them.

Ben-Ami Scharfstein has claimed that the informality of a natural language makes its paradoxes harmless (Scharfstein 1993: 157). Paradoxes further allow us to think unthinkable and impossible situations (for example, *Russell's paradox* or Zeno's *Achilles and Tortoise* paradox; see Clark 2002). Thinking paradox is thinking the impossible and the very limits of the thinkable. As Søren Kierkegaard formulated it: the ultimate paradox of thought is the desire to discover something that thought itself cannot think (Kierkegaard 1985: 37).

Arthur Gibson writes (2003: 54): “It can be proved that paradoxes have logical relations to each other, whether or not they all share essential properties. If, following classical bivalent logics, we assume that the consistent limits to expressibility are marked by the outer boundaries of paradoxes.” That is to say, paradoxical expressions could give us valuable insights when limits of semiosis and boundaries of language are concerned.

Paradox raises the issue that a language system is never total, nor is it thoroughly propositional and logical. Language always contains expressions which point beyond meaning or which cannot be expressed at all. Arising on the borderlines of semiosis, paradoxes are meaningful ways to understand the possibilities of the impossible. According to Gibson (2003: 55), the relation of transcendence to paradox is that “the former tears through the boundary of formal consistent limit to the totality of expressions using semantic properties within that totality and applying some of them outside that limit”.

As transcendental entities, paradoxes have ostensive power to point towards the impossible, beyond text and beyond distinct understanding. Often their message can be grasped only intuitively. In spite of their semantic obscurity – or actually, because of it – paradoxes show that the non-appearance of a sign can be a sign too. Therefore the impossible is

never encountered without a context, but this context could ultimately be formed by a lack of present meaning.

Paradoxes blend *impossible signification* and *impossibility of signification*. Thus they open up possibilities to criticise conventional limits and boundaries of representation. Ultimately, the paradox as a sign of the impossible transcends the limits of texts and of the language system to which it belongs.

In his preface to *Tractatus Logico-Philosophicus* Ludwig Wittgenstein states that “In order to draw a limit to thinking we have to be able to think both sides of this limit (we should therefore have to be able to think what cannot be thought)” (Wittgenstein 1988: 3)/ By the means of paradox and other impossibilities of semiosis, Wittgenstein`s hard demand could be made a bit easier. The way of paradox is a *via negativa* towards boundaries of semiosis.

4. Promising the impossible

As a textual principle, the impossible avoids reducing language to the closed system of signified and signifiers. Instead it establishes and transgresses a borderline between language, meaning, and thinking, on the one side, and silence, nonsense, the unthinkable, on the other. Thus it opens up the other side of language.

That is why the impossible, as it manifests in language, could be called *immanent transcendent*. Paradoxically, it is at the same time present and absent, significant and meaningless. It thereby deconstructs ontological dichotomies, which are based on the hegemony of the possible. Thus when the impossible presents itself in language, the limits of semiosis become temporarily visible and flexible.

To conclude: the sign of the impossible, like paradox, leads to somewhere else, beyond rule-governed use of language, and maybe towards utopian possibilities of semiosis. Impossibility opens up the possibility that transcendence in language can be grasped immanently and experienced in different readings. Then then limits of discourse become more visible and crossable. Therefore impossibility also could be a concept for textual critique – a blind spot that allows us to see.

Mathieu Schneider

De la non compréhension comme catégorie de l’humour romantique

Les “humoresques” de Mahler

Parmi les vingt-quatre lieder que Mahler a composés à partir du recueil *Des Knaben Wunderhorn* d’Arnim et Brentano, nombreux sont ceux dont le poème repose sur une structure dialoguée faisant interagir entre eux des personnages qui ne se comprennent pas, ou qui refusent de se comprendre (*Lied des Verfolgten im Turm*, *Trost im Unglück*, *Der Schildwache Nachtlied*, *Starke Einbildungskraft*...). L’un de ces lieder va même jusqu’à thématiser la question de la compréhension dans son titre: il s’agit de *Lob des hohen Verstands* (Éloge de l’intelligence suprême, pour lequel Mahler a transformé l’intitulé original du recueil d’Arnim et Brentano, “Wettstreit des Kuckucks mit der Nachtigal [*sic*]” (Concours entre le coucou et le rossignol), en “Lob der Kritik” (Éloge de la critique), puis finalement en “Lob des hohen Verstandes” (La Grange 1979–84: 1008–1009).¹ C’est donc Mahler qui a mis en avant l’importance de la catégorie de la compréhension dans le poème, ce qui montre à quel point cette grille de lecture peut avoir sa pertinence.

1. La non compréhension thématisée:

Lob des hohen Verstands

Il est en effet question, dans le texte, d’un concours de chant entre le rossignol et le coucou, dont l’âne est l’arbitre. Or le choix de l’âne est absurde, car l’âne est incapable de porter un jugement, c’est-à-dire incapable de comprendre ce que chantent les deux oiseaux et de déterminer, en fonction de critères appropriés, lequel des deux est le meilleur. Il n’importe en effet pas seulement de percevoir le chant, mais aussi de l’analyser et de le juger.

Là réside la différence entre perception et compréhension. Cette dichotomie entre perception et compréhension se retrouve dans la formulation du texte qui insiste lourdement sur les verbes liés à la production et la perception (*sprechen, singen, hören, erzählen*) et leurs organes (les oreilles de l'âne notamment: "*denn er hat zwei Ohren groß*"). En revanche, les termes gravitant autour du thème de la compréhension sont soit niés ("*ich kann's in Kopf nicht bringen*"), soit tournés en ridicule par le contexte ironique de la saynète ("*Das sprech' ich nach mein' hob'n Verstand*"), soit remplacés par des expressions qui substituent à la compréhension raisonnée le plaisir esthétique ("*Dem Esel g'fiel*"). L'ironie du titre n'en est que plus criante, et le choix du titre paradoxalement plus éloquent.

Comment la musique parvient-elle à thématiser, dans sa forme, cette absence de compréhension? Essentiellement dans les discours des quatre protagonistes: l'âne, le coucou, le rossignol et le narrateur (on notera toutefois que le rossignol ne parle pas dans le texte). Si Mahler ne tient pas compte de la réalité "parlée" du texte, c'est-à-dire que, dans la partie vocale, il ne change ni de motif ni de tonalité ni encore de registre, lorsqu'il y a changement de locuteur dans le poème, il rend parfaitement compte de la réalité "chantée". Tant qu'aucun oiseau ne chante, c'est-à-dire jusqu'à la fin du troisième vers de la troisième strophe, la musique adopte le ton de la narration épique, et donc une forme quasi strophique, qui prend clairement ses distances de l'histoire en lui servant simplement de cadre. Les deux premières strophes sont rigoureusement identiques pour ce qui est de la mélodie du chanteur, et très similaires pour ce qui est de l'accompagnement de piano (la différence principale tient à la transposition de l'accompagnement une octave plus bas dans la deuxième strophe). Seul le début de la troisième strophe est légèrement modifié par une modulation en *fa* majeur, mais l'impression de strophisme n'en est pas altérée. Lorsque le rossignol se met à chanter, Mahler rompt le strophisme, en faisant entendre son chant au piano,² à savoir un motif léger et ornementé de broderies (mes. 64–65), qui contraste fortement avec le rythme de bourrée du thème principal. Ce motif est suivi de tout un thème en *ré* majeur (mes. 66–73), composé de dactyles et de doublures de tierces, dont le caractère, opposé au thème de bourrée, découle du motif précédent. Lorsque, juste après (mes. 80–81), l'âne intervient pour commenter la prestation du rossignol, Mahler ni ne reprend le thème "neutre" des deux premières strophes, ni ne compose une nouvelle mélodie qui serait le discours de l'âne. Au contraire,

il choisit simplement de reprendre le thème du rossignol en *fa* dièse mineur et en lui ajoutant la mention : “*barsch*” (avec brusquerie). Ce détail peut paraître anodin, mais il est en fait d’une grande importance. Le fait que l’âne ne soit capable que de reproduire le chant du rossignol, et non de produire un jugement à lui dans une langue qui lui soit propre, prouve bien qu’il n’a rien fait d’autre que percevoir et répéter le chant, là où il lui était demandé de le comprendre pour le juger.

Le même procédé est utilisé pour le chant du coucou auquel Mahler confie un thème (mes. 88–91) également différent de celui des deux premières strophes, mais très proche de celui du rossignol par l’usage qu’il fait du rythme dactylique et de nombreux mouvements conjoints. Lorsqu’aux deux vers suivants l’âne intervient pour annoncer qu’il va rendre son verdict, Mahler ne lui compose pas de thème propre, mais reprend successivement 1) la fin du thème du coucou (mes. 94–95), 2) sa tierce caractéristique (mes. 96–97) déjà entendue dans l’introduction, et enfin 3) le thème principal des deux premières strophes (mes. 98–100). Une nouvelle fois, l’âne ne fait que percevoir et reproduire, au lieu de comprendre en produisant un discours qui lui soit propre. La dernière strophe ne fait que confirmer cela, en reprenant, probablement aussi pour des raisons de symétrie, le thème des deux premières strophes.

L’incapacité de l’âne à comprendre, celle-là même que Mahler avait ironiquement choisie de mettre en avant dans son titre *Lob des hohen Verstands*, est donc placée au cœur du processus d’élaboration de la forme musicale. Le choix d’une forme non entièrement strophique s’explique par la volonté de rendre audible le chant des oiseaux, celui d’une forme reposant simplement sur deux groupes thématiques – et non trois, c’est-à-dire un par animal – par la bêtise de l’âne qui l’empêche de raisonner dans un langage qui lui soit propre. L’acte de communication avec l’âne en reste ici au stade de la perception et n’accède jamais à celui de la compréhension. En ce sens, la musique et la forme thématisent l’absence de compréhension revendiquée par le texte.

Lob des hohen Verstands ne constitue cependant pas un cas isolé. Comme je l’ai dit, d’autres lieder du *Wunderhorn* utilisent, sur un ton ironique, comique ou humoristique, une forme dialoguée dans laquelle la communication entre les personnages semble problématique. Faut-il y voir un trait humoristique? Cette hypothèse n’est pas à rejeter, car Mahler nous a laissé deux indices importants allant dans ce sens: 1) les cinq lieder (dont

trois dialogués) composés quasiment d'un seul jet par Mahler en janvier et février 1892 étaient intitulés *Humoresken* (Mahler 1993: XIII-XIV; voir également La Grange 1979–84, I: 996); 2) les huit lieder suivants, dont la composition s'étala jusqu'en 1898, furent regroupés sous l'appellation *Lieder, Humoresken und Balladen* (Mahler 1993). Autrement dit, sur les vingt-quatre lieder, treize ont de près ou de loin été influencés par l'esprit de l'humoresque. Il semble donc pertinent de s'interroger sur le lien entre humour et non compréhension, en faisant un détour par les théories romantiques que Mahler connaissait bien, en particulier celle de Jean Paul – l'auteur auquel font référence les titres primitifs de la *Première symphonie* (voir Schneider 2005: 130–131) – dans son *Cours préparatoire d'esthétique*.

2. *L'humour romantique, ou la non compréhension revendiquée dans la parataxe*

Cet ouvrage, dont la première édition est de 1804 et la seconde, légèrement augmentée, de 1813, comporte deux "programmes" sur l'humour et un sur le trait d'esprit, le trait d'esprit dont on connaît, depuis les fragments de l'*Athenäum* des frères Schlegel, le lien étroit avec l'humour.³ Ces trois programmes, assez systématiques dans leur exposé, sont aussi les plus longs du cours dont ils représentent en tout plus d'un quart de la longueur. La définition que Jean Paul donne de l'humour est relativement simple: il oppose dans sa théorie l'humour au sublime, en définissant le premier comme l'inverse du second. Partant du postulat que la poésie romantique se situe dans l'espace de l'infinitude du sujet, il définit le sublime comme un "infini appliqué" (Jean Paul 1979: 112–113), c'est-à-dire comme l'application de l'infini à un objet sensible qui lui donne un aspect inhabituel, "spirituel" (ibid.: 113). Il avoue donc implicitement sa dette à Kant qui situait aussi le sublime dans l'infini, littéralement "au-delà de nos sens" (Kant 1993: 127). Est alors sublime "un oiseau de proie planant haut et sans bruit" (Jean Paul 1979: 113), en ce qu'il désigne un espace imaginaire infini que nos sens ne peuvent se représenter.

L'humour est, pour Jean Paul, l'exact inverse du sublime, puisqu'il s'occupe à "glisser et insinuer [la] finitude comme contraste *subjectif* sous l'idée (infinité) prise comme contraste *objectif*", c'est-à-dire qu'il est, au lieu d'un infini appliqué, "une sorte de fini appliqué à l'infini" (ibid.: 129). En ce sens, "l'humour anéantit non pas l'individuel, mais le fini, par le contraste

avec l'idée" (ibid.). Ce principe de l'anéantissement du fini par l'idée est ensuite développé (§33 du programme VII) et étayé d'exemples tirés des domaines littéraire et musical (ibid.: 134). Et là, c'est d'Haydn dont il est question: "Quelque chose d'analogue à l'impertinence désinvolte de l'humour anéantissant, l'expression en quelque sorte d'un mépris du monde, apparaît dans l'œuvre de certains compositeurs, Haydn par exemple, lorsque des phrases musicales entières vont s'anéantir dans un motif différent, et lorsque alternent impétueusement pianissimo et fortissimo, presto et andante" (134). L'anéantissement dont parle ici Jean Paul a en fait à voir avec l'*attente*: c'est parce que le discours musical implique logiquement une suite qui n'arrive pas et à laquelle on substitue un élément antithétique, ou de nature radicalement différente, que l'idée initiale est réduite à néant par l'humour. En d'autres termes, c'est parce que l'attente est déçue et qu'elle l'est de manière inopinée et décalée, que le discours – littéraire ou musical – prend un tour humoristique. Le sens de l'idée en est changé, et avec lui, le mode de compréhension. La compréhension linéaire et exclusivement rationnelle du discours classique est remplacée par une compréhension fractionnée, imprévisible, qui peut aller jusqu'au non-sens, c'est-à-dire jusqu'à provoquer volontairement l'absence de compréhension.

Cette première caractéristique de l'humour, que l'on peut qualifier à la suite de Jean Paul d' "anéantissante", débouche sur une seconde qui lui est directement liée et que l'auteur du *Cours* expose un peu plus loin (§35, "Sensibilité de l'humour"): il s'agit de la parataxe. Jean Paul l'explicite comme suit:

Le sensible, qui est déjà indispensable au comique, ne saurait dans l'humour, où il est l'exposant de la finitude appliquée, être trop riche en couleurs. L'exposition doit déborder d'images et de contrastes prodigués tant par le trait d'esprit que par la fantaisie, c'est-à-dire déborder de groupes et de couleurs afin de gorger l'âme de sensibilité et de l'embrasser de ce dithyrambe qui, face à l'idée, dresse et oppose le monde des sens devenu, dans le miroir concave, anguleux et démesurément allongé. (1979: 139)

L'humour réside donc non seulement dans l'anéantissement de l'idée par le fini, mais dans la répétition de ce processus, qui crée une succession d'images humoristiques indépendantes les unes des autres. C'est cela qui détermine l'humour comme discours parataxique, c'est-à-dire comme discours juxtaposant, sans lien logique, des concepts, des idées ou des images.

Jean Paul donne ensuite un exemple si vraisemblable qu'il aurait pu le tirer d'un de ses romans; il s'agit d'un habitant de Friedrichstadt, "qui, installé sous une cloche de plongée, sans un seul camarade de chambre ni de cloche, écrit dans la mer froide à la lumière de sa lampe, et n'est relié au monde à bord de son bateau que par le tuyau respiratoire qui prolonge le tuyau de sa respiration. 'Et c'est ainsi, conclut [l'auteur comique, ici Jean Paul], que le Friedrichstadtien n'éclaire que lui et son papier et méprise monstres et poissons autour de lui'" (1979: 140).

Le comique réside bien évidemment dans la chute (le mépris des monstres), l'humour en revanche dans la situation grotesque et dans la construction de la phrase. L'idée du Friedrichstadtien qui écrit à la lumière de sa lampe est anéantie par la finitude des détails le décrivant, contre toute attente, dans une cloche de plongée. Mais plus encore, la phrase est absurde parce qu'elle accumule, dans sa parataxe, une foule de détails qui confèrent à la scène un impossible réalisme. Cette juxtaposition d'éléments hétérogènes est un point tellement essentiel de l'humour romantique, que Jean Paul lui consacre un paragraphe tout entier dans son programme sur le trait d'esprit (§44, "Le trait d'esprit non figuré"). Il y dit en substance que "le trait d'esprit esthétique [est] ce prêtre travesti qui accouple tous les couples" (ibid.: 172). Aussi l'humour jean paulien se conçoit-il comme l'action médiatisante du trait d'esprit, qui rapproche, dans la parataxe, des éléments dont le lien semble inexistant ou incongru et qui, ce faisant, anéantit l'idée par le fini. Le discours, quant à lui – fût-il musical ou littéraire –, abandonne la syntaxe et la logique pour la parataxe et le chaos.⁴ Et de ce chaos résulte une nécessaire incompréhension interne à la phrase, qui se répercute ensuite sur le lecteur/auditeur.

3. Verlorne Müh'!: *Une humoresque musicale*

Si l'on s'en tient à la définition de l'humour donnée par Jean Paul, beaucoup de lieder de Mahler tirés du *Wunderhorn* peuvent à juste titre être qualifiés d'humoristiques.⁵ *Rheinlegendchen* ou *Des Antonius von Padua Fischpredigt*, par exemple, reposent sur des textes utilisant volontairement ces accumulations parataxiques et absurdes que mentionnait Jean Paul: les carpes et leurs petits, les brochets aux museaux pointus, les morues séchées, les crabes et les tortues constituent autant de détails descriptifs annihilant le contexte sérieux du sermon d'église. Stylistiquement, ce lied

est construit comme la description du Friedrichstadtien. D'autres lieder revendiquent plus ouvertement l'humour. C'est le cas de *Verlorne Müb'!* pour lequel Mahler a donné comme indication de caractère: "Mit Humor, gemächlich" (Avec humour, tranquillement).

L'humour dans ce lied réside principalement dans son texte qui met en scène un garçon et une fille, cette dernière essayant de séduire le garçon en lui proposant toujours plus. Ce genre de saynètes dialoguées, au nombre de strophes variable et au contenu énumératif, existe en grand nombre dans la littérature populaire, et particulièrement dans la littérature alémanique, à laquelle appartient *Verlorne Müb'!*. Le chant traditionnel alsacien *Müeter, i well ä Ding*, par exemple, est construit à partir du même principe: une fille confie à sa mère qu'elle veut quelque chose, mais n'en précise pas la nature. La mère fait à l'envi toutes sortes de propositions (un parasol, une crinoline, un chapeau, etc.) jusqu'à ce qu'elle lui propose un homme et que la fille accepte.⁶ *Verlorne Müb'!* reprend entièrement les canons du genre, à la différence près que jamais la fille n'arrive à satisfaire le garçon, ou pour dire les choses autrement: que jamais le garçon ne cède. Et c'est dans cet anéantissement de la chute par la dernière réplique du garçon ("*Närrisches Dinterle, i mag es bolt nit*") que réside l'humour du poème. Mahler le renforce du reste, en répétant le "*nit*" final, ce qui prouve qu'il avait très bien ressenti ce qui faisait l'originalité du poème.

Il n'est de ce fait pas étonnant de trouver des traits humoristiques dans la musique, où Mahler fait un large usage de l'humour "anéantissant". Celui-ci concerne en premier lieu le caractère populaire de la mélodie, qui est soit nié par l'harmonie (comme aux mesures 7–8 où la simplicité des sauts de tierce et de sixte à la voix ne laisse pas supposer l'arrivée, en fausse relation chromatique, du *do* bécarré et de l'harmonie de *la* mineur à la mesure 8, soit par l'insertion de tournures mélodiques et harmoniques empruntées au genre savant de l'opéra (Exemple 1). Ceci est notamment le cas aux mesures 89–95 (Exemple 2), où le chant répète, dans une emphase "plaintive" (*kläglich*), le motif de seconde descendante entendu sur "[ge]denke" (mes. 86). Cette répétition culmine à la mesure 94 sur un accord de septième diminuée avec tierce diminuée [X] dont la sonorité et la structure sont aux antipodes de la simplicité harmonique des *Volkslieder*. Tout ceci contribue à souligner l'importance de l'adverbe "*immer*" et à renforcer l'insistance la jeune fille dans la dernière strophe. Mais c'est surtout

la destruction du caractère populaire de la mélodie par la théâtralisation grandiloquente de cette phrase qui frappe.

Exemple 1. Verlorne Müh! Mes. 7–8).

Exemple 2. Verlorne Müh! Mes. 89–95.

Mahler utilise également l'humour à l'encontre des canons de la forme musicale. Ceci est particulièrement visible dans les cadences dont la fonction conclusive est niée à deux reprises. La première fois, à la fin de la première strophe (mes. 30–33; Exemple 3), le garçon termine la phrase "geh dir holt nit" par une formule qui pourrait être conclusive, si le piano et la voix finissaient par une progression cadentielle V-I. Or il n'en est rien : l'harmonie prend le contre-pied de la mélodie, en faisant entendre la progression cadentielle V-I une mesure avant la fin de la mélodie et en frappant l'accord du VI^e degré sur "nit", là où l'on attendait la tonique. La cadence attendue n'arrivera finalement pas, et Mahler conclut la strophe plus loin sur une dominante (mes. 37) qui enchaîne directement sur la deuxième strophe (On notera également que Mahler a utilisé le même procédé de détournement de la cadence à la fin de la phrase de la jeune fille (mes. 27–29). La

seconde fois, aux mesures 102–108, lorsque le garçon claironne pour la dernière fois son refus (Exemple 4), Mahler ne mène pas la ligne mélodique à son terme: l'harmonie et la mélodie progressent cette fois-ci ensemble vers une cadence en *la* majeur, mais la mélodie s'arrête de manière imprévue sur la sensible *sol* dièse au deuxième "nit" (mes. 106–108) sans conclure sur la tonique *la*. Le piano conclura bien entendu à la fin du lied par une cadence parfaite (mes. 111–112), mais le geste mélodique reste bel et bien inachevé. Là encore, l'humour met en jeu ses facultés anéantissantes pour ôter à cette fin sa nature et sa fonction mêmes.

Ce détour par l'humour doit permettre, en conclusion, de mieux revenir sur la question de la compréhension, ou plus exactement de la non compréhension. Celle-ci semble en effet aller de pair avec l'humour,

voire en constituer une des conséquences les plus directes. Dans *Lob des hohen Verstands*, l'humour s'exprime essentiellement dans le discours musical simplement imitatif de l'âne qui vient ironiquement contredire la "suprême intelligence" qu'annonce Mahler dans son titre. La négation de l'acte cognitif se fait ici toutefois à l'intérieur du lied. Dans *Verlorne Müb'*, le texte procède sensiblement de la même manière: l'humour joue avec les attentes du genre et impose la non compréhension comme élément constituant du dialogue entre le garçon et la jeune fille, le premier refusant de comprendre, et du coup d'accéder, aux demandes de la seconde. La musique, en revanche, ne traduit pas cette incompréhension entre les deux protagonistes, mais thématise la non compréhension dans sa forme. Les attentes formelles, liées aux conventions du langage tonal (cadences notamment) et du genre du *Volkslied* auquel Mahler fait clairement référence au début de la mélodie, sont systématiquement déçues, si bien que la non compréhension ne se joue ici plus en interne entre les différents discours musicaux, mais en externe avec l'auditeur. En effet, ce dernier croit entendre un *Volkslied*, mais immédiatement l'harmonie dissonante du piano vient contredire cette première hypothèse. De même, il croit entendre une cadence, mais Mahler en détourne soit la progression harmonique, soit le *telos* mélodique.

L'humour peut donc s'appliquer à différents niveaux de la forme et, de ce fait, nier ou biaiser la compréhension de celle-ci de diverses manières. Quoi qu'il en soit, le lied humoristique romantique est certainement le seul genre musical dans lequel le rapport normal de communication repose sur une compréhension déformée. Là où la musique et la littérature cherchent en général la syntaxe, c'est-à-dire le discours articulé, cohérent et univoquement signifiant, l'humour – et plus généralement la poésie romantique – vise la parataxe et le décalage. C'est certainement là que se trouve l'élément le plus novateur du langage romantique et, ici, des *Wunderhorn-Lieder* de Mahler.

Notes

1. On sait très bien que Mahler a pris d'assez grandes libertés avec les poèmes du *Wunderhorn* qu'il a souvent remaniés (Vill 1979: 34–108; Finson 1987: 102). Ceci n'est toutefois pas le cas de ce poème, car Mahler n'en a que légèrement modifié la quatrième strophe en y supprimant deux vers ("*Und thät die Noten brechen / Er lacht auch drein nach seiner Art*").

2. Nous citerons ici la version pour voix et piano. Toutefois, en effet, notre analyse se basant sur la structure et l'harmonie des lieder, elle n'a rien à gagner à prendre en compte la version pour orchestre.
3. Le fragment 305 de l'*Athenäum* dit en effet: "L'humour a à faire à l'être et au non-être, et son essence propre est la réflexion. De là son affinité avec l'élégie, et avec tout ce qui est transcendantal; mais de là aussi sa superbe, et son penchant pour la mystique du Witz" (Lacoue-Labarthe & Nancy 1978: 143). Mais on peut aussi lire au fragment 237: "L'humour est en quelque sorte le Witz de la sensibilité" (1978: 132). Si humour et Witz ne peuvent être considérés comme synonymes, le Witz est indéniablement à considérer comme un des organes de l'humour romantique.
4. Sur l'importance du chaos dans les théories des premiers romantiques allemands, voir Lacoue-Labarthe & Nancy 1978: 72–73.
5. La question de l'humour chez Mahler et de son lien avec Jean Paul a certes déjà été traitée dans Schadendorf 1995, mais les exemples qui y sont cités ne concernent que les lieder intégrés aux symphonies. La présente contribution entend à la fois réinterpréter les textes de Jean Paul à la lumière de la question de la compréhension et traiter du cas des lieder non intégrés aux symphonies.
6. Principe même de ces chansons est que le nombre de strophes peut être augmenté à l'infini, au gré de l'imagination du chanteur. Aussi n'existe-t-il pas une version du chant, mais de multiples, chaque village ayant souvent la sienne.

A walk in the invisible city

I focus here on the reality of one of the biggest metropolitan areas in the world – greater Mexico City – through the mirror of urban interventions by the conceptual artist Francis Alÿs. During the 1980s, postmodernist urbanism in cities like New York and Los Angeles shaped the paradigm for critical analysis of the fragmentation and multiculturalism of the global city. Globalized North American and European cities became paradigms of the post-modern experience of the impossibility to make a coherent image out of the multiplicity of signs, the loss of historical identity and the fading ability to map conceptually our position in the urban totality. Interpretations of this post-modern unreadability projected a vision of the future city as an anonymous “no-place” or as a chaotic, local reinvestment of multicultural difference and estrangement. In spite of this melancholy diagnosis, many Western cities experienced, by the end of the century, a certain renaissance that accompanied economic recovery, control of population growth, and modestly successful urban reforms. At the same time, urban problems only seemed to increase in Latin America. Though we can detect partial reform initiatives in some Latin American cities, like Rio de Janeiro and Buenos Aires, stimulated by the democratic process and economic stabilization, we continue to experience strong social segregation. There is increasing inequality in living standards between the upper middle-class areas and miserable shanty-towns on the periphery, these last haunted by the lack of the most basic services and resources, such as electricity, water, sanitation, public transport, education, together with increasing unemployment and organized crime.

The Argentinean sociologist Nestor Canclini (1994) suggests distinguishing four cities, or four main layers of city, within the Mexican capital. First, there is Mexico City as the *historical* and territorial centre of the nation, founded in 1324 by the pre-Columbian Aztec culture, which defines a great many of the historical monuments in the centre of the city.

Second is the *industrialized city* that caused the enormous growth of the urban territory due to expanding population during the second half of the twentieth century. In 1940, Mexico had around 1,600,000 inhabitants; today the population is close to 20 million, incorporated into more than fifty municipalities. The resulting image is of a multi-focal and polycentric structure, where formerly neighboring towns now are the palimpsest of a disseminated city, such that one can no longer experience the city as a totality, that is, from a centred point of view. Most of the population circulates in a very limited area, has no knowledge of other parts of the city, and relies on simulations of unity offered by media surrogates (for instance, weather and traffic reports). Third, we have the *informational city*, or *global city*, built by connections between the physical city structure and other cities through a complex network of communicational circuits. Huge parts of Latin American cities are excluded from these networks, since they lack access to such means of communication as telephone, Internet, cable television and fibre-optic wiring. Finally, as a fourth layer, Canclini suggests the recognition of an *imaginary city*, outlined by physical and historical patrimony, but also by symbolic investments in all kinds of artistic, literary and cultural representations. The result is a city without clear frontiers between centre and periphery, urban and non-urban, global and local; the result is a simultaneous experience of distinct historical levels in pre-modern, modern and post-modern references, as an archaeological landscape to be explored and reinvented.

In the work of Francis Alÿs (1959), the multicultural city experience is intertwined with a scenario of anthropological encounters. The artist is a trained architect from Belgium, who came to Mexico after the great earthquake in 1985, where he settled and soon after began to experiment with conceptual artistic intervention in the city, always in close collaboration with local Mexican artists. For him, the city centre became a space of cultural and social discovery, a kind of open installation, an artistic happening, and a way to rethink urban concepts. The street becomes a place of invigorating possibility and confluence, where the complexity of popular life collides and interacts with the practice of making art. Since 1991, going on “paseos” (walks) has been the focus of Alÿs’s artistic practice, especially those in the centre of Mexico City. His works in photography, painting, video, drawing or other mixed media are a result of his walks. Often he invents a pretext that defines a certain route, pattern or behavior; on other

occasions, the walk itself will dictate the artistic results. He records the path and the results of his walk, collects objects and artifacts, and stores images, all of which he later uses in his drawings and paintings. His first experience was *The Collector* (1991–92), in which he strolled through the streets of Mexico City pulling a small metal “dog” by a leash, its magnetic wheels collecting debris in its wake. Later, he had a similar experience in the historical part of Havana, Cuba, this time walking through the historical centre with magnetic shoes. In *Paradox of Praxis* (1997), the artist pushed a large block of ice down the streets for hours until it evaporated into a misty trail in the dirt. Similar interventions were made outside Mexico; for example, in producing *The Leak* (1995) he roamed the streets of Ghent with a punctured can of paint, leaving a trail back to a gallery space, where he finally mounted the empty paint can to the wall. In 1998 he crossed Stockholm with a thread unraveling his sweater, and in the project *Narcotourism* (1996), he recorded seven days strolling around Copenhagen each day under the influence of a different drug. His walks have been executed under various circumstances and in different political contexts. In Los Angeles, for example, during an exposition of his work, he would each day take one of his paintings from the gallery wall and walk it through the downtown area where the Rodney King demonstrations took place, and at the end of the day put it back in the gallery.

It is obvious that with all this Alÿs makes a humorous re-enactment of the *flâneur* figure invented at the dawn of modernity by Charles Baudelaire and later projected as a heuristic figure by Walter Benjamin and Michel de Certeau in our comprehension of the modern city. Restaging the *flâneur* character in contemporary mega-cities may seem rather quixotic, or even a melancholy lament on the loss of individual autonomy and impossibility of restoring affective relationships between city-dwellers and the urban space. Nevertheless, it is at the same time a journey of discovery, where the aimless wandering of the artist’s body connects with the city landscape, with no maps and no pre-established routes, only the drive – *le dérive* – of a body exposing itself to urban influences of all kinds. Alÿs does not deny the importance of the curiosity of the foreigner, the tourist, the gringo, the outsider and the *voyeur*, all hoping to glimpse a secret side of street life. For example, his slide show *Ambulantes* (1992–2002) shows “street people” scratching together an existence by gathering and selling all kinds of goods from little trolleys; and the *Sleepers* (1997–2002), made up of

slides showing homeless people lying on the streets together with images of sleeping dogs. The exposure of this miserable border-zone in the city landscape is an obscene reminder of the breakdown of one of the modern city's fundamental distinctions: the private and the public. "For the homeless the street is the living-room", the artist remarks. You could say that Alÿs giving priority to pictures of deterioration, but as the Mexican writer Carlos Monsivais points out, this is not

with a view to extracting any kind of "poverty aesthetic" or projecting the hidden beauty lurking in these territories of neglect; but rather something more tangible, something that portrays a certain condition, a state of affairs, a refashioning of the Centre of the city of always unexpected energies, and more exactly, a portrayal of the artistic journey that combines town planning, sociology and resident's experience to obtain unique pictures. (Monsivais 2006: 53–54)

The neighborhoods around the main plaza, El Zócalo, in the heart of Mexico City, have been the scene of a long series of Alÿs's interventions, as recorded in the recent retrospective exposition, entitled *Walking Distance from the Studio*. Typically, his attention is focused on the centre of the city, within ten blocks of El Zócalo Square, the most important historical site in Mexico. El Zócalo was the centre of Tenochtitlán, the pre-Hispanic city of the Aztecs, and has been an important place for manifestations of, and protests against, public power in representative buildings. Here you find the archaeological remains of a magnificent indigenous past in the *Templo Mayor*, the *Palace of Moctezuma II*, the *Sun Temple* and the *Serpent Wall*. The plaza is flanked by the *Metropolitan Cathedral*, on one side, and the *National Palace* on the other, and in the middle is a gigantic flag, called *Madre Patria*. These characteristics make the plaza a perfect stage for all sorts of propaganda spectacles. Today, it is a vital focal point in an otherwise sprawling Mexico City – a vast public space that is at once local and global, a microcosmic mixture of human existence. In his *Patriotic Tales* from 1997, Alÿs led a flock of sheep into the plaza and around the flag, blindly following the leader. The critical meaning of that video, enhanced by digital manipulation, was quite evident. In the later video *Zócalo, May 22*, from 1999, Alÿs filmed life in the square from high above it, following the comings and goings of everyday social encounters. At the centre the shadow of the flagpole progresses like a huge sun-dial. Unaware of Alÿs

and his camera, people come and go, and always a considerable crowd following the shady retreat in the shadow of the flag. Slowly they move round with the sun in order to stay in the shade, thus creating a sort of human clock in the centre of this inhospitable meeting place.

In certain installations Alÿs's art is more explicitly political, as for instance in the 1994 project, *Vivienda para Todos*, where he built a house in the middle of the city out of the signs, posters and other propaganda materials from the general election, the result being an ironic statement about party-political promises. Also his strolls have sometimes been marked by a political edge, as in the *Re-enactments* video from 2000, where his alter ego appears as a "turista". In this video we see Alÿs, the worried *estrangero*, buying a 9-mm Berretta pistol, which he later holds in his hand as he walks through the streets. He doesn't try to hide the gun, and passers-by are shocked by the sight of a man with a pistol. As the tension mounts, we begin to wonder how long Alÿs' journey will last and what will happen as a consequence of his "performance". After twelve minutes he is arrested and taken away in a police car; we as spectators are left both relieved and amused by his brave if foolish provocation. From a Latin American point of view this was a very stupid action, and in Brazil his life would have been in serious danger. Of course, the provocation puts the finger on the presence of crime and violence, as well as the need urgent need for security in the streets.

One may ask if this kind of artistic intervention is adequate to catch the complexity of today's urban reality. You might argue that the centre of the city is not representative of the reality lived by the great majority of the population, both the modern urban housing of the middle class as well as the shantytowns on the periphery. Nevertheless, the artist's choice of city centre as the location for intervention is a way to read the unreadable, to reduce the 1500 square-kilometers of urban sprawl, yet still account for diversity of experiences in human itineraries. Perhaps there is no way to regain mental control over the urban space, no way to map the totality of the city in its chaotic dynamics, but by focusing on the centre, Alÿs goes against those currents of history that have reduced the city centre to a "historic landmark", a place of dramatic melancholy, a territory of public neglect which has been abandoned by the city planners for half a century. Unlike in most western mega-cities, where gentrification took place through reforms and well-planned valorization real estate in older urban

areas, never really succeeded in Mexico City. Here the golden age of the centre – La Merced, the Student Area, las Vizcaínas, Meave and Santa Cruz, Plaza Garibaldi and Alameda Central – are now melancholy ruins of an unrecoverable history. In the past, Mexico City was the center of gravity for the country, sustained for centuries by its ceremonial functions, religious and political, a place where symbols and reality were inseparable. The historical process of abandonment and decadence of the centre is long and complex but, as Carlos Monsivais points out, two main factors can be identified. The transferral of the national university during the sixties, from the original historical buildings to the North American-style campus of UNAM, interrupted the cultural importance of the centre. A second stage can be marked by the opening of the metro-system opened in the seventies, which succeeded only over-crowding the streets of the central neighborhoods without offering any real reform or renovation. So what is the centre of Mexico today? What remains of it? What became of its past greatness? Let us listen again to Monsivais (2006: 68), the most prominent writer and commentator on contemporary Mexican culture:

A vast array of shops, superb museums, little factories, bookshops, neighborhoods, museums, public offices, law firms, medical clinics, inns, restaurants, dance halls, refreshment stalls, schools, burlesque theatres, the mariachera square, locksmiths, pastry shops, remodeled temples, fashion stores, first- and third-class hotels, hostels, ballrooms, the Alameda... And dives to cater to practically every taste (barring a few exceptions, those targeting widows in their nineties and honorable gangsters), dives for young trainee lawyers and professionals, gays, workers, the unemployed, students keen to find out how their predecessors lived it up, groups of friends not entirely convinced of the risk that is synonymous with tipsy dawns.

Viewing the city through the fragmented mirror of the centre is one way of restoring its symbolic value and showing how development in Latin America often is synonymous with neglect and abandonment of history, heritage and tradition. Here the artist finds material for criticism but also for an imaginary fabulation and prophecy of the future city; here he frames human relationships and invisible structures that no map can catch. Strolling around local neighborhoods close to his studio is at the same time a way of reinventing the voyage of discovery in a city where traveling has become a daily endurance test for millions. One of the main problems in Latin American mega-cities is the distance from home to work; and it

is estimated that in Mexico City around 30 million persons travel daily either by public or private means. Five million people use the subway every day, and more than 3 million cars flow through the streets. These statistics show a huge infra-structural problem, but also point to where most multicultural encounters actually happen, in streets and where desire and fear catalyze the imaginary outline of the city. Walking the streets is no longer a statement of modern autonomy and personal freedom, but the last resort of an underprivileged population.

Invited to the third Biennial Iberoamericana of Lima, in 2002, Alÿs made a contribution in the spirit of his *Paradox of Praxis* series, as a dialogue between land-art, conceptual art and his city interventions. The project, called *When Faith Moves Mountains*, makes a statement about the Peruvian capital, focusing on a desolate area, called Ventanilla, just a few kilometers from the city limit where spontaneous occupation is happening as a result of the enormous growth in urban population (about 9 million inhabitants). The dimensions of the project were epic: a group of some five hundred volunteers armed with shovels formed a line at the end of a massive, 500 meters long and 200 meters tall sand dune; they moved the sand about ten centimeters from its original location. Nothing was actually achieved; nothing was added to the landscape and nothing taken away. The result was not really important. What mattered was the potential for allegoric fabulation and myth in this collective act. Just as the artistic walks in the centre of Mexico City restored the symbolic layers of the urban map, the action in Lima underlined the indexical resistance of geography and landscape to iconic projections in urbanization and city planning. In both cases, the goal was a critical intervention by performance, which in turn became an intervention in the modern dissociation of time, social group, and culture, and at the same time an attempt to restore their unity in imagination and art.

Understanding bi-paradigmatic irony as postmodern signification

Given that the goal of communication is the successful delivery of intended meaning, ideally the sender and receiver grasp the same meaning on the basis of a common code of understanding. Irony is a precarious form of communication prone to misunderstanding if the receiver does not perceive its signals. Contrasting a “meant” and a “said” meaning in a single expression, this trope presents two contrasting signifieds in one signifier. If misunderstood the intended order of meanings is ignored: the meaning that is actually “meant” is either not perceived or ranked lower than what is “said.”

For stating an underlying “meant” meaning, irony is said to be characteristic of postmodern signification. Discourse on postmodernity itself is replete with misunderstood ironies, for instance in the use of Paul Feyerabend’s phrase *anything goes*. Feyerabend himself did not understand this phrase as a motto of his own but rather formulated it ironically as the exclamation of a narrow-minded rationalist who is overwhelmed by the messy course in the history of science (1991: vii). Since the late 1980s, the affinity between irony and postmodernity has been addressed in studies combining semiotics and postmodernity, be it in applying semiotic approaches to postmodernity or for advocating a postmodern version of semiotic analysis.

One of the better-known examples of postmodern irony was presented by Umberto Eco in his chapter on “Postmodernism, Irony, the Enjoyable” in his *Postscript to The Name of the Rose*. He locates the quality of irony in the risk that “[t]here is always someone who takes ironic discourse seriously” (Eco 1984: 68). Eco is concerned about the postmodern attitude as an attitude towards history, or more specifically, towards those cultural-

historical codes which we see as ideologically loaded and can no longer take seriously.

I think of the postmodern attitude as that of a man who loves a very cultivated woman and knows he cannot say to her, “I love you madly”, because he knows that she knows (and that she knows that he knows) that these words have already been written by Barbara Cartland. Still, there is a solution. He can say, “As Barbara Cartland would put it, I love you madly.” At this point, having avoided false innocence, having said clearly that it is no longer possible to speak innocently, he will nevertheless have said what he wanted to say to the woman: that he loves her, but he loves her in an age of lost innocence. If the woman goes along with this, she will have received a declaration of love all the same. (Eco 1984: 67)

By means of quotation, this postmodern irony solves the man’s problem on how to attract a cultivated woman into bound language and feelings. For cultivated and ideologically sensitive readers, Eco recommends postmodern irony since its quotational shape can be as equally communicative as non-quotational signification. Love, a supreme kind of communication, is the issue at stake here, and two different declarations of love are involved around the same communicative goal of not only stating one’s feelings, but triggering a positive response. While there is a serious will to communicate, the ironic quotation of the Cartland-code of romance novels introduces a playful element and enables intellectuals to maintain ideological credibility. Whether taken literally (and thus misunderstood) or ironically (and thus understood), Eco’s declaration of love occurs within the same norm of communication.

But what if what is at stake is not love as a pleasurable form of communication, but the sign or signification as such? What if we do not have an alternative between different codes of love, but between different codes of signification, different models of the sign? In that case, we are dealing with different theories of signs and signification. If we group semiotic theories into more general theory formations, we can speak of paradigms such as Saussurean semiology or Peircean semiotics. This raises several questions: Are there types of irony which present different semiotic paradigms in an ironic contrast that is played out between a “meant” and a “said” meaning concerning the topic of signification as the issue at stake? If there are such types, does it make sense to classify some of these types as postmodern?

And, finally, can we find concrete examples for these postmodern ironies in theory and practice?

I view Saussure's distinction of diachrony and synchrony as paradigmatic perspectives of signification. The term "synchrony" is here understood as "static synchrony" in contrast to Roman Jakobson's concept of "dynamic synchrony" (1990: 54). On this occasion, I ignore the poststructuralist critique of the clear-cut, analytical character of this distinction as well as proposals to mediate the two perspectives, for instance in the form of a dialectic panchronicity. As used in the static sense only, synchrony is a perspective according to which signs are displayed in co-presence, simultaneously, at no time at all, or at a given point of time irrespective of their historical dynamics.

The opposition between synchrony and diachrony is an opposition between two paradigmatic perspectives and generates the opposition between 3 paradigmatic ideologies of signification, three ideal-typical ways to understand signification as the use of signs: these semiotic ideologies will be called *communicationism*, *poststructuralism*, and *structuralism*. These ideologies are understood as views on how to produce, present, and understand meaning. Whereas both communicationism and poststructuralism employ diachrony for dealing with the dynamics of signs, structuralism works only with synchrony for regarding signs in a static format. Communicationism has stronger and more restrictive premises governing the way signification is to be narrated, whereas both poststructuralism and structuralism are best conceived in contrast to communicationism insofar as both weaken or abandon the defining features of the latter.

According to communicationism, communication is or should be the norm of the action of signs. In the ideal communicative scenario, the text remains within the framework set up by sender and receiver. The text is not supposed to get lost while traveling from the terminal of departure to the terminal of arrival, figuratively speaking. Among the examples we find Jakobson's model of communication, Eco's notion of postmodern irony as applied in the above postmodern declaration of love, or E. M. Forster's concept of plot, which will be applied later. Poststructuralism is the second ideology applying diachrony. It rejects communication as the norm, although communication remains a possibility among other modes of dynamic signification, of how signs can travel, so to speak. The claims of poststructuralism are weaker and less conformist than they are in the case

of communicationism. Analytic distinctions are rendered problematic as well, for instance, those between world and text, synchrony and diachrony, literary and figurative (metaphorical), text and context. Poststructuralism stresses those features that are suspect in or obstructive to communication; it is more interested in the marginal, the eccentric, the undermining, and the less controllable. Unlike both communicationism and structuralism, poststructuralism dislikes the idea of a text being fully confined by a context. Codes and contexts are preferably broken, only partially binding, or never to be fully determined. As in the case of Barthes's *punctum* experience, the code may simply vanish completely. Other examples for this semiotic ideology include Barthes's poststructuralist works and Derrida's notions of dissemination and *différance*. Finally, structuralism is the ideology governed by synchrony; it conceives of the sign by abstracting it from the process of signification and by proposing a synchronic view as modeled after Saussure's semiology and linguistic structuralism à la Hjelmslev or the early Barthes, whose notion of *studium* is the structuralist pendant to the poststructuralist notion of *punctum*.

For further investigation, the above characterization of semiotic paradigms must be expanded, also in order to account for possible mixtures of ideologies, as in the case of Peirce's semiotics. For the current purposes, the classification of two perspectives and three ideologies must be sufficient, and if this is granted for now, then 6 types of bi-paradigmatic irony are possible among the three ideologies: communicationism (as the "meant") targets poststructuralism or structuralism (as the "said"); poststructuralism (as the "meant") targets communicationism or structuralism (as the "said"); structuralism (as the "meant") targets communicationism or poststructuralism (as the "said").

Because there are always two paradigmatic ideologies involved in this type of irony, I speak of bi-paradigmatic irony as in contrast to mono-paradigmatic irony. Eco's postmodern declaration of love demonstrates mono-paradigmatic irony insofar as the two codes of love involved both belong to communicationism, governed by the norm of communication as specified in the topic of love. This type of irony establishes its ironic contrast within the same paradigm, whereas in bi-paradigmatic irony, the "said" and the "meant" meanings belong to different paradigms.

For the sake of brevity and understanding, I limit myself here to three comparable examples of bi-paradigmatic irony, which all deserve to be

called *postmodern*. The first two cases represent the type of poststructuralist irony targeting communicationism and are taken from Derrida and Barthes; the third example is a novel by the Austrian writer Christoph Ransmayr and demonstrates the type of structuralist irony targeting communicationism.

Derrida renders a poststructuralist targeting of communicationism in “Signature Event Context” from *Margins of Philosophy* (orig. 1972). He starts from Austin’s analysis of the signature concerning presuppositions about the “the presence of the ‘author’ as the ‘person who does the uttering,’ as the ‘origin,’ the source, in the production of the statement” – but, as Derrida continues, “in order to function, that is, in order to be legible, a signature must have a repeatable, iterable, imitable form” (Derrida 1982: 328). Thus the signature “must be able to detach itself from the present and singular intention of its production” (ibid.) and thus precisely from the event-like presence associated to it, from a “moment of presence to consciousness which is the origin of subsequent obligations or other effects” (Culler 1994: 126). Derrida’s critique of the signature is part of his broader critique of the notion of communication. According to him, “[a]s writing, communication ... is not the means of transport of sense, the exchange of intentions and meanings,” and he sees an “historical unfolding of a general writing of which the system of speech, consciousness, meaning, presence, truth etc.” (Derrida 1982: 329) are only an effect that he likes questioning in terms of logocentrism. The notion of communication is punctured by writing, by the intervention of dissemination; the notion of signature, too, is deconstructed on the grounds of writing as dissemination.

As Derrida points out repeatedly, this deconstruction of the notion of communication is delivered in an oral communication of a paper, of which the printed version was sent to the organizers beforehand, with his signature attached. The right side at the end of his essay presents the reproduction of his handwritten signature in the form of “J. Derrida,” above a printed “J. Derrida” (1982: 330). To the left of this signature, Derrida adds, in brackets, the following remark:

(Remark: the – written – text of this – oral – communication was to have been addressed to the Association of French Speaking Societies of Philosophy before the meeting. Such a missive therefore had to be signed. Which I did, and counterfeited here. Where? There. J.D.)

The signature that we encounter at the end of his essay also functions as a countersignature or counterfeit for the original signature placed on the written version sent in before his talk. Derrida deliberately employs an ironic structure here: On the level of the ironically said, he continues to use the term “communication” and conventional assumptions about communication in the sense of the transmission of meaning; in addition, the ironically said includes the conventional use of his own signature at the end of his text. On the level of the ironically meant, we can locate everything Derrida says critically in deconstructivist manner throughout his essay against the conventional ideas about communication and signature, basically against the metaphysics of presence and origin, against the idea of an authoritative “presence to consciousness of a signifying intention at a particular moment” (Culler 1994: 125). In sum: in this ironic structure of postmodern signification, the notion of signature as a type of sign functions as the issue at stake between the communicationist and poststructuralist paradigms of signification.

Barthes’s use of his own handwriting is another example of a post-structuralist irony targeting communicationism. On the back cover of an English edition of his autobiography *Roland Barthes par Roland Barthes* (1994), the last review quotation is a statement by Hayden White according to which this book “is a genuinely postmodern autobiography”. Some of the studies on Barthes’s book describe its asserted postmodern features in more concrete terms, mentioning heterogeneity, frame breaks, narrative coherence, intertextuality, parody, self-reflexivity, narrative discontinuity, playfulness, and, most importantly, the critique of concepts of subjectivity and authorship. However, instead of locating the book’s alleged postmodernity within the main text, one can place it in the form of bi-paradigmatic irony in the relation between the main text and the preliminary epigraph, which reaches out to the reader in paratextual function. As an epigraph, Barthes uses a facsimile reproduction of his handwriting, which, in the original French, reads as follows: “Tout ceci doit être considéré comme dit par un personnage de roman” (1995: 5). This is translated in the English edition as “It must all be considered as if spoken by a character in a novel” (1994: 1). The original 1975 edition distinguished Barthes as the book’s subject from its producer by capitalizing the former: “Roland Barthes par roland barthes.” This noted difference indicates the book’s insistence on irrevocable splits between Barthes as the writer, Barthes as

the narrator, and Barthes as the narrated subject. Barthes even wrote a review about his own book, according to which he claims, in general, that “the subject who writes acquires reality only in the act of writing and that in any case, it is impossible truthfully to speak about oneself,” and he adds that he himself is “the only person who cannot speak truthfully of himself” (quoted in Brée 1978: 4). If this is the case, then letting a character in a novel speak about the actual Roland Barthes in the third person could again come closer to autobiographical truth. Instead of introducing, at the outset, a specific novel-character, who speaks the entire text that follows, Barthes imposes on us a reading strategy: he wants us, on a meta-level, to think of his text as framed by such a narrative voice. This reading-device hardly suits Lejeune’s idea of the autobiographical pact (1975), according to which the autobiographer guarantees that the writer, the narrator and the protagonist are *one and the same*, and that the factual events are truthfully recorded. Still, Barthes appeals to us to adopt the idea of the imagined narrator who simply enters a more complex pact that binds us as readers in a communicative gesture. Despite all the problematization of autobiography within the main text, this framing device introduces some formal closure, comparable to those enclosing bubbles in comic-strips that are drawn around spoken words and point to their speakers. The epigraph re-appears within the main text with a more disturbing ending: “All this must be considered as if spoken by a character in a novel – or rather by several characters (1994: 199). If we look at Barthes’s talk about such novel-characters, we are lead to believe that we are dealing with a somewhat traditional kind of character, the sort of nineteenth-century realism to be found in Balzac and the kind of novels containing an “image-repertoire” as “the fatal substance of the novel” (1994: 119). The appearance of this epigraph within the main text belongs to the set of passages that can be read as comments about the preliminary epigraph, for instance, passages about handwriting, proper names, signature, inscription, and the like.

Given what Barthes critically writes, in the main text, about his book and the genuine impossibility of autobiography, the epigraph does not follow these insights and instead strongly requests us to read the main text as a unified spoken account coming from a single source. The handwritten shape of this imposed reading device makes this request personal and pressing, and it can be linked to Derrida’s idea that speech implies presence and writing absence. All the critical comments on autobiog-

raphy within the main text must be considered as utterances by a more traditional novel-character, and to see it this way seems to be the writer's primary will delivered in hand-written shape. With this epigraph, we get an ironic device that remodels the genre of autobiography, but instead of delivering an avantgarde-like version, we read the main text as a quotation. Similar to the case of Eco's sophisticated declaration of love, Barthes want us to adopt a meta-level which then enables him to write – and us to read – some autobiographical pieces while constantly being aware of all its theoretical troubles.

If one applies the concept of bi-paradigmatic irony, one can say that the main text, with all its problematization of subjectivity and autobiography, establishes poststructuralism as the ideologically last word. The epigraph, however, imposes at the paratextual outset in the shape of a strong reader-address a communicative device that frames the poststructuralist content with communicationist ideology. Both paradigms are co-present throughout the book in this ironic opposition, where the "said" communicationism works like a formal operator on the ironically "meant" poststructuralism, in order to set up a new kind of autobiography without innocence.

The third example to be discussed as postmodern signification, a novel by Christoph Ransmayr, demonstrates the type of structuralist irony targeting communicationism. *Die letzte Welt* (orig. 1988), translated as *The Last World* (1990), is recognized as a postmodern novel, and the notion of bi-paradigmatic irony applies well to this book, which (ab)uses communicative actions and narrative strategies to construct plots in order to arrive at a fictional setting that is emptied of any communicative human agency. What happens, in short, is this: The narrator called Cotta attempts to discover traces of the poet Ovid in Ovid's exile in Tomi at the Black Sea. Instead of finding the poet, Cotta realizes that he, like all the other figures he meets in Tomi, have been narrated by the poet in advance; they undergo transformations and become non-humans in the form of stones, plants or animals. By the end, Cotta is the sole survivor on the scene, but he, too, has been narrated ahead by Ovid and ceases to exist as a human being. His disappearance marks the end of human history and narrative plots about humans in this setting; it marks the end of human communication within the setting and between the narrator and the reader. This state of non-communication based on the absence of human consciousness is presented as the telos, the final state towards which the entire narrative drives. This state

is not described as a frightening apocalypse, but as a desirable, peaceful eradication of human consciousness as a prerequisite for communicative-narrative plotting in the sense of E. M. Forster, according to whom the plot narrative ties events by means of causality (Forster 1974: 60). Basically, Ransmayr constructs a plot by means of communicative actions involving Ovid's poetic narration and the interactions between Cotta and the other people in *Tomi*. These means of plotting signs and ultimately the ideology of communicationism occur on the level of the ironically "said," whereas the ironically "meant" consists of ideological structuralism in the version of an anti-human, or better, an a-human state of affairs assembled in synchrony. If the understanding of bi-paradigmatic irony as postmodern signification has any merits, additional examples for the other types of bi-paradigmatic irony must be found in both theory and practice, apart from refining the classification and characterization of ideologies involved.

The semiotic attractors that determine recognition in advertising

One important aspect of semiotic research is the problem how to deal with meaning. Designers often underestimate the dimensions of meaning, when they focus primarily on form. The “intradisciplinary designer” deals only with syntactical aspects of signs and aims to solve syntactical problems caused by syntactical errors. But even in marketing the situation is more complex. To communicate a cultural or subcultural pattern (and to link it to an institution or a company) requires a deeper understanding of the reconstruction of meaning in the recipient. To decide whether an offered advertisement is favorable, we have to understand the audience and what this audience (or subculture) finds attractive. We think, attractiveness cannot be understood without understanding attractors. At this point the empirical and the speculative perspective of research are touching each other. Understanding an effect means to be able to produce the effect (Bense 1971). This is what we did: We took an existing empirical study and tried to reproduce the results using a system semiotic model of attractors, which we developed. The two essential steps were: First we developed the model by using the stimuli of the Czaia (1998) study. In the second step we tested the quality of the predictions, which is our model able to provide, using an other study (Stern 2001). This is important, because the model with its coefficients was tuned to the stimuli of the Czaia (1998) study. So it would be rather trivial that the model was able to reproduce this results. But it was not trivial to reproduce the results of the Stern (2001) study, what our model did in an astonishing accuracy.

So, how does it work? Our expert system is an approach to deal with semiotic attractors using a rather simple visual interface. Therefore it is usable even for designers who do not have any statistically education.

The aim was to reproduce the recognition values of advertising elements (according to D. Starch, in Stern 2001) in the studies of Czaia (1998) and Stern (2001). Due to Stern's discriminating between male and female, we decided to aim at the average of both (see Figure 1). This is in accordance with the values of the study of Czaia.

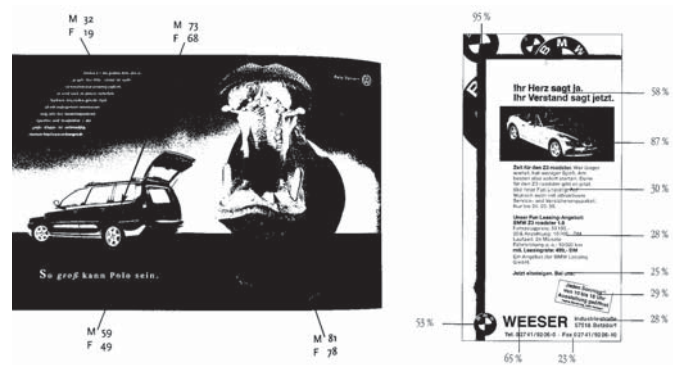

Figure 1. A double-page advertisement of Volkswagen from Stern (left), and a quarter-page advertising of BMW from Czaia (right); both ads in colour.

To reproduce the empirical observed Recognition values we developed a model that contains the assumed most relevant factors as they appear in the literature (e.g. in Kroeber-Riel 1993; or Lachmann 2004). In order to keep the model as simple as possible, we tried to reduce the number of factors. But we reduced the number of factors not as far as possible, what would have been possible by a statistically operated factor analysis. More important to us was the usability of the model. And this is driven by an intuitive approach much more than by abstract accuracy.

The tested model was inspired by semiotics, and so the factors are of three groups: Syntactic, semantic and pragmatic factors. Each factor is implemented as an extra layer over the stimulus. In each layer the areas are manually marked by an operator, where the aspect is true. The user just marks the area for example where the factor "Text" is true. This is done as a binary differentiation (true, false) without any need to quantify the extent (more or less of extent). In the first step the weights of each factor of the model were adjusted to match the results. Further usage of the expert system is free of such concerns.

Figure 2. Phases of our analysis demonstrated through the BMW ad from Czaia (1998); from left to right: original ad, manually added binary markings, weighted markings, and the masked ad.

To show the principle, Figure 2 offers the whole process in a simple example (from left to right): on the left side is the original BMW advertisement (approx. 1/8 page of a local newspaper; Czaia 1998). Then (center-left), all the areas where one factor is true are marked: just black, where one factor (whichever) is true, and white, where no one is true. The third stage (center-right) shows the results after application of the weighting coefficients, which are of course different for each factor. All the layers sum up to the values of the predicted recognition, at which every single layer has a different opacity (coefficient of relevance). In the weighted view the percentage of grey tone is exactly the percentage of the predicted recognition value, which you can read directly from the graphic. Additionally, the resulting map of recognition values can be used as visualizing mask to show how efficient the elements will be recognized. These visualisations can be done in different ways. A very simple alternative is shown (right).

Now, what are the semiotic factors to be marked and analyzed in detail? The four syntactic factors are Size, Colour, Convexity and an additional layer for the Focus Periphery. You see that the syntactic factors are given with the stimulus. The semantic factors are represented by four layers, which denote the Biological Codes, Cultural Codes, Scriptural Codes and the Individual Codes (which are Sub-Cultural Codes). In contrast to the syntactic factors, which can be found in the stimulus (in our case, the advertisement) the semantic factors cannot be analyzed without additional information. We have to know about the observer and the audience, he is

embedded culturally. Because we have to “walk in their shoes” by observing their construction of world by using their codes. And of course, this has speculative aspects if the analyzing user does not know the audience properly. The pragmatic factors are four again, which correspond with the Schema Affiliation (the Action Script in the situation of observing), the Transactional Style (which element is used rhetorically to provoke, show or hide emotions), the factor of Broken Taboos (which has to consider the situation and the subculture), and fourthly the signs for the Sender/Origin of the message (who addresses me).

LAYER-MODULE 1	WEIGHTING-MODULE 1
12 semiotic parameters as a binary decision on a own layer	weighting the layers due to the particular coefficient of relevance
1: element bigger than X?	Value 1: element bigger than X? 18%
2: coloured?	Value 2: coloured? 17%
3: simple/good shape?	Value 3: simple/good shape? 10%
4: in sight direction?	Value 4: in sight direction? -%
5: a biological item?	Value 5: a biological item? 30%
6: is it text? (code 1)	Value 6: is it text? (code 1) 23%
7: is it an artefact? (code 2)	Value 7: is it an artefact? (code 2) 25%
8: subcultural? (code 3)	Value 8: subcultural? (code 3) 9%
9: a broken taboo?	Value 9: a broken taboo? -%
10: indicates sender/origin?	Value 10: indicates sender/origin? 17%
11: rhetorical element?	Value 11: rhetorical element? 13%
12: matches action script?	Value 12: matches action script? 13%

Summary of Weighting-Module 1 values:

- Value 1: 18%
- Value 2: 17%
- Value 3: 10%
- Value 4: -%
- Value 5: 30%
- Value 6: 23%
- Value 7: 25%
- Value 8: 9%
- Value 9: -%
- Value 10: 17%
- Value 11: 13%
- Value 12: 13%

Grouped totals:

- Values 1-5: 45%
- Values 6-9: 87%
- Values 10-12: 43%
- Total: 175%

Figure 3. System-semiotic factors as binary questions; answers weighted.

As shown in Figure 3 the syntactic factors sum up to only 45% recognition, whereas the maximum value through all the factors is 175%. The semantic factors are dominant with 87%. And the pragmatic factors with 43% are almost as important as the syntactic ones. (Two factors are set to zero in this scheme, because they did not appear at all in the analyzed print advertisings.) But, by the way, it seems quite clear that information aesthetics had to fail, if ignoring three quarter of the relevant factors and focussing only on syntactic factors (Bense 1971; Sprinkart 1982; Frank & Franke 1997). And, of course, there is the problem of including the observer – not only the observed. Our model needs to be calibrated to a given culture.

The coefficients were adjusted with a set of 5 ads (with 43 elements) from Czaia. Then we tested two other sets of advertisings (from Czaia and Stern) without changing the weights of the factors. All in all our model was applied to a set of 23 advertisements (with 146 elements), which were tested concerning the recognition values of the single graphic elements in

advertising. And these recognition values were reproduced by our model even better than we expected. We achieved a correlation of 0.945 (Pearson) between the empirically obtained values (Czaia 1998; Stern 2001) and the predicted values from our model. This was not obvious, because of the simplicity of the model: We did not need to discriminate elements due to their individual shape or colour (Espe & Krampen 1986) – with the exception of the factor “simple/good shape”, which indicates a high-contrasted closed shape in general, which is also known as “goodness of gestalt” (but does not care about the shape in detail).

Our model uses pragmatic and semantic factors. And both are not independent of culture. At least in two ways this influences the results of a model like ours: every observer has structurally determined pragmatics, capabilities and limitations. A mechanical observer like an OCR-system will use other codes for other aims. And even humans are quite different. A typical citizen of Central Europe will observe the same advertisement differently from, say, an “African illiterate” from the savannah. We tried to simulate an analysis of an advertising (the one from Figure 1, on left) by three very different observers with our model (results are shown in Figure 4). The “Average-European” and the “Savannah Illiterate” use different codes and have different pragmatic aims. But they share the same “hardware” (the biological system determinants). The technical OCR-system (on the right in Figure 4) however is interested in text and nothing else. But it is to be seen immediately that the weights do not work for this intercultural approach. The weights have to be fixed for every main culture. We can see this clearly in the fact that the simulated OCR-system would have much higher relevance for text (probably 100%). And from this we can also conclude the “ethnocentric distortion” of the simulated “Savannah Illiterate”.

Figure 4. Different observers (from left): Central European, African “Illiterate”, and technical OCR-system.

We try in our current research to derive a narrative analysis from this method (which is patent pending) by using the masked ads (as in Figure 2, right). Considering the recognition value and the size of the corresponding element, we think it is possible to predict the “semiotic fixations” analogous to “visual fixations”. This way we hope to predict the narration of the recognition, which is the remembered story of an advertising. For marketing and advertising the perception is only the vehicle for the higher goal of getting “the story” in the audience’s minds. Therefore it is of less interest to predict the visual path of perception than to predict the semantic path of recognition and remembrance.

Figure 5. Construction of Semiotic Path as basis of Narrative Analysis.

Our model and method permits optimizing the design of an advertisement in several aspects. Of course we can enhance the recognition of the design of an advertising by adding or changing (or eliminating) elements. Additionally the visual path can be optimized by making it shorter and by reducing the angle between the lines, which connect the fixation points. But the narration itself can also be made more salient by optimizing the goodness of gestalt. And finally, the semiotic path can be designed by making it less complex, easier to read and, in that way, easier to learn and to recognize, respectively.

Entente / mésentente au Cameroun entre l'homme et la femme par rapport à *La Journée Internationale de la Femme*

Introduction

Au Cameroun, la *Journée Internationale de la Femme* constitue un véritable ressort visant à mettre en exergue l'importance de la Femme comme être humain à part entière au sein de la vie sociale. Mais cette journée du 8 mars s'avère très polémique au regard de l'Entente et/ou de la Mésentente qu'elle suscite entre l'Homme et la Femme, non seulement par rapport à sa catalyse, mais aussi à l'agencement et la pragmatique des diverses festivités qui la marquent.

Dans notre communication, qui est loin d'être un plaidoyer aveugle pour la réhabilitation de la femme, nous ferons un examen froid de la réception critique de cette journée par l'être humain de sexe masculin et pourquoi pas, une autocritique de la femme.

Pour ce faire, nous mettrons de l'emphase sur l'historique de la Journée Internationale de la Femme, l'importance de la Femme, et l'organisation de la Journée, l'entente et la mésentente entre l'Homme et la Femme par rapport à la journée en question. Et enfin nous ferons quelques suggestions.

1. Historique de la journée internationale de la femme

Sous l'instigation de Clara Zetkin, une militante allemande d'un mouvement socialiste, l'organisation d'une Journée de la Femme fut décidée

en 1910 à Copenhague au Danemark. Clara Zetkin soutenait “qu’il faut supprimer tout ce qui empêche La femme comme l’Homme de créer, de produire, chacun selon sa particularité d’être humain différencié”. Cette journée sera célébrée dans le monde entier au mois de Mars et, dès 1911, des millions de femmes vont se rassembler à travers l’Europe et plus tard, l’Organisation des Nations-Unies en fixera la date le 8 Mars en 1977, après avoir proclamé 1975, Année Internationale de la Femme.

Les Nations-Unies, en fait, ont pour objectif d’attirer l’attention de la communauté internationale sur la nécessité de lutter contre les discriminations faites aux Femmes et promouvoir leurs capacités de citoyennes et d’actrices du développement social, économique, politique et culturel. Dans plusieurs pays, la Journée du 8 Mars est déclarée fériée et chômée. D’une manière générale, chaque pays organise des manifestations pour commémorer cette journée qui suscite ainsi à travers le monde entier une prise de conscience générale sur la condition de la Femme.

Pour ce qui est du Cameroun, sa première célébration remonte à 1986. Dans certaines régions, la femme camerounaise subit plusieurs formes de discriminations. Par exemple, elle n’a pas le droit de parler aux hommes en public car, semble-t-il, “les urines d’une femme ne peuvent jamais traverser un tronc d’arbre jeté par terre”. Certaines entreprises sont réticentes au recrutement des femmes du fait de leur maternité et de la nature des travaux (gardiennage, docker, etc.). La femme camerounaise a des difficultés d’accès au crédit et à la propriété foncière. Elle reste une mineur qui doit obtenir l’autorisation ou une procuration du mari pour tous ses actes d’achat ou de vente des biens immeubles. Dans certaines régions, les mariages sont précoces et forcés. Au Nord Cameroun, on pratique encore les mutilations génitales féminines. Une préférence est donnée en matière d’éducation aux enfants de sexe masculin. Beaucoup de jeunes filles ont dû abandonner leurs études pour s’occuper de leurs frères. En matière de santé de la reproduction, c’est le parent ou l’époux qui donne l’autorisation et choisit la méthode de contraception.

Par ailleurs, les femmes sont victimes de plusieurs types de violences psychologiques. En effet, selon l’annuaire statistique sur la situation de la femme au Cameroun (Décembre 2004):

- 23% de femmes n’ont pas la confiance de leur mari en matière d’argent.

- 51.3% de femmes ont un mari qui veut savoir à tout moment où elles sont.

- 14.1% de femmes n'ont pas le droit de voir leur famille.

- 25.6% de femmes n'ont pas le droit de nouer des amitiés avec d'autres femmes.

- 67.2% de femmes ont un partenaire qui est jaloux quand elles causent avec d'autres hommes.

- 10% de femmes n'ont jamais vu leur époux nu, pourtant, ils ont des enfants.

Ces violences psychologiques se suivent généralement d'actes qui peuvent porter atteinte à l'intégrité physique de la femme. Elle peut recevoir des gifles, des coups de pied, coups de poings, être jetée par terre, étranglée, brûlée, menacée avec une arme ou subir des violences sexuelles.

2. Importance de la femme et organisation de la Journée internationale au Cameroun

Le Cameroun accorde une très grande importance à la Femme. Le Chef de l'Etat, Son Excellence le Président Paul Biya, œuvre activement pour l'amélioration des conditions de la Femme. En témoignent par exemple les créations par divers décrets présidentiels des Ministères de la Condition Féminine, des Affaires Sociales et de la Condition Féminine (Fusion de deux ministères), de la Condition Féminine, et enfin de la promotion de la Femme et de la Famille. Ce dernier ministère a pour objectif d'élaborer et de mettre en œuvre des mesures relatives au respect des Droits de la Femme Camerounaise dans la société, à la disparition de toute discrimination à l'égard de la Femme et à l'accroissement des garanties d'égalité dans les domaines politique, économique, social et culturel.

Depuis 1994, il est organisé une semaine de la Femme camerounaise afin de susciter une prise de conscience générale de la condition de la Femme. L'Organisation des Nations-Unies, chaque année propose un thème qui est développé, exposé et débattu sous forme de séminaires, de conférences par des experts à travers les villes et les compagnes. Ces cinq dernières années, les thèmes retenus sont les suivants:

- 2003: "Egalité des Genres et Développement Technologique du 3^{ème} Millénaire"

- 2004: "Femme et HIV/SIDA"

- 2005: “Egalité des Genres au-delà de 2005: Construction d’un Futur plus sécurisant”
- 2006: “Femme dans le processus de prise décision”
- 2007: “Violence contre les femmes et les Filles: Briser le silence, agir”.

En fait, les thèmes choisis ont pour centre d’intérêt, la femme. Ils véhiculent un message ayant une portée didactique et sensibilisent non seulement les femmes, mais aussi les hommes sur la condition de la Femme. Les femmes reçoivent ainsi des enseignements et peuvent par conséquent poser leurs problèmes.

A partir du mois de janvier, un pagne en coton aux couleurs vives est mis en vente sur toute l’étendue du territoire national. “FEMME” ou “8 MARS”, c’est ainsi que l’on nomme communément ce pagne, illustre non seulement les idéologies politique, économique, social et culturel du Chef de l’Etat, Monsieur Paul Biya mais aussi le thème de l’année. Le 8 mars, le jour de la fête proprement dite, est marqué par un grand rassemblement de femmes dans toutes les localités.

A Yaoundé, la capitale du Cameroun, dès 8 heures, les femmes se retrouvent au Boulevard du 20 Mai en tenue avec des pancartes et des banderoles où on peut lire des messages de félicitation, et de remerciement adressés à la Première Dame, Mme Chantal Biya qui préside le défilé après un discours solennel qui tient à conscientiser la femme de sa condition.

Les femmes défilent au rythme des mélodies traditionnelles qui louent et vantent les mérites de la femme, mère, épouse, agent de développement économique et social et partisane de la paix. Elles font une exhibition de leur connaissances, et de leurs activités. On peut voir une femme sur un tracteur, des cultivatrices avec des fruits de leur champ, des femmes militaires, enseignantes, des infirmières, des musiciennes, des danseuses, des sportives etc. Mme Chantal Biya, ce 8 Mars 2007, a défié le service du Protocole et est descendue de la Tribune Présidentielle pour aller défilé avec les femmes. La Journée se termine par des agapes populaires dans les Ministères, les Résidences, les Restaurants, les Bars et les Quartiers. Cependant, nous notons qu’au Cameroun, la problématique de la Journée Internationale de la Femme n’est pas encore assez bien définie d’où l’entente et/ou la mésentente entre l’Homme et la Femme.

3. Entente entre l'homme et la femme par rapport à la Journée internationale

Une petite enquête auprès des populations nous a permis de relever qu'au Cameroun, tous les hommes et toutes les femmes pensent que le 8 Mars est un grand Jour qui met en exergue la valeur de la femme. Ce jour, la femme est à l'honneur et peut tout se permettre (aller au restaurant, au cinéma, aller danser, aller rendre visite à sa famille, à ses amis, etc.). Ils pensent que la femme devrait exploiter ce jour pour revendiquer ses Droits, mais que malheureusement, la majorité de femmes ne sont même pas intéressées par les thèmes de réflexion proposés par l'ONU.

Pour beaucoup de femmes, La Journée Internationale de la Femme connote simplement l'obtention du pagne du 8 Mars, le défilé et les festivités populaires. Ils regrettent aussi le fait que beaucoup de femmes ne puissent même pas faire une lecture du message véhiculé à travers le pagne, elles discutent plus sur les différents tons mis sur le marché. Cette année, nous avons 3 tons: le vert, l'orange et le bordeaux. A côté des points sur lesquels l'Homme et la Femme s'entendent par rapport à la Journée Internationale de la Femme, on relève aussi quelques points qui suscite de plus en plus de mésentente entre eux.

4. Mésentente entre l'homme et la femme par rapport à la Journée internationale

Plusieurs aspects font l'objet d'une mésentente entre l'homme et la femme. Par exemple, le pagne modifié chaque année entraîne beaucoup de discordes dans les familles et même dans la société. Quand un homme ne peut pas offrir le pagne du 8 Mars à son épouse ou à ses filles, son autorité est bafouée, il est chosifié par ces dernières qui, parfois, vont se prostituer pour en avoir un. La plupart des hommes rencontrés se sont dit déçus par les femmes. Elles ne mettent pas en application les enseignements reçus, ne revendiquent pas leurs Droits, et ne sont malheureusement "qu'une foule qui ne crie pas son vrai cri" comme disait Aimé Césaire.

Beaucoup d'hommes pensent que la Journée Internationale de la Femme est inutile, on bloque les activités économiques pour rien. Cette Journée devrait même être abolie car elle est devenue un jour de "débauche", un jour de "délinquance féminine", et d'immoralité. Le 8 Mars 2007

par exemple, les femmes, sans distinction d'âge, de rang social ou de niveau d'instruction, se sont faites remarquer par des attitudes déshonorantes. On a noté que plusieurs femmes sont rentrées chez elles très tard (minuit-1 h) beaucoup ont découché, commettant ainsi l'adultère. Il y a eu des abus d'alcool.

Beaucoup de jeunes filles, ce jour là, ont leur premier rapport sexuel, s'exposant ainsi au Sida et aux grossesses non désirées, fument leur première cigarette, boivent leur première bière sous prétexte de l'émancipation de la femme. Le 08 Mars est devenu un jour qui occasionne des divorces, car l'absence de tolérance des hommes génère des conflits plus ou moins violents qui peuvent déboucher sur des bagarres.

Les femmes quant à elles, se justifient en affirmant que le 8 Mars est un jour où la femme peut se venger, un jour où elle peut aussi faire comme les hommes, c'est-à-dire boire librement dans les bars, se faire courtiser librement quand elles-mêmes ne font pas la cour aux hommes ou même à d'autres femmes.

Les hommes pensent aussi que le gouvernement accorde trop de Journées aux femmes. On peut citer, par exemple, celles-ci :

- 08 Mars: Journée Internationale de la Femme.
- 31 Juillet: Journée de la Femme Africaine
- 15 Octobre: Journée Mondiale de la Femme Rurale
- 06 Septembre: Journée de l'Égalité des Genres

Ils se moquent de toutes ces journées. La Femme a les 365 jours de l'année, mais elle l'ignore. Elle peut s'affirmer tous les jours, mais elle sera toujours le sexe faible qui a besoin de protection, d'autorité masculine pour ne pas s'égarer.

Pour les hommes chrétiens, l'homme et la femme se complètent. Ils ont chacun un rôle dans la société. Chacun a sa morphologie et ses capacités. L'Homme peut procréer tous les jours et la femme a une période bien déterminée pour concevoir. Cependant l'homme malgré sa puissance, ne peut jamais porter un bébé dans son ventre. Dieu seul sait pourquoi il a créé l'Homme et la Femme différemment, et c'est lui seul qui peut changer la condition de la Femme.

5. Conclusion et suggestions

Quoi qu'on dise, les femmes ont un rôle important à jouer dans la société. L'attitude désinvolte de ces dernières est tout simplement l'expression d'individus privés d'un certain nombre de droits.

A regarder de loin, la femme donne l'impression qu'elle passe à côté de ses problèmes. Elle semble hésiter entre l'être et le paraître, entre ce qu'elle est au plus profond ou au plus secret d'elle-même et ce qu'elle fait paraître. Certes, l'illettrisme des femmes et la persistance de certaines pratiques et coutumes restent un handicap qui empêche le plein épanouissement de la femme, mais le Ministère de la promotion de la Femme et de la Famille, quant à lui, reste optimiste et espère bien atteindre son objectif: *l'amélioration de la condition de la Femme*.

L'épanouissement de la Femme dans les domaines politique, économique, social et culturel serait un atout dans la lutte contre la pauvreté et l'insalubrité. En général, la femme africaine a encore beaucoup à apprendre: la notion de "globalisation" est complètement ignorée de beaucoup de femmes, elles n'ont ni connaissance, ni maîtrise, du Droit de l'Homme, des Systèmes Economiques et des Nouvelles Technologies d'Information et de Communication. En dehors de leur langue maternelle, beaucoup de femmes ne parlent aucune langue étrangère, quand bien même celle-ci serait une langue officielle de leur pays.

Au regard de tout ce qui précède, nous pensons donc qu'il faut redoubler d'effort dans la conscientisation de la Femme sur sa condition.

La femme est un pilier indispensable à la construction de l'humanité. C'est elle qui donne la vie, c'est elle qui éduque l'Homme. La phalocratie est un frein pour le développement de l'Humanité. L'homme et la femme sont tous "un animal *rationalis*", leur éducation devrait avoir pour "point de départ et point d'arrivée la personne humaine", car ils sont tous des individus autant égaux et différents possédant des qualités et des valeurs égales et jouissant des mêmes droits.

Nous proposons que les Nations-Unies, à travers le Ministère de la Promotion de la Femme et de la Famille, révisent leur programme d'action en proposant par exemple, un thème quinquennal ayant des objectifs bien déterminés. En outre, le thème de l'année devrait être annoncé solennellement à partir du 09 Mars et pendant 12 mois, il sera développé et exposé à

travers les villes et les campagnes, dans les associations féminines, les maisons de la Femme et même au sein des familles.

Par ailleurs, la semaine de la Femme devrait plutôt être une semaine d'évaluation des enseignements reçus, où, non seulement les femmes, mais aussi les hommes pourraient exposer les améliorations et les difficultés rencontrés. Le 08 Mars, le jour de la fête, serait donc le jour de la clôture des activités féminines.

Communication in the age of the “Great Turning”

Understanding the role of analog and digital modes in liberating imagination

1. Introduction: Communication in the digital world

We live in an epochal transition where the purpose of communication can hardly be overestimated. Understanding or misunderstanding communication has far-reaching consequences. But our inability to imagine and communicate new possibilities is beyond understanding; and this inability can lead to the demise of our humanity. Observing current world affairs and events, it is evident to me that there is a growing need to go beyond what we are conventionally able of transmitting into what we are imaginatively capable of communicating. There has never been a time in history when it has been more significant for societies to communicate a transformational process that would lead to global well-being and an imaginative sustainable way of living. Equally troubling is that we live in an age so infatuated with new digital communication and analytical verbal thinking that it is easy to overlook the significance of the analog mode in accessing the realm of imagination.

By *digital mode*, I mean systems that represent the complexity and richness of life by breaking it down into discrete bits or packets of information so it can be managed efficiently. *Analog mode*, on the other hand, is direct representational or analogous systems of continuous undifferentiated whole experiences. An analog recording, for example, is where the characteristics of the original sound are represented directly in the groove of a gramophone album. Digital recording is where the original sound is converted into bits of information that can be easily compacted and stored as well as mass-produced in a compact disk (CD). A clock with hours,

minutes, and seconds is an example of the digital mode,¹ whereas an hour-glass represents analogically the time of the day through the continuous flow of sand, or as humans experience time through the undifferentiated movement of the sun and stars.

Ever since societies acquired alphabet literacy, we have seemed to rely heavily on a rational, digital sequential thinking process. In fact, the fictitious notion that logical, linear thinking is better than intuition and holistic perception is a fallibility written by left-brainers. Thousands of years of left-brain dominance have encouraged digital dependency, and may have led to numerous world conflicts and the devastating experience of Hiroshima. Even with all their intrinsic worth, “abstract science, linear words, and sequential equations had led the world to the brink of extinction” (Shlain 1998: 409). It is not unusual for language to dominate and monopolize the mind to a degree that thought is rendered a slave to words (Koestler 1964) and imagination is trapped in digital analytical boxes. It is obvious that the mass rush to digitization and analytical thinking comes with a high price. When the shocking events of September 11, 2001 took place, the US government concluded that they were due to the intelligence failure of the Central Intelligence Agency. But 9/11 was not a failure of intelligence; it was a lack of imagination. Digitization is becoming our addictive path to maximization. But this is the antithesis to the nature of life, where “life tends to optimize rather than maximize” (Hawken 2007: 183). Digitization, while it is an advantageous technological achievement in speed, accuracy and efficiency, it impoverishes the role of the analog mode in simultaneously capturing whole and infinite imaginative possibilities.

Certainly, the division of knowledge into fields and domains is the consequential influence of rational analytical thinking and digital efficiency. While specialized jargons and linguistic obfuscation – which are mediated efficiently by the digital mode – have contributed to the advancement of human knowledge, they have rendered professional domains and fields more isolated. Consequently, “each domain is becoming increasingly specialized not only in its vocabulary but also in the conceptual organization of its rules and procedures” (Csikszentmihalyi 1996: 338). While the tendency toward specialization has made professional mastery and precision possible, it has also created rigid boundaries accessible only to those qualified practitioners who are well trained to play *within* those established boundaries. However, as Thackara (2005) argues optimistically, if we were

once able to create our way into this disarray, we can certainly design our way out of it.

With the growing complexity of domains and fields, the digital mode with its influential precision and efficiency has become the state-of-the-art means of communication. Although the digital mode of communication has been around for nearly 800 years, its technology has recently accelerated with amazing speed where time, space, and energy have been divided into bits of information. Despite the fact that these bits of information are very helpful in communicating *information*, they do not provide sufficient qualitative significance or meaningful *knowledge*. The digital mode seems to be ideal for disseminating and retrieving information; on the other hand, the analog mode is indispensable for creating new knowledge and imagining new realities.

In this paper, I explore the possibility of making deliberate connections among disparate domains and fields by playing with their boundaries. Yet more significantly, I offer what I call a *conceptualization process* for understanding and integrating digital and analog modes which has the potential to intentionally make the fundamental shift needed to kindle the time of the “Great Turning”,

2. *Experiencing the “Great Turning”*

What is the “Great Turning”? And why do we need it? There is strong evidence that our global community is experiencing unprecedented movement, cognitive revolution, and spiritual awakening. It is an extraordinary global movement. Although David Korten (2006) circulated the term widely through his book: *The Great Turning: From Empire to Earth Community*, it was Joanna Macy (1998) who coined the term “The Great Turning”. Paul Hawken (2007), in his most recent book *Blessed Unrest*, also describes this massive happening as “the movement with no name” which “doesn’t merely advocate recycling, it actively *imagines* a system of human production that is as elegant, frugal, and abundant as what we observe in nature” (Hawken 2007: 179, italics mine). The Great Turning, as Joanna Macy (1998: 17) describes it, “is a transformation from the industrial growth society to a life-sustainable society.” It is, to borrow a phrase from William McDonough (2002), a shift from *efficiency* to *effectiveness*. It is a transformational process that goes beyond the need for speed and

accuracy into meaning making and holistic living. We need this transformational process to move beyond the perceived limitations and illusionary barriers, and their unintended consequences, that we have constructed for ourselves.

Why do we need both digital and analog modes for communication in the age of the Great Turning? According to Joanna Macy, there are three dimensions of the Great Turning: “1) action to slow the damage to Earth and its beings; 2) analysis of structural causes and creation of structural alternatives; and 3) a fundamental shift in worldview and values” (Macy 1998: 17). However, action without analysis is a mindless task, and analysis without a major shift is a paralyzing effort. A brief look at the first two dimensions of Macy’s idea reveals a process that can occur through currently available problem-solving methods, as well as cause-and-effect models. This process triggers minor changes that are described by systems theorists as a “first order of change” (which fixes what already exists), whereas meaningful change is a “second order of change” and is attained through cognitive shift.

Granted, we can approach a problem with thoughtful analysis and even sensible action to achieve remedial goals or objectives; such being the case, we still perform within established boundaries. But without a shift in our perception and thinking process, social and environmental problems will remain the same even though their appearance might change. Only by reframing social problems – seeing them from a fresh vantage point and playing with their boundaries – can we make truly meaningful changes. How, then, can we creatively reframe social problems and not simply accept their common appearance by analyzing and rushing to fix them?

It is in Macy’s third dimension – a fundamental shift in our worldview and values – that we find a promising point of departure. A fundamental shift in our worldview and values implies a transformation in our consciousness, a cognitive revolution, and use of imagination. Such a transformational change, as I mentioned earlier, is a “second order of change” which can best be attained by a *design approach*. A design approach makes use of design principles, including the expectation of surprise, guiding intention, and seeking not a prescribed solution but a desired outcome that is limited only by our imagination. This cognitive leap is essential for intentional and sustainable social and environmental change as it provides the lens through which we come to imaginatively interpret the context within

which these changes will take place. I believe the third dimension is fundamentally significant for such a transformational change, and consequently requires that we make a major shift in our way of thinking.

3. *The nature of change and our way of thinking*

We know that change is the fundamental nature of *reality*. Changes can be triggered by different causes, among them intentional design by human agents; necessity, inevitable condition, or circumstantial need predetermined by universal law; chance, an accidental event, an unintended act, or luck (flip of a coin); chaos and disorder as a result of systems bifurcation and randomness; evolution and genetic reconstruction; and a cosmic event or act of God (Figure 1). When looking at these various causes for change, it becomes apparent that other than intervention by intentional design, there is really little or no interference by humans in these causes. Only through the coping mechanism of a problem-solving strategy can we handle changes imposed on us by other causes. On the other hand, animating and leading change can only be accomplished intentionally by design. Interestingly however, changes made by human intention and changes made by divine intervention (or a cosmic event) complete the full loop of changes (Seif 2005). This is a revealing proposition, which I shall return to later.

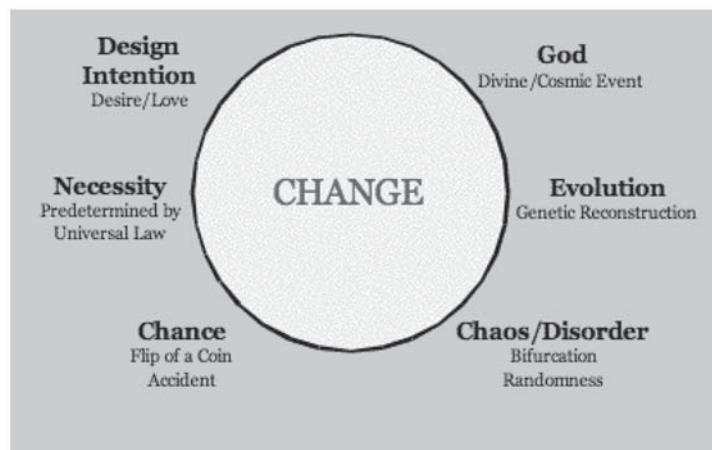

Figure 1. Causes of change.

If we accept the premise that a transformational change requires a different way of thinking, we could begin by engaging in a process that has the potential to stimulate such a shift, which in turn would create the second order of change. An intentional change at the second-order level will not take place without imaginative thinking, augmented by a high level of abstraction. Undoubtedly, language offers us resources for thinking abstractly. Ironically, however, while language makes it possible for us to think abstractly, we seem to “abandon the use of images and are able to carry on without resorting to them” (Shlain 1991: 18). Since imagination involves more than logical, linear operations and depends on the acquisition, interpretation, and manipulation of images and nonverbal codes, it does not fit neatly into the mainstream, conservative understanding of abstract thinking. This is the paradox of language. As Shlain puts it, it is “the majesty and the tyranny of language” (ibid.).

4. *The paradox of language: Analog-digital polarity*

In order to develop an appreciation for the paradox of language, perhaps it is helpful to briefly revisit and locate language within the larger scope of semiotics. Under this large umbrella, there are three major semiotic systems: linguistics, kinesics, and objects. As we can see, language is only one of three major systems of signification in almost any sociocultural setting (Figure 2). While language is one of our systems of communication and signification, it is not our highest ability. A considerable portion of our mental activity is of a nonverbal character.

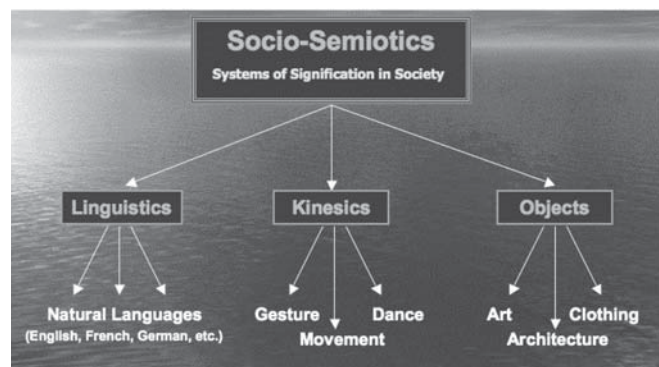

Figure 2. *The place of language within the realm of semiotics.*

As we know from C. S. Peirce (1955), semiotic signs in relationship to their entities or objects are three types: icon, index, and symbol. An iconic sign and its object have an isomorphic relationship of strong resemblance; that is, some qualities of the object are represented or perceived in the icon – e.g., photos of persons, drawings of buildings. An indexical sign is one where spatial-temporal contiguity or concurrence defines its link to its object. In other words, it has a physical relationship with its object, but this relationship is not defined by shared qualities or resemblances – e.g., smoke and fire, window and view. A symbolic sign relates to its object only by an association of an idea, which has to be created and learned within a social or cultural context. Convention sets the random link between a symbolic sign and its object or entity. In this type, signs and their entities are related by virtue of an agreement and convention, not by virtue of any quality intrinsic to either the entity or its sign (Figure 3). Though Peirce noted that there is an inclusion of the three sign types in any given representation, words in all natural languages are *predominantly* symbolic signs.

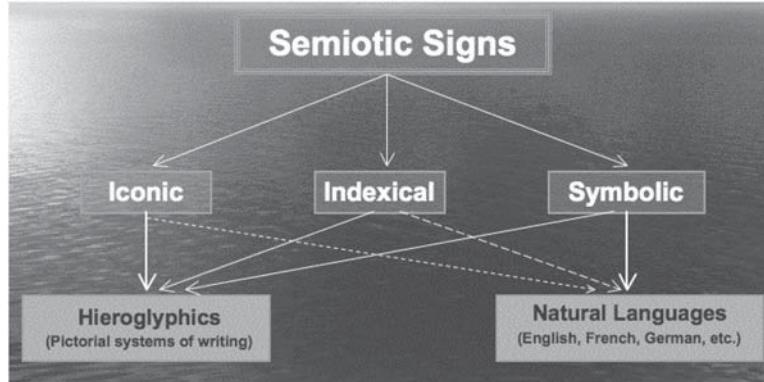

Figure 3. Semiotic signs.

The fact that we often use gestures and facial expressions in our communication strongly indicates our disparate efforts to include more iconic and indexical signs, and overcome the limitations of language. Words, as symbolic signs, are effective systems for describing life experiences and cognitive events, but they are not the experiences or events themselves.

Words are “vehicles of thought, but the vehicle should not be confused with the passengers” (Koestler 1964: 600). Even with its magnificence and robustness, language is not indispensable to our thought. Mere verbal thinking is the prototype of “thoughtless thinking” in which the habitual recourse of the mind retrieves connections from stored memories. In this sense, language is useful but unimaginative. Language is helpful to thinking; however, thinking is not in words. “It must be the help that words lend to thinking while it operates in a more appropriate medium, such as visual imagery” (Arnheim 1969: 232). While linguistic abstraction and symbolic representation could be perceived as limitation, it has, as we shall see shortly, the capacity to be manipulated freely through random association, a quality that is essential for conceptualization. This paradox of limitation and advantage of language is in the core of imaginative thinking.

5. Abstractions and imaginative thinking

“Abstraction” is one of the most ambiguous words in language. Because of its many interpretations, it may be helpful to describe what I mean by abstract thinking. First of all, we should be cautious viewing abstraction as the opposite of concreteness. The terms “abstract” and “concrete” are neither antonyms nor synonyms. As Arnheim argues persuasively, “concreteness is a property of all things, physical or mental, and many of these same things can also serve as abstractions” (Arnheim 1969: 156). He goes on to say, “generalization presupposes abstraction” (161). Being not mutually exclusive, abstraction and concreteness are connected perceptually through the notion of generalization. Both abstract and concrete concepts, then, are conditions for generalization.

As stated earlier, abstraction is the human brain’s highest function. It is an indispensable attribute of thinking. When we think of concepts such as freedom, justice, *or* peace we are not thinking in physical or visual images, rather we are thinking abstractly and in a digital mode. When we make imaginative connections among freedom, justice, *and* peace we are also thinking abstractly but metaphorically and in analog mode. Only when we reflect, muse, play, and imagine, do we revert to images and metaphors, and experience the analog mode. Due to the erosion of images by words at an early age, “we forget that in order to learn something radically new, we need first to imagine it” (Shlain 1991: 18). Not only does imaginative

thinking depend on a high level of abstraction, it also must exist within a different type of conceptualization. Unlike the digital mode of thoughts and sequential order of language, the analog mode, with its undifferentiated and seamless perception and experience, offers interpretations of numerous ensembles of images.

Imaginative thinking is a multi-dimensional encounter with the subconscious and engages multi-sensory perception. The experience of “synesthesia” involves all senses; in this experience, the perception of one sense is based upon stimuli received by another sense. In order to function properly, “the imagination must be rendered capable of remaking whole aspects of life, that is, of performing genuinely poetic or hypothetical operations” (Grudin 1990: 52). As Kant asserts, the imagination reveals “an idea of the whole” to transform what is lacking in the existing situation (Makkreel 1990). However, revealing the “whole” doesn’t mean elaborate and extensive laboring over a situation; it is more spontaneous, what Malcolm Gladwell (2005) calls “thin-slicing”, extracting and making sense quickly of the most meaningful characteristics or qualities of the situation.

To imagine is to make an image. The act of *making an image* is a “philomorphic”, or form-loving, act (Grudin 1990). James Hillman also reminds us of the connection that “when we fall in love, we begin to imagine: and when we begin to imagine, we fall in love” (1992: 9). Imagination is intimately interconnected with love, a connection that is exhilarating. In view of this, an act of making an image is really a *lovemaking* process. And in this process we experience holistic, synthetic, undifferentiated seamless reality; it is an experience that takes place in the analog mode *par excellence*. In the vein of God’s creation, the act of making an image is giving life to form, or what Hillman (1992) calls *ensouling*. Imaginative formation, as Kant perceives it, “raises from an activity of the soul” (Makkreel 1990: 15). This idea recalls what I introduced earlier: intentional design and God’s creation complete the loop of changes. By implication, this idea also reveals the splendor of imagination where “the thought of the heart and the soul of the world” (Hillman 1992) reconnect humans with the “numinous” or the divine.

Ever since the Neolithic age, we seem to have lived in what Erick Jantsch (1975) calls a “conceptual space” where our thoughts, feelings, and imagination reside, urging us to create new realities. Although analog con-

ceptual space has been in human consciousness for millennia, it has been overshadowed by the information and digital age. This trend has certainly prompted a few writers to encourage us to adopt a different way of thinking and acting in a more human sustainable global society (McDonough 2002; Thackara 2005). Others declare that we are moving from the Information Age to the Conceptual Age (Pink 2005). But the conceptualization cannot truly be divorced from the information. Therein lies our challenging polarity. There must be a process through which one can access imaginative thinking that relies on holistic, undifferentiated, and seamless experiences associated with the analog mode without rejecting (or even compromising) the efficiency, speed, and accuracy of the digital information mode. In other words, we need a process where conceptualization is at ease with the paradox of language.

6. Making the shift through the conceptualization process

As we have seen, imaginative thinking does not rely on the digital mode and sequential syntax of language. This idea raises challenging questions: Can we experience the analog mode in a digital world? In a sense, how do we engage in imagination using language, which is sequential and linear in nature? How do we use the digital mode of language in an analog manner to conceptualize the imaginable and sustain the age of the Great Turning? How do we access imaginative thoughts that hover in some subliminal space waiting to be linguistified? To bear fruit, imaginative thinking must be communicated to self and others through some sort of efficient articulation. But in what way can we effectively communicate the concept of that which is *yet-to-be*?

In order to formulate the concept of that which is *yet-to-be*, the conceptualization process is designed to trigger the fundamental shift needed for our thinking and perceiving. Generally, concepts can be invented, discovered, or revealed. In the spirit of image making, the conceptualization process depends primarily on what Paul Laseau (1980) calls “concept formation”, which is unlike “concept recall” or “concept attainment”. I should add that concept formation is synthetically formed, imaginatively interpreted and reinterpreted, and playfully cogitated. And it is apparent that “interpretation can begin only when we have some sense of a whole” (Makkreel 1990: 37). In concept formation there are no preconceived ideas

or fixed answers to be remembered or discovered – concept formation is truly *expecting the unexpected*.

The conceptualization process begins by identifying known and important categories. These categories are essentially boxes of digital information represented predominantly by linguistic symbolic signs; and as I mentioned earlier, symbolic signs and their degree of abstraction are easily manipulated and deconstructed into qualities, attributes, or characteristics. The next step of the process is to list as many characteristics or qualities as possible under each category or entity. Without any analysis or debate, the listing evolves very quickly through, what Gladwell (2005) calls “thin-slicing”, where first impression is essential in identifying more characteristics or qualities in the blink of an eye than labored scrutiny. My experience with graduate students has shown that the habit of relying on the digital mode and analytical thinking often leads to fixation on one particular category. This fixation often disappears when I suggest moving in non-sequential order and diving freely into other categories (Figure 4).

Figure 4. Examples of different entities sharing similar characteristics.

Following the creation of various categories and then the identification of their qualities, attributes, or characteristics, we use free play to integrate or combine them into phrases. It is important that we not be critical about the syntax or semantics of these phrases at this point in the process. The mind operates on the spur-of-the-moment, making unconscious associations among these characteristic words. Since words are mostly symbolic signs in natural languages, they also lack explicit qualities intrinsic to what they signify. However, as symbolic signs, and because of their random association and convention, they can be interpreted and manipulated much more easily than other sign types. And because characteristics or qualities are the very essence of categories and entities, countless possible phrases – which share the same characteristics or qualities – can be formulated. Often interpretation and manipulation of the identified characteristics

reveal a metaphor, an analogy, a similarity, or a profound isomorphism. When two or more characteristics seem to share conceptual structures on some level of abstraction, magical things can happen. That is why abstraction is one of the most valuable tools in this process.

It follows that these phrases in turn be integrated into a comprehensive statement or an inclusive inquiry question that guides our design endeavors and provokes action in the world. Ultimately, by deconstructing the familiar symbolic and digital categories or taxonomies into unfamiliar iconic analog mode – in the form of qualifiers (adjectives, adverbs, active verbs) – infinite imaginative connections are formulated that give birth to breakthrough (Figure 5).

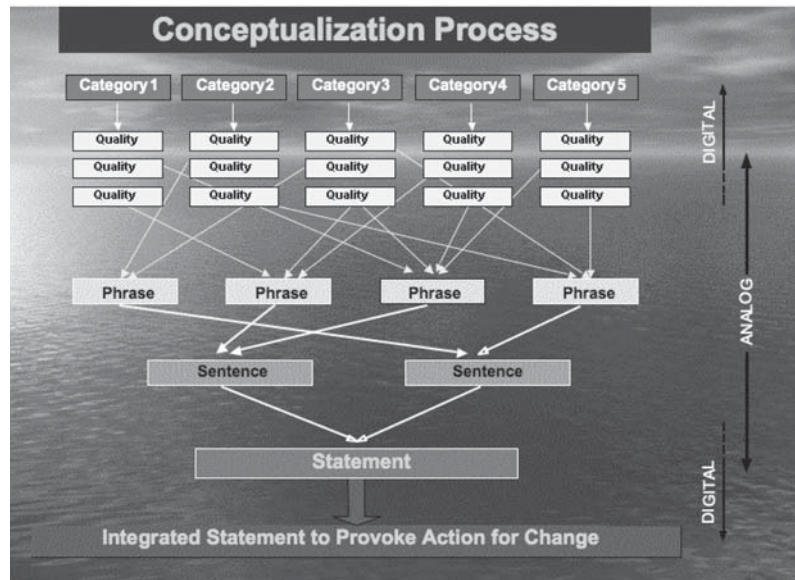

Figure 5. Conceptualization process.

It should be noted that while the conceptualization process utilizes words as vehicles of thought, imaginative thinking does not rely on the digital sequential syntax of language. In this process, aesthetic composition, philomorphic act, and free play are weaved seamlessly in our experience into an imaginable whole. Due to the high level of abstraction and generalization, conceptualization operates metaphorically as a *crystallization* process “by which the vague or fluid play of the imagination and

the understanding is suddenly captured in a form” (Makkreel 1990: 64). Consequently, out of the disorderly array of explored characteristics or qualities, an orderly whole emerges. Without any connection with logically constructed words, qualities and characteristics seem to attract us to a mysterious zone. It is then fair to say that despite the fact that imaginative thinking can be accessed *analogically*, it has to be communicated *digitally*. Therefore, a fundamental shift is accomplished by using new formulated qualities of a *desired reality* to modify the representations of the *present reality*.

Additionally, whereas the act of reading and writing is generally a solitary endeavor (Shlain 1998), the conceptualization process requires camaraderie, dialogue, intimacy, and collaborative efforts. In this context, conceptualization always takes place in a collaborative fully engaged small group,³ where individual members perform as crystals coming together through the crystallization process to actively envision the emergent new. This distinctive collaborative grassroots quality is, in fact, congruent with Paul Hawken’s lucid description of the Great Turning as a movement without a leader, sage, or ideology, which emerges locally in small, discrete endeavors and enormous numbers (Hawken 2007).

7. Conclusion: Is it a duck or is it a rabbit?

The imaginative shift needed for the age of the Great Turning is accessible linguistically through the use of both digital and analog modes. Interestingly, some technologists have been converting digital and analog systems into each other in the process of achieving quality recording, and others are making efforts toward a “hybrid” approach to telecommunication. Also, an interdisciplinary approach to learning has been at the cutting edge in education, where learners have overcome the limitation of language. Language as a system of arbitrary rules binds us together socially through communicating our thoughts and feelings. But through the conceptualization process, language is also our means to communicate the significance and meaning of the imaginable.

In a highly digitized world, the television and computer greatly increase the power of images, and iconic representations have superseded alphabetic representations as the single most significant cultural influence of our time. In fact, the influence of written word “has been declining for the last

fifty years, counterbalanced by the increasing power of the image” (Shlain 1998: 411). Ironically, as the television and computer (both of which are products of the digital mode) become dominant forces in our lives “the supremacy of the left hemisphere dimmed as the right’s use increased” (Shlain 1998: 408). This contradictory, yet complementary, relationship between the digital and analog modes cannot be resolved, but in fact, can only be experienced. Some can perceive only the “duck” of the left hemisphere; others can see only the “rabbit” of the right hemisphere! A few individuals have acquired the capacity to experience both modes. Albert Einstein, Marie Curie, Leonardo da Vinci, Queen Elizabeth I, Thomas Jefferson, William Shakespeare, Mother Teresa, among many others, demonstrated their capacity to operate freely within these two polarities.

I have attempted to offer a way to understand and engage with both the analog and the digital modes with “a new whole mind”, and to experience wholly their intriguing paradoxical relationship. Imagination is thus accessible linguistically through the use of both the digital and analog modes, in a kind of creative dance. With a clear intention and within the appropriate context, the kaleidoscopic flexibility of the conceptualization process is certainly the most effective intra-communication and inter-communication tool we have in an age we experience as the Great Turning. My experience reveals that students and professionals learn to master the conceptualization process and inevitably access the realm of imagination needed for transformational changes. Perhaps the wise words of Black Elk can best articulate this profound experience of engaging in the digital and analog modes together and liberating our imagination: *I saw more than I could explain; I understood more than I saw.*

Notes

1. Conventionally, digital watches go from one numeral to the next without displaying the intermediate values between numbers. Watches with hands moving around the face have been viewed as analog. However, the two types can both be viewed in the context of this paper as digital, particularly if we compare the two with the hourglass, or a human experience of time.
2. “Synesthesia” from the Greek *syn* + *aisthanesthai*, which means to perceive together. Interestingly, the meaning of synesthesia is also similar to that of the word “synthesis”, one of the leading principles in all design fields.

3. My experience in conducting numerous sessions involving a conceptualization process indicates that a group of 7–13 participants is the most appropriate and efficient size.

The semiotics of Bollywood movies

Analyzing iconic images of heroes in contemporary Hindi cinema

1. Introduction

Reading iconic images and symbolism in Bollywood movies (Hindi cinema) could enlighten us about the current state of Indian popular culture and society in the twenty-first century. Iconic images projected on the silver screen by the filmmakers of Bollywood movies often reveal cultural and social trends along with the features of the dominant ideology and cultural values in the new evolving Indian society.

In this paper I explore the significance of iconic images in contemporary Bollywood films. I look at the evolution of iconic images of film heroes in post-independence India, evaluate well-known iconic images selected from a few contemporary Bollywood movies, and derive relevant meanings from those images.

2. Ideology of Hindi cinema

The narrative mechanism of film by which the national imagery gets allegorized can be framed within the context of nationalism and modernity, positivism and westernization and socialism and late capitalism, reflecting the dominant ideology and cultural values of the times. The feudal aristocratic ideology has a strong hold on the narrative in Bollywood cinema, so much so that a growing middle-class ideology opposed to the feudal family structure still involves an elaborate conflict between feudal and democratic values. Post-independence Bollywood narrative cinema has been predominantly “feudal family romance”. This form survived along with

the realist and melodramatic aesthetic modes. In an independent India, the dominant status of this form reflected the power-base which was an alliance between a colonial elite with a pre-capitalist socialist base and an aspiring bourgeoisie to be a partner in the coalition. The configuration of the “feudal family romance” is directly in conflict with the new realism and melodrama of today’s cinema. It is not really a conflict between tradition and modernity but rather a “conflict between two ideologies of modernity, one corresponding to the conditions of capitalist development in the periphery, and the other aspiring to reproduce the ‘ideal’ features of the primary capitalist states” (Prasad 1998: 55).

In the six decades since India’s independence from Britain, Nehru’s nationalist, populist government, rooted in socialist ideals, has given way to neoliberalism, globalization and turbulent capitalism. Raj Kapoor, the iconic hero of the 1950s and ‘60s made himself at home on the streets of Bombay (Mumbai), where the street belonged to the ordinary and the underprivileged, and they lived their lives with optimism and hope despite the squalor, filth, overcrowding and crimes. Rochona Mazumdar, film and cultural historian at the University of Chicago, points out that in the film songs of those days one saw “the dreams of the socialist come to life” (Gibson 2007).

Globalization and late capitalistic values, on the contrary, have made the same streets of Bombay dark and threatening. Consequently, Bollywood films have started reflecting the new realities: there is more emphasis on the individual rather than on universal experiences, and movies with exotic locales rather than domestic settings have become more prevalent. For domestic consumption filmmakers are producing gritty gangster movies with lots of violence and raunchy dance numbers. Shot and produced in Bombay, Bollywood films reflect the growing disillusionment in politics and public life and as Mazumdar says, the movies portrayed “the web of crime and corruption that welds India into an informal global economy of crime” (Gibson 2007). Politicians, criminals and dishonest businessmen are all presumed to be a part of the corrupt system. With an increase in murder rates and random violence in urban areas the public believe that there is a “nexus between the underworld smugglers, terrorism and anti-nationalist elements.”

3. *Iconic images and symbolism in films*

Any symbol, iconic image, or set of symbols/iconic images communicates a concept, a general idea, pattern or a form. Philosopher Susanne Langer saw meanings derived from symbols or iconic images as a complex relationship between the symbol, the object and the person perceiving both. Meaning derived thus can be construed as having both logical and psychological aspects (Littlejohn & Foss 2005: 101). Consequently, iconic images could reveal the underlying symbolism of the narrative in a film. Films can reveal meanings from apparent signs and images which manifest themselves, at the micro level, in characters' mannerisms, behavior, looks, dress and gestures, as in the film *Julius Caesar* (Barthes 2001: 27–28). At the macro level, iconic images may reveal the status and character of the society, culture and a nation's dominant ideology via symbolic associations, references and alliances. If a symbol makes us think about religious, cultural or political alliances and associations, then so do iconic images.

The usual way of describing an iconic image in Indian cinema or painting is that the figure in the image is frontally placed with the body and face or only face and its features in full view. Rajadhyaksha (1987) and Kapur (1987) argued that images of actors facing the camera and looking towards or right into the camera are similar to the traditional iconic images. Iconic images have their source in past materials and so they are already familiar to the audiences/spectators either in the form of narrative or as a discourse. An iconic image is an image which the spectators have already conceived and stored in their minds; but when used in a film, such an image acquires new meanings and a new story is initiated by the use of an icon in the narrative through the process of editing. When an image is preceded or followed by another image, the aspects of time and motion mobilize the inner narrative of the visual icon (Chatterjee 2005: 93).

Iconic images in Bollywood films are largely derived from religious and traditional cultural images from the past. Religious iconic images contain either single or dual figures. For example, Radha and Krishna can be represented singly or together; these Hindu gods might look out towards the viewer or they might be looking at each other. The iconic image of a couple prevails in Indian cinema as a two-shot composition. In *Devdas* (1935), for example, the movie's hero and heroine are never filmed in a shot-counter shot manner but always in a single or in a two-shot format. The woman

worshiper's iconic image has its antecedents in miniatures and other medieval Indian paintings and art. Most common are iconic images of the goddess Parvati worshipping Shiva. These iconic etchings and photographs were first found in the serialized novels of early twentieth century, which later found their way into cinema (Chatterjee 2005: 97).

Rajadhyaksha (1987) traced the source of iconic images in cinema to calendar art and to painters like Raja Ravi Varma who influenced early filmmakers. From print images to cinematic images was a natural progression – prints were available in a great many styles and in a wide range of sectarian and secular topics, covering iconic figures of gods and goddesses to natural scenery, ordinary people, cityscapes, architecture, national leaders and “Mother India”. With the coming of cinema, movie posters promoted iconic images of heroes and heroines from the films (Chatterjee 2005: 97).

4. Iconic images of Bollywood heroes

The iconic image of the hero in Bollywood movies have evolved over a long period of time – from religious-spiritual figures (Raja Harishchandra) to the post-independence hero exemplified by Raj Kapoor's comic Chaplinesque figure, filled with socialist and nationalistic enthusiasm, to the “angry young man” of the 1970s and '80s. Each period with a different set of political and economic circumstances yielded a particular iconic image of the hero. In the pre-independence India, feudal and colonial attributes and attitudes dominated all facets of society.

Raj Kapoor (1924–1988) was the first of the post-independence actors/directors who left a distinctive mark on the Bollywood film industry. His movies *Awara* (1951) and *Shree 420* (1955) are partly romances but they carried the nationalistic and socialist messages embodying the dominant ideology of the post-independence India. The first ten years of Indian independence, transformed into sentiment and song, belonged to Raj Kapoor. Scholars point out that the dominant genre of Bombay cinema may be called “sentimental melodramatic romance”, and this melodrama also incorporated the nationalistic and socialist aspirations of the new India (Mishra 2002: 98–99).

In the new socio-political environment of the '70s, the growing middle-class had become impatient with the governing socialist ideology and

was searching for new roles to identify with, at the same time the commercial Bollywood cinema was experimenting with a gradual reform of the textual form that could preserve the star as the main attraction. Into this breach steps in Amitabh Bachchan, who becomes identified with the down-trodden and the proletariat – an iconic figure of resistance who appeared to speak for the working classes and other marginalized groups (Bannerjea 2005: 135).

The beginning of the “angry young man” evoked new set of codes and marked a clean break from the romantic persona of the former superstars. The brooding inward looking, yet outwardly searching, anger was symptomatic of its time. Personified by Bacchchan, his dialog delivery, sense of timing and restraint in acting ushered in a new kind of anger hitherto unseen on the Indian silver screen. The new language of control in many ways operated in reverse to some of the existing melodramatic codes of the existing Bollywood formula. His ability to absorb and transmit both the “modern” and the “transitional”, the “western” and the “eastern”, through a new body language was the most important reason for his status in Bollywood. He was a hybrid of two cultures and forms and it was said that he could not be compared to any other actors from the past and in present (Mazumdar 2000: 243–244).

5. *New Bollywood heroes*

The iconic image of the “angry young man” as a hero gave way to a whole array of heroes representing different shades of cultural values and ideologies currently prevalent in today’s Indian society. Using a few recent films as examples I have tried to locate iconic images of heroes who currently dominate the Indian screen.

The iconic image of a superman as a hero, in the mode of Superman, Spiderman and Batman, entered the Indian consciousness in the form of *Krrish* (2004). For the first time an Indian superman made its mark in the Bollywood cinema. The gangster movies have a big hold on the Indian audiences’ imagination. Movies like *DON* (2006) and *Omkara* (2006) have become major hits in recent times. The iconic image of the gangster as a hero has made a strong comeback with the advent of an ideology promoting free market capitalist system. In *Don*, the Indian gangsters have gone global, operating not only in India but also in Paris, Rome, Kuala

Lumpur and in other parts of the world with all the high-tech gadgets available to them.

An iconic image of a businessman who makes it really big, from rags to riches, in the business world is one of the latest offerings from the Bollywood cinema. In the movie *Guru* (2007), a village youth hankers to leave his small parochial community and make it big in the world. In *Guru*, the image of a business tycoon, coming from one of the thousand villages in India to become one of the biggest industrialist in the country, shines like a lighthouse for the common Indian man.

Reflecting the zeitgeist, the “terrorist” as a hero has emerged as another of the iconic images to jar the Bollywood silver screen. In *Mission Kashmir* (2002), the hero as a boy was rescued by the Indian forces when his entire family was wiped out in an encounter with the “terrorist” in Kashmir. As he grows up he finds out who his adoptive father is, rebels against him and goes and joins a Kashmir terrorist group. In *Fanaa* (2006), the hero is a tourist guide in a city in India but secretly he is a terrorist who is working for an insurgent organization. In the end, the “terrorist” heroes in both movies are killed, re-emphasizing Bollywood’s vigorous stance against terrorism.

With terrorists and gangsters making appearances as heroes on the screen, it is no wonder that the Indian audiences took to the appearance of Mahatma Gandhi with great enthusiasm in *Lage Raho Munna Bhai* (2007). Even though Gandhi is not the main character in the movie, he is the wise sage who counsels a reformed gangster into behaving in a non-violent and forgiving manner in order to win over his adversaries and the hand of the lady radio announcer with whom he had fallen in love. A gangster full of love and forgiveness is not what an audience normally would expect, and this takes audiences by total surprise. The resurgence in patriotism and morals and values from earlier times is another facet of the transitory Indian society. The iconic image of Gandhi gracing the Bollywood screen gives an additional dimension to contemporary Bollywood cinema.

A resurgence of patriotic movies with military themes are gaining popularity among Indian audiences. The confrontation and battles with Pakistan over Kashmir and terrorism has given impetus to movies depicting soldiers and officers of the Indian armed forces performing heroic feats at the battle front (*Kargil, Watan Saathiyo, Border, 1971, Lakshya, Mission Kashmir, Veer Zara*). The iconic image of a hero as a soldier or an officer of

the Indian military has gained significant popularity in people's imagination, and these films have become the new voice of the people (Mazumdar 2000). The plethora of patriotic films was to a large extent initiated by *Lagaan* (1998), a tale about a village in Northern India fighting the British from imposing unfair taxation on their annual crops. The taxation issue is settled by a cricket match where eleven villagers play against the British team. The match is wholly unfair because none of the village members know how to play cricket, a quintessentially British game. The fight against the British was again shown from a Gandhian non-violent perspective and not as direct confrontation, thus reflecting the undercurrent of Gandhian ideology which persists in Indian society.

6. *Conclusions*

Bollywood now offers a variety of iconic images of heroes that were not available in earlier times. By analyzing an array of iconic images it becomes apparent that iconic images tend to reinforce the dominant ideology and values of the society and nation. Even though in the liberalized free-market, the power is wielded by those who have the capital, in a transitional society like India, feudal values are still represented by corrupt politicians, businessmen and landlords who rule their domain via threats, bribes and gruesome violence. However, the transitory nature of the ideology and values is apparent in the interplay between the traditional cultural values, political authoritarianism and economic stagnation of Nehru years, and the free-market forces of today. The outcome is still undecided and the forces are pulling in all directions. Nothing demonstrates the flux, the transitory nature of the ideology, as much as the pantheon of iconic images of heroes projected on the silver screen in contemporary Bollywood cinema, the so-called mediator of the Indian national consciousness. Democracy, market liberalization, pluralistic society and diversity of cultures, languages, religions and ethnic groups in the nation seem to have opened up a Pandora's box of cinematic representations of heroes.

Understanding and misunderstanding of Russian canned jokes

Joke-telling is an important part of social interaction in Russian society. Joke-tellers are socially popular and those who lack sense of humor are not in high esteem. That is why every proficient native speaker of Russian knows how to tell jokes and how to react to them.

There are some formal means of introduction of a forthcoming canned joke into discourse: the speaker may use such clichés as *Znaesh' anekdot?* (Have you heard this one? Lit., “Do you know this joke?”). It may be observed that such cues never introduce spontaneous jokes. If the speaker sees that the hearer took a spontaneous joke at face value, s/he often adds an overt statement such as *Eto shutka* (This is a joke).

In a regular Russian joke, the setting of context is a narrative sentence which starts with a verb in present tense (or a perfective verb in past tense) followed by its subject:

- (1) *Sidit Stirlits v restorane...*
Is-sitting Stirlitz in restaurant
“Stirlitz is sitting in a restaurant...”
- (2) *Edut v poezde russkii, ukrainets i evrei...*
Are-traveling in train, Russian, Ukrainian and Jew
“A Russian, a Ukrainian, and a Jew are traveling on a train...”

That is why when Russians translate French or American jokes into Russian they usually change the word order of the first sentence: *A man and his wife are talking...* would be rendered as

- (3) *Besedujut muzh s zhenoj...*
Are-talking husband with wife...

Joke-telling is a cooperative enterprise; so, if the hearer fails to get the joke or gets it too late, mutual frustration is a result. The understanding of jokes requires not only high linguistic competence and “humor competence” (Raskin 1985) but also background knowledge of social and cultural life, ethnic and gender stereotypes. Consider:

- (4) *In the Olympics, a Soviet hammer thrower set a new record. Correspondents interviewed him. “How did you manage to hurl that hammer so far?” “If it were together with a sickle, I would send it twice as far.”*

This joke will fall flat if the audience does not possess the necessary knowledge that Soviet State emblem was a hammer and a sickle.

Comprehension of jokes needs also the inner knowledge of the conceptualization of the world in Russian jokelore, that is, what is taken for granted in Russian jokes and what one needs to know to understand them. To understand a joke, the audience often must be able to recognize the main characters that act in the fictitious world of the joke. Characters of Russian jokelore are recognizable by their appearance, way of behavior, clothes and other accessories. For example, the description *a short, bald man with beard wearing a kepka* (a leather cap with peak) would be inevitably understood as referring to the Communist leader Lenin; if a male joke character wears a red jacket, gold chain and speaks on the cellular phone all the time, he is recognizable as a “new Russian”.

By way of illustration, let us consider the following Russian joke cited (in Draitser 1998: 38) as an illustration of “the Georgian stereotype”:

- (5) *With his very last ruble, a student buys a dozen walnuts. He cracks one of them. It’s empty. He cracks another one – again, it’s empty. When he comes to the last one, a worm wearing a cap crawls out and says: “It hurts, doesn’t it?”*

It is hardly plausible that one may conclude from the English version that the “voracious worm” represents a Georgian. Certain background knowledge is required here (e.g., that Georgians as fictional characters of Russian jokes usually sport oversized caps). What is more important, in the original version of the joke, the worm speaks with a Georgian accent (easily recognized by the Russian audience) and uses the “tag-particle” *da?* attributed to Georgians of Russian jokes (*It hurts, doesn’t it?* stands for *Obidno, da?*).

Even more important, the hearer often has to recognize the “behavior masks” of joke characters, which correlate with their “linguistic masks” (linguistic clichés, accent, typical grammar mistakes, etc.). Thus, the Chukchi, a popular character of Russian ethnic jokes, is a naive outsider, who knows nothing about modern civilization and looks around in bewilderment. This attitude correlates well with the use of the particle *odnako*, which is typical of the Chukchi and expresses bewilderment and perplexity. Georgians of Russian jokes aim at contact and mutual understanding with other people, which correlates with their overuse of the “tag-particle” *da*?

In order to understand the following Russian jokes, the hearer must know not only that (1) in Russian clinics, they normally announce the newborn baby’s weight in grams (because of the metric system), and 3500 is a synonym of general normalcy; (2) Volga is the name of a great Russian river and is also an expensive Russian car brand; and (3) that in the world of Russian jokelore, new Russians are rich and ignorant while their behavior expresses aplomb and self-assurance:

- (6) *A New Russian is waiting in a maternity home lobby to hear news about his wife, who’s presently at labor. A radiant orderly exits the maternity ward and says: “Congratulations, sir! You have a boy, and it is 3500!” “3500 is no problem for a man like me”, says the New Russian with all the self-assurance he can muster, reaching for his wallet and producing cash.*
- (7) *“Can you afford buying Volga?” a New Russian is asked. “Of course I can”, he replies, “but what shall I do with all those boats and water?!”*

If the audience does not possess the required background knowledge, the jokes would be seriously affected or even entirely collapse.

When different jocular views of the world are compared to each other, one can discover substantial differences between them. For example, American and Russian marital jokes are very similar. They have the same characters (*husband, wife, lover*, etc.) and same plots – sexual life, family budget, housekeeping, shopping, children, in-laws, etc. But stereotypes of family life in Russian and American jokes are different. For example, in American jokes the husband earns money, he has a bank account and credit card, and the wife spends family money buying diamonds or fur-coats; by contrast, in Russian jokes the wife is responsible for family budget, the husband

should give all money to her, and he does his best to hide some money from his wife. The “standard” husband as presented in Russian jokes usually tries to get out of making love with his wife; he prefers to drink vodka with his friends; whereas in American jokes it is the wife who always tries to avoid making love with her husband. Consider:

(8) *A man asks, “Doctor, tell me, what can I do to help my wife. The best hospital in the world, best doctors, the most expensive drugs, I can afford it.” Doctor answers, “Nothing helps. If you want her to live, you will have to make love to her three times a day.” The man comes back to his wife. She asks him, “So what did the doctor say?” The husband answers, “What did he say? He said you were going to die.”*
(Translation of a Russian joke.)

(9) *Woman: So give it to me straight, Doctor.
Doctor: Very well. Your husband is in terrible shape, and if you want him to live, you’re going to have to make sure he’s well fed and comfortable and happy at all times, and you’re going to have to make love to him three times a day.
Woman: Three times a day?
Doctor: Three times a day.
Husband: So what’d the doctor say?
Woman: He says you’re going to die.*
(American joke; in Danforth and Voeltz 2001: 147).

Russian and American jokes also have different stereotypes of wife’s and husband’s duties to keep the house clean, to wash dishes, etc. Consider the following two jokes:

(10) *A French woman, an American woman, and a Russian woman were sitting around discussing their new husbands. The French woman said that just after the wedding she had told her husband she would not do all the cleaning, the dishes and the cooking. She said that the first day she did not see him, the second day she did not see him, but on the third day he came home with a housemaid and the house was clean, dishes washed, lawn mowed, laundry done and hot meals were on the table. The American woman said that just after wedding she had also told her husband she would not do all the cleaning, the dishes and the cooking. She said the first day she did not see him, the second day she did not see him, but on the third*

day he came home with a vacuum cleaner, a dishwasher, a washing machine, a dryer, etc. And the house was clean, the dishes were done, and they had a huge dinner on the table. The Russian woman said that just after the wedding she had told her husband the same thing. She said the first day she did not see him, the second day she did not see him, but by the third day she could see a little out of one eye.
(Translation of a Russian joke)

- (11) *Three men were sitting around bragging about how they had given their new wives duties. The first man had married a Catholic woman and bragged that he had told his wife she was to do all the dishes and housecleaning that needed doing at their house. He said it took a couple days, but on the third day he came home to a clean house and the dishes were all washed and put away. The second man had married a Mormon woman. He bragged that he had given his wife orders that she was to do all the cleaning, the dishes and the cooking. He told them the first day he didn't see any results, but the next day it was better. By the third day, the house was clean, the dishes were done, and he had a huge dinner on the table. The third man had married a Jewish girl. He boasted that he told her that her duties were to keep the house clean, dishes washed, lawn mowed, laundry done and hot meals on the table, every day. He said the first day he didn't see anything, the second day he didn't see anything, but by the third day most of the swelling had gone down and he could see a little out of his left eye.*
(<http://www.azarajokes.com/forum/default.asp>.)

There are a lot of jokes based on allusion to a popular novel, poem or movie, a popular advertising or TV show. Allusive jokes fall flat when the audience does not possess the necessary knowledge to which the jokes allude. For example:

- (12) *Pilots are trying to land a plane at Sheremetyevo airport near Moscow but because of engine trouble can't do it. They repeat their attempt twice with no result. The second pilot asks the first one: "Do you have an idea as to what we shall do?" – "No idea" – "So, no idea, no IKEA."*

To understand this joke hearer must know that (1) IKEA is a big store chain; (2) one of the IKEA stores is situated near airport Sheremetyevo; (3) its advertising slogan is “New Idea from IKEA”.

In many jokes the allusion is further complicated by the presence of another phenomenon:

- (13) *The Armenian Radio was asked, “What did Tatiana tell Onegin after their first intercourse?” The Armenian Radio answers, “Onegin! I’m not getting out of bed” [Onegin, ia s krovat’ – ne vstanu].*

The answer of the Armenian Radio is a take-off on a well known line from the libretto of Tchaikovsky’s opera *Eugene Onegin*: “*Onegin, ia skryvat’ ne stanu*” (I won’t hide my love) rendered with an “Armenian” accent. It is worth noting that Emil Draitser (1999) cites a version of this joke but fails to recognize the object of parody. He is under the impression that “*Onegin, ia skryvat’ ne stanu*” is a line from Pushkin’s *Eugene Onegin* (Draitser 1999: 123), when in fact the line only appears in the libretto by Pyotr Tchaikovsky and Konstantin Shilovsky. Further, he writes that the sentence “*Ia s krovat’ – ne vstanu*” is used “instead of the grammatically correct *Ia s krovati ne vstanu*” because “in order to make the parody fit the rhythm of the original, the lines of Tatiana’s letter to Onegin are rendered with a stereotypical Jewish distortion of the Russian grammatical norm” (Draitser 1999: 277). First, the cue should be pronounced with an Armenian rather than Jewish accent; second, such a “distortion of the Russian grammatical norm” is typical both of Armenians and Jews (as characters of Russian jokes); third, and even more important, *Onegin, ia skryvat’ ne stanu* is not a line in Tatiana’s letter to Onegin, but rather in her husband’s aria.

Linguistic sources of misunderstanding in cross- cultural communication

Misunderstanding in cross-cultural communication is to a great extent linguistically determined. At least two linguistic sources of cross-cultural miscommunication should be mentioned.

The first one is of a purely semantic nature and consists in the idiosyncratic semantics of numerous language-specific linguistic units. The meaning of such linguistic units includes implicit semantic components that are lacking in their counterparts in other languages. The worldview encoded in a language is usually presented in non-assertive components of meaning (that is, connotations, presuppositions, etc.); therefore, the speakers of that language often tend to take it for granted and get the illusion that life in general is arranged in this way (cf. Shmelev 2002; Zalizniak et al. 2005). But when different linguistic pictures of the world are compared to each other, one can discover substantial differences between them.

Thus speakers of Russian (as well as many other European languages) tend to take for granted that the psychic life of an individual can be classified as an intellectual and emotional life. Intellectual life is associated with *head* and *brain* while emotional life is associated with *heart*. The Russians use such expressions as *svetlaia golova*, bright intellect (literally, “bright head”) or *dobroe serdce*, kind heart; they use *head* for thinking and memorization while *heart* specializes in emotions and, in particular, love. They take this conceptualization of human inner life for granted and would be surprised if they knew that it is far from being universal. Thus, Hebrew (as well as Chinese) does not put emphasis on the distinction between “rational” and “emotional”; the *heart* is the right organ for both. While kidneys

do not participate in psychic life for the speakers of most European languages, some emotions are localized in kidneys for the Chinese speakers.

The words that have idiosyncratic non-assertive components of meaning can open a clue to the worldview encoded in a language; they may be referred to as the *key words* of that worldview. They tend to cluster together; more often than not, they occur in discourse together. The semantic components that reoccur in an implicit form in the meanings of many lexical units are of special interest; they may be considered *key ideas* of the language-specific view of the world. In other words, the linguistic conceptualization of the world (unique for every given language) is shaped by a system of key words and invariant key ideas that connect them and reoccur in an implicit form in the meanings of many lexical units.²

Thus, the significance of heart in the Bible is in complete agreement with the view characteristic of the Hebrew linguistic conceptualization of the world. In line with this picture, it is in the heart where all our thoughts and desires have their origin; the heart is the organ of understanding in the same sense that ears are organs of hearing and eyes are organs of seeing. Hence, if some people are described as having a *fat heart* or the *heart* that is *waxed gross* or *hardened heart*, this means that they will encounter a difficulty in solving intellectual problems and understanding parables, signs, etc. as in the following passage: “Make the heart of this people fat, and make their ears heavy, and shut their eyes; lest they see with their eyes, and hear with their ears, and understand with their heart” (Isaiah 6: 9, 10). Jesus quotes Isaiah: “this people’s heart is waxed gross, and their ears are dull of hearing, and their eyes they have closed; lest at any time they should see with their eyes, and hear with their ears, and should understand with their heart” (Matthew 13: 15); “He hath blinded their eyes, and hardened their heart; that they should not see with their eyes, nor understand with their heart” (John 12: 40). Likewise, Paul’s Letter to the Ephesians (4: 17–18) unambiguously shows that the image of *blind heart* or *hardened heart* involves “darkened understanding” and ignorance: “This I say therefore, and testify in the Lord, that ye henceforth walk not as other Gentiles walk, in the vanity of their mind, Having the understanding darkened, being alienated from the life of God through the ignorance that is in them, because of the blindness of their heart” (King James Version); “This I say therefore, and testify in the Lord, that ye no longer walk as the Gentiles also walk, in the vanity of their mind, being darkened in their under-

standing, alienated from the life of God, because of the ignorance that is in them, because of the hardening of their heart” (American Standard Version). However, since the word for “heart” as it is used in the Scripture is translated directly into most of European languages, many speakers of those languages tend to take the image of people with a *hardened heart* as callous, insensible or stubborn (cf. the English word *hard-hearted*). In other words, they take the concept of “hardened heart” as referring to inability to feel while in the original text it has to do with the lack of understanding.

In the case of ideological terms, poor translation may cause long-lasting consequences. This is what happened to Karl Marx and his Russian interpreters. We mean the problem of the Russian translation of Marx’s central concept, *der Wert* (roughly, “value”). The Bolshevik leader Lenin called the *surplus value* doctrine “a corner stone of Marx’s economic theory”. The *surplus value* (*Mebrwert* in German) is the value that the exploiter or the capitalist takes away from a worker, so the proletarians should get it back.

The first Russian edition of *Das Kapital* (*Capital*), published in 1872, has *stoimost’* as the translation of the term *Wert*. In 1899, Peter Struve published a new translation of *Kapital*, where he replaced the word *stoimost’* with *tsennost’*. In fact, *stoimost’* and *tsennost’* are close in meaning, but differ in connotations, and Mr. Struve argued that the word *stoimost’* was misleading. He insisted that the Russian word *tsennost’* conveyed the meaning of the German term *Wert* well enough. In contrast, the connotation of the Russian word *stoimost’* is closer to the idea that is normally associated with another root in the German languages (cf. the English word *cost* or German *Kosten*). Mr. Struve succeeded in convincing a certain part of the Russian Marxist movement. Lenin, however, only used the term *stoimost’*. When the Bolsheviks came to power, the term *stoimost’* prevailed. The connotations of this translation placed emphasis on the role of costs, charges and expenses and cost-based pricing.

Soviet students had to study Marxism as an all-triumphant doctrine. They learned that, according to Marx, goods have “consumer value” (*Gebrauchswert* in German) and “exchange value” (*Tauschwert* in German). The Russian counterparts for these terms are *potrebitel’naia stoimost’* (which is closer to “consumer cost”) and *menovaia stoimost’* (roughly, “exchange cost”). However, the combination of the words *potrebitel’naia* and *stoimost’* makes very little sense in Russian since their non-assertive components are

incompatible. So the whole theory of Marx, which was originally intended to be clear and transparent, was perceived as doctrinaire and confusing.

The second linguistic source of misunderstanding in cross-cultural communication that may lead to a communication failure is related to the difference in conversational strategies used in different cultures. It is common knowledge that what the speaker “means” often does not coincide with what s/he “says”. Any utterance has a “hidden meaning” and is made in order to convey this “hidden meaning”. It is of fundamental importance that the “hidden meaning” cannot be missing: if the speaker attempted to make explicit as much of the “hidden meaning” as possible and to explain in all cases, “I am saying this in order to...”, the latter utterance would in its turn pursue some objective and thus have a “hidden meaning”, so that the hearer would end up asking him/herself, “Why?”

It should be recognized that the Gricean proposition that the “hidden meaning” of an utterance can be derived from universal conversational maxims has been challenged by modern cross-cultural pragmatics. What the hearer infers from an utterance does not necessarily coincide with what the speaker implied (cf. Bybee et al. 1994: 285). The rules for inferences are language-specific and culture-specific. Different cultures use different conversational strategies and accordingly different principles for retrieval of “hidden meaning”. The difference between the conversational strategies used by the speaker and the hearer is a widespread source of communicative failures in cross-cultural communication (cf. Visson 2003).

Thus, some Russians who have immigrated to the United States have misinterpreted denials or refusals as some kind of acceptance: refusals of employment, of publishing a paper, of making a grant for a project. This is because Americans tried to “sweeten the pill”, saying something like “we will get back to you”, “we will be in touch with you again”, etc. In general, American culture seems to have many prohibitions on saying unpleasant things to people (and probably even stronger “prescriptions” for saying pleasant things). It might seem that the prescription for saying pleasant things requires the willingness to say something that is not true if truth-telling might be painful. Yet in some situations – e.g., in communication with the authorities – the Russian culture shows greater tolerance for telling a lie (*vran'e*) than does Anglo culture does (for more details, see Shmelev 2005).

Addressing the hearer by name in the middle of a discourse is quite common in Russian, but very rare in Finnish, except for purposes of securing someone's attention unambiguously in questions and commands. Names may be used as fillers of pauses in Russian conversation, whereas Finnish conversations show a great tolerance for silence, which does not cause any discomfort among the interlocutors. Addressing the hearer by name in the middle of the discourse may sound extremely personal in Finnish, and conversely, addressing the hearer by name in utterances referring to some negatively evaluated situation would sound pushy in Finnish, as if the addressee were held responsible for the state of affairs. Or, again, if a Russian addresses his/her Finnish interlocutor in accordance with his/her conversational habits, the latter interprets it as a hidden accusation of lack of attention (Leinonen 1985).

In cross-cultural communication, an interlocutor who speaks the language of his/her interlocutor faces an alternative: Should s/he use conversational routines of the language of communication (which would often be inconsistent with his/her communicative intention)? Or should s/he put into the focus what would be kept in the background if s/he spoke his/her native language. In other words, if someone uses the conventions of the "other" culture in cross-cultural communication, s/he does not circumvent the possibility of misunderstanding, since the other person is not in the position to determine whether the interlocutor respects the conventions of his/her own culture or the culture of the other. This may pave the way to paradoxical situations, such that techniques of understanding become the cause of misunderstanding. Massimo Leone (2007), in this same collection, illustrates this point by a comparative analysis of different cultures of hospitality, with special focus on the tradition of Italian *cerimonie* and Iranian *taarof* (cf. also Levontina 2000).

Both of the above-mentioned mechanisms can work simultaneously. In her paper presented at the 7th ICCEES World Congress in Berlin (July 2005), Ludmila Stern discussed challenges that court interpreters faced at the International Criminal Tribunal for the Former Yugoslavia. Multilingual courtroom communication at ICTY involved a predominantly English-speaking judiciary and counsel, on the one hand, and Bosnian/Croatian/Serbian-speaking witnesses from the former Yugoslavia, on the other. Dr. Stern demonstrated that interpreting/translation techniques did not adequately deal with certain aspects of communication between

two strikingly different cultures. Interpreters were faced with the problems of conveying language- and culture-specific legal vocabulary and “frozen language” of the Anglo-Saxon court, which, from a linguist’s point of view, they distorted by using accepted interpreting techniques such as loan-words, cultural adaptations, paraphrases, etc. In addition, the simultaneous interpreting mode allowed a certain loss of information and a reduced level of accuracy. Similarly, interpreters could not always adequately convey the counsel’s strategic questions routinely used in the Anglo-Saxon court and unfamiliar to the witness from the Civil Law system. The problem went beyond the interpreters’ competence when interpreters were faced with the Yugoslav witnesses’ cultural script, as the witnesses made references to their culture-specific customs, way of life, values and relations, not to mention their perception of giving evidence and replying to questions (Stern 2005).

Along the same lines, an inquiry aiming at deducing the index of happiness for different nations uses the question *Are you happy?*, which is usually translated into Russian as *Vy schastlivy?* (lit., “Are you happy?”). This translation, however, is totally misleading, both for lexical as well as communicative reasons. First, the Russian word for “happy” is generally reserved for rare states of profound bliss, or total satisfaction of serious things such as love, family, the meaning of life, etc. (Wierzbicka 1992; Zalizniak 2003). The Russian translation of sentences like *We’ll be happy to come* would not include the Russian equivalent of *happy* (Shmelev 2003). Second, Russian conversational strategies do not encourage claims that the speaker is fine; such claims might be perceived as a kind of boasting. Therefore, the answer “Yes” in the inquiry is much less probable for Russian speakers than for speakers of many other languages, regardless of the level of “happiness” they experience; hence the results of such an inquiry provide the wrong picture of the “Russian character”.

Katriina Siivonen

Culture as anthroposemiosis

1. The basic flow of culture

The definition of culture has been a constant topic of discussion during the whole history of ethnological and anthropological research. Researchers have since the 1960s questioned the use of culture as a concept, which defines certain cultural wholes with clear borders. However, the question of the ontology of culture is still topical. First, it concerns questions of whether culture exists as a whole that is independent of observers and researchers; second, whether culture exists only as a flow of individual, heterogeneous and partly contradictory phenomena; third, whether culture is just different constructions describing different cultural wholes and produced for various purposes in human interaction. (See, e.g., Hannerz 1992; Borofsky 1994: 243; Gerholm 1994: 15; Moore & Sanders 2006: 5; Åström 2006: 82.)

My aim in this article is to give one answer to these questions by defining culture primarily as a signification process, in which exist different cultural wholes, both conscious and unconscious. I start with individuals and the possibilities they have of interpreting their surroundings and acting within them. At the end of the article, I touch more closely on questions of different cultural wholes.

In every situation in which a human being perceives something and interprets that perception, (s)he uses a sign. According to the semiotics of Charles S. Peirce, our possibilities of knowing anything about the surrounding world is based on sensations, which are organised with the help of signs, leading to perceptions, interpretations, and understanding of the world (Peirce 1992/1868). A sign is “something which stands to somebody for something in some respect or capacity” (CP 2.228). A sign is a whole comprised of three interrelated elements, illustrated in Figure 1 with three interlinked segments of line (Merrell 1995: 41–43; see also, CP 1.347; and Bergman 2004: 176–177).

Figure 1. An illustration of Charles S. Peirce's concept of sign.

In human interaction in the totality of a sign, an interpretant is a sign in the mind of a human being, a representamen, which is a material or immaterial manifestation of the sign, and the object of the sign (CP 2.228: 274–302). In front of an unfamiliar phenomenon, one searches his or her thoughts and formulates an interpretant that can organise the perception in the best possible way. After the perception, the experience of it with the interpretant functions already as a part of the following representamen, with the help of which it is possible to pass on information concerning the perception to someone else. One might also think the perception to herself/himself and interpret it as a new interpretant in her/his mind with a representamen presented for oneself. The new interpretant is in relation to its own representamen and its own object, and includes the understanding that the first interpretation brought about the perception. In this way a complementary, dynamic interpretant grows in the mind of a human being. With one can interpret new, similar kinds of perceptions. Interpretants and signs form chains, that is, processes of presentations and interpretations of signs. In every situation human beings have at their disposal a number of interpretants for organising the richness of perceptions. In every situation interpretants grow according to the available possibilities and form a number of chains of interpretants and signs (Deely 1990: 22–49; CP 2.303; Deely 1994: 94–96.)

Perceptions might also concern immaterial and/or material phenomena presented by other human beings, or natural phenomena. In the whole of the sign, the interpretant is connected to these perceived phenomena from outside of the mind of the perceiver and is completed in interaction

with them in the process of semiosis in interpretants following other interpretants. In other words, human beings remolds their understanding of the world of their mind in such a way manner that it becomes part of their understanding. At the same time, one's understanding and activities based on this understanding remolds the external world. This happens with all human beings, and the external world of all of them consists of signs containing thoughts expressed by other human beings and material surroundings. This is the basis of cultural change, creativity, learning and memories. (Deely 1994: 30–2; CP 7.536: 587.)

In the interaction between human beings, their chains of interpretants are linked to the chains of other people, the combined chains forming a network. One dimension of this network is time. John Deely writes about semiosis as a network that covers the whole *universum*. One part of this network is an interactive network between human beings and their surroundings. This Deely calls anthroposemiosis (Deely 1994: 22–31). I understand anthroposemiosis as a constantly changing relationship between human beings and their surroundings. In this network contacts between different individuals and their surroundings are composed of signs based on sensations. In this network signs are in a state of perpetual change, because the network consists of the chains of interpretants and signs, wherein one sign following another is never identical to the previous one.¹ In the process of semiosis, single, immediate interpretants become parts of dynamic interpretants, which are always wider than any single interpretant used in whatever situation. At the same time, dynamical interpretants change continually and grow through single, immediate interpretants (Bergman 2004: 401–402).

Through the process of semiosis, it is somehow possible to discern dynamical interpretants of a human being always at a certain stage of life. These are matters that one has learned, remembered and produced; in other words, it is a person's life experience and life work. Through semiosis, it is also possible to discern the life work, life experience and memories of mankind, from which the semiosis of the individual person can not be disconnected. But it is more difficult to discern the particular semiosis of any group of people that one may define as the possessed culture of that group. This is difficult, whether the group is defined according nationality, ethnicity, locality, ideology or, for example, some organisation. Human fields of interaction are not limited to any border in time, space or social

organisation. People are always connected to other people, and these last are connected further to other people, until the whole world is encircled many times. Hence semiosis is a global process, as is obvious in the global world of our time.

The anthroposemiotic network consists first of the physical world with nature, people and a material environment produced by people, that is, artifacts, buildings and cultural landscape.² Second, this network consists of concepts, thoughts and stories, which people exchange with each other.³ So, in this network both material and immaterial elements are equal and have a mutual impact on each other. Change is a basic quality of the network, since people, their thoughts, perceptions, and so on are constantly changing. The creative core of culture varies and changes continually in the process of anthroposemiosis. It is impossible to prevent changes in culture.

The process of anthroposemiosis gives one form of existence to culture, and in my understanding, this is the basic form of culture. According to this, culture is a global, constantly changing diachronically and synchronically varying process, including both material and non-material elements. As a part of all this, both internal and external matters of the human mind vary and change. This happens in the interaction between human beings and their surroundings, which includes social interplay. The basic element in culture is the human individual. The wholeness of culture exists as an interactive network between individuals and their surroundings, in which they have a mutual impact on each other. This kind of wholeness is never total in the sense that it would be possible to find some part of semiosis that all individuals involved would know, remember and recognise as the same kind of whole. But it is a totality in the sense that nobody can live separated from it.

2. *The creative skill of habits*

Besides being something that changes, culture has been seen as habitual, homogeneous, and having the ability to resist change (see Borofsky 1994). It is possible to attain these qualities of culture with the help of the concept of the sign. In *firstness* the sign is *iconic*. In the purest form it is just a sensation, without any conceptual form. In *secondness* the sign gets its form. Its physical elements are organised in relationship to each other and

form a whole as an *indexical* sign. In *thirdness* the experience of qualitative, iconical elements of the sign and the indexical relationships between them are combined to become a whole with an interpretant. In other words, the experience of the representamen is combined with the human and cultural understanding of the world. The symbolic sign in thirdness is the conscious and manifested rule that explains the sign. All people compile their iconic, indexical and symbolic understanding of the world in the process of anthroposemiosis in interaction with their surroundings. (CP 2.243–264; Deely 1994: 27, 53–58.)

Peirce has expressed the conformity of a sign and an interpretant with the concept of *habit* (CP 1.530–536). Every sign in the present moment is connected to coming signs and also to previous signs, that is, to past time, habits, memories, experiences or, as it could also be expressed, to traditions. I see traditions as dynamical interpretants, which have perhaps already grown for a long time in the process of semiosis. The chain of immediate interpretants forming a dynamical interpretant can also be short; equally, the processes of compiling experiences and memories or the process of traditions can be short (see Bringéus 1981: 122–130).⁴ In the same manner, interpretants are always habitual and reproduce something from their previous interpretants. In the chain of interpretants, one interpretant following another can differ from it by a smaller or greater amount, but it cannot be totally separate from it. So, anthroposemiosis consists of both changing and stabilising elements, which create faster or slower change in its different parts.

Habituality is one characteristic of the interpretant. This brings a tendency of stability to the process of semiosis. In this process, one sign following another is very close to the previous sign, but always deviates slightly from it, according to the basic nature of the sign. A habit is no longer a conscious symbol in the mind of the perceiver and interpreter of the environment. It does not actualise as interpretant to thirdness. It is also possible that the person in question has never had it in mind in thirdness. (See CP 1.530–536; Deely 1994: 57; Merrell 1995: 106–108.)

Some concrete actions and skills, even if highly sophisticated, are habits of this kind. They are very strong in firstness or secondness, and it is sometimes difficult to express them as symbols in thirdness. For instance, certain kinds of manual labor, involving tacit knowledge of a work community and the ability to act according to it, are not easy to verbalise com-

prehensively. Silent, non-verbal signs come across from one human being to another without argumentation in firstness and secondness, as with experimenting and imitating. However, it is possible to raise this kind of knowledge partly to thirdness and make it more visible and conscious with argumentation. (See Merrell 1995: 106–108; Polanyi 1969; Borofsky 1990: 78–104.)

Consciousness of habits raises conformities to thirdness and to reasoned thoughts and speech, and at the same time opens the way to changes and creative solutions. Consciousness is aroused by facing up to something different and unconventional. Art is one cultural activity that plays with conventionality and makes it visible by releasing habits from everyday routines and putting them into objects of conscious perceptions and interpretations. In fact, everyday routines themselves consist of creative and changing power. Maarit Knuuttila has analysed this in her empirical research concerning home meals and cooking. According to her, cooking is the imaginative combining of food ingredients which every now and then creates new and fresh elements in life (Knuuttila 2006: 253–260).

3. *Cultural wholes*

In addition to the basic cultural process of anthroposemiosis, there are two different ways in which cultures exist. First, all people are connected to the global whole of anthroposemiosis through their own surroundings, both material and non-material. All persons form part of the process of anthroposemiosis, which they are constantly re-creating, but also constantly repeating and remembering throughout their whole life. When some people form relatively homogeneous elements of anthroposemiosis through mutual interaction, it is possible to make visible a relatively homogeneous culture with some kind of wavering borders. Connective, but not totally common, memories and traditions guide perceptions, interpretations, actions and productions of new things in somewhat similar ways. Interactions can occur in a place, which may also be on the internet, or through common interests, media, international organisations or international trade, with intertwining chains of both local and global signs. Common traditions exist in homogeneous condensations of this kind, although they are not conscious events and people are not aware of the homogeneous condensation.

Second, cultures exist as a shared consciousness about their own cultural distinctiveness in relation to other kinds of distinctiveness, be they national, ethnic, or local. In this way, cultures are seen as distinctive wholes with a common cultural heritage (see, e.g., Hall 2003; Barth 1969a and 1994). In these situations, consciousness about specific cultural originality is argued in thirdness, and specific features are presented as symbols that tell about proper distinctiveness. It is possible for an organisational power to support symbolic originality of this kind. Nations, regions, ethnic groups, ideological groups, organisations, for example, have their own supporters who create and uphold their own spirit. But symbolic originality also exists in everyday life.

Consciousness about one's own cultural distinctiveness grows through cultural interaction when people encounter something different, as Fredrik Barth remarked long ago (Barth 1969a; see also, Barth 1994).⁵ This symbolic distinctiveness can be expressed as single and clear symbols, such as national flags or songs. The distinctiveness of a culture is, however, also expressed as a symbolic sign or story about its originality.

It is interesting to observe that symbolic stories about certain cultures, with their original, symbolic traits, are not necessarily the same as common and noteworthy phenomena in the relatively homogeneous condensations of the same people. But the symbolic cultural wholes and relatively homogeneous cultural condensations of the same people cannot be totally separated (Barth 1969b and 1994). In the global process of anthroposemiosis, in the process of everyday habits and actions, argued symbols and silent knowledge, cultures argued as symbolic wholes can never be totally separated from other, corresponding cultures, and the homogeneity of a symbolic cultural whole is never total on the level of everyday life. All stories and symbols telling about distinctive cultures are eventually subordinate to and subsumed in the global process of anthroposemiosis. As symbols always do, they are unavoidably changing and varying, growing and becoming unconscious habits in the local and global process of semiosis. Still, individual creativity intervenes in these collective symbols, as it does with other cultural phenomena.

Notes

1. Peirce writes that an interpretant can be equivalent or perhaps more developed than a representamen: “A sign, or *representamen*, is something which stands to somebody for something in some respect or capacity. It addresses somebody, that is, creates in the mind of that person an equivalent sign, or perhaps a more developed sign” (CP 2.228, original emphasis). Deely clarifies Peirce’s view of the nature of signs as constantly growing and changing elements in the process of semiosis (Deely 1990: 23). See also Bergman (2004: 401–402) on change as a central part of Peircean semiotics.
2. Because the physical world has become a part of human perceiving and conceptualising, it can be described with Jakob von Uexküll’s notion of *Umwelt*. This last is that form of the world that can be perceived by the human senses and cognized in human concepts. (See Deely 1994: 42–46; Uexküll 1981).
3. In the entire process of semiosis the mental parts of signs, that is interpretants, chains of interpretants and networks of interpretants, are in constant interaction with the external matters of the human mind, that is with *Umwelt* (Deely 1994: 42–48).
4. “Tradition” is seen here as cultural products that vary and change in the interactive human process, not necessarily as cultural phenomena of a particular and distant past (cf. Anttonen 1993).
5. Barth points out that culture and ethnicity are so closely connected that it is possible to use them side by side (Barth 1994: 176). Ethnicity, if an excellent example, is not the only definer of cultures.

Palaeolithic cave-paintings as cognitive maps

1. Introduction: The nature of cave paintings

In 1879, Marcelino Sanz de Sautuola, a Spanish amateur archaeologist, began to explore the Altamira caves on his property in the Spanish Cantabria in search of prehistoric artefacts and pieces of portable art. One can only imagine how he must have felt, when his five-year old daughter Maria asked him to lift his gaze from the floor and look up at the cave walls. According to his own testimony, he was dumbstruck with awe, when he realised that he was staring at hitherto unknown kinds of ancient paintings representing images of bison. After a careful investigation of the evidence together with Juan Villanova y Pierra, a Professor of Palaeontology in Madrid, Sautuola came to the conclusion that the paintings must originate from the late Palaeolithic period and, thus, be over 10, 000 years old (Lewis-Williams 2002a: 30–33).

His bold claim was strongly opposed and ridiculed by professional archaeologists of his time. Sautuola was even accused of forgery. However, new discoveries soon followed from other parts of Southwestern Europe; finally, in 1902 the claims of Sautuola got official academic recognition, and the search and interpretation of these earliest known examples of human produced art could really begin. Indeed, by now around 150 sites with Palaeolithic cave-paintings – dated between 40 000 and 15 000 years ago – have been found in Europe alone, and additional sites in South Africa and Australia provide further evidence that we are dealing here with a universal phenomenon (Mithen 1996:178; Soffer & Conkey 1997: 2; Clottes 1997a: 205).

With the growing amount of new finds it has become quite evident that Palaeolithic cave-paintings – even if we confine ourselves to Franco-Cantabrian evidence only – is very diverse in form and nature. For exam-

ple, while some of them are situated deep inside the caves, others can be found near the entrances of caves or even in open rock shelters and open-air vertical rock surfaces. In addition, the caves and shelters are unique in the sense that they differ in form and size, so that no common features are easily identified between them (Clottes 1997a: 203–204; Lewis-Williams 2002a: 28).

Also, as pointed out by R. Dale Guthrie in his recent work *The Nature of Palaeolithic Art*, the level of skill and concern used for producing individual images varies greatly, from highly artistic expressions by expert hands to casually and undisciplined images painted hastily, maybe by youngsters, and often left uncompleted (Guthrie 2006). We should also keep in mind that that Palaeolithic cave-paintings were produced from around 40,000 years ago until about 15,000 years ago, covering a period of 25,000 years. This is a very long time period for any cultural practice to survive, so some variability in the production of cave-paintings is only to be expected (Mithen 1996: 178).

At the same time, there are some intriguing common features shared by most or all of the known sites. To begin with, the motifs of cave-paintings can be categorised into four clear groups. The earliest figures produced by the Palaeolithic artists appear to have been the hand-prints. These were produced simply by applying paint to the palm and fingers and then pressing the hand against the rock. Alternatively, a hand was placed against the rock wall and then paint was blown from the mouth over it so that when the hand was removed, its outlines survived on the painted cliff wall (Davidson 1997: 148–150; Lewis-Williams 2002a: 29). Second, there are the occasional and highly stylistic anthropomorphic images. Indeed, anthropomorphic representations are less common than others and they occur mostly in later sites. When they are present, they are more stereotypical than animal representations and often nothing more than crudely drawn iconic symbols (see Humphrey 1999: 121–122).

The third group consists of abstract signs and markings, such as circles, dots, grids and other types of geometric forms. Interestingly, though there are numerous different abstract signs in the material, certain forms – some of them quite complex – recur in the ethnographic evidence. According to Lewis-Williams and Dowson, these include nested catenary curves, sets of parallel lines and expanding hexagonal patterns (Lewis-Williams & Dowson 1988: 201–245). Finally, there are the highly naturalistic

animal images, primarily of terrestrial ungulates like bison, horses, deer and aurochs (González Morales 1997: 193–194). These images outnumber those of other categories, clearly being the most common motif (Hayden 2003: 105; Trompf 2005: 225).

A second common feature of the sites is that the casual, less ornate cave-paintings are mostly found near the entrances of the caves, whereas fine carvings and paintings are mostly represented deeper inside caves. This might be explained by the fact that few people went to the end of caves; those were the true craftsmen of the trade, who painted figures that were not meant to be seen by many people if at all (Clottes 1997a: 212–213). This takes us to the third shared feature of Palaeolithic cave-paintings, which is that the image makers used special features in the rock surfaces in their work. Many of the paintings follow the natural features of their surfaces, and sometimes an undulation in the rock becomes the dorsal line of a painted animal in suitable lighting. Indeed, in the light of a flickering torch, the moving shadows gives an impression that the walls are alive, and it becomes very easy to see animal shapes in the rocks. It appears that in such instances the image-makers simply added legs and other features to such shadow animals. One can argue with Lewis-Williams, that there is a real interaction between the image and its surface (Clottes 1997a: 211–212; Lewis-Williams 2002a: 210–223).

Indeed, while it might be too much to argue that Palaeolithic art is “animalist” in the sense that it is all about animal representations, we cannot ignore the fact that these play a major role in the repertoire of Palaeolithic image-makers (see González Morales 1997: 194). Thus, in what follows I focus on these animal representations and refer to the other categories only when they have some relevance for understanding my main topic.

2. Explaining animal representations in cave-paintings

Close study of the animal representations is of course nothing new. On the contrary, it has been the preferred strategy by most scholars dealing with Palaeolithic cave-paintings. Thus, in order to make clear what I want to argue here, we must start by taking a look at how animal representations have been dealt with by these previous writers.

Historically speaking, the first response of modern scholars was to take animal representations as purely decorative. Our Upper Palaeolithic

ancestors were thought to be too primitive to possess any capacity for symbolic thought; so what we have in animal representations is “art for art’s sake”, which our ancestors produced simply in order to pass time between hunting missions (Bahn & Vertut 1997: 170–171). It soon became obvious that this claim could not be true. From other types of evidence, such as portable artefacts, we now know that Upper Palaeolithic populations were quite capable of symbolic thought (Dickson 1996; Mithen 1996: 171–210). Even so, this approach has experienced a recent revival in the works of some contemporary scholars, who argue that the driving motivation for the creation of cave paintings is aesthetic experience and that, in this task, the image-makers – living in hunter-gatherer societies – used as models the motifs they found in their everyday experiences (see Humphrey 1999; Guthrie 2006).

Even this weaker formulation of the art-for-art’s-sake argument is, however, not that appealing, for two reasons. First, heuristically speaking it lacks potential for provoking further questions and research. Second – and more importantly – as anthropological and historical research clearly demonstrate, the aesthetic emotion was not considered a crucial element in art until eighteenth-century Europe. That was the birth time and place for art in the modern sense of the word. Before then, and in most traditions and cases even today, art is produced for certain purposes, usually to serve the interests of the community in which it is created (Dissanayake 1992: 39–42; Coe 2003: 64–66). This takes us to the second and most popular approach to explaining cave-paintings, which is to decipher their meaning and function.

The most widely held interpretation of cave-paintings has been that they were produced as part of rituals of hunting magic. The images, it is argued, were intended to give hunters power over their prey. The argument is backed by the fact that most of the animal images depict game animals, many of which seem to have spears or other projectiles sticking into them. Most recent scholars find this suggestion unconvincing, however; for example, Margaret Conkey, among others, notes that modern ethnography seems to indicate that hunter-gatherers were not necessarily “anxiety-ridden about food and the hunt” (Conkey 1981: 24; see also, Dickson 1996: 126–129; Lewis-Williams 2002a: 45–48).

This is why other functional explanations have been proposed as well. In the early decades of the twentieth century, one favoured idea was to

interpret the animal images as totemic. However, no real evidence has been adduced to support this argument (Dickson 1996: 124–125). A stronger case is made by scholars who claim that animal images depict spirit-beings connected with a shamanistic cult. This view is consistent with what we know about the religious practises of modern hunter-gatherers. It also seems to explain why images and the surfaces on which they are painted interact with each other as described above. Maybe the Palaeolithic people envisioned the caves as entrances to the spirit world. But simply because animal images are associated with shamanic practises in historic times, does not guarantee that they were so associated in the Palaeolithic – at least all of the known images (Dickson 1996: 129–137; Lewis-Williams 2002a; Hayden 2003: 105–108; Trompf 2005: 224–234).

The most important thing we have learned from functional explanations is how difficult it is to discover the meaning of signs that lack ethnographic, ethno-historic or textual anchors. Indeed, today we have nearly as many explanations of the meaning of cave-paintings as we have scholars addressing the subject (Dickson 1996: 123–158; Soffer & Conkey 1997: 6). More recently, this has led to a third strategy for explaining animal images: not through their function, but as signs of world-views or cosmological maps drawn on cave walls (Bahn & Vertut 1997: 189–197; Lewis-Williams 2002b: 73–93). This approach is heavily influenced by structuralism. Thus, it has been argued that cave-paintings' structures are grounded in the structures of the human mind; hence analysing the patterning of the images also reveals the structuring of the Palaeolithic mind. The main methodological weakness of this approach is that it takes as a given that individual images are parts of larger, integrated compositions. As demonstrated by Jean Clottes, among others, this is clearly something that we can neither assume nor demonstrate (Clottes 1997b: 37–52). Indeed, according to Clottes, modern techniques of paint analysis demonstrates that sometimes similar looking images situated close to each were actually painted thousands of years apart. This finding in effect ruins the argument for cosmological maps.

Finally, influenced by modern information theory, cave-paintings have been approached in terms of media for transmitting information. In this approach the idea is to view the animal images as vehicles carrying information between the image-maker and his audience. In other words, through cave-paintings the image makers could signify their power and

social influence beyond face-to-face contacts (Soffer & Conkey 1997: 7; Gamble 1999: 382–383). For this approach the motifs of cave-paintings are of secondary importance, and the main question is why cave-paintings in general were created by the Palaeolithic peoples.

While much can be said in favour of this approach, the insights it provides are severely attenuated by the fact that so little is known about the referential social context of cave-paintings (Soffer & Conkey 1997: 7). Moreover, as art historian Ernst Gombrich points out, images convey information poorly. What they do well is to evoke emotions. Thus, as information-carrying vehicles, cave-paintings work best as triggers for emotional memories (Gombrich 1982). Without more detailed information about the Palaeolithic culture and the image-makers as individuals, the social function of cave-paintings remains as much a speculation as the explanations of the previous approaches. Nevertheless, it does open some interesting avenues – especially when combined with insights from the other approaches – and to explore one of them is the aim of the present article.

3. Cave-paintings and emotional communication

In my view an information-theoretical framework may possess great heuristic value for gaining understanding about cave-paintings. Yet, following the suggestions of archaeologists like Steven Mithen and David Lewis-Williams, I suggest that, instead of turning our attention to the contextual social environment, we follow the structuralist method and approach cave-paintings in terms of human cognition.

My suggestion, therefore, is that we examine cave-paintings – not as signs of power, nor as expressions of cosmology – but as cognitive maps. More precisely, animal images functioned as cognitive tools used in Palaeolithic society for transmitting and transferring emotional markers (see Liben 2001: 45–47). By creating shared emotional environments, they enabled the birth of culturally shared meaning for whatever cultural information was attached to them by the society.

It has long been known, that humans use animal images in symbolic communication. In the words of Stanely Walens:

Wherever they appear, animal symbols are used to convey the deepest and most abstruse dimensions of human existence. They are symbols of core values and categories, representations of the most fundamental ideas and images of a culture. As core symbols, they are multivalent, complex, anti-monic, used simultaneously to capture and display many different image and meanings at many different levels. As core symbols, they also serve to link other domains of symbolic discourse, creating juxtapositions and contrasts of images from which people derive meaning and from which they generate narrative forms. The natural realm of animals is an important part of the way in which people project their knowledge and experience through symbolic discourse. (Walens 1987: 291)

Nevertheless, animals do not only symbolize core values, neither are they by any means restricted only to religious communication. As a group, animal images seem to overshadow all other types of motifs in general. In the words of the famous French anthropologist, Claude Lévi-Strauss, animals simply are good to think about (Lévi-Strauss 1969: 89). By this he means that the use of animals for symbolic communication is due to the fact that they enable us to make abstract ideas more concrete. This is because animals, in contrast to abstract beliefs and ideas, belong to our natural environment. This way empirical representations of animals ground abstract representations in our everyday experiences and make these last easier to grasp and remember (Lévi-Strauss 1969: 92–104).

What I argue here, instead, is that animal images are used for symbolizing – not because of their concreteness – but because they evoke emotional responses in us. They are tools for creating meaning and relevance through emotional contagion. Animal symbols are especially suitable for this purpose, because we humans seem to have an innate affinity to react emotionally to living beings and life-like processes. Following the biologist E. O. Wilson, I will refer to this affinity as *biophilia* (Wilson 1984). Biophilia evolved in our species because it enables us, in any given situation, to make appraisals of what is relevant for us and what we can ignore. According to Richard Lazarus, emotions are manifestations of such appraisal processes (see Lazarus 1991: 134–135). Moreover, while emotions do play this role in all kinds of interactions, their role is highlighted in cases where we interact with animals or humans, where the nature of interaction is often fast and quite literally connected with survival (see, e.g., Jerison 1991; Guthrie 1993; Buss 1999: 312–314).

My suggestion then is that the Palaeolithic animal images are symbols used to convey emotional signals. An immediate objection to this view is that if the strength of emotional responses is based on the strategic importance of the situation at hand, then why do we not always represent religious ideas and entities in human form? After all, it is generally agreed that it is the social realm which is the most basic for us, and that emotional communication with other individuals in our social group is what really matters to us. Wouldn't humans be an even better symbol for creating emotional responses? Human images in Paleolithic art, however, are few and highly stylized.

Indeed, we do frequently represent gods and other counterintuitive entities in human form, so the anthropomorphic tendency is certainly present (e.g., see Guthrie 1993; Boyer 2001: 142–144). But when we are trying to create a shared emotional environment, where all members of the community hold similar emotions towards specific issues, the use of anthropomorphism might not actually be the best strategy. This is because we tend to deal with humans on the individual or group level. There seem to be no evolved emotional responses to humans as a species. Indeed, since we ourselves belong to this species, how could there be? This means that emotional responses to other humans are situational and conditioned locally. It also makes them untrustworthy as markers of emotionally conduced meaning.

With animals the situation is totally different. In most cases, when we see an animal we react to it first as a representative of a certain species and only secondarily as an individual in its own terms. In short, animals signify to us as representatives of their species, and we represent them in our minds as such (Baker 1993: xvi; Shepard 1993: 275–300). In evolutionary terms this makes sense, because in our interactions with representatives of other species it is their shared characteristics (such as, they are usually dangerous to us, we can eat them, and so on) that provide the basis of our relationship with them. Indeed, our emotional responses to some species appear to be of very ancient origins, going back to the time when we shared an ancestor with our closest relatives, the primates (Mundukur 1983: 218–23; Shepard 1993: 278–279; Jones 2002: 25–54). Such responses are deeply rooted and universal for all humankind. This makes it rather easy for us to manipulate them in symbolic communication, because reactions to certain symbolic cues are everywhere the same. It is this combination of strong and stere-

otypical emotional responses that makes animals, or at least some species or types of animals, optimal for symbolic communication of meaning.

Why language sign-systems are the most popular of all sign-systems

1. Classification

Languages occupy the middle position among the various types of sign-systems.

1.1. In my system of classification, I divide sign-systems into five categories (stages) based on their types and on the degree of abstractness of the signs they contain. This classification scheme has a hierarchic structure that reflects both the progressive phylogenetic development of the human race and the ontogenetic growth of each individual.¹ The hierarchy, and the basic signs contained in each type of sign-system in the hierarchy, is summarized in the following diagram:

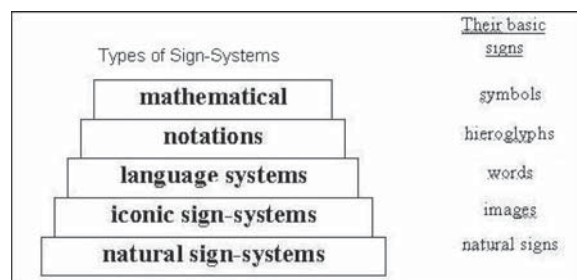

Figure 1.

This classification scheme is most easily understood when the basic signs of each type of sign-system are explained sequentially, beginning with the lowest level of the hierarchy, as follows:

1.1.1. Natural signs, the basic signs of natural sign-systems, are things in and of themselves – visible (or audible) elements of an item that represent the whole item. These objects allow us to conjure up the whole item when

we cannot sense it directly. For example, a visible pillar of smoke may tell us that a fire is burning, when that fire is not otherwise within the scope of our senses. Similarly, a light coming from a window may suggest that the inhabitant of the room is at home.

1.1.2. Images, the basic signs of iconic sign-systems, are not parts of a real object but a reflection of it; they represent the things they signify because they resemble the forms of those things. Clearly, images are more removed from the things they signify than natural signs, which are themselves parts of the objects.

1.1.3. Words, the basic signs of language sign-systems, are generally arbitrary signs, having no intrinsic resemblance to the things they signify. As such, they are more distant from the things they signify than images are, because, unlike images, they do not resemble those things. Yet words do have an extra-systemic relationship to the things they signify, in that they represent actual things that exist in reality, beyond the bounds of the language sign-system to which they belong. For example, the word “table” represents an actual thing that exists outside of the English language.

1.1.4. Hieroglyphs, the basic signs of notational sign-systems, only exist within specific sign-systems, and only in relation to the other signs in the sign-system. Their purpose is to represent something within a sign-system in graphic form. For example, the letters of the alphabet are hieroglyphs that represent sounds in graphic form. Although hieroglyphs are more abstract than words, they nevertheless maintain a constant relationship with the things they represent. Thus, the written form of the word “table” is always “t-a-b-l-e”, and the individual letters that compose the word “table” continually represent the sounds assigned them by the particular language whose alphabet contains them.

1.1.5. Symbols, the basic signs of mathematical sign-systems, are more often than not chance notations for dealing with ad hoc situations. For example, “z” may mean weight in one situation and something entirely different in another. Thus, symbols are signs with the remotest possible connection to their referents. These are the most abstract of the basic semiotic signs.

1.2. As the descriptions of the various types of basic signs show, the degree (quantum) of abstractness rises as we move from the bottom of the hierarchy of sign-systems to the top. That is to say, as we move up the hierarchy from one type of sign-system to the next, the basic signs become

more and more distant from their referents and, consequently, more and more abstract in their nature. This increased degree of abstraction is also reflected in the process by which people become aware of each type of sign; both in terms of individual cognitive development and in terms of collective human development, each type of sign is introduced to our minds in succession, one type after the other, from the least abstract to the most. This sequence is apparent in the histories of various sciences and also in studies of human psychology (Jean Piaget and others). Parents can also observe this progressive development in their own children's growth.

It is important to note that the linguistic stage is situated exactly in the middle of the hierarchy. That is, words, the basic signs of language sign-systems, are intermediate in their quanta of abstraction, equidistant from the extreme ends of the continuum. I will return to this point later in my discussion.

2. *Four different functions of signs*

2.1. Most discussions of semiotic signs attribute only one distinctive feature to semiotic signs: denotation. That is, according to the standard point of view, the function of signs is to denote their referents. By contrast, I identify four distinct primary functions of semiotic signs when they are grouped in sign-systems. Denotation is of course the most prominent function of a semiotic sign, since it is the *raison d'être* of the sign, but in my view denotation is only a single element of an entire constellation of functions. Besides denoting their referents, signs also characterize them in some fashion and represent them in sign transformations. In addition, some signs are used to explain other signs and their transformations. Whereas the functions of characterization and representation are present in any sign, explanation is generally limited to linguistic signs, and usually occurs in one of the registers of human language.

2.2. Characterization – identifying the characteristics of a referent – is very prominent in natural signs, where it takes the form of sign connotations. In natural signs, connotations accompany and are incorporated into the denoting element of the sign: while a footprint denotes the imprint of a foot, its connotations may reveal whether it was a human foot or a paw that left the imprint, whether it was produced by a child or an adult, whether it is fresh or old, etc.

With natural signs, all the characterizations are produced through natural occurrences, and are only identified by people later. In all other types of signs, the characterizations are usually developed and implemented by people, and are essentially syntactical components of the signs. For example, in the sign denoting a benzoic molecule, some bonds between the atoms of hydrogen and carbon are expressed by two dashes, and some, by a single dash. These dashes characterize the valences of the atoms they denote and the relations between the atoms. Unlike the characterizations of natural signs, the characterizations of this sign were produced by humans using special designations (dashes). In this case, the dashes characterize the sign by designating its syntactic components.

The more abstract a sign is, the greater the role played by its syntax. As we move up the hierarchy of abstraction, syntax gradually comes to occupy the dominant position in the construction of signs. At the highest hierarchical level, the denotational components of signs are minimal; symbols are chosen to represent their referents at random, either at the whim of the sign-system user or in accordance with the accepted forms used in the relevant construction (i.e., the algorithm). For example, we can use algebraic signs randomly to denote their referents, as long as we abide by the accepted rules of algebra. Nevertheless, we must be careful to use the algebraic signs that represent the syntactic features of algebraic constructions in ways that reflect the actual relationships between the referents – that is, according to the real, substantive characteristics of the referents.

2.2.1. Note that connoting traits are found only in natural and iconic sign-systems, while syntactic characteristics are extant at the highest levels of our classification. These two types of characterizations are distinguished by their origins: connotations develop in nature, whereas syntactic characterizations are human inventions. In language sign-systems, which occupy the middle level of the hierarchy, these origins are merged. For example, in everyday language, common words are used also as characterizations; this trend can be viewed as a natural process because it is not planned deliberately by anyone. On the other hand, language that is used by specialists in a particular field (e.g., scientific language) relies on characterizations that are designed purposely by its users.

2.3. Representation – replacing referents in sign transformations – is the primary function of signs in systems of higher abstraction. These sign-systems are formed not only to aggregate signs together, but to process

them in accordance with the metalinguistic rules of the systems – that is, to transform them.

We can understand this function better if we consider how the use of signs and sign-systems developed. People noticed very early on that they could make use of designees in place of the things they designate, of signs instead of their referents. By doing so, they were able to obtain new knowledge in many situations in which working with natural objects was impossible or ineffective. Over time, this kind of investigation became accepted and came to be viewed as completely normal. Eventually, people began to actively build sign-systems with the express purpose of investigating things through processing their signs instead of processing real-life objects. Sign-systems of this latter type are composed of signs with very high degrees of abstraction. Because their purpose is to enable the processing of the signs they contain, syntactic traits usually appear in processing their signs, the function of representation in them takes on far greater significance than the denotational components of the signs.

2.3.1. Still, the processing of signs takes place in all of the types of sign-systems. In natural sign-systems, the processing of the signs is defined by their connotations. That is, the guidelines for handling signs are fixed in advance and built-in. For example, in the case of the footprint mentioned above, we behave differently depending on whether the footprint was made by a child or by an adult, whether we know the make of the footwear, etc.

In iconic systems, the guidelines are set up mostly by the sign-system user. Thus, a sculptor who receives an order for a particular sculpture, including specifications, nevertheless produces the sculpture largely in accordance with his own tastes and preferences.

Only in the systems of higher abstractness are our processing options defined exclusively by the rules of the system. And the stricter those rules are (they become more and more rigid as the system's abstractness increases), the less we are permitted to deviate from them. That is why it is possible and even necessary in the notation and mathematical systems for guidelines to relate primarily to syntactic content, such that the denotational components only fill secondary roles.

Processing guidelines of language systems contain both denotational and syntactic components, in balanced, equal measure. Although the syntax in languages is rather rigid (we learn its rules and regulations for many years), it nonetheless allows us to utilize many alternative construc-

tions to express one and the same idea. Thus, this is another case in which language systems occupy a central and balanced position in the range of sign-systems.

2.4. Signs cannot exist without props that help us understand and use them. Some signs obtain their props from their affinity and resemblance to the things they designate, as in the case of a photo and the object it represents. Other signs, being remote and detached from the things they designate, obtain their props from the systems that contain them. The props of these more abstract signs are controlled and guided by the syntactic guidelines of their systems.

2.5. Explanations are props that make use of language to help the users of abstract sign-systems keep their bearings. When people deal with highly abstract sign-systems, they are surrounded by intangibles and can quickly lose track of their connections to the real world. In such cases, the users need something to moor them to their common sense and to familiar surroundings. For this purpose, they can find support in linguistic explanations.

Of course, different types of people require different linguistic props to help them decipher particular abstractions. Specialists may find a few hints sufficient, and highly-educated people may be satisfied with less detailed explanations than those required by a relatively uneducated audience. But language, being such a powerful and all-encompassing system, can fill all of these needs (see below). It can explain the intricacies of every system to every kind of observer.

2.5.1. For the sign-systems that are lower than languages on the scale of abstraction, language is used to raise the level of abstraction to its own level; for systems whose level of abstraction is higher than that of language, explanation lowers the quantum of abstraction. Thus, we usually accompany photos with inscriptions to explain their contents; in this case, we elevate the iconic level of abstractness to the linguistic one. Similarly, we supply pictures and sculptures with names, and when we deal with natural systems (in overviews, in collections, etc.), we always furnish users with written or oral instructions. By contrast, when we explain scientific transmutations by using words, we lower their high charges of abstraction. Thus, language functions as an equalizer, bringing the results produced in other systems to its own level of abstraction, and thereby helping us understand and interpret them.

2.5.2. Words are frequently included in the transformations of other signs, interrupting the transformations with explanatory remarks and instructions. In mathematical calculations and chess notations, for example, we come across words and even full sentences whose purpose is to clarify the abstract transmutations. The words that are inserted can also serve to provide the structure for the next stages of transformation. We also insert words in medical and demographic schematics to help make them intelligible to ordinary readers; without these linguistic insertions, these schematics would remain empty syntactic devices. More often than not, we sum up such transmutations with linguistic explanations. Sometimes, we follow these up with additional schematic summaries that rely entirely on words. Figure 2 illustrates this type of linguistic schematic summary, presented in the form of a table that, to my mind, contributes to my explanations in words, making them clearer and more intelligible:

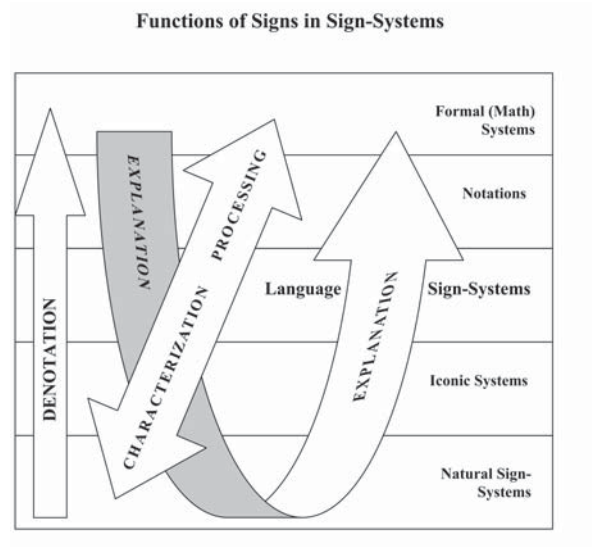

Figure 2. Functions of signs according to their quanta of abstractness.

2.5. We see in Figure 2 that it may sometimes even be necessary to mitigate the abstractness of linguistic explanations themselves. This can occur when we are using the higher spheres of a language. In these situations, we either employ language or an outline or drawing (like my figure above) to reduce the abstractness. This is done quite often in popular texts

aimed at non-specialists or poorly educated people. Because language explanations can be made as concrete as necessary, they are sufficient props for most signs.

3. *Summary*

At this point, I think it will be helpful if I summarize the various functions of signs I have identified:

Denotation: The main and decisive function of all signs is denotation – designating referents.

Characterization: Another function of signs is to characterize their referents – to identify the specific characteristics of their referents. In natural signs, the characterization function is implemented through sign connotations; in signs of higher abstraction – in their syntactic features. This function is present in signs of all levels.

Representation: A third function of signs is representing referents in sign transformations that are implemented in accordance with the rules of the relevant sign-system. This function is also present in signs of all levels.

Explanation: A final important function of signs is the explanation of other signs, of sign processing, and of its results. This function is concentrated mostly in language signs, since language systems are in the middle of the hierarchy of abstractness.

4. *Conclusions*

I cannot visually or in computational terms prove the existence of degrees of abstractness in signs – this is my theoretical conjecture. But this conjecture explains a lot of what occurs with various signs and sign-systems. This concept enables me to elucidate the features of languages that make them so powerful in explaining what occurs in other types of sign-systems.

4.1. Languages are powerful because they are the broadest sign-systems, intended to be able to express everything, both in ontology and in our thoughts. It should be possible to adequately reveal any shade of meaning, any nuance of our feelings and attitudes, in the words of any extant language. And if the existing words are not sufficient for articulating something, we may conjure up new ones, new signs in the language, because linguistic systems are open-ended systems. See, for example, *Ulysses* by James

Joyce; you will find new words on every page. And within the context of the novel, these new words are comprehensible and expressive.

4.2. As was already mentioned, there are many registers in each language, and these registers are of different strata of abstractness. There are, for instance, many languages of science; in fact, a distinct language exists for each branch of science. In each of these languages, common words are intermingled with technical terms and special concepts that are relevant to that particular science. In addition, linguistic strata exist for higher-level conversations (lectures and official communiqués), while other languages are defined for ordinary communication among various audiences. You can toy with all these levels of signs to make your message understandable. If you are not satisfied with the results, you can always apply to other strata and to non-linguistic back-ups in order to solve the problem. No other sign-system has such a variety of different means for conveying messages.

4.3. I have already pointed out that languages have very rich and flexible syntaxes. This allows us to build innumerable variations for expressing one and the same idea – innumerable alternatives for each sentence. No other sign-systems offer such opportunities: in lower-level sign-systems, syntax is restricted by external (out-of-system) constraints; at the higher levels of abstraction, syntax is intentionally made rigid to facilitate the most efficient transformations of signs.

4.4. Last, but not least, some of the power of languages derives from the fact that words can be altered during their syntagmatic formations to a much greater extent than signs belonging to other levels of abstractness. This concept requires some explanation. Signs are frequently changed in the course of their use; initial forms of signs are defined in dictionaries and legends, but these “dictionary” forms give rise to various derivatives in actual sign applications. Imagine all forms of a noun or a verb in various paradigms of a natural language, and you will understand my point.

4.4.1. The actual degree of deviation from the basic form of a sign can vary greatly; in some cases, it may not change at all, while in other cases it can even be changed to the point of becoming entirely unrecognizable. For example, in English, the verb “to be” is unrecognizable in the forms “was” and “were.” In other languages, cases of this sort are even more common. The changeability of the forms of signs becomes more apparent in sign-systems with higher levels of abstractness. In natural signs, deviations are normally close to nil. Thus, for example, evidence in criminal cases is

meticulously preserved throughout the proceedings. At the highest level of abstractness, changes in sign form become very prominent. Imagine any mathematical transformation, even the simplest one, and you can see how the form of the equation changes between the initial and the final expressions – modifications that occur even though all parts of the equation are connected by an equals sign throughout.

4.4.2. When it comes to form alterations, languages are once again in the middle position, balanced midway between sign-systems of minimal abstraction and those of high abstraction. Although alterations to words may be quite extensive, words are almost always recognizable in all their transmutations. This is necessary to ensure that we are always aware of what we are speaking about, so that we can immediately correct ourselves, respond with new arguments, and make meaningful amendments. By contrast, we are greatly deprived in this respect when we are involved in performing computations or other sign mutations in systems of higher abstraction, in which we are guided only by rules and instructions that are specified in advance. In these cases, we can only verify our procedures after we reach the end of a calculation, either by repeating the process anew or by implementing the established procedure for verification.

4.4.3. Our discussion of the functions of signs in general and of language sign-systems in particular leads us to the conclusion that languages are the most efficient systems for explaining the transmutations of other systems. This does not mean that languages are the most basic type sign-system, or that all other sign-systems developed from them. Nothing of the kind! It is my belief that the various types of sign-systems came into existence sequentially, beginning with those of the lowest abstractness and continuing with sign-systems of gradually increasing abstractness. Language developed in its turn, after the sign-systems of lower abstraction came into existence. It is not because of how or when languages developed that their current central function of explaining other signs became established, but because of their intermediate position in the hierarchy of sign-systems, and all that that position implies.

Note

1. I recently began dividing mathematical sign-systems into two subgroups, but this does not affect the current discussion.

Song Hyosup

Mythical thinking and anti-mythical thinking: Two semiotic models

1. Introduction

Dangun has been thought by most Koreans to be the progenitor of the Korean people. His story is found in the ancient document *Sam-guk-yu-sa* (*Stories of Three Kingdoms*) as follows. A bear was transformed into a woman by staying in a cave and eating only garlic and wormwood for 21 days. She gave birth to Dangun, who became the founder of Ancient-Chosun. In the modern era, this story was changed and memorized by Koreans such that the woman gave birth to Dangun, who became the *ancestor of the Korean people*. We can see mythical thinking operating in this change. In this case, a change of story is due to a change of thinking about that story.

The story itself is the *mythos*, while thinking about the story is called *logos*. A thinking of *mythos* is mythical thinking, that is, having a faith in the story itself, whereas a thinking about *logos* is anti-mythical thought, which provides the story with logical explanation. Generally, human thinking consists of these two opposite sides, but these two appear interwoven in real thinking situations. Starting from the assumption of two semantic terms, *mythos* and *logos*, this paper proposes two semiotic models of these opposing sides of human thought.

2. Mythos and logos

The opposition of *mythos* and *logos* is shown by the semiotic square in Figure 1 (after Greimas 1970: 136–140).

Mythos is a story, and a story consists of sequential actions. That the story is regarded as *mythos* means that it is believed to be an absolute truth, regardless of its logicity. Generally, it is told as heard from someone

Figure 1. *Opposition of mythos and logos shown by the semiotic square.*

without any doubt. In this case, the story is not thought reflectively but accepted as a transcendental message.

By contrast, *logos* is the logicity of story, the reasoning by which the story is validated. Logicity is always dubious in nature. It is destined to ask if the story is valid. The logicity of a story can be considered from two sides. One is whether the units of the story are combined with necessity and/or motivation, and the other is whether the story world has a valid relation with real world outside the story. The former is the problem of *plot*, which is mainly discussed in narratology. The well-composed story is accepted by virtue of its persuasiveness; while the story not so composed leads to suspicion of its truth value. The latter is the problem of *reality*. Criteria of estimating whether the story is plausible or not are found in the real world.

These two problems are deeply interrelated. For example, in the previous story, one may think that there is no logical necessity between the fact that a bear stayed in a cave just eating garlic and wormwood and the fact that the bear became a woman. It is because everyone thinks that such an event cannot happen in real world. Therefore, the logicity of story has to be estimated by criteria inferred from the real world. Such criteria of logicity are always variable, due to the variability of situations where stories are told. This means that there needs to be a certain compromise among different ways of thinking about stories whenever they are told. We can assume a discursive field of *logos* where conflicts of different interpretations of stories are compromised.

On the basis of these descriptions of *mythos* and *logos*, we can present a semantic relation between these two opposite terms. *Mythos*, that is, story itself, simply consists of actions, and hence can be represented as the modality *to do*. Every occasion of *to do* happens just once, so it can be described in terms of Peircean *Secondness* (cf. CP 1.322–336). However, if two *to dos* are combined, a certain logicity, Peircean *Thirdness* (CP 1.327–353), emerges

between them. This last cannot be represented as *to do*, but rather as *to be*. From this distinction, I suggest the semiotic square shown in Figure 2.

Figure 2. Opposition of *to do* and *to be* shown by the semiotic square.

Though the opposing relation between *to do* and *to be* is shown clearly in this figure, the two modalities are interwoven in complex ways in real storytelling situations. There is no absolutely pure story in the real world. Since stories always have to be told, logicity is inevitably given to them. In a word, *mythos* can only exist with *logos* in the real world.

Figures 1 and 2 show not only static relations of each term but also the dynamic operations among them (cf. Greimas 1970: 164). Movement from *mythos* to *logos* and its inverse are shown.

In order to pursue the analysis of these complex relations, some semiotic methods will have to be used. One of these concerns modalization. As shown in Figure 3, a narrative program inferred from mutual modalization between *to do* and *to be* can be a starting point (see Hénault 1983: 65)

manipulation		competence	/	performance		sanction
To do-doing		To be-doing		To do-being		To be-being

Figure 3. Narrative program inferred from mutual modalization between *to do* and *to be*.

In this process, the stages of *competence* and *performance* correspond to *mythos*, while stages *manipulation* and *sanction* correspond to *logos*. The whole process – from the planning of actions to estimating their results – is one of constructing the logic of the story. Even if the purpose of telling the story is to show *mythos*, the story always appears as *logos*, in that it is intended for or affected by someone (see Figure 4).

Logos appearing as a logic of story embraces not only linguistic reasoning (syntactic, semantic, or pragmatic) but also reasoning inferred from relations between story and real world (social, cultural, and histori-

Figure 4. *Mythos and logos shown in narrative program.*

cal). The subject of manipulation and the subject of sanction in Figure 4 respectively correspond to sender and receiver of messages in Jakobson's communication model (Jakobson 1987: 66). But in a real storytelling situation, they are revealed by means of various inferences. For example, in the Dangun story, the sender can be the author of a document containing this story, the original author cited in this document, or a large number of tellers of this story over the ages. It is same in the case of the receiver. Therefore, we can only describe the *discursive* sender and receiver according to an assumed communicative situation.

A *cognitive* dimension incorporating manipulation and sanction is always realized together with a *pragmatic* dimension embracing competence and performance (cf. Hénault 1983: 65). If we suppose a discourse consisting purely of manipulation and sanction, it may not be story but pure argumentation by means of which someone suggests a hypothesis and proves it. Even if it is proved, it may be questioned by others. Such doubtfulness is a typical characteristic of *logos*. If the cognitive dimension is complemented by the pragmatic dimension, its doubtfulness can be overcome in some degree. This shows the power of story.

In the cognitive dimension, the stage of sanction has more obvious characteristics of *logos* than does the stage of manipulation. In the stage of manipulation, someone acts in order to make someone act. But in the stage of sanction, someone does not just act, but acts so as to give sanction to the action already done. In this stage, there is no possibility to change the situation by action. Still, there may be a lot of other possibilities, as shown in Figure 5 (Greimas 1987: 71–73; Hénault 1983: 62).

Besides these semiotic possibilities, many pragmatic possibilities may also be realized in real situations where stories are told. This means that the stage of sanction can be the field of *logos* where many different interpretations of *mythos* collide.

Figure 5. Veridical modalities shown by the semiotic square.

I have already said that the logicity of *logos* becomes stronger with the help of *mythos*. If just one, among the many possibilities of *logos*, is realized, what happens next? Pragmatically, there occurs the making of belief, which may be a general process of human thinking. The change in the Dangun story shows the same process. It definitely shows a strengthening of *mythos*, but on the other side, a weakening of *logos*. The crisis of *logos* results from *mythos* drawn in order to support *logos*. As *mythos* becomes stronger, *logos* becomes weaker. This paradoxical situation is shown in Figure 6.

Figure 6. Strengthening of mythos shown in narrative program.

Logos becomes stronger as the subjects of manipulation and sanction reflect a whole storytelling situation. As new stages of manipulation and sanction add to the existing situation, the pre-existing territory of *logos* becomes the territory of *mythos*. Such a change brings about a strengthening of *mythos*, which, paradoxically, comes from a strengthening of *logos*. If the Korean people think about the Dangun story from a nationalistic perspective, many debatable issues become transformed into clear facts in their minds, crystallizing into a firm belief in which *mythos* and *logos* are no longer distinguishable. This clearly demonstrates the process of mythical thinking.

3. Mythos-logos *interaction*

We cannot make clear the point where mythical thinking arises, which indicates that *mythos* and *logos* are not distinguished clearly in human thinking. In real thinking situations, Figure 1 has to be changed into Figure 7.

Figure 7. *Interactive-creative process between mythos and logos.*

This shows an interactive, creating process between mythos and logos. *Mythos* is created from *logos* and vice versa. However, this figure still does not show the real direction of human thinking. The terms *mythical* and *anti-mythical* imply certain directions, respectively. It is not enough only to say that *mythos* comes from *logos* or *logos* comes from *mythos*.

When a human being begins to think, *mythos* and *logos* in the human mind begin to work together. A thinking stirred by *logos* creates *mythos* in order to support the existing *logos*. For example, someone may suggest a hypothesis and show several cases in order to prove it. If it is proved, cases drawn are also invested with truth values. If these cases appear as stories implying concrete situations, stories drawn here also may be invested with truth values. This shows a kind of *deductive* thinking. If someone makes a hypothesis from many cases, the hypothesis created may be invested with truth value by means of generalization. In spite of the fact that hypotheses here are only plausible, they may be invested with absolute truth values. It is a matter of *inductive* thinking. Both ways of thinking raise the value of *mythos* owing to an increase of *logos*. In other words, human beings create *mythos* incessantly as long as they live and think. However, even when one has to create *mythos* perpetually, if one tries to think about it reflectively, he can prevent the infinite increase of *mythos* owing to a strengthening of *logos*. Someone may suggest a hypothesis from cases that he experienced, but he can guess about cases by means of the hypothesis inversely. If he finds something in a hypothesis that does not accord with cases, he

modifies his hypothesis carefully. This is a kind of *abductive* thinking (CP 2.619–625; Eco 1986: 40), where making belief and breaking it are connected as shown in Figure 7.

Such an interaction between two opposite terms *mythos* and *logos* shows the most typical figure of commonsensical thinking. Mythical thinking and anti-mythical thinking, that is, two opposite sides of human thinking founded on *mythos* and *logos*, respectively, seem to be similar in that both have a certain direction, but different in that their directions are definitely opposite.

I propose two models of this thinking process, beginning with a fundamental situation that shows human thinking implying two opposite terms, *mythos* and *logos* (see Figure 8).

(*mythos* ————— *logos*)

Figure 8. Human thinking implying two opposite terms, *mythos* and *logos*.

On the basis of Figure 8, we can create two opposite thinking models, which proceed in two opposite directions. First, let us assume the stages according to which mythical thinking is created. As I have said, the creation of mythical thinking is a strengthening of *mythos* accompanied by a strengthening of *logos*. In the first stage, a human being regards his mind as implying both *mythos* and *logos* as a *logos* (see Figure 9).

(*mythos* ————— *logos*)
logos

Figure 9. Human thinking, implying both *mythos* and *logos*, regarded as a *logos*.

Developing thinking means strengthening *logos* and also means beginning to make belief. Even if we do not know the point where it ends, at a certain extreme point, *logos* may be changed into *mythos*. This is the point where hypothesis becomes story, or doubt becomes belief (see Figure 10).

Figure 10. Incessant process of creating myths.

The dotted arrows in Figure 10 show that the process of creating *mythos* cannot be articulated clearly. At a certain extreme point, *logos* becomes *mythos*, and these newly created *mythos* and *logos* also create new *mythos* and *logos* by the same semiotic operation. It results in an unlimited and unceasing proliferation of *mythos*. Thought proceeds spirally toward a certain point but never reaches it. It seems like a figure of Peircean unlimited semiosis (CP 5.484), which shows that human thinking is in progressive form. Hence, I suggest a final model of human mythical thinking, beginning with Figure 11 (cf. Song 2005: 54–56).

Figure 11. Model of mythical thinking.

A semiotic model of anti-mythical thinking is also created from Figure 8. Anti-mythical thinking is a thinking that recognizes my thinking is mythical (see Figure 12) and ceaselessly tries to eradicate mythicality from my thinking.

Figure 12. Human thinking, implying both *mythos* and *logos*, regarded as a *mythos*.

This kind of thinking proceeds not to strengthen *mythos* but to weaken it. Anti-mythical thinking reduces the power of *mythos* by help of *logos* (see Figure 13).

Figure 13. Incessant *mythos*-reducing process.

The process of anti-mythical thinking that denies equalization of *mythos* and *logos* cannot be articulated clearly. Anti-mythical thinking that minimalizes *mythos* also takes on a spiral shape, as in Figure 11; however, it appears not as outward proliferation but as inward reduction (Figure 14).

Figure 14. Model of anti-mythical thinking.

4. Conclusion

A little bit of thinking can induce a lot of stories. Thinking does not exist without story. By means of story, doubt becomes faith in human thinking. It is the reason why thinking has to be analyzed on the basis of a story model.

As I have emphasized, mythical thinking and anti-mythical thinking are universal phenomena of the human mind, and cultural values arise from these two opposite ways of thinking. The two models proposed here can be either a first step or a last step of such an anthropological work.

Can dolls communicate? Some semiotic aspects of dolls and their clothing

1. Introduction

Playing with dolls is a kind of communication. Children and dolls together form a social unity, “a family”, where they communicate with each other, and a reciprocal relationship develops between the dolls and the players. The playing with dolls means a complex of social and visual semiotics. The dolls discussed here are mostly used as toys by Finnish children in Finland. The descriptive analysis is an attempt to show how the children and the dolls along with their clothes communicate with each other. A paper doll, called Cinderella, is further discussed in a case study.

Roland Barthes’s famous study of the “fashion system” (1984) has been an inspiration for the analysis, though my study focuses on the communication with the dolls and their clothes, not on written texts. Nevertheless, to illustrate the gender of the players I use literary texts written by Oscar Parland.

2. Communication

Communication, understood as semiosis (cf. Nöth 1985: 124–125, Tarasti 2004: 9–11), takes place between a sender and a receiver, which in this case are children and their dolls. The message is formed by them, the dolls, and their clothes together. In case of one player only, which is not so unusual either, he or she is both sender and receiver in the same game. Through the player, even a doll can the roles of both the sender and the receiver, and consequently, communication is (theoretically) possible internally,

between the dolls. The children are characters in the dolls' games of make-believe.

As to participation, a difference is usually made between the players and the onlookers: "Participants consider the rules or principles of generation to apply to themselves. Onlookers, observing the game from without, do not think of themselves as subject to its rules ..." (Walton 1990: 209). The children sometimes have imaginary companions in the communication in their playing (cf. Taylor and Mannering 2007: 235), but usually they are themselves "props, reflective ones: they generate fictional truths about themselves" (Walton: *ibid.*). In this study, the role of an onlooker is played by me.

Dolls have a long history, possibly being the oldest playthings of mankind, but the play between dolls and children did not appear very early on (cf. Urbancic 1998: 94–95). The communication is implicitly included in the definition by means of the words "child" and "toy": "a child's toy modeled, however crudely, in human or animal form" (EB Micropædia, Vol. III: 606). The dolls represent generations of people, among which can be found babies, children, teen-ages and grown-ups. All of them have clothes, and the reality is described by means of the clothes in plays with the children as participants. Sometimes even the dolls have dolls. These last do not have very important roles in the game playing; still, there are examples of a coffee party, in which the dolls' dolls are participating. In a communication between dolls, one doll has the role of the mother of the family; the other one is her child, who also has a doll.

The communication here involves an exchange of words and clothes between individuals in each other's presence, the "individuals" meaning both players and dolls. The playing takes place here and now: it has neither a future or a past. The communication in playing is actually similar to that which occurs between two or more individuals. The players are talking with each other and intervening or participating in the communication between the dolls. However, the oral talk in the playing is not possible to study here, due to lack of material. Hence my focus here on the dolls' clothes, seen as signs, with the play being the object, and the player with make-believe action the interpretation (cf. Peirce 2007: *passim*).

Even mechanical toys can communicate, but initially, the player must use them before they start to function. Mechanical dolls may sing, cry, play piano, etc., and may move its eyes up and down, its head from side

to side, say “mama” and “papa”, and the like (King 1996: *passim*). Even though communication between mechanical toys is not a trivial issue, it is not addressed in the present study. Also not discussed here are dolls in their functions as souvenirs and/or decorations.

3. Dolls, clothes and players in communication

It is a well-known fact that the clothes give information about the person wearing them, and the same is true for dolls. A simple jacket “says” something other than slippers with golden embroidery do. The dolls’ clothes reflect the clothes worn by people, both male and female, a fact which actually belongs to the culture of clothing. The dolls’ clothes are in that way a miniature of the social environment, but they can be changed into unreal ones as needed when played with. The clothing is changeable, hence a doll often has a variety of clothes during one game. It is through the set of clothes that communication takes place. Special clothing and certain kinds of behavior are associated with specific times and places (cf. Lotman 1989: 125). Moreover, dolls are often kept for many years, “not only as totems of childhood but also as practical items, such as purveyors of fashion” (Urbancic 1998: 93). Dolls and their clothing can bring back memories with strong emotional force. This appeared to be quite obvious in my interview with a lady who played with dolls in the 1950s and now is a collector of them.

After the Second World War, there was a great lack of every kind of material in Finland. The dolls and doll clothes were a dream for Finnish children during those times, and to have beautiful clothes meant the realization of that dream. Many kinds of materials came from Sweden to Finland after the war. Periodicals from Sweden had pages with sheets of paper dolls, which had plenty of beautiful, even royal clothes. The clothes partly represent real time; and they can also be partly unreal, luxurious, even fantastic. In playing with dolls, the players imagine that it is spring, summer, winter or autumn. When playing everyday life, they imagine morning or evening, bath, work in the kitchen, meals and festivities such as christenings, weddings, funerals and many kinds of parties. The clothes are chosen according to the needs of the situation. The dolls can also temporarily be used as, say, a witch on Halloween, as the child Jesus at Christmas (alternatively as the Virgin Mary or Joseph), donned with suitable clothes for these

roles. Barthes suggested that appropriate clothes for given contexts may be compared with the syntax of language (cf. Barthes 1984: 213–221), though no attempts have yet been made (Eco 1985: 242). In reality, the collection of doll clothes restricts the choices of the situation. This restriction can easily be overcome, however, if one has the ability to design, sew or draw clothes. This process, too, is part of the communication.

4. *Cinderella, a paper doll*

In this case study, special attention is paid to paper dolls. Paper dolls came to Finland in the nineteenth century, at first of German origin, then imported from other countries. Sheets of paper dolls could further be found in magazines. The production of paper dolls started in Finland at the beginning of the twentieth century, often for educational purposes (Lehto 2007).

A paper doll called Cinderella is represented here in two different prints (pictures 1 and 2, below). Sheets of Cinderella were sold in Finland, the older one in the 1950s, and the newer one in the 2000s. The divergent features of these two prints are compared in this case study. Both of the dolls represent the fairy-tale character of Cinderella, the poor girl with a mean stepmother and malevolent sisters. The dancing slipper that Cinderella loses when leaving the ballroom is the central sign in this fairy tale. The slipper is found by the Prince, and Cinderella is the only girl whose foot fits it. The older doll has more obvious fairy-tale characteristics than does the newer one. On the older sheet, there is a print of a paper doll in shape of a prince, whose accompanying page shows him with the shoe resting on a pillow in his hands. The clothes of the older Cinderella and her shoe are apparent signs of the old fairy tale, while the newer Cinderella has “normal” clothes without any clear allusions to this tale. Still, Cinderella’s slipper is highlighted, isolated at the bottom right on the sheet. On it also is a good fairy godmother, a cleaning implement, a number of pigeons, and a little mouse. These details are placed by the side of Cinderella in Picture 2. All of them are signs with obvious allusions to the tale of Cinderella, but all of them may easily be lost when the paper doll is cut and separated from the sheet, in which case they have no communicative function at all.

When the clothes of the paper dolls are directly printed on the dolls on the sheet, they are of course not changeable, which is not regularly the case.

As for the 1950s Cinderella, the clothes she wears for cleaning are directly printed on her, but she also has a separate, “princess” dress. Apparently, she needs that dress because she will get married to the prince, who stands beside her on the same sheet. Of course, these paper dolls cannot speak for themselves, which means the children must add the voices when they play with them.

The slipper motif has been researched by Norvill (1986), who points out that the fairy tale of Cinderella contains an allusion to the ancient Egyptian myth of Osiris, king of Egypt and husband of Isis. Norvill writes: “... consider, for instance, the comparison between Cinderella’s foot fitting the slipper where all others had failed, and the body of Osiris being the only one to fit the casket. The themes are identical” (Norvill 1986: 56). Cinderella’s shoe, printed on the sheet of this paper doll, is a long-lived sign of this old story.

5. Reflections on life

Play is an essential part of the activities of a child. However, children’s toys have often been neglected in scientific analyses (cf. Munthe 1991). Playing with dolls can easily help the child to learn to live in the society. In fact, one can speak about the world of the dolls, existing both in reality and fantasy. Playing with dolls with changeable clothes teaches the players something about the relations between persons in social life (as in a family, for example). Dolls like Cinderella and Sleeping Beauty recall the fantasy worlds of old and well-known fairy tales, but we also talk about “real-life Cinderella stories”. There comes a time, though, when girls who play with dolls become interested in clothes and fashion, and the dolls are no longer relevant; i.e., there is no longer any communication between the girls and the dolls. On the other hand, it has been argued that the playing follows the players all their lives, assimilating in different kinds of social and psychological processes (Lotman 1989: 125).

The dolls are often associated with glamour and female image. Dolls and doll collecting have been seen as a predominantly female activity (Urbancic 1998: 93), but boys, too, sometimes want to play with them. When children are playing Cinderella or Sleeping Beauty with dolls, a boy doll is needed to take the role of the prince. In the fairy tale of Cinderella, there are culturally sanctioned gender roles as there are in real life, where a

girl, simply by changing her clothes – as the dolls do – can be transformed into a princess, and a boy into a prince.

Leaving behind the fairy tale world, it is in doll games like “family” or “doctor” the child comes nearer to social life. Both girls and boys are needed in this kind of playing. A good example of a boy playing family with dolls is given by Oscar Parland, a Finnish writer and semiotician, in his autobiographical novel *Den förtrollade vägen* (1953). In one passage a girl, his cousin, with whom he is playing, suggests that he will be her man, and they will get married when they grow up (Parland 1953: 150). In another passage, the boy and girl are playing, when she suddenly suggests that both she and the boy take the role of mother. At first this does not work so well: the boy-mother has plenty of children to deal with. However, he and his doll-character gradually get used to cooking food and feeding the children, and finally becomes quite interested in playing this role (ibid.: 160).

We should also mention the world of advertising and marketing dolls. Children can nowadays get a new virtual combination of clothes via the internet. The clothes can be selected from a variety of alternatives, for dolls representing both females and males, for example actors, actresses, singers, models, royals, superstars and athletes. The players are able to choose the color of the eyes, hair style, and the whole “personality” of the doll. In other words, there is great variety in the ways one can play with dolls, which in many respects reflects the multiple means of communication in modern life.

6. Summary

The analysis above is an attempt to understand playing with dolls and doll clothing as forms of communication. Oriented to real-life “games” such as family interaction, such play is both social and developmental. In more fantastic realms, such as those of fairy tale, the players with dolls are immersed in a fantasy world of cultural and literary features, as we have seen in the case of Cinderella. In sum: Dolls can communicate, but only with the help of human players.

Understanding Rautavaara's angels

In the history of music, Einojuhani Rautavaara (b. 1928), a Finnish composer of the older generation, is probably the only one who has dared to put angels in the titles of his instrumental works; for example: *Angels and Visitations*, *Angel of Dusk*, *Playgrounds for Angels*, all dating from the 1970s and 80s. The composer gave his *angelic* compositions titles and commentaries, but claims there are no programmes, stories or fixed imagery involved.

How, then, should these angelic titles be understood? Perhaps the *angel* is in the music itself, as a musical symbol. Here I first discuss the term *angel* and what it conveys symbolically in Rautavaara's music; and second, how these angels in music can be read and understood in light of the composer's comments.

1. Angels in religions

The word angel comes from the Greek *aggelos*, meaning "messenger". Though angels are probably most often linked to the Christian faith and tradition, one finds divine messengers in many earlier religions as well. They mediate between the visible and invisible worlds, Gods and man, the living and the dead. One may suppose that the Christian angel-messenger model was formed over the ages in various ancient cultures: Assyrian, Mesopotamian, Hindi, Chinese, Egyptian, Greek, as well as in pagan mythology. This symbol is universal and deeply rooted in mankind's desire for spirituality. Despite numerous representations of angelic creatures, their ontology is always the same – the angel is a spirit or an invisible creature, whose function is to mediate between the physical and spiritual planes. Angels and archangels are said to be divine messengers who transmit the word of God to humankind (Tresidder 2004: 33). In the Middle Ages, Saint August-

tine provided the best definition of an angel: “Angel’ is the name of their office, not of their nature. If you seek the name of their nature, it is ‘spirit’; if you seek the name of their office, it is ‘angel’: from what they are, ‘spirit’, from what they do, ‘angel’” (see Catechism of the Catholic Church, verse 329). The best characteristics of angels are given in The Bible, in both the *Old* and the *New Testament*. From these we may discern two general types (Oleschko 2003: 17–18): (1) *Anthropomorphic* – a young, handsome man, well-dressed or almost naked, with items in his hand; e.g., a sword, keys, chain, trumpet, crown, cranium or cane. Here, their similarity to people is so precise that actual characters in The Bible (Tobias, Abraham, St. Peter) didn’t recognize they were in the presence of angels. (2) *Symbolic* – fire, a cloud, light, shining body, fantastic winged creatures with human or animal faces, sometimes reminiscent of a moving bronze or copper statue and sometimes emitting strange voices and other sounds. The appearance of such an angel is a frightening experience for every Biblical figure. Meetings between angels and men are described closely in The Bible and other sacred writ, where they are called “visitations”. Eero Tarasti (2007) has noted that the term visitation leads to the term *apparition*, which thus signifies the “appearance” of something surprising to the spectator.

2. *Angels in music*

In music of the past, “angels” and “archangels” appeared only in great vocal scores, such as Heinrich Schütz’s *Histories* (proto-oratorios), Bach’s cantatas, and the oratorios of Handel and Haydn. In such cases, the role of the angel was sung by a singer or by a choir. Angels were treated as people – as concrete actors in the action or as commentators. In opera, good spirits are cast as God’s messengers, as heroes, or as symbols of a phenomenon or sensation. Similarly, there are also angels in ballets where the plot is expressed through dance and gestures (e.g., Prokofiev’s *A Fiery Angel*). Other examples of angels in twentieth-century music include the one, a soprano, in Messiaen’s *Saint François d’Assise* (1975–83); Hindemith wrote the symphony *Mathis der Maler* in which the first movement is entitled Angelic Concerto, but this work also alludes to an opera with the same title. Some examples of instrumental music with angelic titles are the string quartet *Black Angels* (1970) by George Crumb, some pieces in the great Messiaen cycles: *La nativité du Seigneur* (1935), *Les corps glorieux* (1939),

Quatuor pour la fin du temps (1941), *Visions de l'amen* (1943), *Vingt regards sur l'enfant Jesus* (1944), and a composition by Tomaso Marco from 1971 entitled *Angelus novus*.

The best exemplification of an angel's visitation in music is that of the Commandatore at the end of Mozart's opera *Don Giovanni*. Although this is an opera and in it the representation of the spirit is anthropomorphic, it is probably the best exemplification of musical visitation and thus deserves examination. Of course, the Commandatore is the spirit of a dead person – a ghost; however, its representation as a moving statue comes close to that of an angel. The ghost's visitation to Don Giovanni breaks the linear time of the music and its harmony: D minor is introduced and the tempo slows. The contrast between the two planes – the living and the dead – becomes evident (Example 1a and 1b).

Example 1a. Mozart, *Don Giovanni*, end of scene XIV, mm. 424–432.

2. Symbol of the angel in Rautavaara's music

How is it possible to find an angelic figure in Rautavaara's instrumental music? Are all such significations merely due to the angelic titles? They are very important for Rautavaara, since as a pre-idea for the ensuing com-

position he often uses repeated mantras for inspiration. These last, as the composer has said, are words radiating energy, the starting point for his music, and ultimately become the title of the entire composition (Finch 1996: 24).

I shall examine three pieces: the orchestral overture, *Angels and Visitations* (1978); the concerto for double-bass, *Angel of Dusk* (1980); and a work for brass ensemble, *Playgrounds for Angels* (1981). The main musical

feature of these three pieces is a technique which the composer calls “disturbance”. The aim of this technique is to break or interrupt the natural musical process with strong, dissonant outbursts from the brass ensemble. The role of this technique is especially evident in these three compositions. In *Angels and Visitations*, dissonant outbursts disrupt the main diatonic melody. In *Angel of Dusk*, everywhere the outburst from brass ensemble appears, the double-bass solo is suspended on long notes and afterwards continues or stops completely. In *Playgrounds for Angels*, the situation is different. The intrusive, mechanistic elements played by trumpet, trombones and tuba seek to disturb a free and open melody played by a single horn (Example 2).

Example 2. Rautavaara, *Angel of Dusk*, *mt. 1*, contrabass solo, *mm.* 12–52. Printed by permission of Fennica Gehrman Oy, Helsinki © Warner/Chappell Music Finland Oy.

In all three compositions, the trumpets and trombones play the role of the angel in an analogy to the disturbing visitation of Il commandatore in *Don Giovanni*. Single instruments or groups are like actors in Greimas's mythical model, where the main situation lies in the relationship between *subject* and *opponent* (Tarasti 1994: 106). A similar opposition occurs in Rautavaara's operas – *Thomas, Vincent, Aleksis Kivi* and *Rasputin*; the *hero* is always in conflict with his environment (*opponent*), and this relationship is fundamental to the overarching plot. Anne Sivuoja Gunaratnam has discovered that the musical subject (*hero*) in these operas is always enunciated by the cellos in a register that lies within the baritone range (1997: 191). This instrumental “voice” belongs to the main soloist and could be regarded as a musical representation of it (Cone 1974: 81–114). Here the situation is the same. The trumpets and trombones represent the *opponent* (*angel*); they disturb the natural process of the melody of the subject (*hero*) and thereby become musical symbols (see Figure 1).

Figure 1. Abridged model of mythical actants in Rautavaara's angelic pieces.

In the Peircian view, the symbol is always a sign under a specific convention; the relationship between sign and object is arbitrary (Tarasti 2002: 11). According to Paul Ricoeur, every symbol (including musical ones) has three dimensions: *cosmic* (religious), *oneiric* (psychical), and *poetical* (1986: 13–17). In light of Rautavaara's comments on his three compositions with angelic titles, it is not difficult to find these dimensions. The most essential comments for us are the composer's program to his *First Duino Elegy* (1994) for mixed choir and statements made in the documentary film on Rautavaara, *The Gift of Dreams* (1997). Concerning the first of these works, the composer wrote (1994):

From that time onwards I continued to carry with me – both mentally and in my suitcase – the *Duino Elegies*, Rilke's seminal work. Over the years I would take it out, finding myself particularly drawn to the first elegy, whose angel figure took on the role of a personal *animus*. My orchestral works *Angels and Visitations*, *Angel of Dusk* and *Playground for Angels* are all musical personifications of this figure.

And in 1997:

... I realized that it is so much about angels and I found out that his [Rilke's] angels had something very special. He says "Every angel is terrible". It was exactly what Jacob in the Bible does with his angel: He has to wrestle with it. And then I thought probably everybody must wrestle with his angel.

In the comments above the composer provides us with possible keys to understanding the figure of the angel: The Bible, Jung's *theory of archetypes*, Rilke's *Duino elegies*, which furthermore correspond to Ricoeur's distinction of the three dimensions of every symbol: *cosmic*, *oneiric*, and *poetical*.

2.1. Poetical dimension – Rilke's *Duino elegies*

Rautavaara remarks that his angel was created under the strong influence of Rilke's work. Rautavaara always carried with him a copy of Rilke's elegy while in Vienna (1955), the United States (1955–57) and later in Switzerland. He explained that he "was just waiting for the right time to turn them into music" (Cutts 1998: 22). In *Duino Elegies*, Rilke develops the concept of the transcendental function of his own poetry – "transforming the visible earthly world into the invisible". Rilke advises looking for the new in material things, and turning them into internal, hyper-subjective substance. In the *Elegies*, Rilke aims to develop a new image of the universe, without the division of past and future, being and non-being, or the physical *versus* spiritual dimension; and the principal medium of this universe is the angel myth (Antochewicz 1991: 204–205). Hans Georg Gadamer explains the sense of Rilke's *Elegies*:

[The Angel] represents a greater ability of heart than that of Man; it is the power on account of which a Man's heart fails and cannot cope with it. Thus a Man is conditioned in various ways, and in terms of feelings he is unable to give oneself unconditionally and explicitly. (Gadamer 1979: 238)

The angel is neither human nor divine; it represents a constancy of feeling which man will never attain. Contact with angels terrifies man and makes him aware of his imperfection. In their greatness, angels are beyond man's reach, overshadowing his minuteness and imperceptibility. The great world of angels is dark and sinister for man. Rautavaara has always said that his angel, as Rilke's, is a terrifying one.

2.2 Cosmic dimension: *Old Testament* and *Quran*

Some scholars argue that Rilke's *Elegies* took this "terrifying angel" figure from the presentation of Mohammed's call to prophecy in the *Quran*, while ultimately giving it new significance and putting it into the different context of his own poetry (Campbell 2003: 191). The first religious dimension of the angelic symbol is linked with Rilke's poetry: man terrified during the angel's visitation in the Bible and the *Quran*. In the Bible, Jacob had to wrestle with his angel opponent, the prophet Daniel was overcome by an appearance of the angel Gabriel, and creatures with four faces and eight wings terrified the prophet Ezekiel (Rautavaara 1995: 113–114). Similarly, the archangel Gabriel gave Mohammed a scroll and ordered him to read it. This religious dimension of angelic symbolism in Rautavaara's compositions is limited only to the terrifying representation of angels.

2.3. Oneiric dimension: Jung's archetype

Although the Jungian view is sometimes rejected by scientists and semioticians, here it remains necessary to examine the theory of archetype not only from the viewpoint of the composer's comments, but also because Rautavaara, in my private conversations with him, admitted his fascination with Jung's theories in the 70s and 80s. By most accounts, the angelic pieces were composed during this period.

In Jung's theory, the human psyche is the sum of consciousness (the thoughts and actions under control of the will) and the unconscious, this last divided into the personal and the collective. The personal unconscious is a reservoir of individual memories to which we occasionally gain access through dreams or sudden flashes of recollection. The collective unconscious is a deep level of our psyche in which lie instinctive patterns of thought and behaviour common to all civilizations throughout the ages. These patterns can be examined only in symbolic form as images projected by our minds – *archetypes*. Through the analysis of dreams, archetypal symbols can be used to explore the boundaries between the conscious and unconscious mind (Fontana 1994: 8–13).

Rautavaara interpreted the angel figure as his personal *animus*. But during a personal conversation he instead qualified this archetype as a *shadow*. This term captures the interior nature of this archetype. All

humans have a personal shadow, an alter-ego, the dark and evil side of their personality. It is a disruptive force, the inner terror and antisocial desires of which we are ashamed and attempt to bury within the unconscious (Fontana 1994: 16–17). The *shadow* is a moral problem for human nature, a “potentially terrifying experience, so much so that we usually protect ourselves from such disturbing awareness by making use of ego-defence mechanisms: we deny the existence of our shadow and project it onto others” (Stevens 1990: 44). It is obvious here that the shadow archetype is also very similar to the first and second dimensions of the symbol.

3. Conclusion

Rautavaara’s *angel* symbol joins factors of the shadow archetype with the terrifying angels of the *Old Testament*, *Quran* and Rilke’s *Duino Elegies*. The role of shadow is also similar to Rilke’s poetic analysis of dreams through the conscious use of oneiric images to discover the hidden, invisible world (unconscious). The process of self-knowledge through the *shadow-angel* symbol is the act of uniting unconscious and conscious feelings, and is compatible with Rilke’s conception of the universe without the division of past and future, being and non-being, or physical and spiritual. Rautavaara created the musical angel-symbol through a disturbance technique which could be understood as a transference of Greimas’s mythical actants models to instruments.

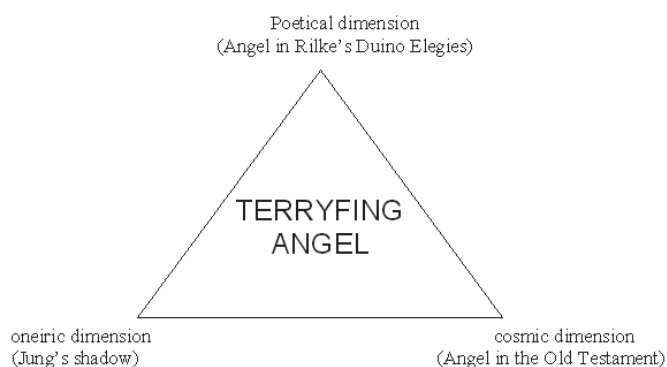

Figure 2. Three dimensions of Rautavaara’s angelic symbol.

The role of externalisation of tacit knowledge and the problem of reference in an antique philosophical debate: The cradle of Stoic semiotics

The philosophical debate between the two Athenian philosophical schools, the Stoa and the Academy, dominated the philosophical scene for more than two hundred fifty years. That debate was very important from the point of view of the development of semiotics because a new theory of signs emerged in the Stoic school, whereas a strong criticism of it appeared in the other camp, at the skeptic Academy.

Actually, this debate started with the birth of the Stoic school founded by Zeno of Citium (c. 334–262 B.C.E.) about 300 B.C.E. He was a pupil of several masters, but first and for a long time studied at the Platonic Academy under the guidance of Polemo, the fourth head of Academy. After having founded his own school, Zeno took over many ideas from the Academy, changing the categories. That is why Polemo (c. 355–270 B.C.E) said to him: “It did not escape my observation, my dear Zeno, that you trespassed through the garden gate to steal our doctrines from us in order to put Phoenician robes on them” (Diogenes Laertius 1972: VII 25). In that way Polemo, who was most competent concerning this affair, also indicated that he was aware of Zeno’s appropriating and transforming academic doctrines by changing the names of categories. The expression “Phoenician robes” clearly refers to the use of another language, which is probably the Cypriot version of *koiné*. The repeated accusations in the literature about Zeno using academic doctrines make it probable that this process really took place.

1. *The linguistic change caused by the koiné,
and the consequences of that change*

The question comes up as to how Zeno could nevertheless find an audience to his lectures, the content of which was borrowed from the Academy. The background of his success with these lectures can be highlighted by the interpretation of a linguistic change. In the era of Alexander the Great and during Hellenism, a new, simplified version of the Greek language, the so-called *koiné* (literally, “shared”), came into being in the Middle East, and spread in the polis states, too. The spread of this new language pushed the classical and more sophisticated Attic literary language into the background, even in Athens, which resulted in a lot of interpretation and reference problems in the philosophy as well. It was necessary to reinterpret many philosophical and other terms, and that paved the way for the discussion of reference. This prepared the way for the Stoic reference and sign theory, which opened a new chapter in the history of semiotics. The present paper aims at revealing the prehistory of this Stoic semiotic theory by involving the theory of tacit knowledge as well.

In the time of the establishment of Zeno’s school, the so-called *koiné*, a simplified version of the Greek language coming from the territories of Hellenistic realms, arrived in Athens, too. A version of the Attic dialect, *koiné* contained Ionic words and grammatical elements, as well as a lot of new words coming from other Asian languages; the spread of this new, so-called “common tongue” made it necessary to write guides for interpreting classical works, first of all the Platonic dialogues. Young Greek students speaking the *koiné* as mother tongue could understand Plato’s dialogues only by means of these commentaries. There is no doubt about the linguistic commitment of Academy to the Attic dialect in the epoch of the spreading of *koiné*, because three of the first four heads of it, including Zeno’s teacher, Polemo, were born and educated in Athens. After Plato, who was himself a classic writer of the Attic literary language, another Athenian philosopher, Speusippe, took over the leadership. The only exception was Xenocrate, the third head of Academy, who had lived from his early youth in the city and thus could easily master the new dialect. It is typical, however, that he, the foreigner, started to deal with linguistic issues at the Academy, perhaps because he had the knowledge to compare the two dialects. For Polemo, Plato’s high-level texts, written in the literary version

of the Attic dialect, posed no problem; whereas young people, like Zeno, coming from territories of the *koiné* to Athens, certainly had difficulties learning the more complex Attic dialect, especially as it was used in serious philosophical debates. Zeno came to Athens from the small seaport city of Citium (today Larnaca) in Cyprus, a place very near the sources of *koiné* (namely, the diadochos states remaining from the empire established by Alexander the Great). Zeno's encounters with classical Greek indicated to him his own limits, which he surmounted by building up a philosophy in his mother tongue, the *koiné*. His several speeches against rhetoric, quoted by Diogenes Laertius (1972: VII 16–28), give evidence of his unpleasant experience with the requirements of beautiful oration. Zeno discovered a “market” among young people who had difficulties with the interpretation of Platonic and other texts written in the classical Attic literary dialect. Young students with similar linguistic problems turned to him and his school because they did not speak fluently the original Attic dialect preferred at the Academy, and they considered the simplest solution was to change to Zeno's school where the language of teaching was more understandable to them. That is why Zeno's audience was recruited from the circle of young people coming from cities using the *koiné*, who had the same problems with the philosophical language of the Academy. In this context, it is understandable why none of Zeno's important disciples was of Athenian origin (Diogenes Laertius 1972: VII 36–38).

Thus the change of names of philosophical categories can be highlighted from the point of view of this linguistic change. Because of this change of language, a break occurred between the philosophy of contemporary problems and the philosophical heritage. That put in the forefront the problem of the meanings of certain philosophical terms, and it became obvious that the content of philosophical terms and their linguistic form can be well separated. This resulted, on the one hand, in the elaboration of a philosophical problem very important for semiotics, in the problem of reference, and, on the other, for Stoic logic.

From the philosophical schools, one of the biggest losers due to the linguistic change was in all probability the Academy itself. That is why those who were born into the classical Attic dialect and who were excellent stylists and orators became the natural opponents of this development in Athenian philosophical life. The later generations under Polemo's guidance were also closely attached to this dialect because it could guarantee

the direct interpretation of the former works written by the heads and other members of the Academy. The emergence of the Stoic school at first did not seem to pose any danger to the Academy, but thereafter, Zeno and his disciples began to vindicate the title of the real interpreters of the Platonic philosophy.

2. The first topic of the controversy between the Stoa and the Academy

After the Academicians' initial criticism of the Zenonian appropriation and transformation of their doctrines, the controversy soon centered around the question of whether practical ethical behavior can be taught and, if so, to what extent (Sedley 1999: 151). In addition to the linguistic change, ethical life was also transformed due to the multicultural character of the Hellenistic states and their influence on the Greek city states. Thus the source of the above-mentioned debate between the new Stoic school and the Academy headed by Polemo, as well the current of linguistic change, issued from the same series of historical processes. The ethical debate and the quarrel about the terminological innovations of Zeno (who borrowed a lot of philosophical categories from the Academy in order to create his own new vocabulary of philosophy) were only two different sides of the same coin. In the controversy about the teaching of practical ethics, the position of the Academy was more flexible and closer to real life. The Academicians denied the possibility of a strict externalization and categorization of every ethical aspect of social life (Sedley 1999: 151), whereas Zeno compiled ethical canons, claiming that it is enough just to teach them. According to the Academy, the teaching of ethical behavior includes non-communicable elements, patterns, feelings which can be transferred only by personal contact and personal, exemplary behavior, as well as by texts representing persons of high ethical standards. They were convinced that the high level of style and high ethical standards are fused together in Plato's dialogues; thus, it is also necessary to master this language in order to be virtuous. It seems to be clear, on the other hand, that Stoic teaching of obligations also contains *ab ovo* a reference problem, namely, the problem of the exactitude of knowledge transfer. At this point we are already very near a typical twentieth century problem, that of *tacit knowledge*.

3. The theory of tacit knowledge and its role in explaining the different standpoints in the Stoic-Academic debate

The theory of tacit and personal knowledge, as elaborated by the Hungarian philosopher Michael Polanyi, is a combined result of psychology and philosophy. According to the theory of tacit knowledge, the overwhelming majority of human knowledge, including the semiotic one, is tacit. This sort of knowledge cannot be transferred in explicit forms, in writing, in propositions, but only via personal contacts, through the observation and imitation of the other person's activity. Entering debates, people also have explicit and tacit knowledge and presuppositions. The tacit ones also come from their intellectual background, personal experience, education, social dispositions, and constitute part of cultural codes. In the course of debates, the opposing parties discover a considerable part of their own tacit presuppositions and those of their counterpart. A semiotic approach to explaining these presuppositions can shed new light on the emergence of hidden components of discussions.

One of the main propositions of the present paper is that tacit knowledge played a very important role in controversy between the Academy and the Stoa. The standpoint of the Academy in the above-quoted ethical debate proves it. In addition, the participants in controversy cannot always make clear the roots of their standpoints without revealing the secondary and tertiary conditions, which are in fact tacit preconditions. On the basis of the theory of tacit knowledge, it is possible to discover new areas of argumentation for the participants. As points of debate, conflicts can also be caused by differences in the tacit knowledge of the participants, even if they remain hidden for them for a certain time. The investigations into the history of the debate, including an efficacious self-criticism of the debating parties, can reveal these tacit preconditions and conditions of the standpoints formulated explicitly.

As the research into tacit knowledge went on, the problem of externalization became more and more important. It seems that regular communication on topics connected to tacit knowledge is one of the most important preconditions of externalization. If in any debate, the possibility of this regular communication is given, the externalization process can more easily start. As for the controversy between the Stoa and the Academy, the efforts that went into solving linguistic problems contributed to

the tacit, and later, the explicit emergence of referential problems. Parallel to the spreading of the *koiné*, a new ethical thinking began namely to evolve which, in the same manner, made it necessary to externalize the moral norms embedded in social relations and language. The ethical canon elaborated by Zeno contains the concept of obligation used firstly by him, according to Diogenes Laertius (1972: VII 25). The concept of obligation includes a problem of reference: the individual “ought” to do something specific, and not just be virtuous in general. In Zeno’s practical ethics, action and obligation are connected to each other by a referential relationship.

4. The beginnings of academic criticism and the unfolding of the reference problem

The Zenonian ethical canon to be learned in the Stoic school was very problematic for the academicians, who began to criticize it. According to a cautious reconstruction, academicians were committed to the ideal unity of moral behavior and linguistic capacities before the outburst of the controversy. They emphasized, for instance, the moral teaching capacity of the introductory parts of the Platonic dialogues, denying the necessity of the explicit formulations of the moral rules described in them. Although they were far from discovering the tacit knowledge itself, they nevertheless understood in an intuitive way the importance of the non-explicit components in the teaching of practical ethics. Academic criticism of Stoic practical ethics emphasized the importance of living context in the teaching of practical ethics.

In the next phase of the great controversy, Zeno broadened his philosophical theory to include such areas as the description of human cognition and the theory of signs. He created a new theory of human cognition, thinking and ethical behavior, mostly based on contemporaneous medical research and other sciences. Academic skepticism searched for and found the weak points in the theories of Stoic philosophers, and pressed them to take into consideration and to make explicit their secondary and tertiary presuppositions. On their part, Stoic philosophers pointed out the internal contradictions in Academic tenets.

Zeno made explicit the reference problem with the notion of “cognitive phantasia” (*phantasia cataleptiké*), which meant a sense impression

able to guarantee exact cognition. This Greek concept, which is not identical with the modern concept of fantasy, originally signified the internal picture remaining at once after the sense impression. Zeno used the example of the seal and the melted wax to illustrate the function of cognitive *phantasia*. According to the logic of this illustration, the external object, the seal leaves its traces, its picture in the sense organ, that is, in the melted wax. This is a typical iconic sign relation (Szivos 2000: 366) because the mental picture – the sign – preserves some features of the external object. This sign relation constituted the central element of Stoic epistemology for the next fifty years and led to Stoic sign theory.

Following the old generation strongly attached to the Platonic heritage, a new generation of philosophers emerged at the Academy under Arcesilaos's guidance, thus opening the skeptic period of the Academy (c. 268–264 B.C.E.). On this battlefield between the Stoa and the Academy, Arcesilaos (c. 315–241 B.C.E.), the seventh head of Academy, elaborated new arguments, based partly on the Socratic-Platonic traditions, partly on the results of other Socratic schools, and partly on the achievements of the contemporary philosophers. In the field of ethics, Arcesilaos emphasized the importance of *eulogon*, which means practical ethical rationality serving as a kind of guideline in everyday matters. In this matter he maintained the academic heritage according to which it is not possible to completely externalize the internal relations, contents, norms and obligations of ethical life. In light of the above-mentioned, hidden reference problem in ethical matters, that standpoint counterbalanced the Stoic externalization efforts aimed at giving a finalized collection of ethical rules and obligations which suppose a very clear reference relation between obligations and acts.

At the level of epistemology, Arcesilaos tried to prove that the so-called cognitive *phantasias* cannot afford solid cognition because they cannot leave exact imprints, due to the disturbing environment, and that Zenonian theory does not take into consideration the change of the perceived external objects. The academic arguments considerably weakened the initial Stoic conception of the reference between the external object and its corresponding imprint in sense organs and mind. Due to this criticism, which unveiled the simplifying materialism of Stoic epistemology, the concept of *lekton* (a non-material being in Stoic epistemology and logic) appeared in the renaissance of Stoic philosophy made by Chrysippe

(c. 280–206 B.C.E.) This last proved to be a very important step towards Stoic sign theory and the understanding of meaning.

5. *Conclusions*

Due to the extension of the Greek world by Alexander the Great and the initial period of Hellenism, a new version of the Greek language came into being in Middle East, slowly becoming dominant in the city-states as well. This shift had consequences for the world of philosophy, exemplified in the best way by Zeno's transformation of academic doctrines and his inventing new names for philosophical categories for an audience refusing to learn and use the sophisticated academic version of the Attic dialect. Parallel to this phenomenon, the ethical world also changed, inspiring Zeno to externalize the moral obligations embedded as a kind of tacit knowledge in the everyday world and to create a canon of practical ethics. Both changes fostered the problem of reference which became explicit in the Zenonian epistemology based on the concept of cognitive phantasia.

The Academy represented a standpoint which displayed the intuitive understanding of the importance of non-explicit or tacit factors in both the debate on practical ethics and the epistemological controversy. The criticism of the Academy forced the Stoic school to improve its theories as well as to abandon the simplifying materialism in both ethics and epistemology, as well as in logic and sign theory.

Geach's program and the foundations of categorial grammar

1. Contemporary categorial grammar allows for two kinds of syntactic rules: "multiplying-out" rules and "type-change" rules. Multiplying-out rules, as Geach called them (1970), are the engine of the syntactic calculus. They say how to combine syntactic categories and enable calculation of the overall syntactic category of a compound expression. The classic one was proposed by the founder of categorial grammar, Kazimierz Ajdukiewicz, in (1935/1967); let us mark it (MP):

$$(MP) \alpha/\beta \beta \Rightarrow \alpha.$$

This rule says that concatenation of an expression belonging to syntactic category α/β (regarded as a functor) and of an expression belonging to category β (regarded as the functor's argument) yields a syntactically coherent (SC) expression belonging to category α . For example a one-place predicate /sings/ (S/N) and a proper name /Mary/ (N) form a sentence: "Mary sings" (S).

Type-change rules have the general form $\alpha \Rightarrow \beta$. They say that the syntactic role played by expressions belonging to category α can be also played by expressions belonging to category β ; henceforth every expression belonging to α belongs simultaneously to β . Usually the wording refers to the notion of type: it is said that type α can be raised (or lowered) to type β . Among the most popular type-change rules are (Division) and (Raising):

$$(Division) \alpha/\beta \Rightarrow (\alpha/\gamma)/(\beta/\gamma);$$

$$(Raising) \alpha \Rightarrow \beta/(\beta/\alpha).$$

Type-change rules make the grammars a good deal more flexible and help them to accommodate linguistic data from particular native lan-

guages. That is why grammars containing such rules are often labelled Flexible Categorical Grammars (FCG's). It has been commonly understood that FCG's are natural improvements of Classical Categorical Grammar (CCG), designed to fit better the needs of empirical linguistics (such as automatic natural language processing), compromising little if anything as the logical form of language.

Peter T. Geach has been regarded as the father of FCG, due to his famous seminal "Program for Syntax" (1970). The standard interpretation of this paper suggests that some type-change rules were introduced there for the first (or, at least, most influential) time; Division is even sometimes called the "Geach Rule". Recently this standard interpretation was challenged. For example, Humberstone (2005) convincingly argues that none of the type-change principles can be rightly ascribed to Geach: they do not appear in Geach's paper explicitly and, further, they are simply inconsistent with important statements made in that text. The flexibility of Geach's grammar, Humberstone argues, arises not from type-changing, but from nonstandard (compared to classic Ajdukiewicz's grammar) ways of multiplying out categorial indices (types). Types themselves remain unchanged. The classical Ajdukiewiczian rule (MP) is supplemented by Geach with the following recursive rules:

$$\begin{array}{ll} \text{G1} & \frac{\alpha \beta \Rightarrow \gamma}{\alpha \beta / \delta \Rightarrow \gamma / \delta} \qquad \text{G2} \quad \frac{\alpha \beta \beta \Rightarrow \gamma}{\alpha \beta / \delta \beta / \delta \Rightarrow \gamma / \delta} \end{array}$$

In contemporary FCG's, the above rules are often replaced by a slightly weaker principle following from G1, called Composition: $\alpha / \beta \beta / \gamma \Rightarrow \alpha / \gamma$.

Humberstone, however, seems to indulge too much in the tradition he criticizes. He breaks the alleged concordance between Geach's actual text and contemporary FCG, and rightly so; but when they clash, he often takes the side of FCG against Geach. Admittedly, Humberstone tries to justify Geach's ideas and to show that Composition without Division is not "a distinction without a difference" (2005: 299). As the justification he gives a very valuable observation that the functor type shows not only how the functor takes arguments, but also how it behaves as an argument itself, when "taken" by another functor. But this observation, however valuable, is far from being exhaustive as to Geach's motives; and generally, Humberstone tries to avoid direct evaluation of Geach's proposal or of later FCG,

and limits himself to establishing historical facts and analyzing logical relations.

One goal of the present paper is to show that Geach's objections against type-change rules, as noticed by Humberstone, have deep theoretical reasons and cannot be easily dismissed. It is true that Geach's proposal encounters some serious problems, which perhaps could be *avoided* by adopting the incriminated principles. But they cannot be *solved* by such a move. If we face them, they will lead us into the core of categorial grammar.

2. Let us begin with Raising. Humberstone quotes the fragment from Geach in which the latter complains about lumping together the categories of (proper) names and quantified phrases,¹ and therefore rejects the possibility of accepting Raising. Humberstone in his commentary suggests that Geach rejects Raising too hastily: the rejection of Raising "leaves Geach at something of a disadvantage in several later parts of his discussion" (Humberstone 2005: 287).

Geach's complaint and Humberstone's commentary shall inspire us to examine one of the very basic ideas of categorial grammar. Humberstone perhaps would be right if CG were only a formal calculus intended to express a variety of linguistic patterns and fit empirical evidence. But certainly it is more than that. CG – at least CCG – is in the first place a metaphysical and epistemological enterprise, based upon profound insights of Frege, Husserl and Leśniewski, and all these insights demand the rejection of Raising for fundamental reasons.

To see why, let us ask first what a syntactic category is. Humberstone distinguishes categories (as classes of expressions) from types ("labels" denoting such classes). He admits that two labels may denote the same category (Humberstone 2005: 282). This is a lot, compared to a common standard, but not enough. We shall remember that in CCG syntactic categories are not mere classes. They are classes determined by a certain property of expressions – the ability to play a specific syntactic role. This potentiality must be distinguished from the fact that in a given context a given expression actually plays such-and-such role. Accordingly, there are two different levels of syntactic analysis, confronted by Ajdukiewicz in the following passage (1960/1978: 281):²

I have used the term "operator" in place of the term "functor" ... since the latter is ambiguous. The term "functor" has two different meanings in the

contexts: “the expression f is a functor (simpliciter)”; “the expression f is a functor (performs the role of a functor) in the expression W ”. In the contexts of the first type “functor” is the name of an (absolute) property of some expression; while in the contexts of the second type it is the name of a relation between the particular expression and another one. The use of the term “functor” in both senses results in “the expression f is a functor which is not a functor in the expression W ”. To avoid this ambiguity and such paradoxical statements, I have introduced here the term “operator” for those cases where we deal with a relation between the given and another expression.... The term “functor” may be then used as the name of an absolute property of some expressions.²

This resolution, as well as other points that will be discussed below, stems directly from the Husserlian and Fregean idea that the distinction of basic and derived (or functor) categories is of greatest importance, and that it works on absolute properties of expressions. The analysis of the idea of functoriality – and the notion of incompleteness, “unsaturatedness” of functors – comes mainly from Frege. It is Husserl however, who examined thoroughly the other part of the distinction: the “basicness”. It is basic categories which directly express our intentionality, regarded as the foundational property of language. Functors are needed to unify many atomic expressions into a single, compound expression. But they don’t have independent meaning. Expressions can have a full-fledged meaning only when ascribed a basic category. And there are as many such categories as there are kinds of intentional acts. According to Husserl, there are two: propositional acts and nominal acts. Thus, there are two basic categories: sentences and names.³

This consequence, at least implicitly accommodated in CCG and observed both by Ajdukiewicz and Geach, immediately undermines FCG, where without a word of informal justification different numbers of basic categories are “declared” according to formal needs and tastes of the authors (e.g., Casadio 1988). Furthermore, it should be quite clear that orthodox CCG grammarians would strongly object to any principle that changes a basic category into a functor category. And that is exactly what Raising does.

What speaks for Raising, then? Of course, it can help to solve some technical problems. But from a little distance this argument looks very *ad hoc*, unless there is a good theoretical connection with the core of the gram-

mar. Apart from this, just one observation stands behind Raising; namely, that both names (N) and expressions of the category $S/(S/N)$ combine with a predicate (S/N) to yield a sentence (S). Upon this observation an argument is built that therefore expressions of both kinds are interchangeable and thus belong to the same category.

The observation itself is correct. But not the argument. The argument refers to something that could be called a “common” definition of category: syntactic category is a class of expressions that are interchangeable in any context except meaningfulness. This definition is a shortcut, however, which in the present case reveals its limitations. Originally, it was said that “the structure of [the context within which the change takes place] remain[s] the same” (Ajdukiewicz 1935: 208). This remark is worth emphasizing, being so often forgotten or neglected. For Ajdukiewicz it is perfectly understandable that in a meaningful context we can exchange a word with another word belonging to a different syntactic category, and the context remains meaningful – on condition that it changes its structure. This is exactly what is going on in the case of Raising: it is true that both names (N) and $S/(S/N)$ -s combine with a predicate (S/N) to yield a sentence (S). But they are not interchangeable, because the structure of the sentence categorizable as $(S/(S/N) S/N)$ is completely different from the structure of the sentence (S/N N). Both categorizations are syntactically coherent, but they are different kinds of sentences with different patterns of syntactic roles.

3. The case of Division is a bit different. Humberstone is right in saying that it has been wrongly ascribed to Geach. But Division is not so fundamentally at odds with CCG as is Raising.

Suppose we have an expression of category β/γ as an available argument, and we want to modify it by applying a functor, in order to get something belonging to category α/γ . Of what category must this functor be? Well, $(\alpha/\gamma)/(\beta/\gamma)$ – as says MP. Or α/β as well – as says Composition. According to pure syntactic reasoning, everywhere where we need $(\alpha/\gamma)/(\beta/\gamma)$, (α/β) would do as well. Therefore $(\alpha/\gamma)/(\beta/\gamma)$ is superfluous. We can get by with having only α/β serving as α/β with β -s, or as $(\alpha/\gamma)/(\beta/\gamma)$ with β/γ -s. We can, so to speak, make $(\alpha/\gamma)/(\beta/\gamma)$ out of (α/β) . Is that not Division? Perhaps that is why so many commentators have so clearly seen Division in Geach (1970).⁴

But it wasn't there. Geach aims at showing on syntactic grounds an "incommensurability", so to speak, of two kinds of verbs. For an intuitive example Geach gives the words "presumably" and "probably" for one side, and "passionately" and "sincerely" for the other side. The former can be categorized as $S/S-s$; the latter cannot. They must be $(S/N)/(S/N)-s$; or in this case, $(S/NN)/(S/NN)$. That they are not interchangeable is attested by the absurd conjunction, "presumably and passionately". Division, which changes "presumably" type S/S into "passionately" type $(S/NN)/(S/NN)$, would blur this distinction.

However, this argument does not reach so deeply into the foundations of categorial grammar as do the arguments against Raising. Division, unlike Raising, does not mix basic and derived categories and does not change the syntactic positions of the remaining parts of the context. It is just that it obscures possible distinctions in meaning analysis, which makes Division implausible for Geach. And as we will see in the next sections, much the same could be said about Geach's program itself.

4. So far, we have seen why Geach didn't want – and couldn't want – either Raising or Division. Humberstone is right, however, in pointing out that, without these principles, Geach's program runs into trouble. Let us consider what really made Geach formulate his program, and whether it is possible to reach the intended aims in a different way without these troubles. Or is it, perhaps, that some of these aims are not worth reaching?

Geach wants *de facto* two things: (1) to accommodate a medieval intuition that the negation of the main functor is the negation of the whole sentence; and (2) to preserve the Aristotelian insight that a phrase of the kind "not every man" is: (a) syntactically coherent (SC) and (b) a constituent of a sentence "not every man flies". In his opinion the standard rule of multiplying out (MP) is not sufficient for that, and that is why he feels a need for his G_1 (and G_2 , for two-place functors). This resolution may be challenged: these aims could be achieved entirely within CCG, by admitting only the multiple type assignment to lexical items; for instance, negation would sometimes be S/S , and at other times $[S/(S/N)]/[S/(S/N)]$. Indeed, such a possibility may be "not in keeping with the spirit of Geach ... except in the case of genuine ambiguity" (Humberstone 2005: 287), which brings about the question as to what counts for genuine ambiguity.

Must we really ascribe clearly distinct meanings to all possible categorizations in order to claim that there is a syntactic ambiguity? And must we employ a calculus such that all versions of analysis of a given expression, for which we failed to find separate meanings, turn out to be syntactically equivalent? The traditional answer, such that Ajdukiewicz would have given, and Geach, says: Yes, we must do this.

My claim is that this answer should be re-examined and eventually changed. The starting point for this enterprise is the observation that the distinction between genuine amphibolies and mere variants of syntactic categorization is vague; and that the borderline is very broad. Any grammar flexible enough to cover the needs of natural language would allow for a great number of different categorizations of given strings.⁵ And whether these categorizations would be counted as amphibolies or variants depends heavily on pragmatics, broadly understood, and especially on how precise we intend to be. For at least a decade (i.e., since van Deemter & Peters 1996), it has been widely recognized that the meaning of the expressions of natural language is (and most probably must be) underdetermined to some extent. We adjust the required precision to given circumstances, and “purely” syntactic ambiguity can help us to be more specific when necessary. In brief: if we do not want to be extremely precise, we count certain categorizations as mere variants; however, we do assign to them real difference, if need be. Let us take for an example the sentence *Łukasiewicz died in Dublin*. This is a special case of the general problem with two approaches to adverbial phrases. We have two plausible categorizations (in CCG):

[in ((S/NN)/(S/N)) died (S/N) Łukasiewicz (N) Dublin (N)]
 [in (((S/N)/(S/N))/N) Dublin (N) died (S/N) Łukasiewicz (N)]

Is there any difference in meaning? Well, that depends on how much we want to say by saying this. Without context, probably there would be no semantic difference, just mere variancies. But according to the theory of questions this syntactic difference would reveal a difference in the question to which our sentence is an answer (this is not exactly what topic/focus issues are about, but it is not far away, either). According to the first categorization, *Łukasiewicz died in Dublin* is one of the possible answers to the question *How are Poland and Ireland related to each other* – “died in” is one of the relations between something Polish (Łukasiewicz) and something Irish (Dublin). According to the second categorization, the question

could be *What were the circumstances of Jan Łukasiewicz's death?* – that is, “in Dublin” modifies “died”.

The flow of examples could be endless. Virtually every compound expression can have different categorizations, such that in some circumstances we would rather not expect any difference in meaning corresponding to these categorizations, and in other circumstances these differences would serve as a tool to convey certain subtleties of meaning. Indeed, one of the categories most difficult to connect with different meanings is perhaps the negation. That is why since the Middle Ages it has been commonly assumed – and repeated forcefully by Geach – that negating a sentence and negating its main functor is mere variancy. However, even here we can find apt subtleties, if only we dig in sufficient depth. For instance, *It is not the case that Mary went to the movies yesterday* and *Mary didn't go to the movies yesterday* can have a slightly different implication, if not a purely semantic difference. Namely, if we talk about three, clearly distinguished groups of people – (a) those who surely went to the movies yesterday (they were seen there); (b) those who surely didn't go (were seen somewhere else); and (c) those who declare they didn't, but about whom we are uncertain (we do not have relevant evidence) – then using the first form of negation (negation of sentence) would suggest that we count Mary among group (c), whereas using the second form (negation of predicate) would suggest that we count her in group (b).

In fact, if only we deliberately use two different forms in one discourse, there will be a difference – at least in implication – imposed on them. That is due to the pragmatic principle of contrast, analyzed by Eve Clark: “Speakers assume that any difference in form signals a difference in meaning” (2003: 144). This makes the whole program of unifying categorizations to which we cannot (without context) ascribe different meanings – the “program for syntax” advocated by Geach – subject to endless counterexamples. Geach wanted to have variancies (such as sentential and predicate negations) unified into one form. But since for every variancy we can have, in certain circumstances, a separate meaning (we must have, as Clark says; if we don't have, we will make one), any Geach-like, unifying principle (saying, “there is no difference between...”) would be contradicted. And in fact much of the criticism that Humberstone levels against Geach amounts to such counterexamples.

What is the moral of all this? Humberstone says, Let us have Raising and keep trying to separate variancies and amphibolies. I would rather say, Let us give up this separation; let us count syntactic differences as variancies at one time and as amphibolies at another time, according to our communicative needs. And let us keep away from Raising, because it destroys the most fundamental ideas of categorial grammar.

5. What about Geach's other goals? Let us pause now to examine the phrase "not every man". Should it really be an SC-string? Geach refers to a respectable tradition answering "Yes". But there is another tradition, not entirely unworthy, of saying otherwise. To this latter tradition belonged Ajdukiewicz (1935), who suggested that quantifiers be analyzed as sentential operators (S/S), although very special ones. In that case designations such as "a man" would count as proper names on a par with "Socrates".

Long after Ajdukiewicz this view was commonly neglected, due to serious modeling and theoretical difficulties which would follow from it in semantics (cf. Simons 2006). One can hardly blame Geach for doing so in the 1970s. Later, however, circumstances changed, due to the situational semantics introduced so forcefully by Jon Barwise and John Perry in their famous *Situations and Attitudes* (1983). This book as such does not refer particularly to categorial grammar. But the semantic resources it provides can be used to re-establish Ajdukiewicz's view of quantifiers and nominal phrases. In Fregean model-theoretical semantics, sentence denotations and truth values were the same things; in situation semantics they are separated. This allows for the dissection of truth values apart from operations on sentence denotations (i.e., situations).

Roughly, the idea would be this: the rules of syntax and semantic interpretation work on simple sentences with nominal constants (proper names), in which case they determine so-called elementary situations as the semantic correlates of sentences. Or the rules in question would work on simple sentential functions (atomic formulas with free variables), in which case they determine as correlates the non-elementary situations, being sets or families of sets, of elementary situations. For example, elementary situations can be represented as <kisses, Mary, Fred> (denoted by *Mary kisses Fred*); and non-elementary situations, for example, as {<kisses, Mary, Fred>, <kisses, Mary, John>, ..., <kisses, Jane, Fred>, <kisses, Jane,

John>, ...}; that is to say, as $\{s: s_{ij} = \langle \text{kisses, girl}_i, \text{boy}_j \rangle\}$, denoted by the sentential function *girl kisses boy*.

Of course, this raises the problem of how to get to truth-values from such defined denotations. Clearly the Truthmaker Principle, revived by David Armstrong (1997) and by subsequent discussion in recent literature (mainly in the *Australasian Journal of Philosophy*), does not hold. We cannot say that a sentence is true if, and only if, the situation corresponding to it is a fact. Non-elementary situations corresponding to most sentences are neither entirely factual nor entirely counterfactual.

My answer to the problem is that different sentences have different formulations of truth conditions. Particular truth conditions for a sentence are determined by Boolean operations (negation, disjunction etc.) and quantification. For instance, the sentence *Mary kisses Fred or Jane beats John* is true if and only if the elementary situation corresponding to the simple sentence *Mary kisses Fred* is a fact or the elementary situation corresponding to the sentence *Jane beats John* is a fact. The compound sentence itself has no specific, single correlate. Similarly for negation: *Mary doesn't kiss John* denotes the situation $\langle \text{kisses, Mary, John} \rangle$ and is true if and only if this situation is *not* a fact (this solves neatly the problem of negative situations, which have permeated discussions about the Truthmaker Principle). As to the quantifiers, the sentence *A girl kisses a boy* has the same correlate as the sentence *Every girl kisses every boy*, or as the sentence *Every girl kisses a boy*, or *A boy is kissed by every girl* and so on: $\sigma = \{s: s_{ij} = \langle \text{kisses, girl}_i, \text{boy}_j \rangle\}$. Now: *A girl kisses a boy* is true if and only if at least one of the elementary situations included in σ is a fact: $\exists i \exists j [s_{ij} \text{ is a fact}]$; *Every girl kisses a boy* is true if and only if at least one elementary situation in every subset of σ containing all elementary situations in which the same girl kisses different boys is a fact: $\forall i \exists j [s_{ij} \text{ is a fact}]$; *A (some) girl kisses every boy* is true if and only if in at least one such subset all elementary situations are facts: $\exists i \forall j [s_{ij} \text{ is a fact}]$; *Every boy is kissed by a girl* is true if and only if at least one elementary situation in every subset σ containing all elementary situations in which the same boy is kissed by different girls is a fact: $\forall j \exists i [s_{ij} \text{ is a fact}]$; *A (some) boy is kissed by every girl* is true if and only if in at least one such subset all elementary situations are facts: $\exists j \forall i [s_{ij} \text{ is a fact}]$; *Every girl kisses every boy* is true if and only if all elementary situations included in σ are facts: $\forall i \forall j [s_{ij} \text{ is a fact}]$.

Thus, quantifiers don't have any syntactic value at all. They could be easily dismissed altogether from the analyses, or given the category in which Ajdukiewicz saw them: sentential operators (S/S). Such operators, we should add, denote the identity function, since applying a quantifier to a situation yields the very same situation.

This idea is far from being forged into a theory, though. I realize that this would be a big task, because it is at odds with the mainstream and much prejudice must be overcome. Nevertheless, I feel this is the right direction for a new program for syntax, and semantics as well.

Notes

1. Humberstone uses the term “quantifier phrase”. This can be misleading. It means “a phrase that contains a quantifier”. One may not know whether it should be understood as “a phrase in which a quantifier is connected with what is quantified” – this is the intended meaning – or perhaps “a phrase that simply is a quantifier”. It seems that Humberstone makes such a mistake himself (in 2005: 292): Geach's quantified phrase “John or James” he describes as simply a “quantifier”, which is syntactically incorrect. In order to show why, let us resort for a moment to predicate calculus and a typical formula $Qx[x \text{ is } P]$. As quantifier we can count here “Q” or at most “Qx”, whereas a quantified phrase, as understood in Geach (1970: 6), is the unsaturated string $Qx[x\dots]$.
2. For example: “loves” is a functor of category S/NN, but not a functor in “John passionately loves Mary”, where the functor is either “passionately loves” (according to MP) or merely “passionately” (according to G₂).
3. For a detailed discussion of the two, and arguments for their mutual irreducibility, see Husserl 1913, Investigation V, § 28–36.
4. Among the latest instances of ascribing Division to Geach are Casadio et al. (2005: xv) and Simons (2006: 243).
5. For a good, if pessimistic, account see Marciszewski 1987.

Structural humans *versus* constructive computers

1. Uncontrollable computers

HAL in *A Space Odyssey* and Speedy in *I Robot* are examples of computers becoming uncontrollable. Such stories may be fiction, but they are based on a real problem for many people. Becoming frustrated with difficult to control computers is a common experience for any computer user. Occasionally, your computer hangs up and ignores your commands. In such cases, you may have to reboot the computer, and if the computer fails to obey even then, you might have to refresh the whole computer system; you might feel like literally kicking the computer. Why are computers so hard to control, even after decades of research and development history?

Both machine calculation and human thought are based on the processing of signs. Some might say that human thought includes processing of things apart from signs, such as emotions. However, if we consider logical circumstances, as when we wish to control computers (until we resort to kicking one), human thought is based on signs, usually signs of natural language. Indeed, Charles Sanders Peirce presented a drastic idea “the fact that every thought is a sign, taken in conjunction with the fact that life is a train of thought, proves that man is a sign” (Peirce 1931). On the other hand, every calculation on computers is controlled by signs, at the lowest level of bits of one and zero to the higher level of description of the calculation in a programming language. As a whole, both machine calculation and human thought are based on sign processing.

The sign worlds of computers and humans are totally different, though, which is one reason why humans and computers sometimes fail to get on well with each other. The difference between these two sign worlds is due to the difference in how we humans and computers handle self-reference, i.e., expression referring to oneself. The most famous self-referential expres-

sion is Descartes's "Cogito ergo sum", in that it defines the self referring to the self.

In ancient Greek mythology, there is a famous story of Narcissus, who became immobile while looking into his own reflection in the water (see Figure 1). As shown in such examples, even for humans self-reference has been an issue since ancient times in philosophy, logic and language. Self-reference highlights the limitation existing within human thought and/or human recognition.

Figure 1. Caravaggio, Narcissus.

But while humans do get puzzled, they seldom become uncontrollable because of one self-referential expression. In contrast, for computers self-reference is the major and most frequent source of malfunction. The problem is that such an expression cannot be avoided within a sign system.

2. Sign and self-reference

With any given language and corresponding interpretation system, the language is used for generating expressions which should be interpretable

in the system. Some expressions are situated at the border of interpretability, among which are self-referential expressions.

A self-referential expression here is first defined as an expression that refers to itself. An example in natural language is “The target is to realize the target”. Here, the sign “the target” is introduced and defined self-referentially as “realizing the target”. Another self-referential sentence is “This sentence is a lie”, where “this sentence” refers to the whole sentence.

In addition to such direct self-reference, mutually self-referential expressions are included among self-referential expressions in this article. Mutually self-referential expressions are multiple expressions which can be rewritten into a directly self-referential expression. For example, take the two sentences “A chicken is born from an egg” and “An egg is laid by a chicken”. These can be reduced to a single sentence using self-reference: “A chicken is born from something that is laid by a chicken.”

Some self-referential expressions can be interpreted easily. For example, the definition of a factorial value is

(1) Factorial of N : if N is 1, then 1; otherwise, N multiplied by the factorial of $(N-1)$.

This is no more than the recurrent definition of a factorial that one learns in junior high school. As N gets smaller and smaller in the recursion, finally reducing to 1, the factorial is no more than calculating the following value:

(2) Factorial of N is $N \times (N-1) \times \dots \times 2 \times 1$.

This example of the factorial shows that some self-referential expressions can be resolved into an expression that does not use self-reference. However, such cases are limited and the interpretation of a self-referential expression in general is problematic, because the content could be hollow or even contradictory. For example, the previous expression of “target” is hollow, because what exactly is targeted is not present. Also, an expression such as “This sentence is a lie” is contradictory.

Such self-referential expression easily appears when a new sign is introduced in a language system. The point is that the new sign is usually introduced with its exact value being undefined at the beginning and then consolidated in the future. In programming language, a new sign is often defined as a combination of other signs, and its exact value in bits

will be defined upon execution of the program. Such prior introduction of signs also happens in natural language, where an ambiguous target is often named before what the name signifies becomes concrete. This nature of signs is enhanced in natural language by the fact that the content of a word tends to change over time.

A sign is thus introduced prior to its concrete definition of values, so that it can be referred to from some other expression. Self-reference is then introduced when a sign is introduced, because the expression which refers to the newly introduced sign includes expressions about the sign itself. This occurs in both the content and the usage of the sign .

As for the content: when a sign is newly introduced, it can be defined relative to some existing real-world objects, but at the same time it can also be defined by means of other signs. In this case, a sign A is typically defined by another expression B, in the form “A is B”. In natural language, such definition by words is commonly made in an encyclopedia, and in programming language, “is” is usually considered as assignment and often described as “A: = B”, which means to assign the same value as that of B. This expression B can refer to the sign A; for example, “A is X Y A Z”.

Nor can usage be free from self-reference. For example, suppose we introduce a sign /xytplun/, and it is used as “A xytplun is extraordinary”. This usage will restrict /xytplun/ as a sign, such that “Xytplun is used as a xytplun is extraordinary”. Thus, we see that usage self-referentially defines /xytplun/.

Note how content and usage become mingled. “A is X Y A Z” is another usage of A, and “Xytplun is used as a xytplun is extraordinary” is another definition of /xytplun/, since it has the form “A is B”. Since a sign is always introduced to be referred to, introduction of the sign cannot avoid its value being defined self-referentially through its usage. Thus, introduction of a sign, to be defined by means of other signs, inevitably introduces self-reference.

3. Natural language: A structural system

Given any expression, humans always have the choice to abandon any attempt to interpret, if the interpretation process stalls. For example, “The target is to realize the target” is hollow, and the interpretation is limited; but we do not stop thinking about all other things because of this expres-

sion. Humans have the choice to give up, switch the context, or continue. In the future, another expression will perhaps provide more information, such as “The actual target is related to my study”, and the person can then return to the problematic expression and continue with the interpretation process. Such a feature allows one to choose dynamically when to suspend interpretation, such that a human can start processing any self-referential expression.

Robust processing of self-referential expressions inevitably generates a sign system where many concrete values of signs are left ambiguous, but still exist within the language system. The process is expressed through a generative model as follows. A sign is introduced with its value still being ambiguous. This ambiguity is clarified by language through additional usage and additional definition. Self-reference introduced through such a process cannot be resolved as was the case in a factorial, because usage usually changes over time. The value of a sign thus exists within the system, inexplicit among the network of signs which are used in expressions which refer to the sign. The sign is referred to from an expression consisting of signs referred to from many other expressions, whose signs are likewise referred to, and so forth; hence the value of the first sign relates to the whole system.

Consider the definition of the sign /project X/ as the name of some research project. Usually, the true content of a research project is defined in little detail at the beginning because a “project” refers to a future result. Yet, a name is needed for reference even if its content is not clear, because when we set up a project, there is much discussion about among many people. The project starts, runs, and ends, and at this ending point people finally (might) realize what the project really was. During the time the project runs, the sign /project X/ will be referred to through statements such as “Project X is not interesting” or “Project X has had its budget doubled”. Such usage self-referentially defines the term “project X”. Thus, the sign /project X/ forms the kernel onto which usages and contents will attach.

As a result, it is sometimes difficult to precisely define a sign in a system like natural language, even a sign that seems simple. For example, the first definition of the word “house”, a word that even a five-year-old child knows, is “a structure serving as a dwelling for one or more persons, especially for a family” (*American Heritage Dictionary*). However, a larger building where multiple families “dwell” is usually called an apartment building rather than

a house. What can be called a “house” ultimately depends on the context in which “house” is used. We see here that learning a word means far more than knowing what physical object it represents, and requires learning the usages of the word. This is even clearer when we learn an abstract term (without physical correspondence) or a foreign language. The content of a term can be learned from a bilingual dictionary, but the contour of two signs in each language differs depending on the culture. For example, the most common Japanese translation of the word “water” should never be “hot”, whereas in English “hot water” is relevant. Many such differences are expressed in the form of the usage of a term.

The value of a sign is everything that is related to the sign, which functions as the kernel around which usages and contents accrue. Thus, it is the sign which articulates the meaning: it is not the case that the meaning is named by a signifier. Moreover, usages and contents change over time, and the whole represented by the sign changes. Since this happens to every term in the language system, the system itself becomes self-referential.

Such a view of natural language has been previously presented in many philosophical speculations concerning natural language. It can be summarized in the Quine’s (1960) famous remark: “Our language, which embeds every human theory and belief, is like Neurath’s ship, which we continue to build and modify while being afloat.”

The origin of such a view that emphasizes the value of an element existing within a holistic system lies within the purview of Saussurean structuralism (Saussure 1993). Although the meaning of the term “structuralism” has diversified greatly (Domenach 1967; Sturrock 2003), in this article it is defined as a system where the value of an element exists within the holistic system. The core concept of structuralism is present in the following quotation from Saussure (1993):

We must not begin with the word, the term, in order to construct the system. This would be to suppose that terms have an absolute value given in advance, and that you have only to pile them up one on top of the other in order to reach the system. On the contrary, one must start from the system, the interconnected whole; this may be decomposed into particular terms, although these are not as easily distinguished as it might seem.

In Saussure’s lectures, this structural aspect of the system is explained without specification of any explicit relation as to how a signifier articu-

lates the signified. The generative model explained previously shows how necessarily they are related: how the initial existence of a signifier generates a signified as an ensemble of content and usages, and thus forms a structural system.

4. Programming language: A constructive system

Every computer is driven by a program written in a programming language which contains self-referential expressions. In programs, too, signs are often initiated to acquire values in the future. Computation is an action to obtain exact data in bits in machine memory, where these bits are previously represented by a sign (called an identifier in the programming domain). For example, in a simple calculation program,

$$\begin{aligned} X &:= 1 \\ Y &:= 2 \\ Z &:= X + Y \end{aligned}$$

the programmer introduces Z , which is to be calculated as the addition of X and Y . However, when the user writes this program, Z 's content as bit data is not defined until the program is run and the calculation is made. Such separation of a sign from its final value makes a self-referential definition possible, which is expressed as

$$Z := \dots Z \dots$$

Computers and humans process self-referential expressions totally differently. A computer risks falling into endless loops when interpreting self-referential expressions, since the interpretation of a self-referential expression requires the interpretation of itself. A computer will not distinguish between a program that ends within a minute and one that will never end, even after countless years of computation.

Perhaps, then, a computer could judge whether the processing of a program halts or not before it starts the actual calculation. However, it has been logically proved that any computer based on a Turing machine is incapable of such a procedure (Cutland 1980), and this problem is known as the halting problem. Namely, there will be no computer program that is able to judge whether or not a given program halts. Without the ability to judge whether a given program halts, once a computer starts running any calculation it risks falling into an endless cycle.

Programmers therefore have to write a halting program by manipulating signs that might be self-referentially defined and thus might not be halting. In this sense, a programming language is a language which inherently contains a flaw that could result in unhalting computation. Programmers should take care when writing programs to ensure they avoid this flaw.

Recent programming language systems incorporate various ways to help programmers write properly halting programs. First, theoretical support can be provided by clarifying the general features that executable self-referential definitions possess (Tennent 1991; Gunter 1962). For example, the definition of a factorial, as shown in expression (1) in Section 2, is halting. Very roughly speaking, if a problem recursively defined through self-reference forms a sub-problem of the original problem, then a self-referential expression is halting. For example, the factorial of N is reduced to the sub-problem of the factorial of $N-1$.

Second, linguistic restrictions can be introduced. This means restricting sign usages by disallowing the occurrence of some expressions. One way is to classify signs hierarchically by type. For example, it is known that considering the set of all sets as a set will lead to a logical contradiction (Dalen 2004). Such a case can be avoided by introducing types among data, and considering the set of sets to be a different type from a set.

Another means of aid is the notion of scope; i.e., the range in which a sign is valid. A sign defined within a smaller scope is usually prohibited from use within a larger scope that contains the smaller scope. This has the advantage of encapsulating signs within the appropriate scope and enabling a thorough administration of signs. Such a notion of scope exists in natural language, too, and people are aware of the scope of signs. For example, English terms are generally only valid within an English-speaking community; technical terms are only meaningful to practitioners within a specific domain. In natural language, the scope is usually formed naturally, and the border of the scope is vague.

The notion of scope helps the user to better administer signs. If a sign's introduction, usage, and extinction is thoroughly administered, it is unlikely that a global sign will be badly used by forming an unpredicted self-reference. Further, self-referential signs can be suppressed through the use of scope in a radical way, such as in the lambda calculus framework (Hankin 2004), but this sacrifices the introduction of global signs. Lambda

calculus is therefore incorporated into some programming languages, but it is seldom used alone for large-scale programming. The design of a programming language still consists in finding a balance between allowing free and natural manipulation of signs, and restricting sign usages to help programmers avoid producing non-halting programs.

Figure 2. Structural system (left) and Constructive system (right).

Such programming features encourage an attitude of generating programs in a constructive manner. By “constructive system” we mean one in which a larger element is generated as a combination of smaller components, which are guaranteed to be executed safely and then halt. Any programming language system has basic data and functions, where values are predefined within the system when it is designed. They consist of numbers, characters, Boolean values, decimals, and basic operations applicable to them. Basic data and functions are represented by signs; for example, “1” means the integer value of one and “+” means to add two numbers. The programmer’s responsibility is to write a program so that any sign can be reduced to a combination of such basic data and operations. Such a bottom-up production process is supported by libraries attached to a language; i.e., a collection of components and functions which are guaranteed to work. This definition also applies to self-referential expressions, since halting self-referential expressions are reduced to sub-problems. To write a program is to describe the constructive view of the target calculation.

This term “constructive” is related to the philosophy underlying constructive logic, mathematics and programming: if a mathematical object exists, then it should be possible for it to be constructed (i.e., found or explicitly described). This philosophy began with Brouwer and his intuitive logic (Dalen 1984), which has developed into the form of constructive mathematics of Bishop (Beeson 1985). Intuitive logic is known as a logical framework that does not rely upon *reductio ad absurdum*, and thus elimi-

nates the indirect proof which explicitly avoids showing the existence of the mathematical formula. The sophistication of such theory led to the programming method called constructive programming, where the specification of a software application is formally expressed and programs are formed as proofs.

5. *Structure versus construction*

Note how different a sign system formed of programming language is from one formed of natural language. Constructive and structural are both terms, each containing the morpheme /struct/, but the underlying philosophy of each is the opposite of the other as regards the relation between the system and its elements as signs. By analogy to Saussure's quote, in a constructive system, we should begin with the word (the term), in order to construct the system. In contrast, within a structural system, we should not begin with the word or term but should start from the system. The difference between the two types of system is illustrated in Figure 2.

The relation between a structural system and a constructive system is that the former may include the whole of the latter, whereas the latter may include only part of the former. The self-referential factorial function may be included in both systems, but many terms of natural language, when defined self-referentially, can work in a structural system but not in constructive systems. Moreover, a programming language is founded on a theory which eliminates the *reductio ad absurdum* which is part of natural language. Such a difference appears to be based upon the difference in how humans and computers interpret self-referential expressions.

Such a difference affects the robustness of a system. In a structural system, because any value of a sign is not completely defined, the sign is always ambiguous to some extent, so the value of a sign might overlap that of another. Thus, various expressions can signify almost identical contents. Also, the elimination of one sign will not affect the system, the system will continue to work. In contrast, in a constructive system, a sign is defined so that its content is explicit. Thus, the content of a sign is unlikely to overlap that of another and there is no ambiguity. Elimination of a single sign could be disastrous.

Thus, when writing a program, the programmer – a human being accustomed to using a robust structural system as natural language – is forced

to think in a constructive way. Even though every sign is introduced with its content to be defined in the future, the programmer must generate a halting program, using self-reference, while knowing exactly how the sign will acquire the final value. Programmers must fully administer all signs, remaining completely aware of how they are related. Since computer systems are generated through programs, naturally, the users of current computers face a similar challenge. Neglecting one sign could instantly lead to disastrous computer behavior. Many software applications have safeguards against unhalting executions, and sign manipulation is restricted. Such measures, however, may cause users to feel awkward or inhibited when working with computers.

Still, computers are unlike previous machines in that their behavior can be changed by changing the program (Hofstadter 1979). Thus, computers and certain types of hardware are “thirdness” beings (Tanaka-Ishii and Ishii 2006). Such essential thirdness indicates a potential for structural computation. Devising a “structural computer” would be the key to stopping HAL or Speedy, and would lead to a more natural computing environment, including the creation of more “natural” artificial beings.

Eero Tarasti

What is existential semiotics? From theory to application

Background

During the past fifteen years I have been elaborating a new theory of semiotic inquiry, starting from its philosophical and epistemic premises. I have called this project *Existential semiotics* due to its roots in continental philosophy – following the line Kant-Hegel-Kierkegaard-Jaspers-Heidegger-Arendt-Sartre-de Beauvoir-Marcel-Wahl – and in the history of semiotics via its various generations: classic, structuralist/post-structuralist, and postmodern thinkers. In fact this enterprise has led me almost to the borderlines of semiotics, since the new configuration of knowledge that I propose has become so strongly philosophical and so close to certain hermeneutical and phenomenological approaches, that it may be at first difficult to see its link to the whole tradition of semiotic studies.

As to the latter, my new theory does not aim to show that “classical semiotic thought” has become outdated; rather, it is still valid, but within the limits of a new, more encompassing theory. Coming from Claude Lévi-Strauss’s structuralism (I was his only Finnish student, having studied with him in Paris in 1973–1975, then doing research in Brazil in 1976 following his ideas) and from the Paris School of semiotics founded by Lithuanian born semiotician and linguist Algirdas Julien Greimas, I remain faithful to those classic authors. On the other hand, I am forging an independent theory that can no longer be confined within the framework of Parisian semiotics. In the semiotic context and tradition I would call my theory a “neosemiotics”. It is no longer a “post-” phenomenon (like poststructuralism or postmodernism) but something new, in that it purports to represent 21st-century thought and, as a philosophy of our time, engages with challenges of the present era.

My new theory is not a return to “existentialism”, as its title might suggest. Rather, I am reconsidering and rethinking the foundations of semiotics in the light of certain philosophers, who have paid attention to such notions as subject, *Dasein*, transcendence, situation, existence and value. Basically what this involves is a scrutiny of “semiosis”, the process of production of signs and meaning, from the inside, so to speak. I am interested in how signs become signs and, particularly, how they are preceded by what I call “presigns”, i.e., virtual, transcendental entities. In the most abstract form these presigns are values, axiological entities; in more concrete form, they are “ideas” which, say, an artist may have, prior to their being actualized, transformed, or transcribed into what I call “actsigns”. Moreover, when actsigns are performed or received by the community in which signs are conveyed, they become “post-signs”; i.e., they are realized and exercise their “real” impact upon the destinates.

Such a theoretical scheme is essentially based on two fundamental categories of an ontological nature: *Dasein* and *transcendence*. The first term (literally, “Being-there”) I leave untranslated from the German, because of its subtle meaningfulness. It is simply the world in which we as subjects live, surrounded by other subjects and objects with which we try to come to terms. In structuralist narratology, a primal “desire” to be conjoined/disjoined was viewed as the “initial force” behind narrative processes, and this holds true also in existential semiotics, within the limits of *Dasein*. Note that here *Dasein* is not only “my Being-There”, as it was for Heidegger, but also covers other subjects and objects. Still, we feel our *Dasein* to be incomplete, lacking something, and this catalyses our wish and longing for the transcendent. That is how Sartre explained the notion of transcendence – i.e., as a lack in *Dasein* which forces us to go beyond its borderlines – as did phenomenological sociologists such as Alfred Schutz and Thomas Luckmann.

Transcendence is the realm beyond the concrete world of *Dasein* which our subject can reach via two acts, negation and affirmation. In the first case the subject realizes “Nothingness” in the Hegelian or existentialist sense, with its anguishing psychic reflections; in the latter, as “plenitude” (Gr., *pleroma*; Lat., *plena*), understood as an archetypal experience of the universe as full of meanings rather than devoid of them – an experience endorsed by the Gnostics, and described as well by modern philosophers (e.g., Vladimir Soloviev) and semioticians (e.g., Eco 1990).

Already this theoretical outline seems to stray from common semiotic thought, but when we return to sign studies we will notice how radical the consequences are for the latter. Namely, entirely new sign categories emerge from the traffic of signs between Dasein and transcendence. These are new categories of sign – to use the term by C. S. Peirce – and thus far I have been able to enumerate at least the following ones: presigns, actsigns, postsigns, endosigns, exosigns, transsigns, as-if-signs, genosigns, pheno-signs. But even more fundamentally, we can now reinterpret the entire classical semiotic approach as a kind of transcendental science (in the Kantian sense). Traditionally semiotics has been considered to consist of two great inquiries: one dealing with *signification*, the other with *communication*.

Every sign is, in fact, a transcendental unit, in light of the classical medieval definition of sign as *aliquid stat pro aliquo* (something standing for something). This means the following: by signs we talk and think of objects which are absent. The most serviceable definition of the transcendental might be as follows: the transcendent is anything that is absent, but present in our minds.

The second essential field of semiotics is communication, i.e., how we use signs to transmit meanings and content to others. In Saussure's classical model of dialogue (1916), Mr A says something to Mr B. Yet we might say that a huge gap separates A from B. Mr B is a "transcendent entity" to Mr A, since Mr B represents what might be philosophically called the alien-psyche (*Fremdseelig*). The only certain thing, phenomenologically, is Mr A's stream of consciousness, which may be called "self-" or "auto-psyche" (*Eigenseelig*). Therefore in every act of communication Mr A risks being misunderstood by his partner in dialogue. And yet the space between them is not empty, but filled by what Greimas called *modalities*. In the theory of existential semiotics I distinguish traditional linguistic and logical modalities, which concern life in Dasein, from metamodalities, which portray communication between Dasein and transcendence.

A theory of subject

All this leads us to reconsider the role of the subject in communication and signification, the aspect so strongly criticised and denied by structuralist semioticians ever since Lévi-Strauss's *The Savage Mind* (1962), which rejected the Sartrean theory of subjective "dialectics". Yet the subject re-

entered semiotics in its poststructuralist phase in the 1980s, in the work of many scholars, from Julia Kristeva to Michel Foucault and, in a certain sense, Roland Barthes and A. J. Greimas, with his “third semiotic revolution” – which meant nothing other than the (re)discovery of values and of the modalities, as the ways in which speakers provide their utterances with emotions, expectations, and psychic contents.

If we want to understand the basic problem of every society – namely, why individuals obey its rules and become “socialized” by it – we see this is made possible only by the fact that social rules and laws are somehow “internalized” into a subject’s mind. The society must be “inside”, otherwise it would have no impact but remain a matter of indifference to the subject. How can we explain this process of internalisation and clarify its mechanisms?

There has been much talk about subjects and subjectivity in many neighbouring areas of semiotics, such as psychoanalysis, gender theories, social sciences, philosophy, arts research, etc. Yet, without a more articulated vision of how the subject appears in the fields of communication and signification, such theoretical views stop short of their goals, as laudable as their efforts might be.

To do so requires a short excursion to the roots of existential semiotics, which means going back to Hegel and his logics. For some semioticians Hegel is mere “conceptual poetry”; to others, he is acceptable only after a “Marxist turn-around”, but to still others, like Hannah Arendt, he was the most central thinker of Western philosophy, one who compiled phenomena of nature and history into a homogeneous construction – but as Arendt notes, whether prison or palace, we cannot say. For Arendt, Hegel was the last word in Western philosophy. All that came after him was either imitated him or rebelled against him. Contemporary schools of thought, which in Arendt’s case were Husserl, Heidegger and Jaspers, constituted mere epigones of Hegel.

I take as my starting point only one detail from Hegelian logic, the principle by which we may construct further our theory of subject; namely, his categories of *an-sich-sein* (being-in-itself) and *für-sich-sein* (being-for-itself). In the Hegel dictionary edited by Michael Inwood there is an entry entitled “In for, and in and for, itself, himself ...” (Inwood 1992: 133–136). The third person reflexive pronoun in German, *sich*, is both singular and plural, and covers all three genders. It may thus mean one-, him-, her-, or

itself; themselves; each other. It may be either accusative or dative, but not nominative or genitive. It accompanies German's numerous reflexive verbs, and can also be preceded by several prepositions. For example *für sich* (for oneself, himself, etc.) occurs in such contexts as "He needs a room *for himself*", "She lives *by herself*", and "That is a problem *in itself*", that is to say, apart from its connections with other matters. In ordinary usage *an sich* (in itself, etc.) often differs little from *für sich*: to consider a matter *an sich* is also to consider it apart from its connections with anything else; and if something is certain *an sich*, its certainty is IMMEDIATE, and not dependent on anything else. In both these contexts, *an und für sich* is simply a more emphatic equivalent of *an sich*.

In ordinary German such expressions usually do not have a single, well-defined usage, but a range of uses overlapping those of other expressions. The only one that had acquired a settled philosophical use by Hegel's day was *an sich*. In Plato it meant the form or idea; e.g., the form of beauty is "the beautiful *itself*", or *an sich*. For Kant a thing *an sich* is something apart from its relation to our cognition and the way it appears to us. Thus *an sich* contrasts not with *für sich* but with *in uns* or *für uns*.

Hegel used the terms *an sich* and *für sich* in their ordinary senses, but also provided them with contrasting meaning. As finite, a thing has a determinate nature only in virtue of its relation with other things, its negation of, and by, them. This is true not only of items in the world, but also of Kant's thing-in-itself, since it, too, is cut off from our cognition. Thus a thing as it is *an sich* has no overt determinate character; at most, it has *potential* character, which will be actualized only by its relations to other things. For example, an infant *an sich* is only potentially rational, not actually so. A tailor is a tailor *an sich* in the sense of having certain innate skills that suit him for this role, and of having certain overt features which distinguish him from, say, a sailor. Being a tailor, or musician, thus involves an interplay between being *an sich* and being for another. But a person is not simply a role occupant. He is also an individual, an "I", and as such can distance himself from his role and think of himself just as *me* or *I*. When doing so, he is no longer for others, but *for himself*. For instance, consider a bus driver who has already left but notices one person still running to the stop. Against the rules he stops and takes on the passenger, since he feels compassion for the late arrival. Although his self-consciousness may

presuppose recognition by others, an *I* is not just one in a system of contrasting roles: everyone is an *I*.

Furthermore, the idea that “if something is for itself, it is aware of itself”, leads to the notion that an entity may have in itself certain characteristics that are not *for itself*. A slave is, as a man, free in himself, but he may not be free for himself. The student is a future doctor and professor, but he does not know it. Finally, the terms *an sich* and *für sich* start to mean potential and actual, and may be applied to the subject’s development: when a person becomes “for himself” what he is “in himself”, he usually recognizes his identity: he becomes meaningful to himself (to use semiotic terms).

The preceding linguistic excursion was probably necessary in order to understand the next reasoning, in which we proceed toward a theory of individual subjectivity. But before we turn Hegel to existential-semiotic use, let us look what Søren Kierkegaard did with the notions of *an sich* and *für sich*. In him they turn into subjective and objective being. In the chapter “Becoming a subject”, in his treatise *Concluding Unscientific Postscript* (Kierkegaard 1846/1992), he speaks about an individual who is said to be a subject, or such an individual “who is what he is because he has become like it.” In existential semiotics, such a subject who has become himself may be considered a genosign. The advent of a subject from *an sich* being to *für sich* being, corresponds to his becoming a sign to himself, or the emergence of his identity. Kierkegaard sees the task of a subject as “more and more to take off his subjectivity and become more and more objective.” The objective being is the same as observing and being observed. In his theory, this observation has to be of an ethical nature.

The next careful reader of Hegel (and of Kierkegaard) was Jean-Paul Sartre, whose *L'Être et le néant* (1943) was largely based upon Hegelian concepts of *an sich* and *für sich*, or in Sartre’s terms: *être-en-soi* and *être-pour-soi*. According to Sartre, being simply *is*; it cannot help but *be*. But it has as its potentiality the fact that it becomes aware of itself via an act of negation. In Kierkegaardian terms, the being becomes an observer of itself and is thus shifted into being-for-itself. This is precisely transcending. The *pour-soi* as the outburst of negation forms the basis for identity. It appears as a lack. This, according to Sartre, is the beginning of transcendence: human reality strives for something which it lacks (Sartre 1943: 124–125). Man starts to exist when he realizes the incompleteness of his being. Also

via this effort, value enters human life. Value is that to which one aspires. Being-in-itself precedes every consciousness; Being-in-itself is the same as what Being-for-itself was earlier. The essential change in Sartre's theory, as regards Hegel, is the movement between these two categories, and a kind of subjectivisation of them considering existence.

We need still one more "modernisation" of Hegel and his categories. It has been offered by Jacques Fontanille in his study *Soma et séma: Figures du corps* (Fontanille 2004). The author deals with corporeal semiotics, but presents the distinction between categories of *Moi* and *Soi* in a fresh manner.

As a Greimassian semiotician Fontanille starts from the *actant* and his/her body. He distinguishes between body and form. We speak of body as such or "flesh" (*chair*), which is the center of everything, the material resistance or impulse to semiotic processes. The body is the sensorial, motor fulcrum of semiotic experience (Fontanille 2004: 22). Yet, on the other hand there is a body in the proper sense, which constitutes the identity and directional principle of the body. The body is the carrier of the "me" (*Moi*) whereas the proper body supports the "self", or *Soi* (ibid.: 22–23). The *Soi*, or "self", builds itself in discursive activity. The *Soi* is that part of ourselves which the "me" (*Moi*) projects out of itself in order to create itself in its activity. The *Moi* is that part of ourselves to which the *Soi* refers when establishing itself. The *Moi* provides the *Soi* with impulse and resistance whereby it can become something. In turn, the *Soi* furnishes the *Moi* with a reflexivity which it needs in order to keep within its limits as it changes. The *Moi* resists and forces the *Soi* to confront its own alterity. Hence, the two are inseparable.

Although Fontanille is a semiotician (and here quotes Paul Ricoeur), his reasoning fits well with the above-mentioned Hegelian categories. What is involved is a new interpretation of *an sich* and *für sich*, the first one corresponding to bodily ego and the latter to its stability, identity, and aspiration outwards – that is, to Sartrean negation. The self (*Soi*) functions as a kind of memory of the body (*Moi*); it yields form to those traces of tensions and needs which have been inserted in the flesh of the "me", or *Moi*.

In light of Fontanille's concepts, we could change the Hegelian Being-in-itself or Being-for-itself, the *an-sich-sein* and *für-sich-sein*, into *an-mir-sein* and *für-mich-sein*, i.e., Being-in-myself and Being-for-myself. But before we ponder the consequences this has for our existential semiotics,

let us scrutinize the principles of *Moi* and *Soi* as such, and in music particularly. Anything belonging to the category of *mich* (me) concerns the subject as an individual entity, whereas the concept of *sich* has to be reserved for the social aspect of this subject.

Let us take Uexküll's (1940) principle of *Ich-Ton*, which determines the identity and individuality of an organism. In it we can distinguish two aspects: *Moi* and *Soi*. In "me" the subject appears as such, as a bundle of sensations, and in the "self", *Soi*, the subject appears as observed by others, as socially determined. These constitute, respectively, the existential (individual) and social (communal) aspects of the subject.

The *Moi* of the artist is the pure source of ideas. But we can also say that transcendence lives within a man. The *Moi*, however, is surrounded by the sphere of the *Soi*, that part of the ego which is social, coded and community-bound – not existential. Together they form the phenomenon that Thomas Sebeok called "the semiotic self". This concept coined by Sebeok is determined by the physical and virtual body. Some identify the semiotic moment either with social codes (the Saussurean tradition) or with the kinetic energy of the ego (Julia Kristeva). These theories also have their supporters in musical semiotics.

My colleague in musical semiotics, Raymond Monelle, adheres to the first one when he says that the semiotic appears particularly well in the socially codified forms of eighteenth-century music (Monelle 1992: 5). The latter is exemplified by the "new musicologist", Richard Taruskin, who speaks of the "semiotic" in Russian music; his description as such of the undulating gestures of Polovetsian girls in Borodin is a typically Kristevan "semiotics" of music (Taruskin 1997: 152).

In my theory, both are necessary: they together form the *Ich-Ton* of an organism, which is surrounded by the Other. Insofar as this Other is another subject-organism, one can presume that it is construed in the same manner of *Moi* and *Soi*. Thus the point and surface in which one *Ich-Ton* touches the Other (*Dich-Ton*) and its organism, is of course the sphere of *Soi*. Only on this level does language function as a codified set of rules, which enables communication in the proper sense between these organisms.

Above I asked whether one's *Moi* can directly communicate with the Other's *Moi*. The answer is: mostly, no. *Moi* must first transform into *Soi*

within one's organism. *I* must become *Me*, in the sense of G. H. Mead, before one subject reaches another one.

But correspondingly, if *Sois* were only communicating between themselves, we could never be sure if what Others express, via gestures and words, *really* represents what they intend in their noemas. Intention always covers both *Moi* and *Soi*.

The *primus motor* of art history is the becoming of *Moi* in relation to *Soi*; or rather, the constant rebellion of the *Moi* against the communal, conventional world of the *Soi*. In sonata form, the appearance of the *Moi* was at first permitted only during the development section, amidst harmonic and motivic instability. Then Wagner elevated this principle, as "continuous transition", into the constructive principle of his operas, or their *Soi*. Later came the shift to atonality and serialism, giving total dominance to the *Soi*. Yet even it was negated, since it is impossible to repress completely the *Moi*. The sphere of *Soi* forms a perpetual resistance to the being of the *Moi*. Correspondingly, the existence of *Moi* prevents communication from becoming the mere domain of the *Soi*, a field comprised exclusively of *langue*.

Paradoxically, however, if the *Moi* is left to realize itself freely, the results are not a rich tapestry of modalities, but their scarcity and suppression. In Nietzsche's musical compositions, the modalities of will, know and can do not develop into anything, since they do not take shape in forms codified by the *Soi*. Only with such forms can one create a hierarchical, structured work. Although Nietzsche's inner resolve was tremendous, and although he scatters German performance indications everywhere, in his writings emphasizes the principle of will, and resorts to extra-musical programs in *Ermanarich* and other works, his musical 'will' does not develop to its climax, and neither does 'know' nor 'can'. They lack the 'must' of the *Soi*. Modalities favored by the *Soi* are precisely 'must', 'know', 'can' and 'will', in that order, in such a way that their amount and cogency diminishes towards the end of the list. Conversely, the modalities of the *Moi* go from heaviest to lightest: 'will', 'can', 'know', 'must'.

Of the modalities of the *Moi*, 'will' is the most important; it conveys the inner pressure of movement, the stability of the work. 'Will' does not necessarily appear solely as 'want-to-do', but may manifest also as want-to-be or want-not-to-do or want-not-to-be (this holds true also for other modalities). The second important modality for the *Moi* is 'can', or power

(*pouvoir*), often even a corporeally important category. Next most essential is ‘knowing’, which concerns the memory of the *Moi*, a kind of “profound ego” (*le moi profond*) in the Bergsonian sense. The concept of “intellectual effort” as it relates to Bergson (see Bankov 2000) is interesting since it seems to be based upon the modality of ‘know’, and at the same time on ‘do’ and ‘can’. For instance, a musical or literary composition delivers information only via an effort, not by itself. With the help of the memory of the *Moi*, the composition, as an “organism”, remembers its earlier solutions during its enunciation. Finally, even the *Moi* possesses its own inner obligation, its particular ‘must’ – one cannot go against the laws of *Moi*. Whoever does so, subdues his own expression.

In the modalities of the *Soi*, ‘must’ comes first, as normative forms and communication structures: styles, techniques and topics (musical-rhetorical figures). If a writer calls his literary work a “novel” or “comedy”, or if a composer designates his work as a sonata, symphony or fugue, then he commits himself to a certain ‘must’ or obligation of the *Soi*. Second important is the modality of ‘know’ or the penetration of elements from the store of intonations (Eco would say, from the encyclopedia of knowledge), which are transcendent to the work. For instance, the beginning of Beethoven’s last piano sonata (Op. 111) displays not only the topics of *Sturm und Drang*, but also the French *ouverture* of the Baroque era, with its dotted rhythms (see, e.g., the first movement of Handel’s Suite in G minor). Therefore, when we say that the *Ich-Ton* of an art work determines which elements it accepts from its surroundings, taking them into its organism and transforming them into endosemiotic entities, what is involved is precisely the modality of ‘know’.

The third important modality for the *Soi* is ‘can’, understood as the adoption of certain techniques and resources whereby the aforementioned ‘must’ and ‘know’ can be realized. Least important to the *Soi* is ‘will’. Yet even it appears as a kind of collective wanting; for instance, when a composer expresses the voice of his community, when a painter like Rubens praises his ruler Maria di Medici, when Clara Schumann writes variations on the Emperor Hymn, or when Wagner writes *Mastersingers* in the atmosphere of the Franco-Prussian War. The ‘will’ of the *Soi* is thus of collective origin.

These reflections can be put into the following model, which has three circles:

Diagram 1.

The diagram shows transcendence is filtered via *Soi* to the sphere of *Moi*.

Is the production of an art work mostly an affair of *Moi* or mostly of *Soi*? If one writes a fugue it is an event of *Soi*, without doubt. If one provides it with a little tinge of expressivity, in the line of Mozart-Beethoven-Franck-Brahms, it has a little bit of *Moi* as well. But if one writes a fantasy or an aleatoric work, it is certainly more an activity of *Moi*. In literature, Charles Mauron spoke about obsessive myths of a writer. In films by Kaurismäki or Renoir or Eisenstein we see certain personal themes recurring and being elaborated. Yet *Moi*, left all to itself, is most often helpless, a fact exemplified by musical improvisation. When the performer has full freedom in performances, the probable results are outworn clichés and mannerisms: either as techniques stemming directly from the unconscious of the *Soi*, or as such forms of the *Moi* which our subject supposes the audience wants to hear. What is involved is the artistic *das Man: man schreibt so, man malt so, man komponiert so...*

We can now put together the most important ideas of this essay. My intention was to specify, among other things, the category of 'being', by providing this basic modality with new flavours from Kant and Hegel, and by following the phases of this concept further, from Kierkegaard to Sartre and Fontanille (of course, the project of existential semiotics need not stop here). When one aims for more subtle tools in semiotics, one can still find radical innovations in the classics of philosophy. The Being-in-itself and Being-for-itself became Being-in- and Being-for-myself in existential semiotics. When these notions are combined on Greimas's semiotic square of logical oppositions, one gets the following cases:

Diagram 2.

They can be interpreted as follows:

1) Being-in-myself represents our bodily ego, which appears as kinetic energy, *khora*, desire, gestures, intonations, Peirce's First. Our ego is not yet in anyway conscious of itself but rests in the naive Firstness of its being; modality: endotactic, 'will'.

2) Being-for-myself corresponds to Kierkegaard's attitude of an observer. Sartre's negation obtains, such that mere being shifts to transcendence; it notices the lack in its existence and hence becomes aware of itself and transcendence. The mere being of the subject becomes existing. This corresponds to the transcendental acts of my previous model, negation and affirmation. Ego discovers its identity, reaches a certain kind of stability, permanent corporeality via habit; modality: endotactic, 'can'.

3) Being-in-itself is a transcendental category. It refers to norms, ideas and values, which are purely conceptual and virtual, they are potentialities of a subject, which he can either actualize or not. What is involved are abstract units and categories; modality: exotactic, 'must'.

4) Being-for-itself means the aforementioned norms, ideas and values as realized by the conduct of our subject in his *Dasein*. Those abstract entities appear here as applied values, choices and realizations, which often will be far away from the originally transcendental entities; modality: exotactic, 'know'.

The essential aspect of the model is that it combines the spheres of *Moi* and *Soi*, the individual and collective subjectivities. It portrays semiosis not only as a movement of the collective Hegelian Spirit, but also the presence of a subject, via the addition of Being-in- and -for-myself. Crucial

is not only the distinction of these four logical cases, but also the movement among them, the transformation of a chaotic corporeal ego into its identity, the becoming of ego into a sign to itself; furthermore, the stable and completely responsible ego impacts the actualisation of transcendental values, such that the ego becomes a sign to other subjects. In this phase, the Being-in-myself and for-myself meets Others; i.e., you, or Being-in-and Being-for-yourself. Behind this social field looms the realm of transcendental and virtual values and norms: signs which have not yet become signs to anyone.

In the classical sense, the semiotic sphere consists only of the fields of Being-for-myself and Being-for-itself. The extremities of the semiotic square are the field of pre-signs, which surround from two sides the semiosis, properly speaking. These are totally “concrete” and “sensual” qualities on the one hand, and on the other, they are entirely abstract, “intelligent” norms and values (recalling Lévi-Strauss’s distinction into *le sensible* and *l’intelligible*). However, this semiosis, the process of act-signs, cannot be understood without going outside of it, to transcendence. Hence, in these two phases existential analysis becomes a Kantian, transcendental analytic.

Ultimately we can formulate our semiotic square as follows:

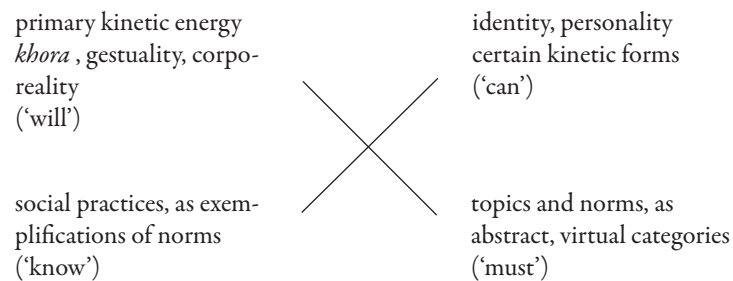

Diagram 3.

Most recently I prefer to speak of two different directions or movements among coordinates of the semiotic square portraying a subject’s mind. This movement goes from the concrete and corporeal towards the abstract and “intelligible”: *Moi* gradually unfolds, developing a *Soi*, and reaching even the most abstract categories of a society. In this development, the weight of

Moi gradually diminishes, of course, but a tiny trace of it remains in even the most extreme case of *Soi*. The other direction starts from the *Soi*, with its norms and values, and leads towards their enactment in certain institutions and practices, and their impact on an individual's behaviour on a personal level, reaching into the tiniest subtleties and nuances of his corporeality. For purposes of analysis, let us call these moments *Moi*₁, *Moi*₂, *Moi*₃ and *Moi*₄, and correspondingly *Soi*₁, *Soi*₂, *Soi*₃ and *Soi*₄. We can easily see how in this model these two movements coincide. Both “streams” can have their own particular signs, and the interesting and provocative point in this theory is the encounter of these two types of signs:

Diagram 4.

Each phase of subjectivity appears to itself as specific and characteristic signs (endosigns, as we called them earlier); whereas when the subject enters into activity and signifying action, he/she produces again its own signs which are quite overt (exosigns). These two attitudes – observing oneself and realizing oneself – correspond to two basic attitudes in Schelling's system of transcendental idealism: *anschauen* and *handeln*.

From postcolonial analysis to a theory of resistance

The new theory of existential semiotics, presented above in a nutshell, has two important venues for application. First, for a theory of arts and culture we may sketch new ways of analysing artistic texts of any nature: music, theater, film, painting, poetry, and more. The processual character of the model enables us to employ it particularly for a theory of the performing aspects of arts, that is to say, how signs are actualized from their pre- and virtual state into actsigns.

Second, the applications also cover the social field of values, communities, ideologies, axiologies. I have already done two experiments in this direc-

tion in my essays on “Postcolonial Analysis” and “A Theory of Resistance”. This aspect is important since it shows that the existential theory has the capacity to account for the *condition humaine* in our globalized era – and to do so in a responsible fashion. Existential semiotics is an epistemic theory, yet it illuminates quite pragmatic problems of our own world. It comes close to what has been called “semioethics” by some scholars (such as Augusto Ponzio, Susan Petrilli and John Deely). Looked at another way, as Bulgarian semiotician Kristian Bankov has done, and with slight modifications, existential semiotics is occupied with the “knowledge-based” and “value-based” society in which we live, at least in Europe. What, then, are the central issues of these two fields of socially oriented, existential semiotics?

In postcolonial semiotics we ponder a situation in which there are two subject positions: the *dominant* and the *dominated*. My proposal started from my reading of anthologies on postcolonial analysis in general, and mostly focusing on the typical cases of, say, the British Empire – India, France – Algeria, Spain – Latin America, Portugal – Goa, Macao, etc. It was easy to notice, however, that the postcolonial situation prevailed even *within* Europe itself, among its “central” and “peripheral” countries. Ultimately, every nation has, inside its borders, certain minorities which it colonizes. Many kinds of semiotic discursive mechanisms are used to maintain such a distinction. Yet they were all essentially based upon a rather simple theoretical scheme: the two actantial roles, as said, of dominant and dominated; i.e., those retaining power and those accepting it and subordinated to it. Moreover, concerning postcolonial discourses themselves one needs only the old Saussurean notions of *langue/parole* and *signifier/signified* in order to explain their functioning. The “grammar” is set by the dominant; the dominated are allowed to adopt and apply it, sometimes even brilliantly, but they are not permitted to change it. If the dominated want to communicate, they must accept what the dominant *Soi* dictates, as I would say now. Yet very often even that is impossible, and the dominated are simply “silenced”, deprived of using their voice in any audible or effective manner. Representatives of the periphery – those who are dominated – are forbidden to speak out about their wishes and aspirations, neither in politics nor in the arts. In the latter case, they are often presented as something “picturesque” and “exotic”, which only strengthens the central/peripheral dichotomy. This kind of repression may occur in the most innocent-looking ways, such as praising the national values

and qualities of a composer, writer, painter, movie maker, and so on. In fact, however, his real message is quite universal, displaying Music, Poetry, Painting as such.

Still, the dominated do have the possibility to rebel, within the sign practices themselves, letting their *Moi* emerge and break the norms, topics, and standards of the “official” grammar that forces signifiers into preestablished, precodified forms. The signified (content) can be so new and radically alien, but at the same time convincing, that it “explodes” the chains of the signified and forces the destinee to receive the message. This process is similar to what Roland Barthes recommended long ago in his classical essay on the “fascism of language”, which we may resist by “cheating” language in literature, which cares little about the rules of everyday communication. The same was said even earlier by the Russian formalists, with their idea of *ostranenie*, “estrangement”.

The relationship of colonialism and nationalism is also interesting since the latter very often emerges as a reaction against the former, and hence relies upon its suppressive power. But it depends very much upon whether we have to do with a benevolent nationalism conveying some new quality, or an aggressive, repetitive, iconic nationalism with subordinating tendencies.

A theory of resistance likewise emerges from certain epistemic premises, though even they are closely linked to and motivated by certain social practices. Again, we are aiming for a more “universal” theory to be applied in the most varied cases of “resistance” in our contemporary world and society. In fact, typical of existential semiotics, which also includes an inbuilt semioethic program, even a theory of resistance has two sides and two starting points. On the one hand, it was launched by a criticism of certain forms of globalisation, which already have been much debated by some intellectual semioticians. Existential semiotics does not just look at the world from a distance but elaborates models and discourse whereby the subjects, living in their *Daseins*, could improve their situation. Hence it shares with structuralism the aspiration to serve as a kind of “social therapy”.

On the other hand, we need a theory that is challenging by its purely logical and intellectual qualities, in order to intervene in the course of the world. Such a theory may open by reversing the ordinary course of semiosis, which we normally think of as going from “left to right”, that is, from sender to receiver. What if there were a countercurrent of signs? That is,

what if the signs were to go from right to left? This would require that we stop for a while, in the process of sign production and emission, so as to reflect on categories such as Being, Memory and History. The first mentioned is by itself central to existential semiotics, as we saw above in the varieties of Being based on Hegelian logics. But it has also been treated richly by Umberto Eco in his comments on Heidegger in his *Kant e l'ornitorinco* (1997). Moreover, Memory, in the sense of Henri Bergson in his *Matière et mémoire* (1941), means that we compare the present, “now” moments in the temporal course to the store of previous events in our memory. This eventually leads to a theory of counterfactuals, i.e., pondering “what might have happened”. If, on its surface level, reality consists of chains of events, there are alternatives which *might* have happened, which at a deeper level constitute a network of possible but not-realized events. According to Georg Henrik von Wright, we can imagine something as possible only if it has happened at least once earlier in History – our third category – and only if we can remember it. Yet, the other, more “existential” view would say that mankind has imagination and that we can figure out possible worlds creatively – something that has never existed before, but which becomes a reality. Altogether, these three mechanisms form the theoretical basis for resistance, in the term’s largest purport.

Signs of *Impressionism*

The art of miniature in the piano works of Finnish composer, Carl Hirn (1886–1949)

1. Semiotics of Impressionism

Impressionism has not been the musical style most favoured by semioticians of music, despite the fact that one of the early works in the history of this discipline, namely *Langage, musique et poésie* (1972) by Nicolas Ruwet, analyzes the Prelude to Debussy's *Pelléas* and that J.-J. Nattiez's perhaps best known analysis dealt with the same composer's *Syrinx*. Musical impressionism was dealt with more richly at the Colmar congress on music analysis in 1989, which even commissioned a series of analyses using varied semiotic methods on Debussy's piano prelude *La terrasse des audiences de clair de lune* (in the journal *Analyse musicale* 16 and 17, 1989). Still, the problem often is that the emphasis remains on the new method and not so much on the object itself and its unique features.

Among the earlier semiotic efforts to approach impressionism in music one has to count Michel Imberty's empirical studies on meanings evoked by Debussy's *Préludes* (Imberty 1981), which interestingly ends – after a very strict statistic analysis of listeners' reactions – with quotations from Jankélévitch (1961) and his very traditional aesthetic insights on “life and death” in Debussy's imagery. Elsewhere, Gino Stefani, in his book *La competenza musicale*, analyses Debussy's prelude *Des pas sur la neige*, in which the rhythmic essence of the music is shown to balance between accents (*scansioni*) and durations (*durate*) (Stefani 1982: 103–105).

Nevertheless, what Nattiez concludes in his study of *Syrinx* seems to be the best approach: in order to define what is “pertinent” within a single piece, one has to study the whole output and stylistic framework of the composer (Nattiez 1982). Therefore, in order to study Debussy or any, so to

say, “impressionist” composer, we have to first study on a deeper theoretical level the nature of semiosis in this style period.

“Is there anything like a general theory of impressionism which would not only cover the painting but music and poetry as well?” asks Eero Tarasti in his book *Musiikin todellisuudet* in the chapter on “Impressionism” (Tarasti 2003: 91). He continues:

The first step in this direction would be to note that obviously impressionism is *not* an art of *representing* the reality. This has to be said in spite of the fact that impressionist music most often seems to be quite programmatic. Yet, what is involved is not the object of the sign, and therefore iconicity, but a sign in impressionism is rather a sign of the act of perception. Signification here is thus quite opposite to the usual course of signifying. In this last case, a sign is like an arrow or bullet which hits the target and finds its signified with certainty. By contrast, with the impressionist sign, the signified is the sensation of the artist himself. Therefore impressionist art is not narrative in as much as it is not subordinated to a plot. (Tarasti 2003: 93–94.)

Basically the new working method of impressionist painters consisted in going out with a canvas and filling it with dots and flashes of colour, dimly and quickly and always guided by first impression (Keller 1979: 36). Atmospheric impressions, light, and air were the determining factors.

What can be said about a general interartistic theory of impressionism? At the least, it emphasizes the act of creation, the “enunciation” and not the message, or “enunciate”. The visual or musical message is only a sign of this act, not of the reality itself. Accordingly an art work is a sign of the meeting of our senses and the surface of the reality – *Firstness*, to use Peirce’s term. It is also essential for impressionist art that the sign go “outward”, that its focus be exteroceptive rather than interoceptive (Tarasti 2003: 93–94).

An impressionist act of painting is always unique, emphasizing a quick and impulsive working method, not slow elaboration, planning and constructing. The artist does not want to force the phenomenon into any vision or preestablished scheme. The subjects of impressionism are often found in nature, but they are generally euphoric, evoking pleasure, not naturalistic *à la* Zola. They do not contain social criticism or existential *Angst*, but dwell in the happiness of the moment, apart from which nothing else matters. It is clear that a society which produces such art is stable, *La belle époque*, members of which have time to immerse themselves in such impressions.

For an impressionist writer “one page or one phrase should fascinate the reader more than the entire book”, as Paul Bourget says somewhere. This technique is realized by Proust and *chez* Debussy. For impressionists it was crucial to portray “the atmospheric” – which which did not mean any Heideggerian *Stimmung* but rather vibrating air. Such a “semiosphere” consists of signs quite different from those of realist art.

As said above, the signs of *Impressionism* are not signs of the object of representation but of the artist’s sensation. Nevertheless, real objects – a haystack, a flag, people in a Parisian street – have caused these signs. In semiotic terms, they are indexes of such real situations, objects and events. However, they do not aim for faithful representation of their objects by penetrating into them, revealing their structure or that which is beyond the reality. The movement of an impressionistic sign stops earlier than that: upon immediate contact with the phenomenon that gives rise to it. The sign then turns back to its perceiver and transmits to us the existential moment – or rather, a moment which has not even had time to become existential, since it is not compared to anything transcendental. The receiver of an impressionist work of art remains in these signs, within the impressions of a moment. The receiver is there totally present, but at the same time rid of all bonds with the reality surrounding such a moment. Yet sometimes into this world of impression there intrude – like glimpses of previous events in the subject’s life – nostalgic reminiscences or longings (Tarasti 2003: 95). So it is often in Debussy and Ravel.

Next, we have to ask which musical techniques were apt for depicting or producing such a sign and sensation. Certainly not the Germanic principle of methodical *Durchführung*, nor by any other kind of teleological, “symphonic” music. Listeners can easily find their way out of a development by music that is “atmospheric”, such as that of Ravel’s *Vallée des cloches* or Debussy’s *La Cathédrale engloutie*.

Strictly speaking, this music does follow a musical logic based on certain intervallic premises, the so-called “planing” of harmonies, such that “sonority and line, rather than specific tonal function, are the important idea” (Baur 1985: 195). The opening of *La Cathédrale*, for instance, with its spacious setting of distant registers, depicts the vastness of such an edifice, with bells heard in the motive D-E-B (Example 1). Together with pedal effects, tertian harmonies, fragmentary and motivically constructed melodies, based on scales other than major/minor (modal, pentatonic and

X...

doux et fluide

Example 1. Debussy, *La Cathédrale engloutie*, *mm.* 1–7.

whole tone) and textures that are either fairly thick or extremely thin and emphasizing extreme ranges of the piano – all this creates the impression of the atmosphere and setting of an ancient cathedral.

An impressionistic sign is atmospheric in the sense that it refers to that space which remains between the signifier and the reality. The message of such a sign is always that the real is not “real” but an impression, which varies according to the perceiving subject and the moment in question. In an impressionistic “enunciation” the existential “journey” of the subject has been stopped for a while. The Other – the reality – is far away. In impressionist art we are in the intermediate state of vibration and atmospheric signs that have no driving force or compelling direction. The existential process stops for a moment; however briefly, we are immortal for a while. We can neither force these signs of impressions nor consciously elaborate them. And although they need to emerge as an “indexical impulse” given by the reality, they also require the rearrangement of these impulses, a detachment from normative constraints, so that they manifest in sensually tempting sensations. Is *Impressionism*, then, a particularly sensual and hedonistic art? Yes, *le plaisir est le règle*, as Debussy said, but the desires and intentions of the subject appear also in their mediated forms.

The techniques of enunciation which were able to manifest such an “impressionist world view” have been summarized by Michel Fleury (1996: 62) in his *L'impressionisme et la musique*:

- the dissolution of line;
- supremacy of color;
- fragmentation in the detail and of the whole text, leading to brief and free forms; a search for new symmetries;
- hedonism, pleasure;
- suggestion preferred over description, nuance over strong contrasts;
- love for the momentaneous, suspension of time;
- a dream-like quality, and the call of faraway places.

2. *Carl Hirn, Finnish Impressionist*

Into this general and theoretical context, I next want to introduce a Northern European composer of the period of Impressionism, but one who passed a major part of his creative life in Paris, Vienna and Berlin. To bring an almost completely unknown, “national” composer to this framework first prompts the question whether there can be “Paris” outside Paris itself, or “Berlin” outside Berlin. True, this formulation might contain a seed of colonialism, that is to say, the suggestion that such a more or less “universal” style of impressionism centers in Paris, and what happens in peripheral areas is only a distant reflection or echo of it. If, however, we define *Impressionism* in such broad, almost epistemological and semiotic manner as above, we can break free of such “nationalist” ideologies and approach the case of Carl Hirn as no less than a pioneer of this musical style. Although to say one is “forgotten” may also prove to be relative. I remember, for instance, how once in Brazil a pianist and director of the African Music Institute in Rio de Janeiro, Aloysio de Alencar Pinto, mentioned that he knew of one Finnish impressionist, the composer Selim Palmgren, whose music he had played in Paris. This case shows above all that, if a composer is at least printed and published by a renowned publishing house, one can never know how “forgotten” a composer truly is. In our case, Carl Hirn was lucky enough to be published by several leading German companies; hence it is hard to say precisely how often his works figured into the repertoire of his time.

Hirn was born in Finland, at Säkkijärvi (famous for the polka of the same name), close to Viipuri (St. Petersburg), on November 11, 1886 and died in Finland on February 16, 1949. He spent most of his life abroad, in big European metropolises. After primary studies in piano at his home town with Alice Silfvast-Furuhjelm, he moved to the Music Institute in Helsinki, which was not yet called the Sibelius Academy. He studied Richter's composition guide on his own and at spring examination performed his first piece: a rhapsody improvisation. The committee, Hirn relates, politely asked him which Russian composer had written the piece. Recommended by Jean Sibelius himself to his own theory teacher Robert Fuchs, Hirn left to begin serious musical study in Vienna, where the light musical atmosphere fitted well to his temperament. He attended marionette theater performances accompanied by piano at the same time as he was studying Professor Kaffka, who told Hirn: "Well, I see that you want to write miniatures, but first you have to pursue basic studies" (Hirn 1945: 461, translation mine).

After passing several years in Vienna he moved to Berlin, where his teachers included Paul Juon, Hugo Kaun, Robert Kahn, Xaver Scharwenka and E. v. Reznicek – the last of whom he characterized as "congenial" and with whom he studied orchestration for two years. Hirn's talent was soon noticed by major publishing houses. It was the triumphal age of the piano, and music for bourgeois homes was needed all over Europe in big quantities. Simrock first printed Hirn's piano works *Schmetterling*, *Kasperl geht zum Tanz*, *Grotesque*, *Ein kleiner Regengott*, *Schwüle Nacht*, *Pierrette*, *Arabeske* up to opus 50. Then he was awarded the Brahms grant, which did not amount to much economic support, but opened still more doors at various publishing houses such as Zimmermann in Leipzig, Hansen in Copenhagen, as well as Ries und Erler, which published his orchestral piece *Bauernhochzeitszug*, a "grotesque with peasant topics". Also his *Indisches Intermezzo* for women's chorus and orchestra was published, as well as his songs (by the Parisian Maison d'Édition Maurice Sénart).

Hirn lived in Berlin for 15 years then moved to Paris where he stayed for 6 years before moving back to Finland. He would not have remained in his homeland, but war broke out and forced him to stay. Thoroughly bohemian in character, he lived in extremely difficult conditions. He was supported by friends such as the pianist Martti Paavola, and pianist (later professor) Timo Mikkilä, who related how Hirn's friends would secretly

put money into his empty pockets. Martti Paavola, a close friend of Viennese professor Bruno Seidlhofer, described Hirns' music as having a "beautiful pianistic sound ..., truly inspired musical insights, sophisticated aesthetic culture and sense of humour" (Paavola 1946: 4–6). Yet, in the context of our study we can say that he wrote miniatures just because he was completely saturated by the "impressionistic" world view, as described above.

In spite of the fact that he lived amidst a German culture of musical "Durchführung" and counterpoint, as well as in Finland where any composer to be accepted had to write at least one symphony, he gained professional appreciation from his colleagues. In Germany, for example, in the *Musikpädagogische Blätter* of July 15, 1911, professor Hans Rothardt wrote the following about Hirn's first collection of piano pieces, just published by Simrock: "They show an unusual independence in inventiveness and form. They are all written in a personal style. They do not seem to have any models except the *Elfendanse* which evokes Edvard Grieg. His composing mostly refers to Max Reger, albeit it does not have this composer's harmonic oddities and over individualist devices. He is more conservative but also modern in the best sense of the word. His phrasing is clear, simple and flowing, which makes his pieces easy to perform" (HBL 22.11.1911, Sibelius-Museum, Turku). Then the writer comments on each piece, as does the head of Berlin's Kaiserliche Library, Wilhelm Altmann, who praises the musical architecture and form and authentic individual musical language of Hirn's work. In the *Schlesische Zeitung* Dr. H. Seliger wrote about Hirn's piano pieces:

They are characterized by originality of invention and an easily sketching hand. Trivialities which often occur in beginners' work are avoided although he always sounds modern. A little outworn are the use of diminished seventh chords as a sequence in the *Scherzino*, and the harmonies in *Valse der Marionettes* which make tonality unstable. But otherwise the small pieces are always engaging and tasteful. They show a talent in gracious and pleasant expression. (July 17, 1911)

His Finnish colleagues generally wrote positively about him, although it was said that "he – as typical of miniature composers ... is not a profound, striking composer regarding both his content and devices, but he captures momentary associations in a charming manner, polishing them into a salon

style. The very titles of his pieces, like *Danse primitive*, *Aquarelle*, *Valsette Capricieuse*, reveal the nature of his art". (*Helsingin Sanomat*, December 13, 1946). The composer Sulho Ranta, one of the modernists of the prewar years, wrote about Hirn: "His miniatures are fresh and graceful – even if they sometimes display the *coqueties* of a music salon – which is not harmful in our region of austere tones ... his collection shows that we try to increase the repertoire of our own music alongside German 'kuck-kuck Stücken' and 'Zändlereien'" (*Iltasanomat*, February 13, 1948). One of his colleagues, Olavi Pesonen, wrote:

Hirn is one of the modest artists who is not yet so well-known as his output would justify. Hirn did not dwell on large scale musical forms, but has written a venerable amount of smaller orchestral pieces, piano works and songs. As to the sound these sensitive miniatures are very successful ... stylistically they belong to French impressionism. He masters musical formation altogether perfectly and has put them to use for artistic intentions. It is a special delight to note that he in spite of the slightly cosmopolitan character of his music, he is able to inject a particularly Finnish flavour.

Nor did the Finnish "media" of the time overlook him, as personal interviews in *Suomen Kuvalehti* (17, 1929) and *Helsingfors Journalen* (no. 17) prove. The latter published an interview in Swedish, Hirn's mother tongue, during his Parisian years. He tells about his bohemian life at Montparnasse, from where he had to move to Pont d'Orleans, where one could live on 7 francs per day. But mostly he lived in tiny apartments under "mansards", i.e., on the highest floors, in "holes" which were so small that he could rent only a miniature piano to fit in them. A typical headline about him, in the *Helsingfors Journalen* cited above, reads: "Carl Hirn komponerar och lever bohémeliv: En äkta konstnärssjäl" (Carl Hirn composes and leads the bohemian life: A genuine artist's soul). Hirn made his living by writing small piano pieces and melodies which were then performed by small orchestras on the streets of Montparnasse. He also wrote reviews on Parisian musical life for German magazines

Close study of his work reveals how various signs from his musical *Umwelt* penetrate into his otherwise classical piano texture. In fact, the mundane street life appears just once in his music, as Charleston rhythms, but even there stylized in the same manner as Debussy used "cakewalk rhythm" in his preludes. One encounters five main aspects or "isotopies" in Hirn's piano pieces: 1) flawless voice leading, the Germanic *Satz* (little

wonder he was likened to Max Reger); 2) idiomatic piano gestures, a certain skill in using “tactile signs” in music, so-called *Spielfiguren* – although some of his pieces make virtuosic demands on the performers; 3) corporeal gesturality in the form of dance rhythms; 4) various national and aesthetic styles, as in his *Danse primitive*, the “primitive” sense evoking the non-periodic rhythmic formations of Stravinsky, Spanish guitar-like accompaniment figures à la Albeniz, and the “orientalism” of Indian topics, these last as seen through French eyes (e.g., Debussyan whole tone scales and harmonies); 5) programmatic contents, i.e., external and “exteroceptive” signs (in the Greimassian sense) (cf. Tarasti 2004: 100–102).

How does the composer strike a balance among such varied strategies? In Hirn’s case, it is provided by the basic aesthetic of an “impressionistic” worldview. It is always the euphoric, “small world” of the bourgeoisie (as Hungarian musicologist Janos Marothy once characterized it). Carl Hirn’s personality gradually finds its forms and true identity in miniature musical expressions; there it meets the existential world of “being-for-itself”. That is to say, the musical genres he used ultimately derive from the style norms of his time, in the European cosmopolitan context of the first half of the twentieth century. We can distinguish these levels in all of his piano pieces.

Semiology of sign-means as a theory of the general conditions of human understanding

1. Semiotics: Semiography, semiology and semiosophy

Semiotics is now understood as the entire sphere of knowledge about signs, including their partial descriptions, general theories explaining the nature of the sign connection, as well as the philosophical foundation of these theories. This heterogeneity in the field of semiotic research allows the distinguishing of semiotics as a “science of signs” on at least three levels of generalization: the semiographical, the semiological, and the semiosophical.

Semiography would include all descriptions of single semiotic units, constructions built from them and rules of their formation and interpretation. Such descriptions can take a normative form or be properly descriptive investigations of what norms are used in definite areas of semiotic practices. Semiographical researches are often performed within the frames of other spheres of knowledge, such as grammars of distinct languages, heraldry, numismatics, hieroglyphics, systems of musical or mathematical notation, descriptions of etiquette, meaningful behaviour, etc. Moreover, they can even be realized apart from any relation to semiotics.

On a higher level of generalization, descriptions of specific signs and sign systems are superseded by explanations of the ways in which signs are connected, how these connections are built, under what conditions something can perform the functions of a sign, what the structure of a “sign situation” is, etc. This level of semiotics can be conveniently called *semiology*, which in this event is no longer a synonym for “semiotics” but rather a term denoting its theoretical part separated from semiography as more descriptive part of semiotics (cf. the difference between “descriptive” and “pure”

semiotics in Morris 1971: 24). Semiology generalizes specific semiographical studies and identifies universal properties common for various semiotic means; it constructs theoretical models describing structural organization and functioning of these means. The semiological level also includes comparative analysis of sign-systems organization of various types and investigations of possible forms of their interaction, when heterogeneous sign constructions are built.

Any semiological theory has explicit or implicit premises related to definite philosophical views on its subject and research methods. These views form a field which can be generally described as the sphere of *semiosophy*. It includes, first of all, various versions of the philosophy of language, sign, name, etc. Various aspects of other divisions of philosophy – such as ontology, epistemology, logic, philosophy of culture, etc., which are employed as bases of semiology – also are “semiosophical” in character. Unlike semiography or semiology, semiosophy is not restricted to the sphere of scientific knowledge, and it may contain elements of specific ideologies as systems of values.

Neither semiography nor semiosophy necessarily claims to be a sphere of knowledge directly related to semiotics. This relation is quite often revealed only to a view directed from some center, from the standpoint of semiology, whence both semiography and semiosophy are seen in the semiotic perspective. In this interpretation, semiology is extracted from semiotics as its “core”, around which semiotic studies are concentrated.

In this system of relations semiology, on the one hand, is crystallized in relations to semiosophic discourse as a more concrete theory of signs. On the other hand, it is developed as the result of generalizing the “semiographical” material in respect to various “-graphies” – descriptions of signs in such disciplines as linguistics, ethnography, history of culture, art, etc. The term “semiology” itself was proposed by Ferdinand de Saussure as a result of linguistic generalization. Despite the fact that in the current paper this term is framed into a different system of concepts, it nevertheless preserves Saussure’s to consider semiology as a discipline, which “would show what constitutes signs, what laws govern them” and to separate it from more special descriptions of definite sign systems, such as national languages, systems of notations, symbolic rites, polite formulas, military signals, etc. (Saussure 1960: 16).

2. *Semiotics and hermeneutics*

Semiotics on the whole, and semiography especially, has much in common with hermeneutics. Both of them study signs and texts, their connections with meanings and senses, their relations to texts' creators and interpreters. Nevertheless, they are non-coincident spheres of knowledge, because they have different aims. The purpose of hermeneutics is interpretation of diverse objects as texts expressing definite senses treated by definite interpreters and, often, in definite conditions. This purpose is common for both theological and philological hermeneutics, and philosophical hermeneutics is developed for "deciphering" the world-as-text as well. The broader the subject of hermeneutic researches is, the more these researches need a general theory of connections between senses and signs used for their expression, and the closer they come to semiotics (for example, see Meier 1757). The subject of semiotics is just the uniform norms of correlation between significant constructions and some unifying ways of interpreting them. Semiotics describes as its subject not particular senses of certain texts, but the norms of interpreting them and general conditions of sign connection.

This purpose to research general conditions of sense-forming and understanding differs and even opposes semiotics to hermeneutics, which always preserves the aim to identify specific qualities of concrete texts and individual acts of interpreting them. Taking no notice of specific contexts, semiotics, on various of its levels, makes generalizations and identifies more or less uniform ways of sign-formation and sign-construal. Hermeneutics sticks to its individualizing disposition even when it has to rise to the level of philosophical generalizations; semiotics, on the contrary, preserves its generalizing disposition even when it deals with specific norms of partial sign systems on the level of semiography and, especially, when it investigates the general principles of creating signs and their meanings on the level of semiology. Identifying systems of such norms and rules, the semiotic scholar endeavours to find reproducible signs and symbols as regular units of semiotic systems – languages or codes whereby meanings are expressed. As a result of applying such systems, semioticians also consider specific texts, but treated in the same generalizing spirit, including verbal and any other sign constructions, where identification of more or less uniform rules of structuring and interpretation is possible.

This generalizing orientation of semiotics, as has already been mentioned, is the common property of all its levels. In this sense, it can clarify semiosophic studies of the grounds of sign theory. Particularly, such a unifying approach is appropriate for logical semantics, where signs are considered only as the means of representation, apart from their communicative functions. For example, Frege's conception of sign connects the latter with a constant meaning (Sinn), which differs not only from the object it denotes (Bedeutung), but also from subjective images of this object (Vorstellungen); unlike various images arising in the minds of different people, the meaning of sign is a unifying and invariant way of representation, independent of the subjects it uses (see Frege 1962: 41–42). In a similar way, the semiotics of Charles S. Peirce, which was formed on the grounds of logic, considers the sign as a member of a triadic relation, where it functions as a “representamen” of an object for an “interpretant” (see Peirce 1931: §§ 541, 564). The representative function of sign is also not necessarily connected with the performance of a communicative function.

Unlike the logical concept, connecting the sign mainly with the representative function, linguistic models to a greater degree consider the communicative function of signs. At the same time, semiology, developed on the grounds of linguistics, is also oriented generatively, considering its task to be the research of a stable “sign function” between semiotic “forms” of expression and contents, independent of a changeable “substance”, and therefore regards signs of language as constant units, where the connections between *signified* (*signifié*) and *signifier* (*signifiant*) are unifying norms preserved in diverse individual acts of speaking (cf. Saussure 1960: 14, 113; Hjelmslev 1963: 47 ff.).

The tendency to generalization is obvious enough for semiology in all its versions, directed as they are to general principles of sign connection (Peircean semiotics), organization of sign systems (Saussurean semiology and Hjelmslevian glossematics), or to the clarifying of relations between diverse semiotic systems (e.g., Barthes, Benveniste, Eco, Lotman, and others).

Finally, semiographical investigations also aim to identify reproducible *conditions*, on which something functions as a sign. Like semiology, semiography studies more or less uniform norms of creating and interpreting certain concrete types of signs and symbols, rather than their specific treatment in particular cases. Multifarious branches of semiography are occu-

pied with the identifying of systematic relations between signs and their meanings, between the “plane of expression” and the “plane of content”, even if these invariant relations are limited to the frames of particular sign systems.

Another important difference between semiotics and hermeneutics is connected with the subject of understanding. Hermeneutics, which originated as an “art of understanding”, is directed to revealing ways sense is presented to the subject. From the point of view of hermeneutics, the research of objective “mechanisms” of constructing and reconstructing senses via signs serves as a supporting, subordinate investigation. The semiotic approach is essentially different: semiotics intends to reveal precisely those objective “mechanisms” of sign action which can be performed independently of whether the subject conceptualizes these mechanisms or uses them only subconsciously. The objective conditions of sign connection are of more interest to semiotics than are the subjective ways of sense interpretation, just as the means-providing processes of communication and understanding are more interesting than the result of those processes in individual cases.

3. “Small” and “large” semiospheres

The versions of semiology do not differ in their purpose to identify general conditions of sign connection, but rather in how broadly they consider this connection to be and in the way they view those conditions. Various versions of semiotic theory define these limits in different ways. If the sign theory of logical semantics is limited to signs used in rational thinking (see, for example, Carnap 1946: 13–14), semiology in its Saussurean project focuses more on “the life of signs within society” (Saussure 1960: 16). Considering verbal language as a model, this project of semiology aimed to extend linguistic concepts to research of other sign systems. Saussure supposed that “linguistics can become the master-pattern for all branches of semiology although language is only one particular semiological system” (ibid.: 68). Such a “linguocentric” approach was developed by Louis Hjelmslev, who suggested that many disciplines – logic, mathematics, literature, art, and music – all be studied from a common point of view, as “concentrated around a linguistically defined setting of problems” (Hjelmslev 1963: 108).

Such a semiological project approaches the realm of “symbolic forms” researched by Ernst Cassirer, who set out to transform the Kantian “critique of pure rationality” into a “critique of culture”, and who considered the human to be not only an “animal rationale”, but more importantly as an “animal symbolicum” (Cassirer 1923–1929, 1944). The sphere of Cassirer’s “symbolic forms” is close in scope to Lotman’s concept of “semiosphere”, which is also broader than the sphere outlined by logical semantics or linguistics, and which includes all means of human communication, generalized in culture (see Lotman 1984). This concept of the semiosphere outlines roughly the same program as that of Umberto Eco, who connects the limits of semiology with the sphere of communicative means supported by certain cultural conventions (Eco 1976: 19).

Eco’s “semiotic threshold”, however, has also been crossed by other semiotic programs, first of all, by the general theory of signs suggested by Charles Peirce and developed by Charles Morris, which despite its logical bias assumes as its subject a much larger sphere, including that of biological processes (see, particularly, Morris 1971: 67, 83). According to Winfried Nöth, “Peirce’s semiosphere certainly includes the whole biosphere” (Nöth 2001: 16; see also, Nöth 2000: 57). Such optimistic treatment of semiotics allows it include “natural signs” among its objects, i.e., phenomena not created deliberately to express someone’s ideas but nevertheless able to point out some peculiarities of a presented situation by virtue of “naturally” arising regularities; we are reminded here of Husserl’s opposition between “Ausdrucke” and “Anzeichen” as two ways of explaining the concept of “sign” (Husserl 1984: 30 ff.). The investigation of signals and natural indexes used in information processes within and between living beings constitutes such domains as “phytosemiotics”, “zoosemiotics”, “biosemiotics” and even “physicosemiotics” (see Krampen 1981; Sebeok 1972, 1999; Nöth 2001). There are thus reasons to understand the concept of “semiosphere” in a broader sense, expanding it to include the realm of every living thing (Hoffmeyer 1996).

Despite their differences, Lotman’s and Hoffmeyer’s conceptions of semiosphere can be coordinated with each other; the former as a “small” sphere of human communicative means developed in culture, and the latter a “large” sphere of information, admitting other communicative means and including mediators of natural processes and technical vehicles. One can speak about *semiology of nature* as well as *semiology of culture* and

even about their mutual interaction in case of the human as “animal symbolic”, who is involved in both of these spheres and hence their interdependence, and whose communicative activities cannot be formulated in terms of just one of these two semiologic directions.

At the same time, the “small” semiosphere cannot be subsumed within a “big” one, because the sign-means, intentionally created in a culture for communication between members of a group and for representation of objects of their activities, cannot be reduced to naturally arising signals and indexes. These “natural semiotic means” are not “sign-means” in this sense. Semiology, as a scholarly discipline, may not ignore the principal difference between these types of mediators; at the same time, it cannot ignore many common properties of informational means functioning in the “small” and “large” semiospheres.

In view of the similarities and differences among information mediators, semiology may be divided into a “general” domain. This last is occupied with fundamental principles of mediation, investigated by the comparison of various means of information-connection in both “large” and “small” semiospheres, a branch of which specializes in the research of sign means intentionally created in the process of human activities.

4. *Semiology of sign means*

A “semiology of sign-means” builds conceptual models of sign connection, which is produced and reproduced in culture and mediates both subject-object and inter-subject relations. Because these sign-means differ from other types of semiotic means, such as natural signals and indexes, the name is not tautological: the “semiology of sign-means” may be distinguished from “general semiology” and from other “partial” semiologic branches by virtue of specific *genetic*, *functional*, and *structural* properties of its subject of inquiry.

First of all, sign-means differ in genesis from other ways of informational connection. Unlike naturally formed signals and indexes in bio-systems, these sign-means arise in culture as human activities that are deliberately produced, reproduced, and applied in acts of communication between subjects, in order to represent objects of their cognition, evaluation or transformation. The interpretation of signs as consciously used means of activity in part allows us to understand its characteristically arbitrary

nature – arbitrary connections between the sign and its meaning, arbitrary selection of sign vehicles and their combination in sign constructs, arbitrary use of signs in specific contexts, arbitrary reactions to signs, etc.

The sign-means created in human activity differ from natural bearers of information also by their *functions*. Unlike signals or indexes arising in nature on various levels of biological processes, signs are able not only to *present* an object within a current context, but also to *represent* objects missing from a current situation, and to *express thoughts* about them, regardless of how distant they may be in time or space. Hence, sign-means make it possible to determine the results of learning, the evaluation or projection of material of communication; and vice versa, the use of communication means in any of these acts.

The combination of *communicative* and *representative* functions is an essential peculiarity of the sign-means, which perform both functions by virtue of the same mechanism. A basic element of this mechanism is a necessary reference of meanings constructed and reconstructed in communicative acts. Whether an object exists in reality or not, whether it is presented in the situation of meaning-expression or has nothing to do with it – meanings expressed by signs are always intended to relate a thought to a certain object. Correspondingly, signs which express these meanings always have an object-correlation, which is the property of signs themselves rather than the context in which they are used. The context and specific referents of signs may vary, but the intention of a sign to relate a thought to some referent is its inherent property.

The sign connection performed through a special “mechanism” of relations forms a specific *structure*. This structure is constituted as a net of connections between different components of a sign situation, where one subject of activity can express to another subject a thought about an object, represented by the sign constructed according to a definite scheme, connected with a scheme of thought formation by a code accepted in the culture. These two types of schemes are reproducible and invariant members of the “expression” and “contents” planes, respectively, and are connected by the relation of *signification* (Hjelmslev’s “form of expression” and “form of content” as two “functives” of a relation identified as “sign function”; 1963: 48).

The relation of signification is a key element in the whole structure of sign connection and should be included in the class of *semantic rela-*

tions together with relations of *reference* between the sign vehicle and the object it denotes, of *expression* between ideas of object and of its sign in the mind of a sender, and of *interpretation* between corresponding ideas in the mind of the recipient. The complete structure of the “mechanism” of sign connection can be represented by a spatial model, the “sign prism”, which shows the way these semantic relations are included in the structure of human activity and allows combining models of diverse aspects of sign connection developed in logical, linguistic and other ways (for more detail, see Tchertov 1993: 313–326; Čertov 1999).

Semiology of sign-means is not reducible to a theory of sign mechanism. The concept of sign-means includes all sign systems (of codes and languages) and sign constructions (texts). Accordingly, there are the reasons to consider within frames of the semiology of sign-means also *the theory of the sign systems* (of codes and languages), the theory of *sign constructions (texts)*, as well as the *general theory of “small semiosphere”*, which considers the mutual connection and interaction of codes functioning in culture and texts created and interpreted by them. Such a theory of semiosphere can be considered also as a *semiology of culture* researching the ways of cooperation between various kinds of sign-means from diverse forms of culture (myth, ritual, religion, art, science, technique, social life, etc.).

5. Semiology of sign-means and inter-subject understanding

Semiology of sign-means, as distinct from general semiology as well as from “partial” semiologic branches, may be interpreted as a theory explaining how and on what conditions *understanding* between subjects is possible. Such theory is based on a presupposition that might be formulated via a “semiosophic” thesis: “Understanding between people is possible”. This optimistic presupposition is not obvious in a world where misunderstanding accompanies almost all joint actions, and where understanding seems to be an unachievable goal. Nevertheless the reasons for its acceptance seem more convincing than its negations. If understanding between subjects was impossible, then any cooperation aimed to achieve common goals also would be impossible. This is equally true for agreements between friends or colleagues, for the general existence of culture as a system of knowledge, values or skills shared by members of a collective and concentrated in

the collective memory of that society, and for the united subject. And vice versa: if a common project is planned, buildings proposed, trains scheduled, and so on, then the fact that such plans were performed would make it evident that minimal understanding among the planners has taken place. If a certain understanding is a condition of any mutual activity of people at all, it is even more necessary to inter-subject communication. Indeed, a communicative act could not have this property without understanding as a result – if not, it would turn into just a huge number of strange sounds or motions.

Understanding, in the semiological sense, relates not only to cases of mutual agreement and cooperation, but also to the cases of opposition and conflict. Even opponents have something in common, relating to the object they are struggling about; moreover, they should have a common language to express the disagreement. A duel cannot take place, if an opponent does not understand he has been challenged.

Focusing its attention on the sign-means of understanding, semiology extracts the mechanism of sign-formation and sign-functioning out of the ways they are used by participants of the communication process. Individual differences mastering these means, the readiness to apply them in various situations, etc. are not taken into consideration by semiology, which only pays attention to the capacity of diverse subjects to use uniformly the same system of meaning-expression.

Signs, sign systems, and sign constructions are treated in a semiology of sign-means as the products of joint activity of subjects communicating with regard to certain common objects. This concerted work of communicating includes some unifying ways of mental treatment of objects involved in cognitive, normative or projective forms of activity. The uniform modeling of these objects is performed by reproducible meanings of signs.

Considering communication between subjects as a joint activity in which any of them can construct and reconstruct meanings on the basis of the same “standard” semiotic means, semiology thereby treats signs and sign systems not only as external mediators between communicating subjects but also as means necessary for the internal processes of *sense-creation* and *sense-expression*. Conscious expression of senses using signs includes acts of constructing these senses by uniform meanings. In turn, any sense-creation by signs is at the same time an initial stage of sense-expression, regardless of whether it is continued in external acts of communication or

just stays at the level of “internal speech” (or its analogs in non-verbal semi-otic systems). Therefore, sense-creation on one hand and sense-expression on the other hand are treated by the semiology of sign-means as two sides (internal and external) of the same sign-mediated activity.

In a semiology that accepts such a supposition, the process of communication between subjects would be seen as the usage of a system of means which, on the one hand, allows the “transmitter” of a message to *construct* senses expressed in the texts by unifying meanings, and which, on the other hand, permits the “receiver” of the texts to *reconstruct* their senses using the same meanings of signs. Such a joint activity of “transmitter” and “receiver” of texts, in constructing and reconstructing senses using a common system of semiotic means, is usually called “transmission”. This metaphor is admissible until it begins to be understood literally, as a transfer of any object independent of acts of construction or reconstruction.

Whereas signs and meanings belong to a semiotic system of “language” and have a universal character, the texts and senses constructed by these language units belong to “speech” and can express certain individual intentions (cf. Saussure 1960: 19). An understanding of these individual senses supposes knowledge not only of the general rules of the semiotic system, but also of the concrete context and individual conditions of generation of the particular text. Such understanding is possible for a receiver who is involved in the same context and knows these special conditions; in other cases it becomes a matter for hermeneutics, as an “art of understanding”. However, the interpretation of sense in both of these cases is based on the ground given by a semiotic system, with its units of expression and of contents. The usage of this common system of codes, like Saussurean “language”, is a necessary minimal condition of understanding, even if it is not enough for a complete understanding.

Semiology studies these necessary, minimal conditions of understanding. From its point of view, understanding appears as a correct *reconstruction* of a sense based on the rules of a pertinent code, with its standard sign units and their uniform meanings. Such reconstruction does not include non-semiotic conditions of understanding – psychological, sociological, ideological or other grounds whereon one subject may or may not be ready to understand the internal intentions of another subject. Semi-otic conditions are responsible only for the correct “delivery” of a message to the mind of the receiving subject, rather than the receiver’s subsequent usage

of it. This correct reconstruction of a meaning may be juxtaposed to its *destruction* or to its borderline case – deconstruction – understood as a deformed reconstruction which is not based on the rules of the code on which the text is built, thus causing a shift in meaning or even changing the text. Diversions of correct interpretations are interesting to semiology only so as to find out, in a situation of incomplete understanding, what is missing that would create semiotic conditions for understanding. *Constructively* oriented semiotics can accept a deconstructed text as an object for analysis only if the research recreates a system of rules to which such a text is correlated, i.e., the code whereby new meanings could be correctly reconstructed.

6. *Concluding remarks*

The semiology of sign-means, unlike other semiotic branches, limits its topic to ways of information-connection that are created in culture and used in human activity. These means differ from signals and indexes generated in nature by a necessary correlation of at least three semiotic functions. These serve together as (1) the means of representing objects to a subject, (2) the means of internal mental activity of this subject, and (3) the means of communication between the diverse subjects. Such superposition of mediative functions in complex subject-object, inter-subjective, and intra-subjective relations is a proper quality of sign-means created and used in human activity. Due to this quality these means can serve for construction and reconstruction of senses. In this way they become the means of expression and understanding available to different people.

This peculiarity gives us reason to consider the semiology of sign-means as a theory that researches the conditions of sense expression and correct understanding of a message by diverse subjects. Such a theory admits that, in the real process of interpretation, complete understanding is hard to achieve and that correct reconstruction of senses is usually accompanied, to a greater or lesser extent, by the destruction and misunderstanding of texts. Overcoming these difficulties is the task of hermeneutics as an art of understanding, which intends to reveal specific features of texts and their senses, by taking into account individual peculiarities of sender and receiver. Unlike hermeneutics, the semiology of sign-means is interested in the general rules of construction and reconstruction of texts and their

senses. It treats the application of semiotic systems, common to members of a communicative process, as a necessary initial condition for successful communication. Thus, the semiology of sign-means can be treated as a theory of general conditions that must necessarily obtain in order for human understanding to be possible.

Morten Tønnessen

Where I end and you begin

The threshold of the self and the intrinsic value of the phenomenal world

[A]s you arrogate all mind to yourself, you will see the world around you as mindless and therefore ... yours to exploit.
Gregory Bateson (2000: 462)

Through semiotic agency, all living beings are sign utilizers and therefore ontological subjects, i.e., subjects of the phenomenal world (see Tønnessen 2003). The reason why it makes sense to regard all semiotic agents as moral subjects is that, in respect to these entities, our actions make a difference. Only for semiotic agents can our actions ultimately appear as signs that influence their well-being. As meaning-utilizers, all semiotic agents, even the simplest creatures, can distinguish between what they need and what is irrelevant or harmful to them.

But why regard higher-level living systems, such as species, ecosystems and landscapes, as moral subjects? Because a living being is not an isolated incident. In a profound sense, a subject *is* what it relates to. The network of relations that it takes part in do, largely, define what being this subject is all about. The individual self branches off into the society of phenomenal subjects and into the phenomenal world; it is already social, already worldly, already more-than-individual. In the end, you cannot really value a subject without at the same time valuing the web of relations in which it takes part.

1. A relational concept of nature

According to Jakob von Uexküll (1864–1944), all beings partake in subject-object relations characterized by a mutual correspondence between the two entities. The known phenomenal world consists of various kinds

of individual phenomenal worlds that, through the interconnectedness of diverse relations, comprise what we call “nature”.

The *ontological niche* of a being can be defined as the set of relations that it takes part in at a given point of natural history. The ontological niche of a being, in other words, delimits the “area” that this being occupies in the phenomenal world. Simultaneously, through its ontological niche, the phenomenal world of a being is intertwined with other phenomenal worlds, thus integrating it into the society of phenomenal subjects.

2. The implicit self and the explicit self

As a first, more thorough approach to the self, I introduce a distinction between an *implicit* self and an *explicit* self. The implicit self is the (somatic, social and ecological) self which is embodied in the behaviour of a being, and can be taken to be an ontological entity where the being in question is considered as an instance of relational being. Each and every living being has (or is) a more or less complex, implicit self.

The explicit self, on the other hand, is the self which manifests itself in the identity (or subjectivity) of a being. The explicit self can be taken to be a phenomenological entity in the sense that it entails a (self-reflective) representation of this being’s subjectivity. There follow four theses on the interaction between the implicit and the explicit self

(1) The implicit self is the ground of the explicit self.

(2) In so far as the behaviour of a being is guided by its identity, i.e., by its self-reflective subjectivity, the explicit self serves as the ground of the implicit self.

(3) In the case of simple (non-social) creatures, the implicit self and the explicit self converge.

(4) In the case of complex (social) creatures, the implicit self and the explicit self diverge, to an extent that broadly speaking corresponds to their level of semiotic freedom.

3. The human explicit self

As Donald Favareau (2002: 84) writes, “we can situate the deeply internalized, seemingly ubiquitous concept of “self” [in the human context] as a product of the uppermost symbol level of our “biological inner sem-

iosphere”. This is a level which, by definition, includes and yet exceeds (in abstraction and in semiotic freedom) the supporting iconic and indexical levels of the never-ending, sign-exchange activity mediating cell, brain, body and world. Following David Agler (2006) and his reading of Peirce, it seems reasonable to stress that “a symbol [such as, in my words, the human explicit self] is always a sign of expectation and memory; it always needs further development”. The human self, in other words, is deeply indeterminate. “If there is no indeterminacy with regard to the conception of the self”, Agler reminds us, “then there is no room for the conception to grow.”

4. *Næss on identification and the self*

“Traditionally”, deep ecologist Arne Næss states (1987: 35), “the maturity of self has been considered to develop through three stages, from ego to social self, comprising the ego, and from there to the metaphysical self, comprising the social self. But Nature is then largely left out in the conception of this process.” Næss tentatively introduces a concept of ecological self. “The ecological self of a person”, he writes, “is that with which this person identifies” (cf. my definition of explicit self). “Because of an inescapable process of identification with others, with growing maturity, the self is widened and deepened. We ‘see ourselves in others’. Self-realization is hindered if the self-realization of others, with whom we identify, is hindered.”

We discover that parts of nature are parts of ourselves. “This becomes the root of the most powerful application of ecosophical thinking to specifically environmental conflicts. We must see the vital needs of ecosystems and other species as our own needs”, David Rothenberg (1989: 10–11) claims, and perhaps somewhat too optimistically: “there is thus no conflict of interests.”

Attempting to combine a biosemiotic understanding of the self, from the Peircean tradition, with a view from deep ecology, I arrive at the following table:

5. *A critique of a critique*

In *Semiotics Unbounded*, Susan Petrilli and Augusto Ponzio (2005) offer a fairly thorough presentation of their *semioethics*. While I agree with several

ASPECT OF SELF	TYPE OF RELATIONS	TYPE OF IDENTIFICATION	MEANS OF IDENTIFICATION
Indexical	Physical (causal)	Functional	Inter-dependence
Iconic	Phenomenological (qualitative)	Immediate	Similarity
Symbolic	Habitual (conventional)	Abstract	Analogy

Table 1. Three aspects of the explicit self, and of human identification.

of the foundational statements of a semioethics proper, I have some critical remarks as to its present manifestation.

First, despite repeated statements that “signs and life coincide”, as Winfried Nöth points out in a paper in process, assertions are made that computers are sign machines which effectively “extends semiosis to the inorganic” (Petrilli & Ponzio: 505). This is an obvious contradiction. Second, it is asserted that the global “communication-production” system is “a danger for communication itself” (ibid.: 230); also, the “risk of the end of communication refers to nothing less than the risk of the end of life on this planet” (538). Such assertions lack a proper scientific grounding. What might be about to occur is a sixth extinction comparable to five instances of massive loss of biodiversity recorded through natural history.

Third, by speaking about ecological destruction and destruction of social systems in the same terms, it is asserted – mistakenly – that the current developmental patterns of those systems converge. They do not. While the semio-economic growth system performs much of its work by inducing a reduction of natural complexity, it would be a mistake to make an equally general assertion concerning social systems.

Fourth, while references to destruction of social systems are well represented, growth in cultural diversity taking place within that very same “communication-production” system is neglected. In contrast I suggest that higher-level cultural diversity, such as the number of languages and cultures worldwide, seems to be declining, whereas many kinds of lower-level cultural diversity seems to be growing at an exponential rate, some-

what corresponding to economic growth. Some examples: The number of works of art and scientific works (and scientists and artists), scientific (sub)-disciplines, artistic genres (at least musical ones) and the number of professions. I propose that these two diverging macro-developments taken as one complex pattern are characteristic of globalization.

Fifth, the authors state that the “productive cycle destroys ... jobs, because it makes way for automation, which further increases unemployment” (555–556). There is no general, long-term global tendency towards increased unemployment.

Sixth, it is stated that “the expanding phenomenon of migration” is underpinned by the fact that the production system “produces growing areas of underdevelopment as the very condition for development” (556–557), whereas in fact migration to rich countries is first of all a result of the combination of the emerging globalization of wealth and the growth in communications and infrastructure for transportation.

Seventh, as points above show, contrary to the claim that Petrilli and Ponzio’s approach “does not orient semiotics according to any specific ideological plan” (540), it has a (too narrow) ideological bias.

Eighth: Semioethics as depicted in *Semiotics Unbounded* does not seem to allow for paradoxes – and where paradoxes disappear, dogmatism tends to crop up. In real-life socio-political development, paradoxes of various kinds are inherent. For instance, the very same “destructive” semio-economic growth system that leads to ecological devastation worldwide has also resulted in a global human life expectancy that is today about twice as long as before the emergence of a growth economy. How do we account for such contrasting effects?

Finally: according to Petrilli and Ponzio “[g]lobalization implies that communication is omnipresent throughout the entire productive cycle” (555), and they relate this to the appearance of computers and the so-called information society. The perspective should be more long-term. Communication is not a recent phenomenon; nor is work, trade, growth or globalization. Former OECD economist Angus Maddison proposes a suitable modern categorization when he characterizes 1500–1820 as a proto-capitalist and 1820– as a capitalist era. By “capitalist” economies we should understand semio-economic systems that aim at indefinite growth by means of advances in technology. This 500 year-perspective also coincides with the European discovery of the Americas and all that jazz.

“Playing with signs”: Le théâtre instrumental de Mauricio Kagel

C'est grâce à une bourse que le compositeur argentin Mauricio Kagel, élève de Borges, a pu s'établir à Cologne à partir de 1957. Il fréquente alors les séminaires de Darmstadt, en se frottant à la nouvelle génération: Stockhausen, qui venait alors de terminer *Zeitmaße*, mais aussi Pierre Boulez – dont il avait déjà fait la connaissance à Buenos Aires,¹ John Cage et Ligeti. Après avoir achevé la réalisation de la pièce *Anagrama*, il met au point le terme de “Théâtre instrumental” pour la pièce *Sur scène*: les techniques compositionnelles acquises entre 1952 et 1958 sont étendues à la scène, les attitudes et les gestes devenant de nouveaux paramètres pour l'écriture.

Cependant, le *théâtre instrumental* n'a pas de connotation dramaturgique en liaison avec un genre particulier, comme le théâtre musical par exemple. Kagel revendique un statut de compositeur à part entière (Kagel 1993: 13): “Je n'ai jamais écrit de ‘musique de scène’ ou d'accompagnement pour une action scénique quelconque. Je considère plutôt que j'ai fait de la musique absolue *avec* la scène.”

Kagel fait ainsi de la partition un espace où le caractère polysémique de l'œuvre impose ses zones de conflits, en piégeant non seulement l'auditeur mais aussi l'interprète lui-même: les limites entre texte musical et paratexte vacillent. Pour en saisir éventuellement le sens, il faut explorer les modalités d'écriture de ces pièces, habiller le chaos apparent de la seule réalité tangible: celle du geste. Trois zones conflictuelles peuvent être mises en évidence: celle du texte, celle de la technique de composition, et enfin celle de la forme, en parcourant sous forme d'allers-retours trois œuvres significatives, *Anagrama* composée en 1957/1958, *Antiithese* (1962) et *Staatstheater* (1967/1971).

1. *Mauricio Kagel: Les conditions de la représentation*

Les œuvres de Mauricio Kagel, en particulier celles qui touchent au genre du *théâtre instrumental*, se distinguent avant tout par leur nature hétérogène, voire franchement extra-musicale, et par leur dimension humoristique et iconoclaste. Le spectateur ou l’interprète deviennent les otages captifs d’énigmes à tiroir où de multiples niveaux d’interprétations coexistent. Les titres des pièces en sont d’ailleurs le reflet. Elles laissent présager, comme dans une œuvre à programme, des éléments constitutifs ou des structures de l’œuvre où la dimension ludique n’est d’ailleurs jamais totalement absente – comme le montrent ces quelques titres accompagnés de leur sous-titres: *Sur Scène, pièce de théâtre musical de chambre* (1958), basé sur une triple jeu de mot; *Journal de Théâtre, ensemble de situations pour instruments, Interprètes et Accessoires* (1960), qui vient de l’allemand *Requisiten*: terme propre au vocabulaire du théâtre; *Le Bruit, invective pour toute sorte de sources sonores et expressions injurieuses* (1960). L’assemblage de termes incongrus a pour effet de désorienter le spectateur en instaurant un jeu sur le sens, qui se résout dans une dialectique de la présence et de l’absence de connotation: *Die Umkehrung Amerikas, Hörspiel épique*; ou encore *Blue’s Blue, Reconstruction ethnomusicologique pour quatre participants* (1979); *Der Tribun, Hörspiel pour orateur politique, sons de marche, et haut-parleur* (1979). L’astuce de *Zwei-Mann Orchester, für zwei ein-Mann Orchester* (1973) repose quant à elle sur un isolexisme. Dans certains cas, les titres semblent livrer des clés structurelles, et dans d’autres cas, le titre semble tout à la fois se soumettre et se dérober à la lecture de la représentation: comme pour *Antithese*, où le spectateur piégé cherchera vainement quel est le terme antithétique. Dans d’autres situations, ces titres permettent d’établir une typologie concrète de la représentation comme par exemple *Sur scène*, qui se passe ... sur scène, ou encore *Acustica* (1970) qui propose un inventaire de sonorités et d’instruments.

Le caractère pseudo-dadaïste de ces aphorismes vient pourtant masquer un deuxième niveau de lecture: le titre de ces représentations remplit une fonction qui est historique. Ainsi, le *Concerto pour piano n°5 en mi♭ Majeur* de Beethoven est un titre purement descriptif de l’œuvre, qui présage déjà d’une certaine structure et d’un instrumentarium précisé à l’avance ainsi que d’une certaine élaboration du matériau – il commencera et finira sur un accord de *mi♭ Majeur*. Dans ce cadre, les titres chez Kagel

renvoient à une tradition similaire, qui n'est pas – paradoxalement – une tradition théâtrale, mais bien une tradition musicale. Ils renseignent ainsi sur une *réalité tangible* de ce que l'on va voir et entendre, accompagnée de la composition instrumentale et/ou de l'effectif présent sur scène: *Anagrama, pour chanteur soliste, chœur parlé et ensemble de chambre* (1957); *Antithese, Jeu scénique pour un interprète avec sons électroniques et [sons publiques]* (1962); *Phonophonie, quatre mélodrames pour deux voix et autres sources sonores* (1963); *Match, pour trois "interprètes"* (1964); *Prima vista, pour appareil à diapositives et nombre indéterminé de sources sonores* (1964); *Staatstheater Composition scénique* (1969–70); *Exotica pour instruments extra-européens* (1972).

De son côté, l'exécutant est mis au défi de jouer la partition, comme dans *Exotica* (1972), dans laquelle il est demandé à des interprètes de la musique occidentale savante de jouer avec des instruments extra-européens. Cette problématique est transcendée par l'aspect visuel et performatif du jeu, qui dépasse les contraintes techniques. La partition devient alors une zone de conflit, car le résultat est à la fois visuel et sonore. Elle nécessite des descriptions et des instructions de jeu dont le mode opératoire s'appuie sur des paramètres hétérogènes (instruments, gestes, sons). Le livret joue alors un rôle de premier plan, comme dans *Anagrama* (Kagel 1965a: IV et V):

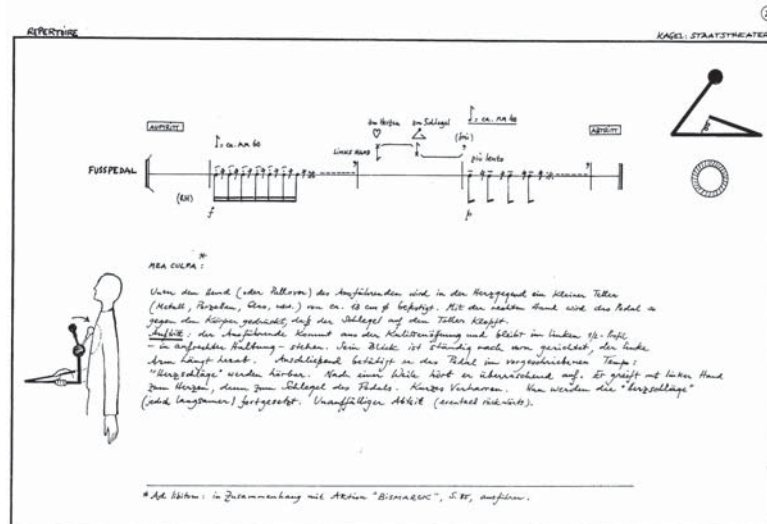

Les parties vocales de l'œuvre (caractères majuscules – mots isolés et phrases cohérentes; symboles phonétiques – combinaisons de sons parlés ou chantés) sont composées par les voyelles et consonnes – ou par leurs variantes phonétiques – du palindrome anonyme (du moyen âge?):

IN GIRUM IMUS NOCTE ET CONSUMIMUR IGNI

Il devient nécessaire de disposer des indications sur la structure "figurée" de la pièce pour l'exécution, ce qui renvoie à une problématique de la perception:

Les endroits libres dans le texte vocal, indiqués par des parenthèses doivent être remplis par l'interprète. Les voyelles et les consonnes du palindrome, ainsi que les symboles phonétiques donnés dans l'appendice I serviront comme matériel de base pour la formation des textes manquants (donc, ne pas employer: A, B, D, F, L ou P). L'exécutant doit remplir les places libres le plus individuellement possible, afin d'éviter une réalisation homophone de l'ensemble.

Dans tous les cas de figures, le texte de la partition va jusqu’à se confondre avec son livret ou sa préface, ce que l’on appelle en littérature le paratexte, comme c’est le cas dans *Staatstheater*.

Exemple 1. Mauricio Kagel, Staatstheater : Repertoire. © Wien, Universal Edition, UE 15197 LW, 1975.

D’après Elizabeth Zawisza (Zawisza 2000: 14–15), cette “zone intermédiaire” qui entoure le texte (titre, livret de partition, etc.) forme des “zones de passage parfaitement perméables qui départagent moins qu’elles n’unissent divers systèmes de signes, de formes d’écriture et de pratiques artistiques”. Ces systèmes de signes aux limites imprécises deviennent ainsi le corps même de la partition qui peut alors relever du carnet de théâtre dans la définition qu’en donne Anne Ubersfeld (2000: 277), c’est-à-dire en tant que *projet* de réalisation: “Le paratexte théâtral [ici les carnets de représentation] est toujours riche, plus riche sans doute que celui de tout autre texte littéraire, puisqu’il s’agit d’un genre inachevé, et que seule la représentation précipite l’œuvre dans ... la relation à l’autre.”

La représentation est donc comprise selon une perspective dialectique: elle est à la fois réglementée et irréductible à son “texte”. C’est le cas notamment de la pièce *Antithese*, où le celui-ci ne fait qu’un avec celui du livret explicatif nécessaire à l’exécution de l’œuvre. Saisir son essence passe alors

par un travail à la fois génétique et analytique, où comme le précise Werner Klüppelholz (2003: 8), “il n’est pas facile de comprendre une œuvre sans jeter un coup d’œil aux esquisses”.

2. Représentation: Les conditions de Mauricio Kagel

Mauricio Kagel est un compositeur qui a su, de manière remarquablement précoce, maîtriser le langage sériel dans les multiples prolongements qui ont été évoqués durant les séminaires de Darmstadt dans les années 50. Les esquisses et les brouillons montrent que dès la réalisation de *Anagrama*, Kagel a utilisé des techniques de composition sérielle lui permettant une prolifération du matériau, mais en laissant ouvert les possibilités d’agencement, en faisant coexister divers modes de structuration. La pièce *Anagrama* constitue en cela une œuvre clé, au sens philologique, car on trouve dans les documents d’archives un véritable inventaire de techniques de composition, qui reflètent les nombreux essais auxquels Kagel s’est livré.²

Dans cette pièce, un palindrome original IN GIRUM IMUS NOCTE ET CONSUMIMUR IGNI, sert de prétexte à la composition vocale et instrumentale en définissant un champ de proportions. Ainsi, des relations entre notes, sons, rythmes sont déduites de l’analyse du palindrome de base, notamment du nombre de lettres à l’intérieur de chaque mot, ce qui permet par exemple d’engendrer des proportions: 2 4 5 4 2 10 4. Puis il procède de même avec les syllabes: 1 2 2 2 1 4 2. Ceci permet à Kagel d’obtenir une sorte de sérialisation des différents paramètres, en associant par exemple une lettre à une note, en établissant des rapports de proportions rythmiques (Kassel 2004: 19–20). Il superpose alors ces structures – en canons, par augmentation ou par réduction – afin de donner une certaine fluidité à la forme musicale.

Mais Kagel *joue* sur l’hétérogénéité elle-même, comme une sorte de défi lancé à l’auditeur. La série qui est utilisée dans de nombreux documents d’archives ne correspond pas du tout à celle qui est exposée dans sa présentation de 1960 (Kagel 1997: 361). Il n’y a pas d’indices ou de clés de lecture dans le résultat sonore: les événements musicaux ne sont plus perçus de manière unilatérale mais comme résultantes de multiples réseaux échappant à la perception, car les structures qui permettent d’engendrer le matériau sont trop nombreuses. Seule compte la définition d’un champ d’espace et de durées – une idée exposée par Stockhausen (1988: 26–27)

à Darmstadt dans “... Comment passe le temps ...” – utilisé afin de “séri-
liser” un ensemble de constituants. Ainsi, dans *Staatstheater*, au sein du
mouvement *Einspielungen*, tous les intervalles et leur renversement sont
exécutés de manière libre par les musiciens (ou les haut-parleurs), à partir
de trois schèmes rythmiques qui servent à jouer des combinaisons d’inter-
valles choisis.

-7-

Exemple 2. Mauricio Kagel, Staatstheater : *Einspielungen*. © Wien, Universal Edition, UE 15197 LW, 1975.

Il est indiqué d’ailleurs sur la préface que le musicien doit se servir
d’un crayon afin de noter et de repérer les notes qui composent les trois
fragments rythmiques. C’est la sérialisation d’un champ diatonique de
hauteurs qui sert ici de point de départ à l’organisation structurelle d’un
espace de hauteurs et de durées indéterminés.

On peut enfin observer une technique de permutation d’un rythme
dans les pages qui composent *ensemble*. Une des sections de la voix de
Soprano 2 est formée par une cellule rythmique de trois temps, dont la
structure est invariante, mais dont la manifestation est à chaque fois renou-
velée par élision ou par remplissage des durées.

Le travail de composition de Mauricio Kagel s’attache à transposer les
méthodes qui sont présentes dans son discours musical aux dimensions

Exemple 3. Mauricio Kagel, *Einspielungen. Musik für Lautsprecher* (1970) de Staatstheater (1967–70), brouillon (Sammlung Mauricio Kagel, Paul Sacher Stiftung).

extra-musicales de l'œuvre. Le point de vue adopté est résolument structuraliste. Comme le remarque Eero Tarasti (1995: 436), la musique “contient des formes et des figures” incluant “des éléments ‘anthropomorphiques’”, or ici Kagel joue justement sur la composition de ces mêmes éléments, mais selon une structure qui leur est étrangère. L'idée fondamentale est ici de jouer sur des *ratios* et de créer des proportions de différences: c'est ainsi qu'il est possible de créer un mouvement dans la forme de l'œuvre.

3. Représentation des conditions: Mauricio Kagel

Revenons à la pièce *Antithese*. La forme de la représentation se trouve ici directement liée au choix des actions par l'interprète. Non seulement ce choix permet de réaliser un “Aktionschema” spécifique, mais encore, il a une incidence directe sur la durée de la représentation – ainsi qu'il est stipulé dans le livret – et sur le trajet spatial de l'interprète.

Une page d'esquisse³ montre comment les différentes actions sont déterminées par un rapport de différence entre chacune d'elles: il s'agit

toujours de faire se confronter des situations dénuées de tout contexte théâtral, même à un niveau fondamental, et à établir un différentiel de structures. Dans le film de Kagel – qui n'est qu'une des formes des réalisations possibles de l'œuvre – tous les mouvements de l'interprètes sont réglementés à l'aide d'une répartition des mouvements et des positions du corps dans l'espace scénique. Le sens des situations montées les unes à la suite des autres échappe irrémédiablement au spectateur, et seule l'absurdité de la situation générale fait émaner de ce chaos apparent un topos sémantique implicite: l'homme aliéné face à sa propre réification, lutant

Exemple 5. Mauricio Kagel, *Antithese*. © 1965, Henry Littolff's Verlag.

contre les bobines qui menacent de l'asphyxier, et tuant sa propre image télévisuelle.

Staatstheater constitue quant à elle une pièce à part, du point de vue de sa taille comme de sa forme. Réalisée entre 1967 et 1970, elle a été commandée par Rolf Liebermann, alors intendant du Staatsoper de Hambourg. Le compositeur s'est emparé du lieu à tous les niveaux, des décors à la scène, en mettant en situation l'Opéra lui-même (Kagel 2003: 402-403). *Staatstheater* réinterprète toute cette histoire, mais aussi l'Histoire de l'Opéra comme genre. Kagel se livre par conséquent, afin de constituer les différentes sections, à une *composition* des différents événements liés à une représentation d'opéra:

- Répertoire: Morceau de concert scénique
- Einspielungen, Musique pour haut-parleurs
- Ensemble, pour seize voix
- Debüt, pour soixante voix
- Saison, jeux chanté (jeux de mots sur *Singspiel* en allemand) en 65 tableaux
- Spielplan, Musique instrumentale en action
- Kontra-danse, ballet pour non-danseurs
- Freifahrt, Musique de chambre glissante
- Parkett, pour scène mesurée concertante

Chacune de ces parties vient donc décomposer le titre général: *Staatstheater, Composition scénique*. Les différentes sections définies par Mauricio Kagel forment autant d’angles et de points de vue différents selon lesquels l’objet principal – le Staatsoper – est à la fois grossi, inventé, et ré-interprété. Les différents éléments des sous-titres qui décomposent le tableau font appel à des situations historiques du théâtre ou à des sections constituantes d’un spectacle: ainsi *Saison, Spielplan* pour évoquer le carnet de mise en scène, *kontra->Danse* pour les ballets, *Debüt* pour évoquer les apparitions scéniques. Les sections sont alors combinées, pour créer la représentation, selon une logique qui est décrite dans la préface de la partition (Kagel 1975: 5): “Une choix parmi les sections est possible. ‘REPERTOIRE’ sera toujours joué au début d’une représentation. Si cette partie ne figure pas dans le choix, alors on peut commencer comme on veut. La durée d’une représentation doit tenir dans une limite de 100 minutes, la pièce doit être jouée sans pause.”

Ainsi, la section *Repertoire*, qui inventorie un instrumentarium, modifie la perception de la scène en la décomposant en autant de figures sémantiques qui sont données sur la partition, et évoquées pour le spectateur. Si bien qu’il existe – malgré l’absence apparente de tout espèce de dramaturgie – une attitude dramatique dans laquelle évolue l’interprète, et qui est appelée *Modell*. Mais cette situation est comprise comme objet, et c’est la somme de chacun des éléments isolés qui définit alors la forme de la section ainsi que son mouvement général. Seuls les mouvements des interprètes donnent une cohérence formelle à l’ensemble : les situations cocasses et absurdes renvoient à un autre niveau de signification: la présence humaine donne sa seule justification à l’œuvre d’art.

Enfin, *Anagramma* – entre glossolalie et pseudolanguage – consiste en une certaine forme de “théâtralisation”, ou plutôt devrions-nous dire en une certaine “gestualisation” de l’œuvre. Malgré l’emploi de structures complexes, comme nous l’avons vu, la pièce se construit sur une cohérence: celle du geste vocal. Ce sont les phonèmes, utilisés dans l’intonation du palindrome, qui sont dévidés en un grand anagramme sonore, et qui cimentent la forme de l’œuvre. Une typologie vocale s’instaure alors, un mouvement, qui va du palindrome latin aux phrases reformées de la dernière section. Ce parcours sur cinq parties fait entendre tous les stades d’un langage ou d’un pseudo-langage en formation, depuis les sons du palindrome latin, en passant par les phonèmes, jusqu’à la formation des mots dans une typolo-

gie syntagmatique sans aucun sens, ce qui n'est pas sans rappeler les jeux littéraires surréalistes. Le sens final est donné par ce que Kagel appelle une "bizarre dramaturgie" (Kagel 1997: 367) liée à la répartition des mots tout au long de la pièce, où le principe fondateur est la *non-répétition*.⁴

L'écriture des pièces de Mauricio Kagel est fondamentalement liée au geste tout en s'appuyant sur une organisation des événements, quel qu'ils soient. Ces événements sont agencés en fonction de différentes structures qui sont définies par des champs temporels qui les contingentent. Ainsi, dans le théâtre instrumental, c'est le geste de l'interprète qui définit ce champ, et par là, qui donne la durée et qui *sédimente* la forme temporelle de l'œuvre, la partition reflétant moins une réalité acoustique qu'une description minutieuse des événements *en dehors* du temps. C'est en ceci que l'on pourrait ramener Kagel à Brecht: la représentation n'est plus pensée comme un divertissement, mais plutôt comme un objet dont il appartient au spectateur d'interroger le sens, et dont les clés se situent déjà en amont de la représentation (Schnebel 1970: 282).

Raymond Monelle exprimait ainsi l'activité sémiologique (1992: 10): "The semiologist, like Hanslick, is more interested in the *system* of signification than the material signified; he sees systems as empty webs of relations, 'without positive terms' (the phrase is Saussure's but it sets the theme for all structuralist study)."

Effectivement, dans les pièces du théâtre instrumental, les objets scéniques, les gestes, les situations sont extirpés de leur contexte car les structures qui les régissent échappent à toute connotation et les vident de leur sens. Mais la perspective structurale qui voudrait ne parvenir à la compréhension de l'œuvre que dans la justification que l'œuvre donne elle-même de l'apparition des éléments se trouve ici mise en défaut. Lorsqu'il existe une "grammaire" d'un système musical, il est possible d'interpréter toute variation du paradigme fondamental de ce système en relation avec une signification ou un topique éventuel. Mais ici, l'œuvre ne s'y soumet pas, car son système paradigmatique change sans cesse, et sa forme ne suit aucun axe syntagmatique préétabli : elle est œuvre et métalangage d'elle-même.

Mais en renversant sans cesse ces fonctions Kagel ne dessine-t-il pas une nouvelle isotopie? Celle-ci dépasserait les situations de surface dans sa dimension anthropologique et politique: celle de l'aliénation humaine et de la place de l'individu dans la modernité.

Notes

1. En fait, Kagel et Boulez s’était rencontré à deux reprises à Buenos Aires. La première fois en 1950, lors d’une tournée du théâtre Renaud-Barrault en Amérique, où Kagel était figurant dans la pièce *Le procès* de Kafka interprétée par la compagnie. La deuxième fois ce fut en 1954, où Kagel a pu montrer la partition du sextet de cordes à Boulez, qui lui aurait alors fait ce conseil: “Ne restez pas là. Vous devez partir” (Rebstock 2007: 352–353).
2. Les esquisses sont conservés à la Fondation Paul Sacher à Bâle (Suisse) sous la cote Sammlung Mauricio Kagel, Anagrama. Les dossiers 1/17 à 5/17 contiennent les brouillons et esquisses ayant servis à l’élaboration de la pièce, basée sur l’expérimentation: correspondance série des lettres et série des notes, découpage de la partition et tirage au sort des segments obtenus.
3. Sammlung Mauricio Kagel. *Antithese*. Paul Sacher Stiftung, Basel, Switzerland.
4. Dans les esquisses d’*Anagrama* se trouve également un important appareil textuel qui correspond à des descriptions parfois assez précises de l’effet esthétique recherché.

The return of the forgotten in Wong Kar-Wai's *2046*

This paper addresses the issue of misunderstanding with an attempt to equate the vestiges of lost love and desire with an impressive and repressive mechanism that keeps people lingering around the repetitive dream scene of the forgotten. Mieke Bal's model of the interaction of the narrative function and visual images in a cultural context, especially her theory of focalization (Bal 1997: 142–161), is applied here to interpret the tangled fragments of various love affairs and memories of the male protagonist, Chow Mo-Wan, and the narratives in Wong Kar-Wai's movie *2046*. The fragmentary love affairs, though bearing a quite distinguished aesthetic style aimed at the representation of Hong Kong's culture in the 1960s, not only heightens Chow's recollection of sentiments but also combines cultural significance with the aesthetic depth that the movie's special and complicated cinematography contrives to bring forth.

Through Chow's narrative, Kar-Wai's *2046* tries to preserve a person's life and hope in a world that never changes, as if it were the key to salvation, and consequently brings forth the question of misunderstanding of love and mischief, all of which emerge through a highly seductive and protective series of gestures between the two lovers. This intriguing point is 2046, both a year and a place, where everything remains unchanged. Playing with the year of historical significance to Hong Kong people as the last year that everything could remain unchanged – fifty year promise made by Deng Xiao-Ping to Hong Kong, Wong Kar-Wai shifts the question the natural state of love, and creates *2046* as an answer to his own queries in his movies, while distorting the political significance of this number. The journey to the never-changing place/year 2046 brings the Japanese time traveler Tak, under Chow's pen, to a moment of star-crossed love with the android on a high speed train departing from 2046. He cannot find his answer in 2046, for the past cannot be found there, and he is to suffer once again for the

android wjw1967, who, as his girlfriend did in the past, refuses to answer his questions. With retrospection on all the fragmentary love affairs he had in Hong Kong and Singapore, Chow cannot find his answer in either *The Mood* or in *2046*. Both Chow – the narrator of the story *2047* and in the film *2046* – and the director of the movie *2046* adroitly record and transcribe their love stories through fragments from past experience and memory, yet without any lack of deliberate contradiction and leeway. In this way they succeed in creating a de-contextualized arena to entrap their characters and allow the movie viewers/readers to focalize in different ways on the fragmented love stories and the (im)possible love objects.

2046, as the last of Hong Kong director and producer Wong Kar-Wai's serial movies set within the decade of 1960s Hong Kong, brings forth once again an obsessive sense of being lost in glamorous shifts of beautiful faces and dresses. In it, the past has never really left us and one's desire, never to be recognized as true love, is always more about a mood than about a woman. The repeated amorous experiences of Chow Mo-Wan (Tony Leung Chiu-Wai), who becomes entangled with various women in Singapore and Hong Kong, only prove to the audience that romances are treasured and worthy of repetition, because Chow cultivates every romance to satisfy his desire and lust, and moreover, to use every failed romance in commemoration of his unrequited love and desire for Su Lizhen (Maggie Cheung Man-Yuk), whose glaring image from *In the Mood for Love* keeps returning to the present and haunting Chow's memory. One misunderstanding (in *The Mood*) broods on more misunderstandings (in *2046*), not because one cannot learn from past failures, but because one refuses to learn at all. Chow's failed romances prove to be a demonstration of this sad truth in *2046*.

When compared with the premiere at Cannes, the Asian version of *2046* can be said to be a better version of a much too self-obsessive indulgence in one's past (for Chow) and in one's works (for Wong Kar-Wai). However, frustrated at Cannes, Wong has to let go of this indulgence, and he allows some fresh air into the dark and damp context of an imagined Hong Kong of the 60s. The Asian version reveals the light of change, by figuring as its main characters Tak (Takuya Kimura) the Japanese time traveler who tries to trace back to his lost love in 2046, where, as rumor has it, nothing changes, and wjw1967 (Faye Wong), the android on the high speed train to-and-from 2046. Applying Mieke Bal's method in ana-

lyzing the focalization in some shots in *2046*, I would like to suggest that it is because of this rearrangement in the plot, the sequence of events and parts of the narrative that that some transformation is finally possible for Chow (and for Wong).

1. *The hole to past memory*

2046 begins with Lu-lu/Mi-mi (Carina Lau Kar Ling) seductively and exaggeratedly swinging her body, while at the same time peeping into a giant, yellow-brownish hole which spreads wide open in a way that threatens to devour her at any second. This swinging is only supposed to be viewed by the audience in a shot taken from behind the character. And since what is inside the big hole should not be seen by the audience, this gigantic yellow-brownish, Gothic hole emits a strange sense of mystery to the audience, despite Lu-lu's seemingly entranced empathy with it. This mystery will soon be swept under the rug, as Lu-lu lies bloodily murdered on the bed in Room 2046 of the Oriental Hotel. The metaphorical function of this hole will immediately be re-oriented to the last scene, where Chow Mo-Wan, in *The Mood*, kept his secret behind a hole in the wall of the ancient edifice at Angkor Wat, Cambodia; it will later to be re-linked to the hole in the wall of Room 2047 in the Oriental Hotel, from which Chow kept peeping at Bai Ling (Ziyi Zhang), a prostitute living next-door to him, and later, peeping at the hotel owner's daughter Jingwen (Faye Wong) rehearsing her lines of a non-existent dialogue. In Chow's novella "2047," the hole appears once again, when the android wjw1967 circles her fingers to form a hole for Tak to let out his secret. Finally, this hole becomes related to Tak's mouth, when wjw1967 seduces her so as to channel all his sorrows into that orifice. The relation between the female bodies and the gigantic hole-like mechanism points to the secret of *2046*: the impossibility of lost love despite the haunting vestiges of it that keeps the subject in question allured in everlasting mourning.

The symbolic meaning of the hole and all the similar, metaphorical signs have the same function – to signify the secret of yearning and the obfuscation of lost love. The obsession of an unrequited love retains in this movie a very stubborn merit shared by Chow, his alter-ego Tak (in "2047"), and even the director of *2046*, Wong Kar-Wai. They let the undying image of their past and unquenched desire return to the present and

haunt their reality as a ghost. They would rather indulge in their melancholy than live out of their traumatic experience. In the version played at Cannes, the romances shown in *2046* are confusing repetitions where only the women and their dresses change; these hold no great significance for most of the audience since they cannot tell one woman from the other. Because themes of elusive love and the haunting images of the past are Kar-Wai's favorite subjects, there is not much new here for the audience to see. It is like a closed loop that encloses and imprisons not only Wong, Chow, and Tak, but also the audience. However, the changes in the Asian edition, which was completed after the premier at Cannes, re-opens the loop and prepares for the audience a new way of interpretation. The following discussion analyzes some shots from the Asian version, applying Mieke Bal's distinction between the *focalizer* and the *focalized*.

According to Bal, "when events are presented, they are always presented from within a certain 'vision.... Perception, however, is a psychosomatic process, strongly dependent on the position of the perceiving body" (1997: 142). Since a vision can be viewed from various perspectives, "striving for objectivity is pointless". With this understanding, Bal emphasizes the importance of the study of focalization, which will distinguish the vision from the narrator. "Focalization is," Bal explains, "the relation between the vision and that which is 'seen,' perceived" (ibid.). Traditional theory of narration does not "make a distinction between those who see and those who speak" (ibid.: 143); however, when dealing with visual narrative, it becomes important that what the speaker says might not be what the camera presents to the movie viewer. What makes the difference is focalization, "the relationship between the 'vision,' the agent that sees, and that which is seen" (ibid.: 146).

In several vision in Wong's *2046*, the study of focalization helps to uncover what is hidden or misunderstood. Usually, the visual perception of a scene is assumed to be commensurate with the scope of the narrator's domain; hence little attention is paid to the possible alternative readings and interpretations that are neglected in the perspective of the narrator. The "hole", as the major metaphor of Chow's secret and a unifying thread for the whole film, will be a good place to start for the analysis of focalization.

In 1966, Chow was seen covering a hole on the wall at Angkor Wat with mud after telling the hole his secret. The film *2046*, as a follow-up to *The Mood*, picks up the secret and makes it a leftover, a remainder, a vestige

of a love that dares not be spoken out loud and that is doomed to decay. The secret thus becomes the initiating sign of all the later ones, which keep returning to the scenes and directing them toward various different significations. The longing of love and desire is buried in the hole of a tree, as Chow would make us believe in *The Mood*, but it proves to be inextinguishable when the signifying function of this tree hole can be found in *2046* in various different signs which are plainly created as substitutes. What is buried can never be forgotten, and it comes back time and again, haunting the one who buried it. A modern day love story, *2046*, in worshipping the sublimity of love, also becomes a ghost story. Reminders of the impossibility of love always turn up, to interrupt the romances Chow encounters in *2046*. Thus all the romances will recur one by one, all of them vulgar replications of this lost love, which torments Chow Mo-Wan. A love that cannot be retrieved becomes the faint image, a memory reminding Chow of love's bittersweet taste. A love that ceased because of misunderstanding creates more misunderstanding later on.

*2. Haunting remnants of love:
Repetition and compulsion*

The romance fragments of repetitive failure in *2046* can on the whole be seen as the result of unresolved issues in *The Mood*. Chow Mo-Wan's inability to cope with his experience of lost love in *The Mood* is further developed into a series of fruitless romances that demand an explanation. I would like to view the whole event from the perspective of lost love and desire as impressive and repressive mechanisms that keep Chow lingering around the repetitive dream-scene of the forgotten. Mieke Bal's model of the interaction of the narrative function and visual images in a cultural context may be applied to interpret the tangled fragments of various love affairs and memories of Chow Mo-Wan's remembrance and narratives in Wong Kar-Wai's movie *2046*. The fragmentary love affairs Chow that experienced in reality, and those created by his pen, are taken and cut according to Wong Kar-Wai's peculiar taste and critical eye. The latter, in his distinctive aesthetic style and characteristic exuberance, aims to depict Hong Kong culture in the 60s. This approach amplifies the emotional poignancy of his the protagonist's experience, an effect compounded by Kar Wai's meticulously sensual cinematography.

In *The Mood*, Chow and Su Li-Zhen (Maggie Cheung) were neighbors in the same apartment building in Hong Kong in the 1960s. Su and Chow usually encountered each other when walking up and down the stairs to buy their meals; in these meetings, a sense of desire and love was secretly transmitted between the two. However, they found out that their spouses were seeing each other, and finally left them to get together. Chow and Su began seeing each other in order to find out the reasons why their spouses would do such a thing to them. They began imitating the situation and rehearsed their spouses' behavior every time they met each other. They even rented a hotel room (number 2046) in which to write martial arts novels together. Finally Chow fell in love with Su, but was rejected by her. He left Hong Kong for Singapore; on his way to Cambodia, he buried his secret in a tree hole. In *The Mood*, Chow can not understand why he was rejected. In reality, Su would never marry him because she was determined not to fall into the same fault as her husband did, and she despised her husband for his immorality and deceit. She is a woman who so highly values morality and chastity in marriage that she sacrifices personal desire and true love to preserve her reputation, even though she and Chow had already crossed the line of pure friendship. She detested what her husband did to her and would rather live alone to celebrate her independence from men, than share the same bed with Chow. Without the sensitivity to speculate on Su's inner heart, and not understanding her ambivalent feelings toward a love that resembles too much the one that broke her heart, Chow could never figure out why he was rejected. They could only keep a relationship that imitated their spouses; marriage was something Su would never deign to accept.

Chow buried his secret in the tree hole in Cambodia but kept the failure of love in mind. He lived in Singapore as a gambler, before returning to Hong Kong as a freelance writer and womanizer. His misunderstanding of Su's true feelings and love becomes the trigger of his later failure in later romances with a second Su Li-Zheng in Singapore (Gong Li), Bai Ling (Ziyi Zhang), and the hotel owner's daughter (Faye Wong). The previous experience of failure in love results from his misunderstanding of Su. By allowing this past failure/secret to visit his present, Chow inscribed the impossibility of lost love in his memory, worshiping the latter as a precious commemoration of his true love for Su (Maggie Cheung).

Through Chow's narrative, Wong Kar-Wai's *2046* tries to represent attempts to preserve one's life and hope in a world that never changes, as if that were the key to salvation. In consequence, he poses the question of mis/understanding of love, in a highly seductive performance by two lovers. Chow – the narrator of the story *2047* and also in Wong Kar-Wai's *2046* – and the director of the movie *2046* dexterously record and transcribe their love stories through fragments from past experience and memory. They successfully create a de-contextualized arena in which to entrap their characters and allow us, the viewers, to apply different kinds of focalization to the fragmented stories of forlorn love.

As a follow up to *The Mood*, Kar-Wai's *2046* cannot abandon the previous story and make a new start, but, as a haunting drama, it continues and further develops the theme of failure in love. The love affair between Chow and Su Lizhen in *The Mood* could have been a sweet, if sad, memory, but the story of *2046* turns it into a defeating blow that limits Chow's chances of starting a new love life. A haunted man, a beautiful image, the memory of an impossible love, and a few heart-broken women all get together to commemorate Chow's lost love. *2046* never tries to tell a new story; instead, it seduces all of the possible future to celebrate the impossible return of a woman's love. Lu-lu, lingering over the great hole-like object, can experience her own sorrows and delights; but she need not wish to learn more. The remnants of love and desire cannot be found – they can only haunt. The mysteries kept within the hole cannot be directly revealed. There is no need for language as Lu-lu dances seductively in front of the gadget.

In another fragmentary story, Chow peeps into Room 2046 and there finds the daughter of the Oriental Hotel's manager. This time, there is no moving torso in the next door, but the delicate and smooth gliding of a pair of legs and shiny shoes send out their own kind of invitation. Chow, the focalizer/peeper, enjoys peering at this excellent performance. Gingwen, the focalized, is so obsessed with her fantastic mimicry that she has no idea anyone is eavesdropping and gazing on her rehearsal of a non-existent dialogue with her Japanese boyfriend. The slow gliding movement of the feet and shoes hint at some story of her own, where desire and love have to be repressed, thus recollecting *The Mood*. From the very beginning of *2046*, Gingwen's identity is always closely related to that of Su Lizhen. In fact, she finally becomes Su's surrogate, who helps Chow write novels, and receives the love and admiration – originally for Su – which Chow

now projects onto Gingwen. After that, Bai Ling, a young call girl, moves into Room 2046. Bai Ling, as the focalized, bares her body, unaware that anyone is looking at her. If Gingwen shares with Su the spiritual love of Chow, then Bai Ling surely represents the physical part of their love. For Su Li-Zhen's sake, these four women in *2046* begin their love dances and receive the praises and sacrifices of Chow's love for Su.

The plot of *2046* is simple. The subject (material) of the story is a collection of four segments of love affairs. Three of them are Chow's personal experiences, and one is a story written by him to recount the impossible love of Su Gin-wen, his proprietor's daughter, who falls in love with Tak (Takuya Kimura), the Japanese. *2046* is in fact a movie constructed of three romances that happened to Chow and one to Tak. However, these four romances perform a quite similar function, since all the episodes indicate the impossibility of love.

Chow voluntarily re-experiences all four fruitless romances. Only through the traumatic repetition of love can Chow regain his virility and a sense of control. As Freud's grandson playing the *fort-da* game, he transfers the loss of love into a game of power. When he can control the comings and goings of the desired object/Maggie Cheung in his fantasy, he proves to be the controller, not the controlled. Maggie's leaving and her rejecting of his gift cause his traumatic experience of love. Chow's resolution and recuperation of his trauma is the total indulgence in various kinds of romances with different women, in whom he finds temporary sanctuary from the onslaught of his emotions.

Maggie Cheung thus becomes a sign of the irrecoverable loss of an impossible love and of Chow's defeat. The symbolic nature of Maggie Cheung, however, grows big and invincible as Chow refuses to admit and face his defeat but instead chooses to run from the real problem behind their break-up. The longer he refrains from admitting that he did not truly understand Maggie Cheung, the more he amplifies the defeat; and finally Maggie Cheung grows into an image icon that chases Chow everywhere. In Singapore he tries to erase memories of her by running to Gong Li, another Su Li-Zhen with the same name. He tried to find her character represented in the personality of the hotel owner's daughter; and ultimately he tried to squander any chance of ever having sex with a woman again.

3. *Escape from traumatic failure*

Singling out “anxiety” as the key tone of *2046*, Nathan Lee contends that “Su Li Zhen’s absence vexes the narrative” (2005: 32). The image of Su Lizhen (Maggie Cheung) continuously returns to the present, mixing with Chow’s fragmentary romances, like some home base to which Chow could return to once he ended an affair. Chow is only too happy to get accustomed to this kind of flashback, and learns to render it into a certain kind of reservoir, where he regains and recharges his energy and belief every time he needs to cut short a romance.

If in *The Mood* Chow was beaten badly in the battle of love because he misunderstood Su Lizhen’s attitude towards marriage and miscalculated her moral judgment towards the distinction between her own love affair and her husband’s adultery, now, in *2046*, he has learned all too well how to play this game of love and power. Chow is a transformed man in *2046*. He cares not so much about love and marriage; when he tires of a relationship, he retreats. His attitude can thus be understood as that of a soul consigned to repressing the past. We can transcribe these emotions into a Greimasian square, as shown in Figure 1 (after Greimas 1987: 121–139).

Figure 1. *A Greimasian square of emotions.*

Because of his indulgence in his love for Su Lizhen in *The Mood*, Chow could not but help but try to repress his nostalgic desire. However, this locked up memory refuses to be repressed and keeps returning to the present as an involuntary repetition that reminds Chow of Su. Chow’s present dalliances results memories about the sadness and emptiness of unrequited love in the past. Though he later tried to seal this secret into the hole at Angkor Wat, it turned out a failure, because this sexually loaded motif is just as ubiquitous as it is obvious, showing up again and again in many similar signs: on the wall of his hotel room, as the void in the circled

finger of wjw1967, in the metaphoric hole on this android's body in his novella "2047".

Bai Ling could not understand this. She did not know his past. Not knowing there was a Su Lizhen and that she was just a substitute for this treasured lady forever lost to Chow's memory ultimately proves fatal to her. There is no chance for her to outshine this everlasting Woman living in Chow's heart. Every time the camera catches Bai Ling's delicate dresses and every movement of her hands and limbs, the audience, as well as Chow, is supposed to remember immediately certain things that were long past, namely, the shot in *The Mood* that reveals the beautiful Su Lizhen in her glorious dress climbing up and down the stairs. It is this secret desire, transmitted through eye contact between Chow and Su, that sealed the moment with its irrepressible pain of Chow's lost love in the context of a new romance with Bai Ling. What the focalizer (Chow and the audience) of this scene sees in Bai Ling is more than Bai Ling herself. However, the woman that is seen on the screen, the focalized, does not have this kind of knowledge. Bai Ling's (mis)understanding of Chow's affection and love makes her too dominant a woman, with whom Chow would finally find an excuse to break up. The focalization of these scenes depicting Bai Ling and Chow's amour, along with the seductive body movements in the bedroom, thus reveals more than what Bai Ling or Chow believes they know.

The relationship between the focalizer and the focalized in this case goes beyond the amour itself (what Bai Ling would believe), and also beyond the mixture of present sexual pleasure with the remembrance of past love (what Chow would consciously or unconsciously think of during the busy enactment of his desire). What the scene reveals in the relationship between this focalizer and focalized is the very theme of 2046 – the impossibility of love. Under the haunting flashbacks from past memory, Chow tries to outgrow his past failure by indulging in incessant romances. He does successfully reverse the power relationship in the various romances in 2046. By having the power to say yes or no to a prostitute and, afterwards, to romance in general, Chow becomes a man who can finally determine his fate. The anxiety of the refusal of the departed Su Lizhen, which triggers the involuntary memory of Su, is now repressed and replaced by the power to start or stop an affair.

Freud, in "Beyond the Pleasure Principle", tells about a "fort-da" (gone-there, i.e., back and forth) game played by his grandson. Suffering the anxi-

ety of the absence of his mother, the little boy tries to use a wooden reel to compensate himself and to master his powerless situation. In throwing out the wooden reel, the boy imitates his mother's disappearance, and while bringing it back again, he imitates the return of his mother. Counteracting one's anxiety through this kind of imitation and control system transforms a helpless child into a master of the situation. In *The Mood*, Chow was just like this powerless child. He cannot help being frustrated by Su's refusal of his marriage proposal and her sudden departure. In *2046*, he takes hold of his power through his ability to manipulate, and he mitigates his anxiety by transforming it into a power game. Freud's interpretation is that the child gains a certain kind of relief and pleasure through forcing himself to face the situation repeatedly, because "by repeating it, unpleasurable though it was, as a game, he took on an *active* part" (Freud 1977: 16). Moreover, by repressing his anxiety and enduring the sense of loss, the child can gain much more pleasure and "revenge himself on a substitute" (ibid.: 17). Chow, similarly, gains a certain pleasure from mastering the situation. However, this kind of mastery cannot be claimed as a victory or recovery from what happened to him in *The Mood*. Without true knowledge and understanding of Su and her situation, Chow's mastery is but a repetitive invocation and commemoration of traumatic love. This is not recuperation, but a kind of narcissistic and abject indulgence. The focalization, in whose acting-out both Bai Ling and Chow participate, tells a story that deepens the anxiety and sorrow which lurk somewhere behind the secret hole.

Geling Yan's *White Snake*: Understanding the misunderstanding

Sexuality is never an easy topic for discussion in traditional Chinese society. Female sexuality is even more so, and has even been compared to the lethal power of a devouring snake. As early as the Tang Dynasty, there was already a recorded story of how a big snake once transformed itself into a beautiful woman in white to seduce man by the roadside to kill him through exhaustive intercourse. This story relates the fear and anxiety of the ancient Chinese about female sexuality and the seductive yet destructive power it carries. Sixteen hundred years later, this same terror still looms in the worst dreams of many a man in China, reminding them of the impending death that accompanies desire and lust. *White Snake* (1999), a novella written by a woman, the modern Chinese modern writer Geling Yan, remodels this traditional fear of man by adding a twist in the direction of this sexuality, and thus successfully ridicules man's anxiety and reveals the sad suppression and denial of female sexuality and sexual identification. No longer lying dormant and suppressed consciously, female sexuality in Geling Yan's *White Snake* awakens to find its outlet in another direction. It no longer desires man, but woman.

This paper addresses how the Chinese attitude toward female sexuality is questioned and challenged by Yan's novella *White Snake*. Adopting a Greimassian semiotic square in analyzing the narrative of the intertwining issues of gender and desire, I argue that female sexuality and the gender problem are masked and regulated through the Chinese traditional concept that regulates and represses a woman's sexuality and her burgeoning desire through the inculcation of an imaginary and monstrous female image created in the traditional story of "White Snake". But the homosexual tendency of a woman is not to be treated as a terrible abnormal-

ity and can usually be tolerated by the public, for it does less violation to the society. In this paper I demonstrate that by adopting a similar title to the famous traditional Chinese monster story, which told of a white serpent which transformed herself into a pretty lady to pursue and experience human love, Geling Yan's novella replicates the theme of the female monster's love and desire, and furthermore, portrays her protagonist, the middle-aged dancer, as a serpent-embodying woman whose sexual power is deemed abnormal and monstrous. Yet, after her experience with a young woman, this dancer finally grows up with a sympathetic understanding of homosexuality and female sexual identification.

In the light of the Greimassian model of the narrative semantics and semiotic analysis of passion and sexual relationships, *White Snake* reveals the Chinese way of demonizing and vilifying female sexuality. Through Yan's tale, the imprisoned woman is portrayed as a monstrous other, whose sexuality is furtively glimpsed, desired and mocked by the public, and is given the queer chance to be seduced, re-initiated, re-directed and unleashed behind the traditional cultural prison-house, not as the un-human, but as the crossroads where social and cultural anxiety encounter the fear of desire and aberration.

1. *The convention that chastises female sexuality*

The novella in question dates back to "The Story of White Snake", a *chuan-qi* (short, grotesque story) from the Tang Dynasty. This story has been rewritten with its plot slightly or greatly changed in many different forms and genres, ranging from *chuan-qi* to novella to drama. The main concern of this transformation/metamorphosis is the impossible love between man and snake. In her quest to experience human love, the white snake transforms herself into a beautiful woman. Although she had had her sexual desire fulfilled, and enjoyed the sweet conjugal married life with her husband Xu Xian, her secret of metamorphosis is never to be forgotten nor her desire and sexuality forgiven. In some versions of the white snake story, Lady White's origin is found out by a great Buddhist monk Fa-hai. To save Xu Xian from being eaten by this big white snake, Fa-hai fights violently with Lady White and her servant Blue Snake. Lady White is finally forced to change back to her original figure – a big white snake – and is kept imprisoned under the Thunder Peak Pagoda. The moral taught by

this story is quite clear: the vicious and demonic nature of female sexuality should never be overlooked. To keep man's life from being threatened by a monstrous race and also to protect the constructed legitimacy behind it – society's righteousness in its patriarchy – it is necessary to stay on guard against female sexuality and to repress her strong sexual desire. Female sexual desire is to be chastised – that is how Chinese men are admonished of the lethal power of a woman, insofar as their life, property and patriarchal legitimacy are concerned. In fact, it is female sexuality and desire that are condemned and buried together with Lady White under the Thunder Peak Pagoda.

Even during the time of the Great Proletarian Cultural Revolution (1966–1976), which sought to destroy all past conventions and archaic, deteriorating traditions as its main concern, conventional ideas and prohibitions about marriage between two races/ethnic groups still prevailed, and the heterogeneity expressed in the mixture of blood in marriage was all the more questioned as the ethnic and racial concepts of one's culture and identity were fervently exalted. These conventions serve to establish a wide gap to ensure further that the male linearity will preserve its superiority by way of emphasizing the inferiority of the female/other side. Moreover, the exclusion and abomination of the female/other is less a question of love or inferiority but more of an identification. Fortifying the mixture of blood, the story at once treats and proscribes the notion of merging with the heterogeneous other through marriage. Such traditional Chinese regulations and prohibitions can be illustrated in the following Greimassian model (after Greimas 1987: 169):

Figure 1. A Greimassian model.

In Geling Yan's *White Snake*, however, the awakening of female sexuality and the desire for woman are described as natural forces that have nothing to do with filthy or abnormal concepts or deeds. In the narrative, even in a society that abhors the strong sexual desire of a woman and compares

it to the demonic power of a serpent, the female desire of homosexuality is not so horrible an issue as to invite vehement reprimand and ignominy. The long repressed female sexuality and desire are delineated in Yan's tale as forces which could never be forgotten even under social repression. Nor will homosexual desire forsake its existence when relegated to a normalized marriage. According to the narrative, even when an arranged marriage is made possible to help Shan-shan, a homosexual, to re-direct and normalize her sexual identification, her homosexual identification may be temporarily hidden and repressed, but never will be buried under the regulations and teachings of a patriarchal society. But Sun Likun, initiated by Shan-shan to same-sex love, might develop a further understanding of the nature of homosexuality. It is significant that at the end of the narrative Geling Yan makes the point that sexual identity is not fixed and that female sexual identity is even more revolutionary in a society where social conventions and regulations repudiate women's strong sexual desires and condemn their overt and frequent sexual activities, a society in which the authorities dismissively reduce the issue into one of reproductive health and its societal importance.

In *White Snake*, a woman's sexual desire will always revive and regain its power even if she finds herself imprisoned in an obscure corner. Detention and exhaustion cannot destroy it, no matter how much derision and contempt such a desire incurs in Chinese society. Sun Likun, a famous, once-imprisoned Sichuan dancer who developed the "White Snake" story into her signature ballet, is the desired object of the burgeoning and repressed female sexuality that Shan-shan suffered. It is the time of China's Great Proletarian Cultural Revolution (1966–76). Sun is targeted and denounced by the Revolutionary Masses in 1966. Before the Revolution, Sun was notorious for her licentiousness, which went against the conservative Chinese tradition that demanded a woman preserve her chastity always. She was marked particularly because of her affair with a Soviet ballet dancer – a sexual activity which transgressed both racial and national boundaries – so that in 1969 "Sun was classified as a decadent bourgeois element, a suspected Soviet-trained spy, a seductress and a counter-revolutionary snake-in-the-grass. She was officially placed under investigative detention" (Yan 1999: 3–4). As a famous and beautiful ballet dancer playing as White Snake on stage, Sun is already too alluring as a femme fatale to her audience, not to mention that she kept seducing as many men as possible in

her bed from one province to another as her ballet played in every famous theater in China. The desire and anxiety of men for her body, however, does not wane even when she becomes a corpulent woman in her middle age, locked up in the small room at the scenery warehouse of the provincial Performing Arts Troupe in Chengdu, Sichuan Province. The construction workers, young and old, while on their break like to pass the time by singing dirty songs to her and take great pleasure in peeping and gazing at her disfigured body, imagining the allurements of her sexuality on bed.

The display of this former ballet dancer's body arouses the lust of the construction workers whose construction site just located adjacent to Sun Likun's place of detention. For a free bag of cigarette butts, passed by the construction workers to her through the barred window, Sun demonstrated her famous leg by putting her foot on her head for them to see. These men's unquenched desire teased out by the sight of sudden revelation of corporeality and sexuality nevertheless immediately became mixed with the ancient myth of "White Snake". Soon these construction workers' fantasy became both alluring and dangerous. In their debauched fantasy, female sexuality is never a pure demonstration of naked desire but a mixture of life and death. The men desire the female body and yet are forced away by the ancient myth's admonishment that the seductive allure of female sexuality is the embodiment of Thanatos itself, and is thus best left alone. To quench their lust and save themselves from the risk of death, a fantasy that put the coiled legs of Sun Likun around the furry Soviet dancer's body satisfies their need for a scapegoat for the sacrifice of this unregulated desire. In their fantasy, they find their furry foreign enemy a suitable scapegoat. Meanwhile, they can enjoy a safe fantasy of debauchery while avoiding lethal danger.

Sun Likuen, a great dancer and actor, who obtained her fame by editing, directing, and playing Lady White on stage in the 1960s, found herself unable to escape accusations of being a rotten capitalist, an anti-revolutionist, and even a trained Soviet agent. Several hundred years after the white snake story was invented, the dancer who plays Lady White receives no better treatment than the monstrous White Snake. Sun Likuen, this snake-like woman, is laughed at and ridiculed by the girl guards; however, she is popular among the construction workers who appear outside her room window.

But these construction workers were ambivalent in their behaviors and thoughts. They thought her to be a woman with strong sexual desires, which do not make her a woman of merit, but of lethal power. They liked to take advantage of her body by teasing her and gazing at her. Sun Likuen could not escape the moral and conventional judgment of a conservative people who would cast aspersions on any woman who affirms her sexual desire, actively pursues love and indulges in lust. Women of strong sexual desire are compared to a White Snake whom men ought to avoid. She is taken as the inferior, monstrous other that kills. The embodiment of White Snake in a woman is always the worst nightmare for any Chinese man who dares to go to bed with a charming woman of strong sexual desire.

2. *The love that contaminates*

The appearance of Xu Qunshan changes this male and female thing outside and inside the construction workplace and Sun Likun's jail room in Geling Yan's *White Snake*. The young commissar's visit rekindles Sun Likun's desire for love. It has been a long time since Sun Likun had an inspector from higher up investigate her case. This young commissar, who appears in front of her window, looking inside while the construction workers tease her, has attracted her attention at the first sight. The first day he came to see her, he immediately made Sun conscious of her vile appearance and comportment. She knew that she must have presented the young man with "the sight of an unbearably ugly naked body" (Yan 1999: 20). Ashamed of her ugliness, the former dancer practices everyday in her small room late at night so as to look thin and young in front of him. She was accustomed to being coquettish with men, but this young Xu Qunshan shows no interest in her teasing manners. The indifference he expresses in his looks and his mysterious daily visits has obsessed her. "In her thirty-four years of life, this was the first time she felt that the most comforting part about being together with a man was not his body but his heart" (Yan 1999: 37). She fell in love with this Xu Qunshan. And what puzzles her even more was that "he had never been like other men she had experienced, no full-bodied, nose-penetrating desire" (ibid.: 40). She had never received any kind of spiritual love and respect, only lust. However, Sun Likun could never know that this nonchalance, this delicate scene of wooing should not be compared with that of ordinary courtship. She would not discover that Xu

Qunshan was a young woman until it was too late for her to retreat back to her deserted corner.

It happens when Xu has paid his last visit to her in the warehouse of the provincial Performing Arts Troupe. She was taken out for the first time after her detention. In the room of the guest house at the outskirts of the city, she offered herself to him: “She took off long outmoded cardigan blouse of India red, letting out the sculpted flesh of her dancer’s body” in front of this young man. It was too late. “The truth importuned her, confronted her, so close it could be touched” (*ibid.*: 47).

After all the expectations “[d]uring these thirty-odd days and thirty-odd nights”, the process of seduction has gone too far to be stopped. The desire is aroused, and the love is there to be proved and realized. Sun had to find out that Xu Qunshan was a young woman. However, GelingYan does not let her protagonist fully wake from her dream of desiring this young man’s love, but lets her half endure, half enjoy the caresses of a young woman’s fingers that rekindle her desire yet at the same time disillusion her. Sun Likun has never experienced this kind of love. She has even despised it. But at that moment she lets herself sink into the illusion and act as a partner of this plan:

Xu Qunshan’s cool fingertips ran over her entire body as if it were a thin shell of delicate porcelain. All the fidgeting and impatience in his fingertips were gone. Each elliptical, well-defined fingernail carefully swept over her silky skin, as if deathly afraid of snagging a thread.... Again and again, she blocked her intuition from trying to tell her a secret. (47–48)

Instead of letting out the secret, Sun Likun chooses to play her role to the end. But her reaction to this kind of love is typically heterosexual. She cannot appreciate it but had to go on pretending as if she had been in a play, otherwise, “[s]he would be left with nothing”:

Through the mist of her tears she could see a hint of wickedness and ferocity in that boyish elegant face. She had already offered herself up. She could not give in to nausea. Before the finale, before she could pass this last day in perfection, everything had suddenly been revealed in all its paradox and sorrow. (48–49)

If she determined to keep the secret, she could not but feel that she was cheated. The narrative plainly states: “the pining body of a thirty-four-year-old woman had been humiliated, toyed with, defiled by Xu Qunshan” (48). Humiliation is what Sun Likun felt for all this play – play she had to

continue acting, although she could only feel exhausted and emptied by participating in it: “[t]he conventional love between the sexes Sun Likun had once understood was now sapped of all meaning, had become emptiness itself” (54). At this stage, same-sex love to Sun Likun was merely a fraud that Xu Qunshan enacted upon her. Her traditional ideas about homosexual relations keeps Sun Likun looking at the whole event as a plot sketched to mock her. It was a laughter that condemned her to humiliation – humiliation at her own sexual desire, and at not being able to see through this vicious scheme. Here, through Sun Likun’s humiliation, the traditional regulations and admonitions about homosexual relations are emphasized. Female self-realization and realization of sexual desire, whether it is Xu Qunshan’s same-sex love and desire or Sun Likun’s heterosexual desire, are ridiculed and deprecated by way of Sun Likun’s repressed dissatisfaction and humiliation in the love relationship. Once again the burgeoning sense of a female’s sexual desire and the righteousness of her sexual potential are to be repressed and humiliated in a sinuous way through Sun Likun’s disappointment in her sexual expectations.

If the direct and coarse revelation of the construction workers’ lust and desire for her obese and disfigured body is shamelessly obscene, the concealed love and care Xu Qunshan expressed is abnormal but paradoxically touching. Through the bewilderment of Sun Likun, Geling Yan transcribes a veiled sense of sympathy with the growing sense of female sexual identity in Chinese society and towards the reawakening of the self-willed female desire that demands its own fulfillment in same-sex love.

If at first the revelation of this female desire and homosexual identity could not be understood and appreciated by Sun Likun, the later development of this female sexual identity and desire will be more or less recognized and welcomed by her, for she has the need to be loved and cannot afford to give up this adoration. Although it could never quench her lust, it could at least partly relieve the loneliness of her imprisonment in the mental hospital in Shanghai.

Nevertheless, conventional regulations on and aversion to homosexuality are not so easily relinquished. Therefore, after experiencing this same-sex relationship with Xu Qunshan, Sun Likun begins to show symptoms of mental illness. She could not bear this loss and the trick played by Xu Qunshan. She is moved to Joyous Song Mountain Hospital in Chongqing, and later, to Shanghai. During Sun’s stay at Shanghai, Xu Qunshan

reappears as Shan-shan, a young woman this time, and without any disguise. During this period, Sun begins to show signs of accepting Shan-shan and her homosexual identity: “When they’d walk around in the courtyard, they would always have their arms around each other’s waists or shoulders or else be walking hand in hand” (52). But it is interesting that everybody in the hospital begins to suspect that Shan-shan is a transvestite, who wears woman’s clothes simply to get close to Sun Likun. Only when they pull open Shan-shan’s clothes do they find out how wrong they were. “After that, everybody completely lost interest in the two of them.... What was so interesting about a couple of women?” (53) Although conventionally Chinese people chastise a woman who shows strong sexual desire and lust towards men, homosexual desire of a woman and the same sex relationship are not so much admonished. It did not even arouse public interest at the mental hospital. People’s attitudes here towards same-sex love and lesbian relationships prove that homosexuality between women is not so much an issue and, therefore, not so proscribed.

When marriage is sanctified in society because of the profitability it can bring to the future productive power, the male homosexual relationship has to be prohibited for its barrenness and the harmfulness it might bring to the patriarchal society. Still, the female homosexual relationship is not so stigmatized, as it is categorized as non-profitable. This is the situation described in the narrative of Yan’s *White Snake*. The close relationship between Sun Likun and Shan-shan can only be of interest if Shan-shan were a man, for this would once again prove that Sun is a snake-like woman, full of lust and lethal power to seduce men and ruin them. But once people at the mental hospital find out that Shan-shan is a woman, they lose interest in them and their relationship, for there is nothing directly harmful to society in it, nor is there anything alluring in the case itself. Thus, Sun and Shan-shan are for a certain time left in peace, which encourages Sun’s further understanding of Shan-shan and homosexual love and desire.

3. *The gift that ridicules*

Through misunderstanding, Sun Likun falls in love with Xu Qunshan. But in the mental hospital at Shanghai, she starts to love Shan-shan again, and again, not without a layer of misunderstanding. In fact, Sun can never become habituated into the same-sex love which Shan-shan practices so

naturally and sincerely. It is partly out of her need for love and care, and partly from the illusory love projected on the non-existent Xu Qunshan, that she half admits and enjoys the love Shan-shan pours upon her. If Shan-shan pursues her love with all her might and is true to her own feelings in all her labor, Sun Likun is a perfect artist, a wonderful dancer who really forgets herself while she dances on stage, playing a role that she would never fully become, yet in her delirium, ambiguously touches the true feelings and passions that permeate the space on the stage. The feelings and passions are real when she dances; however, when the music stops, not all those touching rhythms of passion can be completely forgotten.

Shan-shan knows that Sun Likun cannot be changed into a person of her kind. Sexual identity is seldom that malleable. That is the reason why when Sun Likun is exonerated in the end, and regains her glory with a new appellation, “Formerly Famous Dancer”, and Shan-shan disappears from Sun’s life. There is no room for Shan-shan to continue with Sun, since she will once again be adored by many fans and loved by many men. The result of their relationship could only end like this in a time when Sun could never be a lesbian, and when everything should follow the lead of the normal, rational guide of the supreme leaders, who always take into concern the best welfare of both the country and the people in the 1960s and 1970s. Geling Yan emphasizes the positive side of Shan-shan’s confirming her sexual identity and her will to pursue her love in courting Sun Likun. However, juxtaposing Shan-shan’s courage to reveal her homosexual identity with her later suppression of it with marriage, Yan paints at the end of the narrative a faint sense of sympathy towards Shan-shan’s journey of sexual self-discovery and even attaches a bit of revolutionary color to Shan-shan’s natural tendency to behave like a homosexual, to be like Xu Chunshan.

It is imaginable that Sun Likun would get married as soon as she finds the right man. What is surprising is that Shan-shan tries to get married before Sun does. This really annoys Sun Likun. She gets a little mad, as if she were once again being deceived by Shan-shan. What will Shan-shan do with her homosexual identity? Sun Likun might like to know this unconsciously. This intention is shown by the gift she gives to the newly wedded couple – an intricate jade carving that depicts the drama of *White Snake* and *Blue Snake*. In the Sichuan version of the opera *White Snake*, Blue Snake is in love with White Snake and asks for White Snake in marriage.

But White Snake makes Blue Snake a wager. If Blue Snake wins, she will be his consort; if White Snake wins, then Blue Snake will turn into a female and become White Snake's maidservant. It is quite obvious that in the Sichuan version of the opera, the relationship of the two female snakes and Blue Snake's sexual identity are full of ambiguity and signification. Sun Likun does not notice that she has unconsciously bought Shan-shan and her husband such a gift until Shan-shan sends her a look of suspicion and reproach. This is the ridicule that Geling Yan finally brings forth to end this queer relationship between Sun Likun and Shan-shan with nuance. She scorns Sun Likun's doubly treacherous deeds: to bracket and enjoy freely Shan-shan's homosexual love and care, on one hand, and on the other, to fancy herself uninitiated in homosexuality. Sun goes even a step further, in assuming that Shan-shan would ask her to keep this secret, believing that "Shan-shan herself understood that she had a fatal need for correction" (61).

With this reproach, Sun Likun questions Shan-shan implicitly about the value of homosexual love and refuses to give justification to homosexual identity. Sun Likun utilizes social and conventional regulations as a way out of the ambiguity Shan-shan's marriage incurs, and she even tries to persuade herself into thinking that Shan-shan needed "correction". This unvoiced criticism reveals a lot about Sun Likun's own mental state. Through Sun Likun, Geling Yan ridicules traditional mores. However, it is also through Sun Likun, through her unconscious buying of the marriage gift and her last glance at Shan-shan, that female trust and understanding in a homosexual relationship are confirmed. Shan-shan, standing near a bus stop on the deserted street, "hands in pockets, her shoulders hunched up like a street kid's," reassures Sun that she is not denying her sexual identity. The reader is given a dose of relief at the end of the story. Shan-shan could always be what she wants to be, for Sun Likun's last glance at her reveals the potentiality for both women. Shan-shan's sexual identity will never be completely suppressed, and Sun Likun will never forget completely her initiation in this queer journey to love. Looking appreciatively at the standing figure of Shan-shan, Sun climbs aboard the bus as if once again she were seeing Xu Qunshan's shadow in the girl. After everything, her heart cannot help crying out: "Xu Qunshan!"

The narrative of *White Snake*, with this lyrical ending, could thus be transcribed into a Greimassian square which models the "explosion"

/“transformation” process of a love that finally finds its way to expression, from the opposition of nature and social conventions, to the opposition of camouflaged sexual identity and bi-sexual identity. With this ending, Geling Yan frees Shan-shan and Sun Likun from the bondage of fixed sexual identity, and opens new possibilities for the future of the two. The narrative, from beginning to end, makes a fixed female sexual identity both possible and touching.

Literary meaning and the metonymic function in *A Song of the Sad Coffee Shop*

This paper deals with the metonymic function in literary texts. This function is taken as a strategy for construing textual meanings and philosophical implications in *A Song of the Sad Coffee Shop* (1996), a novel written by Taiwan's woman writer Shao-ling Chu (b. 1966). Given Roman Jakobson's understanding of the literary function of metonymy as the expression of the synchronic relationship, I would like to apply that understanding to Chu's novel and read the latter as a narrative strategy for creating literary meanings in the wanderings and travels of a divorced Taiwanese woman who eventually dies in Madagascar. This is a story about a divorced woman's quest for freedom, which in the end proves to be a quest for identity, a sense of belonging to a social group that one could call a home and homeland. This is a quest and a process of forming identity, where geographical root/route replaces and surpasses social and cultural roots/routes. The narrative deals with this woman's childhood memories of various places she called home, her problematic identification with her ex-husband's home, the Sad Coffee Shop where she finds temporary shelter for her troubled mind and the spiritual home she finally discovers for herself during her trip to Madagascar.

I suggest that the metonymic function adopted in this novel can be analyzed in different layers of literary meaning. I demonstrate its uses in Chu's novel, as a means of structuring the significance of "home" by the geographical juxtaposition of places and the co-relationships of mind and body, as the main character learns to practice and cultivate a sort of ascetic-philosophic space.

1. *The functions of metaphor and metonymy in narrative texts*

In his essay “Two Aspects of Language and Two Types of Aphasic Disturbances”, first published in 1956, Roman Jakobson picks up the syntagmatic and the paradigmatic as a distinctive pair of binary oppositions that constructs and covers the two realities of language (Jakobson 1990: 115). He advances the oppositional terms “metaphor” and “metonymy” as prototypical figures in studying two types of aphasic disturbances, and his definition of the two terms henceforth changed the way the two terms were used in literary circles. Emphasizing the characteristic element of contiguity in the function of metonymy, Jakobson separates this rhetorical trope from metaphor, another trope, whose major function in the sign relationship, according to Jakobson, is to index relationships of similarity. Any impairment of the metaphorical or the metonymic function would lead to aphasic disturbances, since “[s]peech implies a selection of certain linguistic entities and their combination into linguistic units of a higher degree of complexity.” (1990: 117)

Adopting Jakobson’s definitions of metaphor and metonymy, I would apply them to the study and analysis of the social disabilities of the fictional character, Mathi, in the novel *A Song of the Sad Coffee Shop*. I do so not at the very basic linguistic level of phonemes, lexemes, or sentence combination, but on the higher, more discursive level of the narrative, where contextual and cognitive dimensions start to matter. Mieke Bal, in trying to establish a method of studying the narrative text, suggests that we take it as composed of three layers: fabula, story and text (Bal 1997). Textual meaning, thus understood, is never constructed simply by the primary level of fabula nor the second level of story, but also at the textual level, which is constructed within the contextual and cognitive dimensions that take place both inside and outside the text. Through various interpretive tracks within the network of the text, a semantic system of plural quality can be established. The value and efficiency of these are crucial in interpreting a text, as Barthes has shown in his analysis of Balzac’s *Sarrasine* as a “writerly text” (Barthes 1990).

My main premise here, framed in accordance with Jakobson’s functionalism and narratological study, is that the cognitive concept which makes the referent object domain of a person’s linguistic performance possible

cannot be separated from the person's recognition of his social context, since the construction of one's cognitive understanding of the living world, a concept that one's life is related to in the real living condition of existence, cannot be isolated from inter-human relationships; neither can one's interaction with the environment be excluded. This interactive relationship with the environment and the linguistic "interpellation" (Althusser 1993) or hailing that arouses one's concept of the I-other relationship are both proofs that one cannot live entirely alone in a society. The cognitive understanding of one's being in the world is always tantamount to recognition of one's status in a social space where a group identity is established. This understanding of one's relation to his/her existence and community is at the root of one's cognitive understanding of one's environment and group identity. The narrative events in a text, therefore, form an accumulated semantic field of a contextual world. With this understanding, the narrative about Mathi's personal experiences in the city of Taipei forms the linguistic material of the text. The experiences pictured through Mathi's eyes in the narrative help construct a contextual world in the text. The realization that Mathi finally obtains in Madagascar provides a broader epistemological understanding which Mathi believes and recognizes as the guiding principle for both the living and the dead on earth.

When applied to the novel, the daily events that Mathi encounters in the real urban space definitely figure on the first level of Barthes's scheme. At this level, the narrative characterizes Mathi in her suffering as a lonely, wandering soul that loses its home; and so the textual narrative is formed. At the denotation/metalinguage level, Mathi's loneliness becomes a symptom of the general pathology endemic to an over-competitive society. Mathi's sufferings are thus the consequences of the disorder and disaffection that permeates a highly modernized and capitalistic world. On the level of symbolic connotation, the illness of Mathi and society, in Mathi's understanding, turn into a disease whose only cure is freedom. Yet, this is just part of the hypothesis. The premise needs to be re-examined and re-evaluated as Mathi, toward the end of her journey, gets to Madagascar.

Mathi, the fictional character in the novel, though desiring to be free from the bondage of the society she came from, has to admit to herself that no matter how far she tries to flee from and ignore this tie, she, like everyone on earth, can never sever herself from the geographical environment; neither can she resist the interactive relationship that this geographical

contiguity necessitates. Nevertheless, Mathi never becomes accustomed to social interaction (e.g., as a conversationalist).

Heidegger would have us believe that any text is a question posed by the speaker to the reader, and the reader's task is to answer it. Following this reasoning, the primary question raised by Mathi in the novel becomes more clear when the narrative analysis focuses on the core social and communication problems of Mathi and, in turn, allot them into the two opposite axes of linguistic behaviors – metaphor and metonymy.

As mentioned earlier, Jakobson argues that aphasia as a language disturbance should be studied first “with the question of what aspects of language are impaired in the various species of such a disorder,” and “[t]o study adequately any breakdown in communication we must first understand the nature and structure of the particular mode of communication that has ceased to function” (Jakobson 1990: 116). I would like to suggest that the main structuration of the novel is a process that goes from metaphoric elements to metonymic elements. The basic structure of the novel is separated into two different epistemological-cognitive frameworks. The first one delineates Mathi's life in Taiwan, where she floats aimlessly, carried along by the trends of the capitalistic world. In the second part of the novel, Mathi journeys to Madagascar seeking an epiphany of transcendent revelation, a sudden understanding of the logos on earth. In the first part of the novel, Mathi examines herself through the perspectives and judgments of others around her. What happens around her would finally become just one event among a pool of others. She sees the world through individualist spectacles, as if any event is but a single event acting as an index of the inhuman world that she inhabits. In the second part of the novel, Mathi learns to broaden her view and interpret events, thus bringing in the contiguous elements that help one to construe a contextualized worldview. The combination of contiguous spaces and places turns the whole structuration of the novel into a metonymic schema. And only when the focus and emphasis of Mathi's mental concepts shifts from the schema of single events to that of context can she rediscover the road to salvation. Where cultural routes and contextual spaces meet, the exclusive and mandatory power of self-righteousness and self-pity reveals its narrow-mindedness and pusillanimity.

The social space of communication that Mathi encounters can thus be viewed as constructed by the two linguistic axes of metaphor and meton-

ymy, which together make possible a higher-level cognitive construction of sociability and identity formation. I would take the social space of a communal group as a reference field of the language level. In this field the sign functions of the linguistic/behavioral axes of metaphor and metonymy take place. If disturbances in language formation are an index to the linguistic problems of aphasia, then the disturbances (external) to and disabilities (internal) of constructing metaphoric or metonymic substitution and combination in a social space may be seen as an indication of the problems of disintegration of character in society. Hence, the more one is impaired in selecting and combining data received from his/her environment, the more one is hindered from the identifying with the environmental social space. Following this understanding, we may study a character's propensity for mixing or remaining in a social group, namely, the ability to keep company with a group or community as an index of one's sociability, and further, as an index to the problem of this character's social and cultural identity formation. This is the case because social-cultural identity formation is always related to the Other – that is to say, to the person or the group that one stays close with. To examine a character's conversation and communication with others, then, would give us good reason to believe that language disturbances in communication or a character's disabilities to communicate shown in the conversation might also be viewed, if not as aphasia, as nevertheless a similar kind of disorder in sociability.

Feeling herself a loner and an outsider, Mathi's dissociative propensity shows that her problems might lie in the metonymic domain, where a member's interactive relationship in a society or community must function normally. With a strong protest against highly modernized urban life and a desire to seek out real spiritual freedom, Mathi begins her poetic wandering and self-questioning of the concept of home and identity. She thus travels to Taiwan and Madagascar, and ends her journey with a sudden understanding of the significance of life and existence. Before she begins her trip to Madagascar, Mathi was already trying to find freedom from enslaving concepts of success, represented by the listless, hard-working people around her. She desires and imagines a spiritual freedom that would help her abandon the shallow cultural and social identity of a highly capitalistic city. She despises this kind of spatial and economic identity: "In this city, if you want to live like a human being, you need to have a job,

money, and a dwelling place. To make it simple, you need to have an identity, and then, you become a human being, a Taipeiian.” (Chu 1996: 35)

That is what Mathi learns through experience. By refusing to associate with those around her, however, Mathi loses the chance to build an identity that everyone else considers necessary and proper. With further details provided by the novel, I would like to suggest that this is caused partially by her lack of security, which originates from her having no “home”. This kind of unsociability is a habit Mathi has gradually cultivated since she was a child. As a child she found neither shelter nor home to protect her. First, she has no home of her own. When she was three year old, Mathi’s mother left her husband and took Mathi with her. Mathi was always left alone in a dark rented room while her mother went out to work. When she was twelve, her mother died and her father brought her to a “home” where she had a new mother and two brothers. Later, she lived with her boyfriend, who left her for another girl, and later, with her husband, who left her to work in Bolivia, not long after their marriage, and finally asked for a divorce. Both her experiences of being abandoned more than once and the repeated failure in love and trust strongly affect Mathi’s cognitive understanding/imagination of a social space where selfish strangers struggle to eliminate each other in an alien environment.

Money is the only measurement of success, and Mathi knows this axiom of her society well. But Mathi has no money. She always changes jobs whenever she feels bored; however, with no goal in life and no particular relationship with any special group or persons, she is doomed to feel lonely and bored all the time. She has no “home” and no close relationship with anyone around; gradually, she loses any identity of her own. Eventually, she turns her sense of insecurity and her lack of trust into an outward discontent that finds the social space hardly bearable, due to its tenacious thirst for success, power and money. Taipei is too modernized and the people there so ambitious to make money that they only measure people and life in terms of success. For Mathi, Taipei is too small a place to enjoy freedom, and only those who turn themselves into money-making machines can compete with each other for more wealth and higher social status. Even high-school students are pressured by this blind capitalistic force to move forward, and those who want to fight back and resist it can only express their hatred by hitting violently the buttons of the arcade machines on the street until, their fingers are raw and bloody. The outside

social space (Taipei, Taiwan) is thus for Mathi a terrible, inhuman system that tears apart one's soul and body.

But she secretly believes that she can find her answer in Madagascar. Since she first learned of the Madagascar in her high school class, Mathi has dreamt of visiting that island. She fantasizes that Madagascar has the answer to all her questions. This island has a shape similar to that of Taiwan, and, just like its brother in the Pacific Ocean, Madagascar grows rice and enjoys its geographical distance from the continent of Africa. The homeless Mathi looks to Madagascar as if it were the cure-all that will save her from her troubled life. This cognitive fantasy makes Madagascar the counterpart, the mirror image, that holds to opposite values from Taiwan. If Taiwan is the place that stifles every possibility of true feeling and personal development, Madagascar is the place where freedom grows and where no traces of urbanization, modernization and capitalism can be found.

Through geographical contiguity, Mathi collects and construes her experience of a soul-less place in terms of "bondage" – bondage of soul, true feelings and freedom. With all the experiences she goes through, she maps out her understanding of Taiwan. The metonymic, geographical relations between all Mathi's experiences help form the concept of Taiwan as a place where no one can escape the inhuman space of money-making and modernization. The metaphorical, substitutable relations that these experiences demonstrate confirm for Mathi that Taiwan is the very embodiment of capitalism and modernization. Conversely, Madagascar, in Mathi's dream, provides release from this kind of confinement. It is there that freedom dwells. Finally Mathi sets out for Madagascar, strongly believing that Jesus – a mysterious hippie undergoing self-mortification in the barren landscape of Madagascar, a god-like figure for the aboriginal people there, because of his curing them of their diseases – becomes the object of her quest.

2. The Other as a mirror reflection that exceeds the bounds

In *A Song of the Sad Coffee Shop*, the narrative is divided into two parts. As mentioned above, the first part is set in Taiwan, and the second in Madagascar. By making Madagascar Taiwan's counterpart, Chu prompts her character Mathi to travel thousands of miles to find out the true meaning

of life. For Mathi, this is a quest for freedom, a trip to free her body and soul from mundane constrictions – including the need for identification. But Mathi’s experiences and trip to freedom do not end until she realizes that the living nourish the dead, and that the principle of interdependence forms the very foundation of life, that identification is based upon trusting each other on earth, and that one’s death can nourish and enrich the other’s life.

As two sign systems, Taiwan and Madagascar become each other’s counterparts for Mathi. This broader view of how life could be reveals to Mathi a different worldview, which triggers her wandering and restlessness on earth; it strengthens her confidence and makes bearable the idea of returning to where she belongs. Mathi’s quest for freedom finally turns out to be a quest for the meaning of life and for identity. The long journey that takes Mathi to Madagascar proves to be a quest for “home-coming”. Mathi finally finds her “home” in death. But before she returns to death, she sees clearly what a “home” really means. This new understanding lies in the world of co-existence and rewrites the concept of identity with the realization of what it is that binds us, and of the false images that the concept of identity might bring forth. She needs to prove to herself that tearing away the lies and revealing the bare truth underneath in reality does not always bring forward unbearable shame but may also call forth relief. She needs to live her whole life to prove that it is a thing worthy of laborious effort. The quest for one’s own identity, for understanding the meaning of home, and sometimes the sacrifice of one’s life – all these demonstrate the attainment of a true and clear understanding of life.

Searching for a place where one belongs and claiming one’s own identity are the two basic motifs of this novel, relating Taiwan to Madagascar, and the concept of freedom to the bondage of friendship and fraternity. Taiwan and Madagascar, freedom and fraternity, are two pairs of signs help give form to the semiosis of the elementary significance of living, and constitute the schema of identity formation in Chu’s novel. The syntagmatic and paradigmatic construction of these two pairs of signs function as the pivotal core of the concept of identity.

When will a woman begin to realize that she actually has no home on earth? Will she finally create one for herself? Will she be doomed to find none at all, just because she was bereft of the chance when she was a little girl? Chu’s *Song* raises these questions at the very beginning of the novel

through the female protagonist Mathi. She is a woman in her mid-thirties, who suffers living unhappily with her husband's parents. Mathi's husband left her for South America several years ago to avoid fulfilling his obligation as a husband. She keeps this a secret, even though her father- and mother-in-law know, or at least have ample suspicions, that her marriage is broken and that she has no right to keep living with them as a daughter-in-law. This is a married woman who can claim no home of her own. The story starts with Mathi's realization that her run-away husband's former home will never be a place she can call her own.

Mathi's impossible dream is to live a life of one's own and to have a home where warm and tender feelings overflow. She seeks a place into which one would like to project oneself with all one's heart. She is a lost soul, a vagabond, a woman of no real interest in life. Her husband avoided then deserted her, as does her husband's family and the world around her. She has nearly lost her sense of identity when the narrative begins, at the wedding feast of one of her college girlfriends, where the atmosphere is buoyant and lively social greetings and conversations.

Born in Taiwan, an island that borders the great Pacific Ocean and is separated via the Taiwan Straights from mainland China, Mathi finally makes her decision and begins her mental wanderings to Madagascar. At the surface level, Mathi worries much about her losses, a worry that manifests itself in unsociability and self-retreat precisely when the situation demands an interactive relationship. More than the loss of her husband, it is the loss of identity that has greatest impact on her pitiable situation in life. Before she travels to Madagascar, Mathi views everything that happens as single events which reveal to her time and again that she is unfit for society and that her life is meaningless. It is the society and the haunting presence of capitalism and modernization that best characterize Taipei. They are also the target of Mathi's blame and source of her discontent.

During this period, all the events are placed on the paradigmatic axis and function as metaphors. They appear one by one, yet, they all point to a meaningless life and spiritless, inhuman urban space. Hence their functions as metaphors of life are interchangeable. There is no interrelationship nor contextual meaning to them. However, the mixed image of the dying out of a whole village and the vibrant life-force shown by the green plants outside the village pulls her out of her shell and reveals a brand new significance. The power of death is horrible. Yet, when viewed from afar, it is

never the only force that exists on earth at any moment. Right next to this enormous, devastating power, the force of life is spreading its own message of resolution and tenacity. The juxtaposition of the two forces makes the ravaging of life, the annihilation of the whole village, so significant and its impact so devastating. Through the interrelation and contextualization of various concomitant events, through the contiguity that the various concomitant events build-up, humans and entities on earth stop existing solitarily and secluded from each other, and begin the transformation from a single, isolated event/entity to a part of a co-related, growing organism. The substitutable metaphor-events, when projected to the syntagmatic axis of contiguity, begin to form a combination, and the projection of these metaphors becomes the initial germ of metonymic significance.

Taiwan and Madagascar, in Mathi's fantasy, are like two brothers who reflect to each other the same, characteristic traits. In Mathi's fantasy, Taiwan becomes the metaphor that could be substituted for the terrible results of modernization – de-humanizing, mechanical routines, high pressure and sense of loss. Through metonymic combination, Mathi paints Taiwan as a capitalistic society that deprives all its members of the true meaning of life and existence. On the other hand, Madagascar becomes the trope for leisurely tribal life and freedom, and Jesus, a free soul on this land, the sign for this kind of spiritual freedom. In her understanding and fantasy, the metonymic, geographical contiguity with Madagascar, the land itself, embodies Jesus's transcendental power to act and think above the material level. It is also through this kind of geographical-metonymic link that Mathi joins with her social space, and thus transforms her own understanding of her society as a highly modernized and materialized lost world. The geographical-metonymic contiguity only provides Mathi with a reminder of the possible interaction between two subjects, whether they are beings or non-beings. This is only the preliminary step toward combining one with the other on the basis of individual living beings. The contextual, intersubjective relationship has not yet germinated; nor can ontological significance yet emerge.

She habitually observes the relationship between herself and her dog in this way, so as to think of the dog as company in the barren land. She even feels pity for it when she has to forbid it from following her. This is also true when she begs Jesus to ask a fisherman to spare the life of a big fish, and again later, when she implores Jesus to help save the lives of the

dying villagers. Jesus rejects both entreaties. She cherishes lives but overlooks the interrelationship which the geographical contiguity might at the same time help combine and motivate. Only when she looks down from high above the rocky mountain near the dead village, does she find out the sinewy power of interrelation and symbiosis that the geographical contiguity clearly represents. When the village dies out, it enriches the land, and turns into nourishment for the fast-growing green plants nearby. Life and death closely intertwine and embrace the other, and finally become each other's catalysts. It is this broader view and realization of the meaning of life and death that frees Mathi from the bondage and pressures of humanity. This is the first time that Mathi can really face her own identity problem and see it from another perspective. She no longer envies the Madagascar aborigines and Jesus, and she knows that she needs to go back home again to go through sufferings and pressures and learn to look at the whole situation from a higher and broader vision. Identity is never a tag stamped on one from the outside, but a determination that grows from inside. Therefore, what is personal and individual will never be erased as long as one builds up the interrelationship and admits that the contextual view is never a force that triggers the abuse and eliminating of the self. "Home", the basis of identification, is where the interrelational and contextual dimension is established. Identity formation points out the route one should take. The *route* is always in need of re-building and re-connecting; the *root* is always in need of re-founding and re-cognition. Because of this understanding, Mathi can give up her life trying to rescue Jesus from the bullet of a tribal militiaman. Mathi's death gives life to Jesus. She does not die in vain. She finally learns her lesson and gives a noble performance. From Taiwan to Madagascar, the story of Mathi proves to the reader that the quest for freedom is not really so different from the quest for identity. It is the loss of home, the root, that threatens the formation of identity. Home is where one establishes interrelationships, but the way back to it proves that "home" to be imaginary. Though she would never be able to go back home again, what Mathi learns – that the loss of the villagers' lives lead to nourishment of the green plants outside the village – serves her as a precious lesson about life and death and the issue of identification.

Through the application of geographical similarities of Taiwan and Madagascar, Chu deftly juxtaposes the two as counterparts and plays on the concept of home and identity through Mathi's quest for freedom. Chu

creates a powerful narrative through combining and contrasting geographical identities, and prepares a complex turning point, which justifies all the events that go contrary to Mathi's expectation and which emphasizes the opposing characteristics of another possible route. The author succeeds in combining Mathi's misconception and realization in a layered domain of the ontological. The development of the function of geographical contiguity further strengthens the linkage of the various routes by which to reach home.

Attention, rhetoric, and values

Immanuel Kant *versus* Anglo-American philosophy

Komm! Hebe dich zu höheren Sphären;
Wenn er dich ahnet, folgt er nach.
– Goethe, *Faust*

1. Introduction

In Finland we have the law, Finnish law, which, as either a positive or negative regulation, directs citizens how to behave as law-respecting people. In this paper I search for a Law that, as a metaphysical entity, is superior to Finnish law, criminal law, and all other “horizontal” regulations. I argue that moral law is the unwritten regulator of state law – a code that guides the human being in his everyday life.

My claim here is that the deontic moral theory of Immanuel Kant continues to have serious implications even for the present day. One might begin a defense of Kant with, say, something from the Middle Ages. In medieval logic there was a rule of modal consistency: *Ab esse ad posse valet, ab posse ad esse non valet consequentia* – to argue from actuality (or reality) to possibility is permissible, but not from possibility to reality. One may also draw a conclusion from possibility to obligation, but not from obligation to reality. At some point in Scholastic philosophy the inverse relation between those sentences became disqualified. Nevertheless, it has always been problematic to reach a conclusion by arguing from description to normativity. In Kant’s moral philosophy is a sentence that one reads in history class: *Du kannst, denn du sollst*. This sentence was translated into the Finnish as, *You can, because you must*. But probably more accurate is: *You can, for you must*. This conclusion – from possibility to obligation – also “passes” the rule of Medieval logic, while emphasizing the thought

that, if someone is charged with a duty, he also receives the mental abilities to fulfill it.

In what follows I offer some arguments in response to Kant's ethics, while also looking briefly at his conception of philosophy. How did Kant connect his theoretical philosophy to his practical philosophy? Were some basic elements not sharply defended in his theoretical philosophy?

Of pertinence here are two Finnish philosophical articles by Katri Kaalikoski and Marjaana Kopperi about Anglo-American moral philosophy. Kopperi's "From Metaphysics to Rhetoric, or Justice in the Postmodern Way" (1996) summarizes the new American moral philosophy, primarily John Rawls' theory of justice and its newest turns concerning the relationship between community morality and that of the individual. Katri Kaalikoski's article, "Iris Murdoch: Moral Realist", sketches British ethics of the early 1990s as theorized by Murdoch. If Kopperi's article makes a clean break with the argument of deontic ethics, Kaalikoski's essay in turn describes a possible essential quality that links morals as a theory with some claims of psychology.

Next, I describe arguments advanced by two opponents of Kant's philosophy, Friedrich Schiller and Moritz Schlick, then close with a look at German poet Botho Strauss's ideas about publicity and Nicolai Hartmann's "ethics of values".

2. *Kant's path from theoretical to practical philosophy*

2.1. Central points of the theoretical philosophy

Kant poses the main question of critical philosophy in the *Critique of Pure Reason*. How are synthetic sentences *a priori* generally possible? Take, for instance, the analytical proposition "The sun is yellow"; on both sides of "is" there is a tautology. By contrast, a synthetic proposition, along the lines of Kant might read as follows: " $7 + 5 = 12$ ", but could also be read as " $6 + 6 = 12$ ".

How can our concept of reality be equipped *a priori* with faculties of analysis?

With Kant it is not necessary to justify Newton's physics with empirical explanation. Rather, an answer must be found to the question, "How are experiential data generally possible?" Kant's main effort went to dem-

onstrating the conditions of possible experience that are identical to the possibility of the target of experience. This means an object exists only if it can be experienced. Kant's revolutionary move was to transfer interest from empirical study, and toward investigation of the realizing subject, i.e., toward human reason. This last must be structured in such a way that it can receive data before experiencing anything external. In Kant, such an external *datum* consists of "given variety" from the outside and of two factors inside the human being: (1) sense elements – that is to say, a conception of time and matter; and (2) the categories of pure reason – these last being the capacity to define *a priori* any impulses coming from the outside. Among these categories are, for example, those of quality, relations of causality, and modality. To investigate the transcendental is for Kant an investigation directed at these conditions prior to the possibility of their being experienced.

Kant seeks a categorical imperative – moral law – as a counterbalance to the laws of (Newtonian) physics. How does the human being differ from the empirical world? As a thinking creature, the human being must be subject to its own law, one above that of reality: "Act so that the maxim of your will is regulated to the principle of the general law". The essential content here is that of universalizing one's own law. Earlier Kant had expressed the law of virtue as follows: "Act so that the maxim of your will should become the general law of nature". Or another, earlier version: "Act so that you use yourself as a purpose and never only as a tool". How does Kant justify his "law of virtue"?

First, his theory of knowledge, in the *Critique of Pure Reason*, is in itself an investigation of the phenomenal world. In this first critique he is a sheer materialist. But in the second critique he creates a noumenal world, a world we know nothing about.

So Kant – in his own words – in hiding (*aufheben*) knowledge, leaves place for belief, in other words, for ideas of God, immortality of the soul, and free will. In dealing with the freedom of the will he uses "the concept of causal relation which contains freedom", in other words, that is not determined by a natural law. Any creature who has free will is a *causa noumenon*, a theoretically empty concept. He cannot, however, even begin his *Critique of Practical Reason* before explaining the foundation of his moral philosophy. The concept of freedom is with Kant the *ratio essendi* of the law of virtue, and the latter is the *ratio cognoscendi* of freedom. Free will

appears because there is a moral law, and moral law because there is free will. Moral law in Kant is “the only fact” of practical reason; but we must notice that its foundation is a *circulus vitiosus*. So Kant builds his practical philosophy “as if” there were a free will.

In moral law it is only necessary to universalize one’s own actions. In Kant, there is an important difference from the old regulation, “what you don’t want done to yourself, do not do to others – a maxim we meet in different written sources (e.g., Tobias 4: 16: “*Quod tibi non vis fieri...*”). But the difference is based on the speculation in this sentence that someone “could be free not to do good works to others”, Kant writes. I shall return later to this term, “good”.

One of the most important matters in deontic ethics is “the aspect of intellectual poverty”. To moral decision-making some educational knowledge, or “worldly wisdom”, must be added. Moreover, one must continuously observe one’s actions, so that regrets are never necessary, in the form of “I could have acted otherwise”.

3. *Attention, reason, emotion and reality*

Katri Kaalikoski (1996), in a lively and engrossing article, has discussed the moral philosophy of the English philosopher Iris Murdoch. With Murdoch, moral development begins when a human being is directed outwards, away from the self, and so practices a genuine *attention*. It is intuitively clear that, when one begins to attend to the surrounding world after “reducing the self”, then development in a certain direction begins. But why should that development lead in a “good” direction? Why does Murdoch suppose as self-evident that such attention would contain virtuous and elevated moral values? Murdoch’s concept of *attention* has its equivalent in natural science. For example, in physics – as in all behavioural sciences – a researcher follows and observes his scientific object, the phenomenon. This observation has the function of verifying the reality of some objective facts.

The experience of beauty is, for Murdoch, one way to “reduce the self”.)To this I should add the experience of harmony in general.) But how does one go about this? Can I direct my attention towards that which is “good”? Human consciousness is perhaps the consciousness of morality; but the

fact is that there are many other consciousnesses. Is observation, already and in itself, a kind of value-giving?

Is not the semantics of the word “value-giving” already a kind of moral valuation? Kaalikoski claims that “the use of a word is its meaning” that language develops through attention, and that development is expressly *moral* development. The key sentence in Kaalikoski’s article is: “The seeing of reality is a cognitive condition”. Moral concepts are seen as deeply moral forms. “Behind them there are no facts that could be defined as wrong”; as opposed, say, to a scientific intuition. Here, then, is the ontological ground of Murdoch’s morality, something axiomatic that cannot be contradicted. If someone thinks in such and such way, then it is so. But what kind of human being has the ability to rise from the entropy of life, to such an extent that the other party is something or someone other than the self?

For Murdoch, the seeing of reality is thus a cognitive condition that leads to moral choice. It is a continuous wakefulness. But reality cannot always be seen as it is: as a totally other being, and as events that exists regardless of whether we do.

4. *The will*

Iris Murdoch writes: “Both in science and in morals, the attention and the will to development are needed.” Murdoch emphasizes that the human being need not be divided into two parts – that of impersonal, rational thinker and that of personal will. What kind of will is it? Kant’s will – between reason and drives – is a good will. Schopenhauer’s will is like someone who sits on the shoulders of a blind and deaf man. It is a will of reason and drives, leading to Freud’s will as “das Ich” between “das Es” und “das Über-Ich”. Here we have again the old problem of monism *versus* dualism, the solution to which was sought in the dialectic.

5. *Kantian critique*

Kant divided the mind into two parts – the rational and the irrational – by justifying the categorical imperative. Rational man obeys the laws of Newtonian physics. When he encounters a moral problem, he obeys moral law. Thus the human being jumps from the arena of physical obedience to that of moral free will.

A contemporary of Kant, the poet and philosopher Friedrich Schiller, disapproved of Kant's rigorous moral law, arguing that the quality of consciousness could be developed by increasing knowledge and exerting aesthetic understanding. In his main philosophical work, *Über die ästhetische Erziehung des Menschen in einer Reihe von Briefen*, Schiller distinguishes between the "voice of reason" and "natural drives", positing "den Spieltrieb" as a mediatory ground.

From the modern perspective, Kant's theory of morals appears to be founded on aristocratic ethics. In 1930 the Austrian Moritz Schlick, in the spirit of the logical-empiricism, put forth an ethics that answered aggressively to Kant's moral demands. In Schlick's meta-ethics, happiness is the main goal, and the psychological truth is that the human being is motivated to all action mostly in order to attain the greatest feeling of pleasure, the best preconditions to happiness. Among the various drives, Schlick points to the "emotion of motivation" and elsewhere to an "emotion of success"; the result of right cooperation of these drives is a feeling of delight and pleasure – the best guarantors of happiness. To be able or ready to feel happiness, there is need for wholeness, without internal conflicts. Schlick's hedonism culminates in the thought that altruistic social "drives" may guarantee the most durable feeling of pleasure. A human being is by nature disposed to pleasing his fellowmen and hence derives the greatest pleasure from doing so. Among secondary duties are work and hobbies, or science and art, which produce their own delights. When the emotions are in balance, then no moral fight is needed. Schlick's ethics thus conceives the human being as somehow beyond good and evil.

6. Rhetoric as moral justification

Marjaana Kopperi's article (1996), "From Metaphysics to Rhetorics, or Justice in the Postmodern Way", also deals with modern Anglo-American philosophy, primarily the moral theories of John Rawls and Thomas Bridges. Kopperi describes how, instead of goal-directed thinking, as in ancient teleology, or instead of thinking about the good life, as occurred from the later Middle Ages on, the ground of ethics is no longer the concept of the good but the concept of the right.

Kopperi also argues that, even during the Enlightenment, ethical norms were conceded, just re-situated in the human being. Human quali-

ties, abilities, and needs defined ethical convictions. Kopperi summarizes meritorious “postmodern” theories and theorists, who have called into question “modern” ethics in terms of both its metaphysical and deontic character. John Rawls’ *Theory of Justice* (1971), claims Kopperi, is the starting point of these thinkers. For these last, as for communists, there are no universal moral norms, since they are metaphysical and hence cannot serve as objective facts. Kopperi summarizes these researchers’ arguments about the contextual character of morals. The value that fits one environment may not fit that of another group or individual. Such theories allow for anything, if it can be shown to serve a necessary advantage in its proper context.

On the other hand Kopperi describes Rawls’ later thought as the kind of ethical “consensus thinking” typical of Anglo-American trends. Rawls divides morals into two categories: those of the political arena, and those pertaining to the “rest” of life. Hence people obey two different moral systems, as political members of society and as private persons (e.g., as members of ethical or religious organisations). According to Rawls, the same moral positions can be reached by different philosophical justifications. The metaphysical thinking that leads to such positions reached doesn’t matter; what matters is that those positions be accepted by the community. Rhetoric and consensus replace metaphysics.

If the acceptance of the community is the sufficient ground, I would ask, Who first accepts the moral dictum that later will be accepted by the others? Who constructs our opinions for us, such that we accept them by consensus? How can new moral contents and new convictions be born?

For Rawls, the rhetorical justification of morals is enough, if it can effect a consensus.

Thomas Bridges criticizes Rawls for his substitution of truth with post-modernist rhetoric. In Bridges’ view, political morals are more than just a means to secure “peaceful coexistence”. For him, political morals must have “independent value”, secured by deontic-teleological reality.

6.1. A critique of the consensus

Bridges moves in two areas: the human being as a citizen and as a member of a community. At both levels, life is communal. Most attractively, this community is ethnically capacious, unbiased toward gender, and open to

any religion not harmful to its members, who in turn derives his or her sense of context from this group. Without such communities – ethnic, gendered, and religious – the life of the individual would have neither direction nor meaning. *Desire* is the central conception of Bridges.

But this philosophy can be asked difficult questions: When is the desire of a human being leading to right, and when to wrong? If Bridges operates only with the conceptions of “citizen” and “small community”, then how can he claim “to describe the modes of thought that [all of] western civilization traditionally has accepted”? To generalize this dilemma, let us turn to Heidegger, with his conception of “das Man”. Heidegger writes in *Being and Time*:

Being-with is such that the disclosedness of the Dasein-with of Others belongs to it; this means that because Dasein’s being is Being-with, its understanding of Being already implies understanding of others. ... The Other would be a duplicate of the Self. ... If self is not, its Being has been taken away by the Others. ... In this inconspicuousness and indeterminacy, the real dictatorship of the “they” is unfolded. ... Being-with-one-another concerns itself as such with averageness.

The German author Botho Strauss has expressed his opinions in the essay *The Swelled Goat Song*. In ancient Greek drama, the goat song was a tragic one about “the public intelligentsia”, “the cultural majority”, and “the supervisor of the conscience”, which, in shaping public opinion, runs to the nearest microphone or talk-show panel, and tries to establish, with all kinds of nationalist arguments, why the moral sentences he pronounces are the right ones.

In Strauss’s dark, oracular text, the intellectual lodestars never change. He has a bone to pick with the term “liberation”, observing that the “subversive kitsch of pleasure” never can be done away with because of the endless continuity of technical reproduction. The receiver of Strauss’s text is “a walker of his of own road”, a searcher, a rare creature who turns away from following the mainstream.

It takes courage to follow this road of *difference*. Moreover, much non-understanding, or misunderstanding, is necessary to maintain a general system of understanding. Strauss goes on: “The world is suffering from the tyranny of passing transience, and no instance on earth can revolt against it”. This transience will be made available, like so many editions; but unlike

the latter, there will be nothing to cut out, because everything has to be in touch with everything in order for this kind of “permanent” transience to exist.

According to Strauss, in the press everyone who has an opinion understands *a priori* another who has an opinion. No explanations are needed; in public opinion, only conclusions matter. This means that a work of art only needs an interpretation; it means nothing special.

7. Nicolai Hartmann's materialistic ethics of value

Hartmann's materialistic moralizing is directed against Kant's ethics of “Tun-Sollen”. According to Hartmann, behind every goal there are real values. Hartmann asks, How is the relationship between the will and value to be understood? A value is “das Seinsollende”, and a moral request speaks to the will.

Kant undoubtedly gives the most comprehensive answer to the basic question about how the occurrence of evil can be harmonized with the concept of an all-knowing, all mighty Providence. Goethe expressed an opinion against Kant: the human being is monistically disposed. The fundamental difference between Kant and his contemporary Goethe may be the work of the Russian philosopher Lew Shestow (1866–1938), entitled *Athens and Jerusalem*. Ancient monism, *aletheia*, was intended to develop a good, harmonic life; as opposed to religion, which consisted in the finding of the self after the Fall. Here we have a contest between two conflicting forces, good and evil. Jerusalem belongs to Kant, despite his wearing the greatcoat of a philosopher. Kant's God is the same as that of Thomas Aquinas, isn't he?

Nicolai Hartmann thinks about the fundamental questions of Kant's morals. Which comes first: a value or the categorical imperative? What is the contradiction between a value and the will?¹ Hartmann explains it this way:

Value is that which formulates the commandment, the “moral law”, the thing that ought to be. The will is that for which the commandment has validity. The good will is therefore “determined” by the law; it conforms itself to the law. It therefore receives the commandment from beyond itself; the commandment is not its own. For in regard to the law the will is indeed free to act contrary to it. So, at first glance, Kant seems to present

the matter. But this is not his real meaning. Such a receiving of the law from beyond, a taking over of its authority, would be “heteronomy”. Kant draws the opposite conclusion: the moral law must be a law peculiar to the will itself, the expression of its true, innermost tendency. The “practical reason” must be autonomous; it must give its law to itself. The metaphysical essence of the will is precisely this legislation. But here the relation of the ought to volition is reversed. The ought, as the objective reality, shows itself to be something that is subordinate.

Hartmann thus brings up Kant’s paradox: if there are two wills – on the one hand, the empirical will with different drives and hypothetical imperatives, and on the other hand, a pure and only “good” free will, which acts in accordance with the categorical imperative – then which of these wills is exactly free? The empirical will has the freedom to choose between good and evil. The categorical imperative, the pure good will, cannot choose evil.

Hartmann was one of the last great system-builders. His *Grundzüge einer Metaphysik der Erkenntnis* came out 1921 and his *Ethics* in 1926 (in English, 1932). Hartmann, though not a “Kantianer”, nevertheless swam upstream. His philosophy moreover aligns with Kant’s saying: “Wenn Könige bauen, haben die Kärner zu tun” – When kings are building, the cartdriver has a job.

8. *The highest good*

Both morals and philosophy, like all sciences, ought to discuss and develop something new. But as we can see, old streams of thought return under new labels. In all speaking there is rhetoric: in politics, in lectures, in scholarship, in relationships between people, and so on. But rhetoric as an acceptable ground of moral argumentation is doubtful, which is why philosophy has always looked for an individual ground of morals – morals that place the judgement of a human being first.

The interests of the whole critical philosophy of Kant culminate in three questions: “What can I do?”, the theoretical philosophy, “What shall I do?”, the practical philosophy, and “What may I hope?” This last question presupposes a final goal: “Act in a way that you become worthy of happiness”. The “highest good” unites virtue and happiness, and free will brings out the highest good. The goal to become worthy of happiness obtains in

a relationship with the observance of moral law. Those readers who agree perhaps will find it suitable for me to close with a quotation from Kant's *Critique of Practical Reason*: "Two things fill the mind with ever new and increasing admiration and awe, the oftener and more steadily they are reflected on: the starry heavens above me and the moral law within me."

Note

1. It is to be noticed that in the Middle Ages, reasoning about morals, which I spoke about at the beginning, did not consider the will (*wollen*) at all, a circumstance that is perhaps explained by the naturalistic fallacy.

Anna-Riitta Tunturi

On the historical background of Martin Heidegger's metaphysics

Jürgen Habermas (1983) has described Martin Heidegger as a killer of philosophy and spirit, whose metaphysical achievements are epochal in character. On the one hand, Heidegger propounded a metaphysics that located the place of logical empiricism and neo-positivism in philosophy; on the other hand, he sowed the ideological ground of World War II, as it led to Nazism.

I begin by explaining the irrationality of German philosophy since the *Sturm und Drang* as one thread alongside that of the classical influence. Between 1780–90 a so-called “pantheistic debate” took place, born out of correspondence between J. G. Herder, J. W. von Goethe and F. Jacobi. The issue centered on the possibility of justifying reason and experiencing God. Jacobi denied Spinoza and pantheism in seeking an extra-worldly God, with free-will, non-determinism and Utopia. Jacobi hopes to solicit Lessing's help against Spinoza, but he is in fact Spinozist with a new conception of God as *Ἐν καὶ Πάν*, “the one includes the all”. Also Kant's theoretical philosophy has some irrational features, and it is Kant who ends the Enlightenment.

I adduce also the Russian philosopher Lew Shestov's division of knowledge and belief into “Athens and Jerusalem”. I further touch on Schopenhauer, Freud, Nietzsche and Johann Jacob Bachofen before narrowing in on Heidegger's inaugural address, *Was ist Metaphysik* (1929) and a later article, *Ueberwindung der Metaphysik* (1939–40). In spite of the title of this later article – “Overcoming Metaphysics” – for Heidegger it is only thinking and poetry that will protect the philosophy of the future.

Heidegger's critique culminates in an argument against Nietzsche's “will to power”. Responding to one of his critics, the logical-empiricist

Rudolf Carnap (who in 1931 attacked Heidegger's inaugural address with an article *Ueberwindung der Metaphysik durch logische Analyse der Sprache*), Heidegger argues that only technology will remain if metaphysics is overthrown. And if technology is joined with the will to power, then only the "uni-form" remains, the principle of work-performance, or the will-to-will. Technology is the organizing of lack. The human being is made into a work animal, and the will-to-being is *nichts*. Before *Sein* can arise in its primal force, this moment of the will must be undone.

1. *The pantheistic debate*

During whole decade of the 1780s a so-called pantheism debate raged in Germany, which hinged on the possibility of stating reasons for the experience of God. Johann Georg Hamann (1730–1788), a mystic thinker of the Enlightenment, inspired the *Sturm und Drang* movement and, in opposition to Kant held to the creative power of the mind and the senses, which he saw especially in language, in "the mother tongue of the human race".

The pantheistic debate unfolds in correspondence between Herder, Goethe and Jacobi, who in 1785 publishes a book entitled *Die Lehre des Spinoza im Briefe an Herrn Moses Mendelssohn*. Years later he begins to criticize Kant, then Fichte, Schelling and Hegel, and then all of German idealism. Jacobi sees in philosophy only two possible ways. The first is rationalistic, whose path goes from pantheism to Spinozism, from God and Nature being identical, such that God can be eliminated; the consequence is atheism. From this materialism follows naturalism, then fatalism and determinism, which is causal law in nature. The second way is Theism, which proposes a supra-mundane God that also takes up residence in mankind. It is to this extra-worldly conception of God that human freedom being belongs, with it indeterminism and Utopia. The third possibility would be a God who is not out-of-the-world, and this is what German idealism is searching for.

During the so-called age of Goethe, a "world piety" shows itself in Germany, which lasts until Ludwig Feuerbach (1804–1872), up to the years 1836–40. For this reason, Germany lagged somewhat behind the thought of the time. In France this kind of piety lasted until the middle of the eighteenth century and in England till the turn of the eighteenth and nineteenth centuries.

1.1. En kai pan

In 1780 Jacobi tries to solicit G. E. Lessing (1729–1781) as a comrade-in-arms against Spinoza, and they discuss Goethe's poem *Prometheus*, in which there appears the atheistic and humanistic tendency of *en kai pan*, "the one includes the all". But Lessing is a Spinozan. Lessing believes, on the authority of Leibniz, in a transcendental God, which is a new understanding of the deity. *En kai pan*, as such, is an indicator of atheism. Hamann's reaction is to propose a symbolic, meta-idea: God manifests in the world, in opposition to the extramundane God that exceeds time and space. The Greeks had God and heaven, and the Christian religion adopted this idea of such a space.

Herder, too, had Leibniz as his starting point, and came out against of Jacobi's idea of an extramundane God, which was an unnecessary *salto mortale*, as the concept was. God is in the world, thus also in space, and beyond the world there is no space. Herder corresponds with Jacobi and neither of them understand Hamann. Herder saw the difficulty of the idea that God is not "in" the world, but surpasses it.

The initiators of this German idealism were Hölderlin, Schelling and Hegel in Tuebingen, and their motto was *en kai pan*. For them, joy and love are the wings of great acts. Hegel's (1770–1831) conception of God, after he parted from Kant's philosophy, goes in this order: identity of the identity as at first. This puts philosophy, not identity, in the absolutely highest place, with religion second and art third. Then creation is the abstract identity of the created and of the Almighty.

Creation requires an extramundane God, whose identity is wholeness and oneness. Jacobi goes along with this, adding that whatever is rational is necessary. So Jacobi's two-part system has moved to oneness. Jacobi levels his argument against Kant, since the latter's notion of freedom and necessity are not in congruence, because he only supposes there is a *factum* – freedom. And the ground of this fact is irrational. Kant's *salto mortale* is grounded by Spinoza, for whom freedom is necessarily a jump into the irrational. With his real idealism of this practical philosophy, Kant ends the Enlightenment.

1.2. The rational belief of Kant

In 1786 Kant enters the pantheistic debate with his article *Was heisst sich im Denken zu orientieren?* In it he departs only from epistemological starting points, and hence is given the epithet *Alles Zermalmer*, “the breaker of everything”, by Moses Mendelssohn. In this paper Kant divides the faculty of reason into three parts: (1) *Einsicht*, “opinion”, in place of Mendelssohn’s absolute rationalism. Metaphysics here has its own world, which it rules as the “Queen of science”. (2) *Eingebung*, “impulse”, Jacobi’s philosophy, where the concept is important only as an intuition, and the third is the belief, however so, that it is against this reason of this impulse. The categories of Kant’s pure reason are constitutive, but reason is also the ability to create ideas. (3) The last level of rational belief is the categorical imperative, which opens the way to metaphysics. But because this “*factum* of the reason” can not be justified, rational belief is, thus, something irrational, comparable to Jacobi’s *salto mortale*. In German, belief (*Glaube*) is stronger; the philosopher Georg Jánoska translated it as *Ergebnis-Zwang*, the compulsion to submit.

2. *On the relationship between knowledge and belief*

If Jewish-Christian philosophy presents a macrocosm, we can approach it “microcosmically” by way of Russian philosopher Lew Shestov’s perception of two sources of knowledge: Athens and Jerusalem. Athens, Plato and Aristotle mean experience and reason. Jerusalem stands for the New Testament (Christian) and Old Testament (Jewish). There is a strong tendency to connect Athens with Jerusalem, which can happen only by going against the Testaments. Speculative reason must interpret Jerusalem such that there are no conflicts. Hence Aristotle is applied to Christianity, the best example of which is Thomas Aquinas, who built his Christian theology on Aristotelian grounds. The connection of Athens with Jerusalem implies the primacy of the former, since reason must have primary status. Reason lights the way to theology, and Athens is the torchbearer.

During the Enlightenment there was an emancipation of reason, with belief and religion subordinated to it, and Hegel’s philosophy as the culmination. In Hegel, philosophy is on a higher level than religion and God

– an arrangement that led directly to the thought of Ludwig Feuerbach and Karl Marx.

After this, there are no more great systems. The abandonment of attempts to connect philosophy and religion also marks the end of the great systems of philosophy. During Goethe's lifetime, both nominalism and irrationalism made great gains. At the same time, in England there was skepticism, with David Hume's dualistic separation of theory and practice; in France there was revolutionary atheism. Characteristic of Goethe's time, "becoming" (*werden*) took the main position, as a new conception of the philosophy of history. Here God becomes (*Gott wird*). This was a holistic experience, and the human being was not allowed to divide, as did Kant and English empiricism. We must also remember the great influence of Shakespeare at that time, championed by Shaftesbury (1671–1713), which was another turn to aesthetic understanding of the wholeness of nature.

Johann Herder wrote in his *Journal meiner Reise im Jahre 1769* that instead of culture he

sought to lead the natural life, with the world understood as a historical entity. Herder's Faustian sentiments range from resignation to joy. His diary illustrates the dramatic genius of youth and the break-through of Rousseauism. He met Goethe in Strasbourg in 1770, and that was the beginning of *Sturm und Drang*. In this period, Herder was the giver and Goethe the receiver. The *Sturm und Drang* was a movement of young men. Kant, who was already old, never understood it.

3. Arthur Schopenhauer

Schopenhauer was yet another thinker behind Heidegger. The concept of "pity" in his thinking was influenced by Rousseau. In the preface to the first edition of *Die Welt als Wille und Vorstellung* Schopenhauer mentions his sources as being Kant, Plato and the Vedas. Schopenhauer continues his thought directly from Kant and thus denies the whole of German idealism. He remembers having read that in Kant's flat there was only one work of art: a portrait of Rousseau. The latter's "volonté générale" – the will to community – not only influenced Schopenhauer but also Kant's notion of the categorical imperative in the latter's practical philosophy.

Schopenhauer was born in 1788 in Danzig to a patrician family. In 1809 he began studies in Göttingen, got to know G. Schulze, and criticized the

Ding-an-sich. In 1813 Schopenhauer publishes his thesis *Ueber die vierfache Wurzel des Satzes vom zureichenden Grunde*, then goes on to gain reputation as a philosopher. He criticizes Kant's philosophy on two important points.

The first is transcendental idealism, such that only phenomena are to be recognized, and science extends only to possible experiences. Causality is the ground of phenomena in the world of *Ding an sich*. Second, he criticizes the separation of material and form in epistemological theory. Material is given, and the forms are already in the receiver: "reason orders itself to natural law". But Schopenhauer asks, "Who gives the material?" It was a logical mistake to hold causality as a category of reason that can only be used in the sphere of possible experience. If causality is chief, then the material must also have its cause.

As did Goethe and Hegel, Schopenhauer also comes out against the *Ding-an-sich*. In the appendix of the *Die Welt als Wille und Vorstellung* is a critique of Kant's thought. There Schopenhauer explains that, in Kant's philosophy, there is first a fancy, then an object of the fancy, and then the *Ding-an-sich*. He claims that the object of a fancy must also be a fancy. The *Ding an sich* has been presented only to prove the existence of ideas, and these have no influence on theoretical philosophy.

4. Sigmund Freud

Sigmund Freud, a major force at the beginning of the twentieth century in the German world and a competitor of Schopenhauer, always claimed that he did not get to know the latter's philosophy until very late in life, and then only in piecemeal fashion. One must question this claim, because Freud's teachers at Vienna knew Schopenhauer very well. (For example, Ernst Mach was admiring Schopenhauer as early as the 1880s.) Freud said later there was no question of priority, but we must remember that, if you deny a fact, you are admitting it in the best way. For his conception of *das Es* Freud borrowed Grodeck's work of that title (*Das Es*, 1923).

5. Johann Jacob Bachofen

Also a source of Heidegger's thinking was the ethnologist, archaeologist and philosopher of religion, Johann Jacob Bachofen, who belonged to what

Thomas Mann in the novel *Doktor Faustus* called a “district in Munich”. For example, Friedrich Engels, in his initial paper on Communism, points to Bachofen. As a patriot Bachofen searched out the Ancients. One of his main works is *Mutterrecht*, the “mother-law”, and another is *Tanakil*, which treats of Orientalism in Italy. Bachofen befriended Nietzsche, but had no influence on the latter's production. The two were united by their mutual scorn for neo-liberalism.

Bachofen interprets all of Nietzsche's “Dionysian” as a feminine character. The Greek mentality is feminine. But for Nietzsche it was masculine because of the rejection of the mother. Bachofen criticizes this overemphasis on the masculine in Nietzsche's thinking.

Though barely noted in the history of philosophy, Bachofen stands out in the philosophy of history, in the part that treats of gender. He researched myths and symbols, and was thus one of last of the Romantics. These symbols have a genuine emotional resonance, which cannot be framed in terms of “ideas” or “concepts”.

According to Aristotle (986a), manliness obtains in boundaries, form, spirit, peace, being, unity, light, the right and the good. Femininity is unlimited, formless, material, being in movement, coming, variety, chaos, darkness, left, unconsciousness, the wrong and the bad.

The Romantics and Bachofen stood against this polarity of Aristotle. Bachofen divides Plato's allegory of the cave (State) as stretching from the earth to the moon, and from there to the light, the sun. The earth is the cave: femininity, life and death; the moon is hermaphroditic: a femininity that radiates the sun's reflection to the earth; the sun instances manliness. The earth is a mix of chthonic tellurism, sensualism, *gynaikokratie*, promiscuity and initial communism (along the line of Engels). The sun is spirituality, paternity, the role and rights of the father, private ownership. Bachofen's thought aligns with Hegel's concerning the progressive nature of the spirit of the man.

6. Heidegger's inaugural address of 1929

Thus far we have surveyed aspects of German philosophy which are in the background of Heidegger's philosophy. Schopenhauer, Freud, and Bachofen established the spiritual space in which Heidegger's inaugural address settles.

Heidegger begins his address carefully. A year earlier he had published his main work, *Sein und Zeit*, which deals with language. In the present lecture he must demonstrate that he had not gone too far in playing with linguistic terms. Heidegger argues that Science, in every science, is the first and last authority. I quote the leading principle of the whole inaugural address:

Es geht um das Seiende und sonst nichts.

One ought not to speak about this Other (*nichts*) but about this *Seiende*. So:

Erforscht werden soll nur das Seiende und sonst – nichts; das Seiende allein und weiter – nichts; das Seiende einzig und darueber hinaus – nichts.

Heidegger here defends his point in a footnote referencing Hippolyte Taine, a natural scientist from the end of the nineteenth century, who used the word “nothing”.

Then Heidegger, using quotation marks, downplays “logic”, in which the basic rules issue from the law of non-contradiction. He asks, Is reason not the Master of itself, supralogical, capable of thinking about that Nothing? And concludes: *Das Nichts ist die vollständige Verneinung der Allheit des Seienden.*

So: Erforscht werden soll das Seiende und sonst nichts; das Seiende allein und weiter – nichts; das Seiende allein und darueber hinaus – nichts. Wie steht es um das Nichts? Das Nicht selbst vernichtet.

What Heidegger holds as nothing is *Angst*, which embodies both fear and anxiety. The inaugural address has been made to flourishing scientists. If for some reason or other they become anxious or depressed, this frustrates their working, the seeking for the new, *es vernichtet*.

7. Overcoming metaphysics and returning to it

Heidegger’s work *Ueberwindung der Metaphysik* (1936) contains a critique of positivism, which is viewed as only “technique”. Another line of the critique leads to Nietzsche’s “will to power” (*Wille zur Macht*) and from there to the Nazis. When metaphysics is overcome, there remains

only technique, which when joined with the will to power leaves only the principle of performance, the will to will.

The metaphysical human being is turned into an animal-worker. Against the will-being of the will there is nothing but nothing, das *Nichts*. Before das *Sein* in its primordial force can express itself, this moment of the will must be demolished. Metaphysics belongs to the character of the human being. Heidegger, as an ontologist, is a supporter of transcendental philosophy, which is our basic epistemology. In one sentence he declares the empiricist-positivist epistemology to be a logic of misunderstanding. Nietzsche's will-to-power would transform life into pure psychology. Heidegger goes on to criticize Nietzsche's thinking as "artistry" (Wagner), which merely inflames the feelings. Heidegger invites us to think of being as matter. Objects are *there*, where the human being becomes a subject,

Philosophy after metaphysics has become pure anthropology, Juergen Habermas says. In the willing of the will there is first technique, which has become the highest form of rationality. Heidegger distinguishes between the "right" and the "true". The right of the will to will is not true; the right masters true being and pushes truth to the edge. Kant's conception of practical reason about the being of the will as a pure will, is the will of the being, and that is why its contents are formal. Its only content is the categorial imperative.

With Heidegger the will of time (1939–40) radiates in only one direction. Heidegger condemns *Fuehrerschaft* and the *Übermensch*. The rest of his text is a return to poetry. Shepherds live in the wilderness of a destroyed country and think about what is and is not important for life. The imperceptible law of the earth rises and falls in its measured circle. A birch never exceeds its own possibilities. The will, expressed in technology, tires out the earth. Illumination comes to the human being, who by seeing it follows the way of building and poetry.

Constitución y cambio de significado en los fenómenos sociales

La inmigración africana en Canarias

Como figura en el resumen, mi participación en esta Mesa Redonda se desarrollará en dos vertientes. Por una parte, analizaré un fenómeno social concreto: la inmigración africana en Canarias. Pretendo con este análisis hacerme con una idea clara de qué debo entender por significado de un fenómeno social, cómo se establece y cómo cambia. Y por otra parte, reflexionaré sobre algunos conceptos básicos que usaré para representarme científicamente el fenómeno social en cuestión.

1. Aspectos metodológicos

Sobre cualquier cosa como sobre cualquier concepto se pueden decir muchas cosas. No se trata de decir todo lo que se sabe de las cosas y de los conceptos, sino lo que viene al caso y es necesario al caso. Y lo que viene y es necesario al caso lo llamaremos pertinencia.

Toda investigación o análisis teórico siempre se encuentra en un determinado estadio de desarrollo. De manera que habrá fundamentos previos no explícitos en el análisis y habrá aspectos todavía sin desarrollar. Supongamos que tenemos un grupo de albañiles que tiene como tarea hacer los cimientos, levantar las columnas y construir los techos y las paredes de un edificio. A este grupo no se le podrá pedir cuenta de cómo han sido elaboradas las materias primas que ha empleado en cubrir sus objetivos, el cemento, el hormigón y los bloques, como tampoco se le podrá pedir cuenta de aquello que corresponde a otro estadio de desarrollo más avanzado: montar las ventanas o hacer la instalación eléctrica.

Así que dos aspectos deben ser considerados bajo el punto de vista del método en la evaluación de los trabajos teóricos: la pertinencia de los aspectos destacados y el estadio de desarrollo en el que se encuentran las ideas.

2. Sobre el significado

El significado lo entenderé como Saussure, esto es, como concepto. Por concepto entiendo, entre otros contenidos, la visión de conjunto de las cosas. Cualquier cosa, por ejemplo, un edificio, tiene muchos lados. Y es misión del concepto reflejar esta multiplicidad de lados de las cosas. Del mismo modo entenderé el significado de un fenómeno social: compuesto de múltiples contenidos significativos.

Trato de este modo de evitar un error muy corriente. Supongamos que tenemos una fotografía del frontis de un edificio y otra fotografía de uno de los laterales del mismo edificio. Nadie dirá que son dos edificios o que los fotógrafos ven edificios distintos. Esto sería pensar de forma muy ligera. Diríamos sencillamente que cada fotógrafo captó un lado distinto del mismo edificio. Igual ocurre con los fenómenos sociales: no es que para cada agente social el fenómeno social en cuestión tenga un significado distinto, sino que capta un contenido significativo distinto. De ahí que el significado del fenómeno social lo entendamos como el conjunto de los contenidos significativos expresados por la totalidad de los agentes sociales.

3. Sobre la percepción

Mientras que la sensación constituye un reflejo de indicios aislados del mundo, la percepción constituye un reflejo de objetos o situaciones objetivas. El mundo no está sólo compuesto de manchas de colores, sonidos y olores, sino de objetos o totalidades objetivas. Y es misión de la percepción el reflejo de los objetos o de las totalidades.

La percepción supone además la participación mancomunada de todos los sentidos y la síntesis de sensaciones sueltas en sistemas de conjunto. De las naranjas, por ejemplo, conocemos su apariencia cromática, la textura de su piel, su olor y su sabor. De manera que cuando sólo la vemos, se produce

una síntesis de todas las sensaciones sueltas que tenemos de la naranja en un sistema de conjunto.

Vemos que hay proximidad esencial entre percepción y concepto, ambos se refieren a la totalidad y a la visión de conjunto. ¿Qué diferencias hay entonces entre percepción y concepto? Las siguientes: Por medio de la percepción identificamos a un objeto y lo incluimos en determinada categoría, mientras que por medio del concepto elaboramos dicha categoría.

Sabemos además que hay una relación de mediación entre percepción y concepto. La percepción de un objeto está mediada por el concepto del que dispongamos de dicho objeto, y el concepto de un objeto se elabora con las percepciones y representaciones que tengamos de dicho objeto.

4. *Bañistas solidarios*

El 31 de julio de 2006 en *La Vanguardia* se podía leerse la siguiente noticia: “Por encima de leyes y papeles, la inmigración es un terrible drama humano que hoy en día se ha convertido en una aventura a vida o muerte”. Los bañistas que se encontraban disfrutando ayer de un día de playa en La Tejita, en el municipio tinerfeño de Granadilla, parecieron plenamente consciente de ello y no se quedaron indiferentes ante la situación cuando vieron llegar un cayuco repleto de inmigrantes a la orilla. La mayor parte de los presentes corrió a socorrer a los recién llegados, dado el estado del desfallecimiento que presentaban muchos de ellos, entre los que se encontraban menores y al menos una mujer. Los bañistas les ayudaron a salir del agua y les socorrieron sobre la arena, ayudándoles a beber y extendiendo y manteniendo las toallas de playa sobre ellos para procurarles sombra.

Algunos de los presentes llegaron a introducir sus vehículos todoterreno en la playa para ayudar a trasladar a los inmigrantes que se encontraban en peor estado. Tras la primera ayuda de los bañistas, efectivos de la Cruz Roja, Policía Nacional y Guardia Civil acudieron a la playa de la Tejita para hacerse cargo de los inmigrantes. Según testigos presenciales, una vez que la Cruz Roja se hizo cargo de la situación, las personas presentes en la playa estallaron en un aplauso y se felicitaron entre sí por la acción realizada.

5. Percepción práctica y percepción contemplativa

Compararé la percepción de los bañistas solidarios con la percepción de un miembro de la clase media, de ideología conservadora, que contempla el mismo hecho sentado en el salón de su casa viendo la televisión. La percepción que tienen los bañistas del cayuco aproximándose a la orilla los mueve a la acción, mientras que la percepción que tiene el miembro de clase media de las imágenes televisivas de los mismos emigrantes no lo mueve a la acción. Estas dos percepciones no se distinguen por sí mismas, por ser modalidades subjetivas distintas de percibir, sino por la modalidad distinta de existencia del objeto percibido. En el primer caso los inmigrantes existen en carne y huesos, mientras que en el segundo caso sólo existen como color. Y esta distinta forma de existencia del objeto percibido es la que hace que en el primer caso la percepción mueva a la acción y en el segundo caso no.

6. Multilateridad y unilateralidad del conocimiento sensible

Los bañistas no sólo ven a los inmigrantes africanos, sino además los huelen, oyen sus voces y tocan sus manos y sus frentes. En este ámbito la percepción se presenta de acuerdo con uno de sus rasgos esenciales: la participación mancomunada de todos los órganos de los sentidos. Observemos ahora la clase de percepción que experimenta el miembro de la clase media que sentado en el salón de su casa contempla la escena por televisión: sólo puede participar su órgano de la vista; sólo percibe a los inmigrantes como color, ni los oye, ni los huele, ni los toca. Así que dependiendo del modo de existencia del objeto percibido, así será la modalidad de la percepción: como participación mancomunada de todos los sentidos o como participación de un solo sentido.

7. La percepción colectiva y la percepción privada

La percepción de los bañistas es una percepción compartida, social, colectiva. La percepción despierta en ellos sus sentimientos humanitarios y corren sin pensarlo a ayudar a los inmigrantes. Los mueve los sentimientos, no la razón. Sólo piensan en sacarlos del agua, en darles de beber y comer,

y en darles sombra. Se sienten conmovidos y afectados por el drama de estas personas. Y cuando ellos ya no están, cuando la Cruz Roja y la Policía Nacional ya se los han llevado, rompen en un aplauso. Se sienten unidos y por una buena causa.

Pensemos ahora en la percepción del miembro de la clase media. Esa noticia de la que le informan, que unos inmigrantes llegaron a la playa de la Tejita, es un momento pasajero, detrás de esa noticia vienen más. Y su acto es un acto de privacidad. No se siente unido a nadie ni vive la unidad con nadie. Esta división de la percepción en colectiva y privada es una determinación social.

8. Percepción e impresión

Al bañista la experiencia que ha tenido le ha impactado, le ha dejado una honda huella, y cuando ha llegado a su casa se lo ha contado a sus familiares, y ha llamado a sus amigos y también se los ha contado. Ha cenado y ha seguido hablando de los inmigrantes africanos. Ha exclamado con hondo sentimiento: ¡Es una injusticia que esa gente muera de hambre mientras nosotros tiramos comida a la basura! ¡Habría que hacer algo! Y por la noche, mientras dormía, no cesó de invadirle la experiencia: las imágenes de aquellos pobres negros desfallecidos. Mientras que al miembro de la clase media la noticia no le impactó, apenas le preocupó, y la información que dieron después sobre el fútbol borró o cubrió la pequeña y leve huella que le dejó aquel drama. Esta distinción entre percepción con impresión y percepción ausente de impresión es una distinción psicológica.

9. El significante

Pensemos en el significante /mesa/ y pensemos en todas las mesas existentes en la actualidad y en las que han existido durante los últimos cien años. Comparemos ambos seres: el significante /mesa/ y las mencionadas mesas. El significante /mesa/ es uno y el mismo, mientras que las mesas son muchas y variadas. Esta es la contradicción que quiero presentar: la existente entre el significante, que es uno y el mismo, y el objeto significado, que son muchos y distintos.

Quiero trasladar la misma reflexión al ámbito del fenómeno social que investigo: la inmigración africana en Canarias. Debo preguntarme si hay

una imagen que pueda cumplir el papel de ser una y la misma y así convertirse en el significante de dicho fenómeno social. Debe ser una imagen que se repite mucho, que es regular, casi habitual. Y existe esa imagen: es la de un cayuco llegando a las costas canarias repletos de inmigrantes africanos. Le formulé a mi hija y a mi pareja cuál sería para ellas la imagen más representativa de la inmigración africana. Y ambas respondieron lo mismo: los negros con cara de asustados en las pateras o cayucos. Esa imagen, la del cayuco lleno de inmigrantes africanos, se ha convertido en el significante icónico de la inmigración. Cumple la condición esencial del significante: ser uno y el mismo frente a la multiplicidad y variedad de los objetos significados.

10. Los contenidos significativos en los agentes prácticos y contemplativos

Hemos hablado de dos clases de agentes sociales: aquel que vive directamente la experiencia de la llegada de los inmigrantes y aquel que la percibe en el televisor. En función de esta diferencia de vivencias, en el primer agente social se produce aceptación y acogimiento, mientras que en el segundo se produce rechazo y demanda de expulsión. Y en base a esta diferencia de sentimientos, los contenidos significativos también son distintos: para el primer agente el inmigrante africano significa pobreza y necesidad, mientras que para el segundo significa inseguridad y preocupación.

11. Los contenidos significativos mediados por la concepción

La inmigración africana constituye uno de los problemas económicos y políticos más importantes que enfrenta la sociedad española. De hecho la inmigración figura como el segundo problema más importante para los españoles. La inmigración africana supone no sólo la llegada de las pateras a las costas canarias, sino la búsqueda de un puesto de trabajo y de una vivienda, y su asistencia sanitaria y su asistencia escolar en el caso de que tengan hijos.

La izquierda y la derecha tienen una concepción distinta de la inmigración africana. La persona de izquierda concibe que la pobreza de África es un resultado histórico del colonialismo europeo occidental y, en con-

secuencia, piensa que Occidente está obligado a reparar el daño causado. De ahí que defienda que los países ricos deban hacer inversiones en los países pobres y condonar la deuda. Por el contrario, la persona de derecha concibe que la pobreza de los pueblos africanos es culpa de sus propios gobernantes y que Europa occidental no tiene ninguna deuda histórica con ese continente.

Esta distinta concepción provoca que la persona de izquierda mire con buenos ojos a los inmigrantes africanos y la persona de derecha con malos ojos. También los contenidos significativos destacados son distintos: la persona de izquierda ve en el inmigrante africano la consecuencia de la política colonial e imperialista de Occidente, y la persona de derecha ve a unos pobres desgraciados que no saben gestionar los recursos que han tenido y tienen.

12. Los cambios de significados

Los cambios de significados en el fenómeno social de la inmigración que estamos analizando se pueden producir por tres causas: una, porque cambie la relación entre el pueblo inmigrante y el pueblo receptor, dos, por experiencias ocasionales en los agentes del pueblo receptor con miembros de los pueblos inmigrantes, y tres, por cambios en los conceptos en los agentes del pueblo receptor.

Primera causa de cambio. El pueblo receptor tiene una determinada capacidad de acogida. Si el número de inmigrantes que llega a las costas canarias supera el número razonable y hace imposible una vida estable, el pueblo receptor cambiará su percepción. A partir de ese momento los inmigrantes empezaran a significar algo distinto a lo que significaban: de ser signo de pobreza a ser signo de inestabilidad y preocupación.

Segunda causa de cambio. Puede suceder que uno de los bañistas de la playa de la Tejita tuviera un mal concepto de los inmigrantes africanos. Pero al verlos de cerca, al verse impelido a ayudarlos, al percibir su sufrimiento y desgracia, su percepción cambia. De manera que ahora los inmigrantes africanos pasan a ser signo de desgracia y necesidad de auxilio. También puede suceder que una persona que ha simpatizado de siempre con los inmigrantes africanos tenga con alguno de ellos un episodio violento. A partir de ese momento su percepción cambia y los inmigrantes africanos empiezan a ser signo de inseguridad.

Tercera causa de cambio. Supongamos que una persona tiene una concepción de derecha sobre los inmigrantes. Supongamos ahora que esta persona lee un libro sobre la inmigración y la relación entre los pueblos ricos y los pueblos pobres de un autor marxista. Queda impactado y sorprendido de cómo los países ricos explotan a los países pobres y cómo esto sólo genera infelicidad y un mundo no humano. A partir de entonces, y por causa de un cambio de concepción, empieza a percibir a los inmigrantes africanos de otro modo. Ahora los inmigrantes africanos se han convertido en signos de pobreza y de explotación.

13. *Los nombres*

Coincido con Magariños que poner nombre a las cosas debió ser el primer acto semiótico. Así al menos ocurre cuando enseñamos a los niños a hablar. Le señalamos con el dedo el objeto y le decimos: “mesa”. El niño vincula la percepción de determinados objetos con los nombres. Tal vez el nombre va sustituyendo progresivamente al dedo. Al principio el niño señala el objeto con el dedo sin capacidad de nombrarlo. Después lo señala y lo nombra. Hasta que por último sólo lo nombra. Con este último paso diremos que el niño ha liberado al nombre de la percepción. Este es el nombre aprendido en su modalidad ostensiva.

Hablemos ahora del nombre como objeto del concepto. Aquí ya no decimos como se llama el objeto que tenemos delante de los ojos sino qué es dicho objeto. Por ejemplo, ¿qué es una mesa? Nos vamos al diccionario y leemos: mueble compuesto por un tablero horizontal sostenido por uno o varios pies y que sirve para comer, estudiar, etcétera. Este es el nombre aprendido en su modalidad de objeto del concepto.

Pero analicemos el papel de los nombres en el ámbito de los fenómenos sociales. Patera y cayuco son los nombres de las dos clases de embarcaciones que utilizan los inmigrantes africanos para arribar a las costas canarias. Si preguntáramos a los canarios cuáles serían para ellos la palabra más hegemónica e identificativa, tal vez la más regular, de los inmigrantes africanos, la mayoría dirían cayuco y patera. Hay varias razones que lo explican, pero con una de ellas no basta en principio. Cuando por la radio o la televisión nos informa de estos eventos, los periodistas dicen: en el día de ayer dos cayucos con inmigrantes subsaharianos llegaron a la playa de Arguineguín

en la isla de Gran Canaria. O esto otro: dos pateras con inmigrantes subsaharianos fueron interceptadas cerca de la isla de Lanzarote.

Tanto la palabra “patera” como la palabra “cayuco” podemos entenderlas al principio como nombres en su modalidad ostensiva y en su modalidad de objeto del concepto, pero también puede ser entendida en su papel específico en el fenómeno concreto de la inmigración africana en Canarias. Podemos entenderla como puertas que nos abren un universo léxico, una red de relaciones semiológicas, un conjunto de imágenes de la inmigración africana.

14. Ver y representar

En el capítulo II del libro I de *El Ingenioso Hidalgo Don Quijote de la Mancha*, puede leerse lo siguiente:

Estaban acaso a la puerta dos mujeres mozas, destas que llaman del partido, las cuales iban a Sevilla con unos arrieros que en la venta aquella noche acertaron a hacer jornada, y como a nuestro aventurero todo cuanto pensaba, veía o imaginaba le parecía ser hecho y pasar al modo de lo que había leído, luego que vio la venta se la representó que era un castillo con sus cuatro torres y chapiteles de luciente plata, sin faltarle su puente levadiza y honda cava, con todos aquellos adherentes que semejantes castillos se pintan.

Dos ideas claves me interesan en este texto: una, que a Don Quijote todo lo que veía le parecía ser hecho y pasar la modo de lo que había leído, y dos, que viendo una venta se la representó que era un castillo. Cómo quiero analizar estas ideas desde la perspectiva de la Semiótica de los bordes, recordemos lo planteado por Magariños. En la página 4 de su ponencia puede leerse lo siguiente:

Pero ahora, lo que propongo a los lectores es que me acompañen en la exploración de la interpretación, en cuanto trabajo necesario para la producción de la transformación. Una interpretación transformadora habrá de consistir en la producción de otro significado derivado del anterior, que ya no será el mismo, y, por tanto, en otra posibilidad de percepción del anterior fenómeno social, que ya no será el mismo.

Y en la página 5 puede leerse esto otro: “La segunda situación es aquella en la cual alguien imagina algo. La capacidad de imaginar depende de la posibilidad de actualizar recuerdos de efectivas percepciones sensoria-

les precedentes. Se mezclan, se transforman para construir un imaginario posible, pero en definitiva su materia prima (mnemónica) preexiste”.

En el caso de Don Quijote podemos decir que en su persona se da, por una parte, el imperio de la representación sobre la percepción, y por otra parte, que esa representación está alimentada fundamentalmente de libros fantásticos de caballería en vez de por percepciones del mundo real y existente. De manera que sobre una percepción actual se edifica la representación de un objeto inexistente: sobre la percepción de la venta se edifica la representación de un castillo. Estos cambios son sólo de naturaleza fenoménica, sólo ocurren en la subjetividad de Don Quijote, no en la realidad exterior. Esta distinción entre mundo real y mundo imaginado o representado lo expresa Cervantes cuando en la página 83, después que Don Quijote llamara doncellas a las mozas, dice lo siguiente: “Mirábanle las mozas, y andaban con los ojos buscándole el rostro, que la mala visera le encubría; mas como se oyeron llamar doncellas, cosa tan fuera de su profesión, no pudieron tener la risa”. Se reían de Don Quijote justamente porque el mundo que él se representaba no existía como exterioridad, y para sostener y mantener ese mundo inexistente era fundamental las operaciones nominativas: llamando doncella a una mujer de partido (prostituta).

15. Nombre y representación

Sobre este respecto haré dos pequeñas reflexiones. La primera reflexión atañe al quehacer de los escritores: hay un sector de ellos que se esmera en una descripción pormenorizada de lo que relatan, y hay otros que no lo hacen. En el primer caso el lector tiene una representación dirigida y detallada del lugar donde ocurren los hechos, mientras que en el segundo caso el lector debe representarse por sí mismo el lugar donde ocurren los hechos. No sabríamos decir en principio en cuáles de los dos casos la representación es más rica: depende del conocimiento del lector. Tal vez cuando estamos pendientes de las acciones de los protagonistas, la representación al detalle del lugar donde ocurren los hechos es muy secundaria. De hecho si le pedimos a alguien que nos cuente una película que haya visto, en general se centrará en las acciones de los protagonistas y no en la descripción del lugar donde ocurren los hechos. Hago esta pequeña reflexión por qué no sé en principio cómo podría afectar al cambio en el significado de los fenómenos sociales la correlación existente entre nombre y representa-

ción. Debemos preguntarnos cuánto dejamos atrás cuando describimos un fenómeno social y que correlación existe entre los agentes sociales de dicho fenómeno social y el lugar o espacio donde ocurren los hechos. Tal vez, como ocurre en el caso de la inmigración africana en Canarias, el elemento físico geográfico, la determinación espacial, sea esencial en la descripción del fenómeno.

La segunda reflexión tiene que ver con el problema de cómo llamar a Don Quijote: ¿Alonso Quijano o Don Quijote de la Mancha? Podríamos decir en principio que el nombre de Alonso Quijano es el nombre real del personaje de la historia contada por Cervantes y se corresponde con la percepción, mientras que el nombre de Don Quijote es el nombre inventado por Alonso Quijano y se corresponde con la representación que él se hace de sí mismo. Se trata sencillamente de observar que hay esa dualidad en la nominación: hay un nombre para la percepción y otro para la representación. Hemos supuesto que en la subjetividad de Alonso Quijano se daba el imperio de la representación sobre la percepción, de ahí su afán por cambiarle el nombre a todo el mundo, mientras que para quienes lo conocían y sabían de su locura se imponía la percepción sobre la representación y veían en Alonso Quijano sólo a Alonso Quijano y sólo bajo ese nombre lo reconocían. También en este caso la reflexión sobre el significado de los fenómenos sociales me lleva a pensar sí en la representación que de los mismos tienen ciertos agentes sociales se hace necesario un cambio de nominación o no. O tal vez debo pensar que sólo cuando esto ocurre, cuando hayan cambio de nominación, es cuando realmente se ha producido un cambio de significación en el fenómeno social en cuestión. No dispongo de más tiempo para ahondar más detalladamente en estas dos últimas cuestiones. Así que doy por acabada mi intervención. Muchas gracias por la atención prestada.

Carlos Emiliano Vidales Gonzáles

La semiótica como matriz de estructuración de las teorías de la comunicación

1. Particularidades de la relación entre semiótica y el estudio de la comunicación

La semiótica tiene sus propias particularidades, es un espacio en el que convergen, al igual que en muchos otros, más de una sola línea explicativa, más de un modelo y, por supuesto, más de un objeto de estudio. Las dos grandes matrices conceptuales, la lingüística-psicológica y la lógico-filosófica, implican rupturas y diálogos, no todo sigue una misma ruta y no todo se reduce a los signos y los significados. Además, como cualquier ciencia o disciplina científica, la semiótica se mueve, dialoga con otras ciencias e incorpora elementos nuevos, así que elegir un autor o autores implica alejarse de algunos otros. Sin embargo, el problema se genera a partir de la relación de la semiótica con otras ciencias o espacios reflexivos, siendo el que nos interesa, el del estudio de la comunicación, pues en esta relación el movimiento y particularidades del pensamiento semiótico desaparecen y se construyen a su alrededor una serie de premisas, de lugares comunes sobre la semiótica cuyo fundamento epistemológico no es claro y, en algunas ocasiones, es inexistente. El punto central es que la semiótica llegó a producir sus propios modelos sobre la producción de sentido, pero al plantear como uno de sus ejes centrales a la comunicación, estaba implícitamente construyendo un puente con otras ciencias que de alguna manera trabajaban con el objeto comunicación, como la biología, la física, las matemáticas, la psicología y, por supuesto, con el estudio de la comunicación.

El vínculo es entonces la reflexión sobre el objeto comunicación de la que devienen modelos explicativos, tanto de la semiótica como del campo de estudio de la comunicación. Pero lo que sucede con el campo de estudio

de la comunicación es que no sólo ignora las particularidades de la semiótica, sino que cuando importa modelos lo que hace es incorporar conceptos aislados de sus contextos teóricos de enunciación, lo que ha tenido como consecuencia principal, investigaciones donde se mezclan autores, teorías y conceptos que la semiótica mantiene, por criterios epistemológicos, separados. Hablar de semiótica es hablar de signos y significados, un primer lugar común. El problema se hace mucho más complejo cuando el estudio de la comunicación ve a la semiótica como un método capaz de identificar la producción y circulación de significados en los mensajes (casi siempre mediáticos). Por lo tanto, cualquier interpretación, de la naturaleza que sea, encuentra en la semiótica una justificación epistemológica posible para sus propias interpretaciones. Así, lo que se tiene en el estudio de la comunicación son muchas veces términos y no conceptos, un conjunto de autores y no un principio teórico, lugares comunes y no una fundamentación epistemológica.

Cuando John Peters (1999) hace su recorrido deconstructivo sobre la noción de “comunicación”, lo que deja en evidencia es que históricamente tanto el objeto (comunicación) como su estudio (metalenguaje) han variado a lo largo del tiempo. Este primer recorrido arroja pistas y alguna claridad sobre la dimensión de la historia de la comunicación como concepto y objeto, aunque no tanto sobre la dimensión de su estudio. Ahora bien, esta parte del problema corresponde al estudio de la comunicación, es decir, es sólo uno de los dos componentes que construyen el problema. El otro componente emerge propiamente de la reflexión semiótica. Lo que ha sucedido en este espacio es que la comunicación ha sido un elemento de organización y de estructuración dentro de la teoría semiótica, visible principalmente en los trabajos de Thomas Sebeok, Umberto Eco y en los de Iuri Lotman, los representantes de tres genealogías históricas en los estudios semióticos. El punto es simple, mientras desde la semiótica se conceptualiza a la comunicación y se la convierte en un elemento capaz de organizar el mundo biológico y social, lo que sucede con la semiótica dentro del campo de estudio de la comunicación es algo diferente, es un principio metodológico.

Las primeras reflexiones que hemos desarrollado (Vidales 2004, 2005, 2006, 2007) estuvieron centradas en dos ejes fundamentalmente: en la forma en que la semiótica entiende y “usa” a la comunicación y en la forma en que la comunicación entiende y “usa” a la semiótica. Con base en lo

anterior, una primera aproximación al elemento comunicacional dentro del campo semiótico permitió establecer tres características específicas: a) la semiótica supone trabajar con materialidades centrales para el campo de la comunicación: los signos y los procesos de significación; b) la semiótica, en algunos casos, ha estudiado los procesos semióticos como procesos comunicativos e inclusive a propuesto sus propios modelos de comunicación y; c) la comunicación en el campo de la semiótica es un elemento de estructuración, de organización, es un concepto constructor.

La segunda posición, la indagación sobre la naturaleza de la semiótica en el campo de estudio de la comunicación es mucho más precisa y limitada. La comunicación ha usado a la semiótica únicamente como método de análisis a través de la importación de algunos conceptos y elementos metodológicos por medio de los cuales elabora algunos de sus análisis. En este sentido, no podemos hablar de un pensamiento semiótico de la comunicación, sino únicamente de la utilización de algunos conceptos devenidos del campo semiótico. La comunicación, por tanto, no se piensa semióticamente. Podemos plantear varias cuestiones en torno a la configuración de la comunicación, sin embargo, lo más importante parece ser su configuración posterior a un primer recorrido histórico. El primer escenario es el que tiene que ver con lo que dice la comunicación que es la semiótica, al ser ella misma la que plantea a ésta como matriz científica posible. Este primer escenario se mueve entonces desde el campo de la comunicación hacia al campo semiótico, lo que implica la revisión de los conceptos que el mismo campo sugiere como centrales de la teoría de la comunicación. El segundo escenario es lo que dice la semiótica sobre la comunicación. Con base en lo anterior planteamos una primera hipótesis, pues consideramos que hay una comunicación en el campo semiótico y una comunicación o elemento “comunicacional” en el campo de estudio de la comunicación que no se relacionan y que parten y operan de matrices conceptuales diferentes. Este primer marco modifica algunos de los supuestos iniciales sobre la comunicación y la semiótica, y nos lleva a preguntarnos ¿qué semiótica es la que está en el campo de la comunicación? Y, ¿para qué o con qué fines?

Consideramos que las potencialidades de la semiótica son precisamente sus propiedades epistemológicas y no tanto sus formulaciones metodológicas. Pensar la comunicación semióticamente implica no sólo el uso de algunos conceptos devenidos de la teoría semiótica, sino el uso de marcos mucho más generales. Pensamos, al igual que Mario Bunge (2004:

47), que “toda ciencia utiliza, además del lenguaje ordinario, expresiones y transformaciones de las mismas que no tienen sentido sino en el contexto de alguna teoría”. Así, pensar la comunicación semióticamente implica partir de sus marcos epistemológicos y no sólo de la formulación de algunos de sus conceptos. Es con base en estas reflexiones que consideramos que ningún concepto funciona fuera de un marco teórico específico y por tanto, la correcta utilización de los conceptos en comunicación devinidos del campo semiótico parte necesariamente del reconocimiento de sus contextos teóricos. Aquí el elemento clave, aunque reconocemos que no es el único, son los conceptos, a lo que hemos definidos como signos. El proceso que planteamos entonces es doble. Planteamos que es necesario recobrar la naturaleza epistemológica de los conceptos de la semiótica para el campo de la comunicación y esto lo planteamos a través, precisamente, de la semiótica. Este punto se desarrolla a continuación.

2. Pensar semióticamente a la comunicación y a su estudio

La idea de una ruta conceptual implica una forma de aproximación que parte del acuerdo en su constitución. Una primera tesis sugiere que los objetos conceptuales no son materiales ni mentales, ni procesos cerebrales o sucesos que ocurren en una mente inmaterial, sino que son objetos que poseen una naturaleza peculiar e irreductible y que existen en la medida en que pertenecen a ciertos contextos, como son, por ejemplo, las teorías. Para Mario Bunge (2004), los objetos conceptuales o constructos son una creación mental de los que se distinguen cuatro tipos: conceptos, proposiciones, contextos y teorías. En este sentido, los conceptos son los átomos conceptuales, las unidades con las que se construyen las proposiciones, las cuales satisfacen algún cálculo proposicional y que, por añadidura pueden ser evaluados en lo que respecta a su grado de verdad, aún cuando de hecho no se disponga aún de procedimientos para efectuar tal evaluación en algunos casos. Por su parte, el contexto es un conjunto de proposiciones formadas por conceptos con referentes comunes y, por lo tanto, una teoría es un conjunto de proposiciones enlazadas lógicamente entre sí y que poseen referentes en común. Los conceptos están, por tanto, en lugar de algo más, no son meras figuras retóricas, sino elementos que sustituyen a ideas, sensaciones, nociones, colores, formas, etcétera, en síntesis, los conceptos son

signos y, a final de cuentas, su poder estriba en su capacidad de representar las ideas por las cuales los usamos. Por lo tanto, si el concepto es la unidad de pensamiento y es a la vez un signo, por lo tanto, un signo es una unidad de pensamiento. Pensamos en signos. El mismo Peirce ya había contemplado este hecho.

La idea de la semiótica como marco epistemológico para el estudio de la comunicación es una idea que ya se ha venido explorando, como lo muestra el trabajo realizado por Klaus Brhun Jensen (1997), el cual tiene por objetivo analizar y explicar la necesidad de un retorno a la semiótica y el pragmatismo de C. S. Peirce, con la finalidad de generar un nuevo desarrollo de la teoría social desde esta perspectiva y plantear así una teoría sociosemiótica integradora de la comunicación de masas. El punto de partida de Jensen es la idea de que la sociedad del significado es el resultado de la semiosis con la que los agentes sociales informados se comprometen mientras llevan a cabo las necesidades cotidianas de la vida, por lo tanto, una crítica a la filosofía del pragmatismo que se originó a partir de Peirce, identifica dos líneas del desarrollo de su semiótica, a decir, (a) una teoría de la comunicación o semiótica de primer orden y (b) una teoría de la ciencia o semiótica de segundo orden. Esto implica, a su vez, el desarrollo del Pragmatismo como epistemología y filosofía política para la comprensión de la comunicación de masas en tanto que acción semiótica.

Lo anterior es una propuesta, que al igual que la de Thomas A. Sebeok (2001) y John Deely (1990), ubican a la semiótica como una matriz epistemológica posible para la teoría de la comunicación, puesto que se extiende no sólo a la posibilidad de pensar semióticamente la comunicación, sino a la generación de una matriz constructiva general para pensar *desde* la comunicación no sólo al complejo mundo de lo social semióticamente, sino, de manera general, a las diferentes manifestaciones de lo comunicativo en la naturaleza (Sebeok 2001). Es en este sentido que nos parece fundamental reconocer la diferencia entre a) la estructuración, lectura, análisis, definición o configuración de un determinado proceso comunicativo u objeto propio de la comunicación a través de la semiótica, lo que implicaría “pensar” la comunicación semióticamente y, b) el empleo de terminología semiótica en un estudio comunicativo sin que por esto se pueda entender una fundamentación semiótica. Este doble escenario complica una clara lectura del punto que exponemos, pero nos permite apuntar que lo que

encontramos en el estudio de la comunicación es más lo segundo, una relación *terminológica* y no conceptual o teórica.

Como se puede apreciar, la idea de la extensión del marco semiótico como matriz científica general no es nueva, sino que se ha venido planteando hace por lo menos dos décadas atrás e inclusive podríamos extenderla hasta los inicios de la propia disciplina semiótica, pero lo que quizá si sea nuevo sea la pregunta por su pertinencia y por la forma de su fundamentación. El punto de partida es el objeto o materia de estudio de la investigación semiótica, el cual no se reduce al estudio de los signos sino a la acción de los signos o *semiosis*, por lo tanto, la semiótica “contrasta con la semiosis como el conocimiento contrasta con aquello que es conocido” (Deely 1990: 105). Al trasladar el centro de una entidad conceptual (signo) hacia una configuración de relaciones conceptuales (semiosis), la semiótica se expande naturalmente hacia todo aquello que implique relaciones de este tipo. Pero la semiosis, como el complejo sistema conceptual de la semiótica, depende de un elemento que la hace pertinente para cualquier ciencia en general, es decir, la *interpretación*, pues ningún signo existe si no es interpretado por alguien o por algo. De esta forma, como explica Veikko Rantala, dado que la noción de interpretación juega un papel explícito en campos de estudio como la lingüística, la lógica, la filosofía, la teoría de la comunicación, la teoría de la información, la estética, la teoría literaria y la medicina; la semiótica está necesariamente relacionada con todas ellas, pero por otro lado, casi cualquier campo puede ser estudiado desde una perspectiva semiótica, dado que casi cualquier cosa puede ser interpretada como un signo (Rantala 1992: 8).

Entre la semiosis y la interpretación aparece un tercer elemento, la *significación*. Para Charles Sander Peirce el proceso o la relación del signo por medio de la cual es atribuido su *significado* es precisamente la semiosis, es decir, una acción que envuelve la relación y cooperación entre tres elementos: el signo, el objeto y el interpretante. Sin embargo, nuestra intención no es profundizar en la teoría peircena, sino explorar el por qué de la pertinencia de la semiótica como marco epistemológico para el estudio de la comunicación. Este punto se sintetiza partiendo de las nociones de semiosis, signo, significación e interpretación de los que hemos hablado, dado que debajo de todas ellas subyacen preguntas explícitas que la teoría semiótica plantea para su propia fundamentación y que pueden ser extendibles para cualquier sistema conceptual o ciencia en particular a partir de su propia

historia que, para el caso concreto de la semiótica, será, según John Deely (1990), la historia de los intentos por dar cuenta de aquello que subyace a la semiosis y la hace posible, es decir, el signo, partiendo de una pregunta fundamental, a saber ¿qué es un signo, tal que él hace posible la semiosis? La semiótica es ese intento por explicar teóricamente lo que distingue al signo de su entendimiento como tal, de aquellos estudios que lo tienen como objeto.

Esta premisa básica le da forma a un campo de investigación específico, al campo semiótico. Pero la pregunta es obligada, ¿cómo es o fue este proceso en el campo de estudio de la comunicación? El principio de extensión analítica de la semiótica la ha llevado al centro de varias propuestas científicas y la podrían llevar al centro de la propuesta en comunicación, sin embargo, en este punto la complicación es doble, pues por un lado se puede entender la ausencia de un objeto y su conceptualización histórica o, en el lado opuesto, una multiplicidad de objetos históricos. La segunda hipótesis parece ser el caso del campo de la comunicación. Lo que sucede es que el campo de estudio de la comunicación recurre a todas aquellas aproximaciones científico-discursivas que han tratado al objeto comunicación sin importar su matriz histórico-conceptual, las cuales también pueden desarrollar su propia semiótica o bien, ser leídas semióticamente, lo cual complica grandemente el asunto porque implica no una lectura semiótica del estudio de la comunicación o lo que ha sucedido históricamente con él, sino que implica algo distinto, el establecimiento de un marco epistemológico desde el que se conceptualiza no sólo al estudio de la comunicación, sino al objeto comunicación de una forma específica.

Las implicaciones son serias, pues enfrentan en el proceso de construcción de un sistema de pensamiento a la semiosis y a la comunicación, discusión que Dario Martinelli resuelve a partir del cuestionamiento por la propia naturaleza de la investigación semiótica. Según Martinelli, “lo que normalmente sucede es que nosotros tendemos a identificar la semiosis con la comunicación, sólo porque ésta última es la más evidente y predecible manifestación de la primera. Pero en el fondo, la comunicación es *una* forma de semiosis, no el todo de ella” (Martinelli 2007: 20). Esta postura hace emerger la pregunta final, a saber, ¿cuál es la diferencia entre semiosis y comunicación? Aunque por ahora no es posible dar una respuesta definitiva, por lo menos podemos afirmar que en la medida en que podamos dar respuesta a esta pregunta estaremos mirando necesariamente en alguna de

las siguientes direcciones: a) en el pensamiento y fundamentación semiótica de la comunicación o, b) en la fundamentación de la propuesta científica de la comunicación.

Por otro lado, es importante aclarar que las dos direcciones no están peleadas sino que pueden ser integradas, sin embargo, esta integración requiere que las propuestas, para poder ser comparadas, den cuenta de su estructura, especifiquen su sistema conceptual, aclaren su genealogía y evidencien su objeto de estudio, sólo en esta medida se puede vislumbrar un verdadero diálogo entre el campo de investigación semiótico y el campo de estudio de la comunicativo. La tarea consiste, por tanto, en buscar esas propuestas teóricas en el campo de estudio de la comunicación o “completar críticamente” aquellas que ya existen. Esto supone un extenso trabajo del que sólo se puede especular sobre el impacto de su recorrido y sobre la acogida que tendrá en el campo de estudio de la comunicación en este momento actual, pero del que no se puede objetar la necesidad apremiante y la pertinencia de su realización.

3. A manera de cierre

Lo que aquí hemos mostrado es apenas una insinuación de las posibilidades epistemológicas de la semiótica para el estudio y pensamiento de la comunicación, pero lo que debe quedar claro es que este programa es una tarea que recién se está llevando a cabo y de la que queda aún mucho por decir y hacer. De igual forma, lo que hemos intentado dejar en claro es que hay serios problemas en el campo de la comunicación sobre la libertad de la utilización de los conceptos semióticos. Quizá este es apenas un apunte de una tarea mucho más amplia que implica una revisión sistemática de lo que ha pasado en la convergencia entre ambos campos de estudio, y la semiótica, a través de su lógica y su método pragmático, pueden resultar una herramienta de pensamiento eficaz en esta y en otras tareas reconstructivas.

Elina Viljanen

Deconstructing Soviet aesthetics and Soviet artistic consciousness

At the time Stalin called me almost every day and ask me to destroy Shostakovich [...] I want to ask everyone who still wants to talk nonsense: “What was I supposed to do? Should I have gone to Stalin and told him that he is a total ignoramus and that he is surrounded by poor advisers? Would that have helped Shostakovich?” (Khrennikov in *Pravda*, 27.1.1999)

This paper considers problems related to the study of Soviet musical culture. It consists of three parts that attempt to bring some new insights into Soviet cultural history, its aesthetical development, and the literary legacy of the musicologist and composer Boris Asaf'ev (1884–1949).

The first problem brings us to personal letters and memoirs used as research material. I consider the reputation of two official figures in music, Tikhon Khrennikov (1913–2006) and Boris Asaf'ev, in the light of statements made by Dmitri Shostakovich. In reevaluations of Soviet culture, some charismatic cultural figures, such as Shostakovich, have grown into cultural icons, not only in Russia but also in the West. Their accounts of Soviet culture and people have played into many scholarly works and have influenced the formulation of research questions concerning that historical period. Memoirs and letters form an important and bountiful contextual source for such study, providing us with valuable documentation of Soviet culture as such, as well as unique experiences and interpretations of a given period of time. However, their use also causes many challenges in terms of the overall interpretation. People change with surrounding society and politics, influenced by subconscious reasons and individual circumstances – this applies to both the sources as well the scholar and makes reevaluation of cultural history an endless process.

In the second part of this article I endeavor to deconstruct some conventional myths in Soviet tastes by reconstructing Asaf'ev's aesthetics. By reviewing the "unofficial" in "official" aesthetics, I try to indicate that traditional confrontation is only one way of perceiving Soviet culture, which is far from being a clear cut classification. The third part of the article suggests some new ways to pose questions about Soviet cultural history.

1. Flammable personalities

The death of composer Tikhon Khrennikov (1913–2007) was reported in various newspapers. His memory was met with a flourish in Russia, but in the west his passing was treated rather abruptly and in a biased manner. The western media made a reference to the 1948 formalist campaign and to the fact that Khrennikov served as one of the party's mouthpieces at the time. Khrennikov inherited the position of Boris Asaf'ev at the end of the 1940s not only as a scapegoat, but by a resolution of the Politburo was made the new chairman of the Composers' Union. He enjoyed high official recognition as a composer and served as the head of the Composers' Union up until the disintegration of the Soviet Union. Few people in the west know how much music he composed, what activities he was involved in, and that he wrote the popular song "Moskovskie okna". Khrennikov's bad reputation was mainly due to the memoirs of Shostakovich to more general works by Western musicologists (see Fay 1980; also, Brown 2004). Shostakovich, for his part, has enjoyed recognition as a highly ethical person and an authority among ranking personalities in the Soviet Union. He is still the most important symbol of Soviet repression, although recent studies have criticized his official side and ties with the party.

The aging Shostakovich disliked Asaf'ev, calling him a "protean" in its negative meaning (Volkov 1979). If that statement is true, his disdain has long roots in an early episode that took place at the Leningrad Conservatory. "Mitja's" moods and attitudes are documented in letters from 1925 sent to a respected Muscovite musicologist Boris Javorski (1877–1942) (see Bobykina 2000). At the beginning of the 1920s Asaf'ev's radical, modern, but partly nationalistic views about future teaching methods in music caused some splits at the traditional Conservatory. In 1928 Aleksander Glazunov wrote from Paris: "It is very hard for me to part with faculty members of the performing division with whom I have never had any

friction, but the prospect of being in the hands of the composers' faction headed by Asaf'ev is not to my liking" (quoted in Schwarz 1983: 99).

At first, Shostakovich was a keen admirer of Asaf'ev. He had just completed his first symphony and hastened to present it to Asaf'ev:

I started respecting the conservatory more now when Asaf'ev works there. I have always respected Asaf'ev as a musician and his spontaneous passion for music. I feel sorry that I couldn't go to him earlier. After showing him the score of my symphony I feel like the ice broke between us and I can now talk to him. I value him more than any other musician in Leningrad. Can you imagine what they would think of me at the conservatory if they knew my opinion about him? (Shostakovich, letter to Javorski 16.12.1925, in Bobykina 2000: 49)

Soon this all changed, however, because Asaf'ev offended the twenty-year old composer by not attending the premier of his symphony. Shostakovich then wrote to Javorski: "Because he did not come, he pushed me away for good. His is a filthy intriguer and nothing more. I cannot write more. I have a headache" (ibid.: 65). Asaf'ev did not come to the concert organized by the Leningrad Association of Modern Music (LASM) most likely because he had some disagreements with its leadership, especially with Julija Wejsberg. Nevertheless, Shostakovich's first symphony was given a warm reception by Asaf'ev and many others. Asaf'ev dedicated many positive articles to his music afterwards. Shostakovich's attitude towards Asaf'ev was rather emotional, but understandable, considering his young age and the excitement that he felt over the first performance. The fact that Asaf'ev did not appear at the performance was a huge disappointment to him, since Asaf'ev was by then a well established authority in musical circles, and his presence was important. However, Asaf'ev played a big role in helping Shostakovich to get his first teaching position at the conservatory, since he was aware of the composer's financial difficulties and tried to help him in every way.

Shostakovich's epithet of Asaf'ev as a "protean" suits him well. However, it is not very convincing to use the above-mentioned statements by Shostakovich as proof that this quality was inherent to Asaf'ev's character. Shostakovich certainly had very personal and subjective reasons for his characterization. Moreover, Asaf'ev *was* a protean, perhaps even an intriguer in some respects, not only as a person but also as a theoretician,

as his philosophical concepts open themselves to so many different interpretations. This chameleon-like quality was needed especially in order to survive in the complex cultural political climate of the Stalin period; but even after Stalin, it was precisely this feature that enabled Asaf'ev's writings to stand the test of time. Khrennikov inherited Asaf'ev's position mainly as a balancer between the pressure and demands that came from the Party side, on the one hand, and the creative needs of artistic society on the other. Indeed, many artists respected (and still do) in Russia for what he did for their benefit. However, Khrennikov became quite reluctant in giving interviews to western scholars in his later years. He was most likely tired of provocations and polarizing questions about whether he was more loyal to the Party than to his fellow-colleagues, and was wearied of all the confrontations that had shadowed his career (see *Pravda* 27.1.1999, "Ne delajte Shostakovicha muchenikom!"; Khrennikov 1994).

The study of Asaf'ev has suffered the same treatment. Many scholars like to speculate whether he was a "good" or a "bad" guy in relation to Party-mindedness. Some scholars, such as Boris Schwarz (1983), Andrey Olkhovsky (1955) and Robert Craft (1982), seem to think that Asaf'ev was more or less a victim of Soviet "mental misprision". Others, such as Fay and Taruskin, have more critical opinions about his double standard in dealing with the Soviet government.

Whatever his involvement was with the government or his personal moral status, Asaf'ev – who was never Party-member himself – was one of the official aestheticians who experienced interesting mutations and ingenious variations from his encounter with modern western thought and Russian modernism. He did not accept traditions of tsarist Russia as such but reinterpreted and advanced them. In my research, I have focused mainly on Asaf'ev's philosophical and intellectual roots and the development of his aesthetical terminology, as it took place between the years 1916–1949. One of my main areas of interest lies in the kinds of interpretation that can be brought to his many-sided, sometimes contradictory literary output. His career started in the highly modernist context and culminated in his election to the Academy of Sciences of the USSR, earning him the name "father of Socialist Realist theory in music" (ANSSSR 1951; see also, Viljanen 2006). What do his aesthetical vision and main work, *Musical Form as a Process* (1930 and 1947) tell us about the overall phenomenon of socialist realism in music, its philosophical basis and its development?

More importantly, what is Asaf'ev's place as a theoretician in the western history of aesthetics and music? What do his writings have to offer us other than an expression of official Soviet nationalism? I will next address this question and discuss some of Asaf'ev's contacts with the west, as well as influences on his philosophical concepts.

2. *Contacts in Europe*

Asaf'ev's life is quite well documented in the archives. He even wrote lists about the content of his bookshelves. At the early stage of his career he tended towards a cosmopolitan eruditeness and endeavored to maintain close contacts with European culture. He spent the summer of 1910 studying at museums in France, Germany and Italy (see Asaf'ev's curriculum vitae 1919–1927, in Krjukov 1981: 20–28). In 1911 Asaf'ev spent time in France (in Paris) and Austria and also in Italy as a guest of the Italian conductor Riccardo Drigo (1846–1930), with whom he worked with at the Marinski Theatre (Kjukov & Orlova 1984: 67–71). Between 1914–1916 and 1925–1930 he went abroad every spring also traveled the length and breadth of Russia. In the period of 1920 and 1930 he corresponded regularly with his friends, the émigrés Pjotr Suvchinkij, Arthur Lur'e and Sergei Prokof'ev, as well as with leading foreign music specialists and composers in Germany, England, France and Italy (see Korabel'nikova 1999: 163–164). Among those were the Austrian musicologist Guido Adler (1855–1944), teacher of Ernst Kurth (1886–1946), and the modernist composers Alban Berg (1885–1935) and Franz Schreker (1878–1934). Asaf'ev apparently wrote very good German. He also wrote letters in French and English and could understand Italian. In 1927 he was accepted into the French Musicological Society and appointed their associate correspondent in Russia. He sent his books and articles all over Europe and received musical scores and books in return (see Asaf'ev's letters in Krjukov 1981: 67–165).

Asaf'ev also wrote out lists of new books and musical scores that the Leningrad public library should obtain, and in 1927 helped to organize the premier of Alban Berg's opera *Wozzeck* in Leningrad. Later Berg wrote to him from Austria that nowhere else had *Wozzeck* been received as warmly as in Leningrad. Except for Berlin, no other theatre in Germany or Austria dared to stage the work: “Mr. Asaf'ev, you should know how much you did for me and how thankful I should be to you” (letter from Alban Berg

to Asaf'ev 11.5.1928, in *ibid.*: 136). According to Asaf'ev's personal memoirs, which he wrote at the height of Stalinism, these trips abroad enabled him to continue the broad intellectual and aesthetic development which he had begun at the university and under Vladimir Stasov's instruction. His letters and aesthetical development, however, from that period do not reflect Stasovian spirit. He is much less "black-and-white" and appears as an open-minded scholar who is absorbing everything that he could get from Europe.

The extent and quality of notes that Asaf'ev wrote regarding what he had perceived and obtained from different European sources draw a picture of an extremely ambitious and conscientious scholar (cf. Notebooks of B. V. Asaf'ev in RGALI, f. 2658 op. 1, d. 444). In the article "We and the Musical West" (1927) he wrote: "Acquaintance with the best examples of Western music will help the development of Soviet music, will liberate it from the amateurishness and speculation of 'revolutionism,' will lead towards the exploration of new forms and new means of musical expression. To show the masses the musical art of the West will provide criteria for the evaluation of Soviet musical creativity." One of his promoters at the time was the People's Commissar of Enlightenment Anatoli Lunacharski (1875–1933), who supported Asaf'ev's travels abroad and spoke on his behalf (Krijukov 1981: 16–17.)

Asaf'ev's philosophical background stood in clear conflict with official Soviet Marxism (Marajev 2006: 125). He saw reality as continuously changing, a multifaceted philosophical position that he derived from Nikolai Losski's interpretation of Henry Bergson's intuitive philosophy (see Losski 1914). Asaf'ev was influenced by Bergson's concept (and that of modernists in general) of a "living reality", subject to constant change, whereby a purely intellectual perception cannot fully grasp the individuality of an object. He founded his premise of art on the continuity of evolution and on the intuitive contemplation of living reality. Following Hegel, Asaf'ev's reasoning held that not just music, but apparently the fine arts and the whole phenomenon of art, that reflect the history of ideas in a very subtle manner, within the peculiar intonational vocabulary that is summarized by a given epoch (Asaf'ev 1976: 936). According to Asaf'ev, masterpieces of genuine art were somehow able to reflect universal ideas of humanity and the mysteries of eternal life (Silvenius 1998: 368). He applied Wilhelm Worringer's interpretations of Theodor Lipps's theory of

Einfühlung (empathy), and answered Worringer's call to write about the universal psychological basis of art history in the Russian context (Harrison & Woods 1992: 69). Asaf'ev's organicist view of art led to the conclusion that it could be served by no idealized abstract scheme; there could be no proven recipe for beauty, because the world was subject to constant motion, which meant that art as a language of life was also under constant development. This development needed to be natural, without artificiality. Thus socialist realism was, according to Asaf'ev, far from an artistic trend or a set of methodological principles of artistic creativity, the way nineteenth century realist aesthetics was. It was rather a philosophical conviction that beauty lay in the truthful portrayal of reality, no matter what this may mean in different times, at one or another moment in the existence of a world constantly in a flux. "The overcoming of statics, the discarding of the absolute, is the main thrust of modern time..." wrote Roman Jakobson in his article on Futurism in 1919 (Jakobson 1987: 30). As for Jakobson, Asaf'ev's theories were written amid intense contact with artists. Both of scholars were also artists themselves; Asaf'ev as composer and Jakobson as a poet were "insiders". Together with scholars the competitive but interrelated artistic groups of the 1920s searched ultimately new appearance and a format for what is real. Jakobson stated in 1921 "We no longer see a picture. The ideogram needs to be deformed" (ibid.: 22).

3. *Deconstructing Soviet aesthetics*

As Andrzej Walicki has pointed out, "the originality of Russian philosophy is not easy to define, whereas its dependence on Western European thought is obvious. Its striking originality can only be perceived when we examine it within the context of Russian intellectual history ..." (Walicki 1979: xvi). I consider this to be the key to understanding what kind of interesting ideas were born in the former Soviet Union and how to understand current Russian aesthetical thought.

There are two tendencies that I have tried to avoid: first, to romanticize Asaf'ev, which is often typical for current Russian musicological articles; and second, to try to find someone to blame for the narrow-minded artistic atmosphere, a search that has held particular interest to western scholars. As mentioned above, even Shostakovich did not escape this type of speculation. Furthermore, I have been struggling with the issue of what

would be the most fruitful and least polarizing way to pose questions related to Asaf'ev's theoretical development and its allegiance to European philosophy, aesthetics and musicology in order to reveal what was peculiarly Russian in the intellectual and cultural features of his output. Many articles emphasize that Asaf'ev's texts proceeded from abstract Romanticism and Symbolism to socialist demands. "... Vital, creative thought of the scholar and critic desperately opposed to escalating pressure from the outside and that the struggle between gifted thinker and the demands of the current situation continued with variable success in the course of Asaf'ev's whole life" (Valkova 1999). I do not share this idea. Even if official Marxist-Leninist and socialist-realist demands of the party did not exist, Asaf'ev would probably have not continued on the road of a romantic symbolist, as he appears in his early production and which is clearly pronounced, for example, in the religious and all arts synthesizing the aims of the journal *Muzykal'naya Mysl'*. Moreover, I hold that Asaf'ev's thought developed quite logically towards the Russian school of formalists and in a semiotic direction, following the common linguistic trends coming from Europe. One reason for that was his interpretations of Ernst Kurth's theory, which Eero Tarasti has called "proto-semiotic" (Tarasti 2002: 51). Tarasti was among the first to place Asaf'ev mainly in the history of music semioticians. According to him, the theory of intonation, as it appears in its final form (1947), is firmly semiotic in its aim to unite musical signifiers (sound) and signifieds (sense) (Tarasti 2002: 54.)

I contend that from today's perspective it is interesting to approach Soviet musical culture and aesthetics by looking at how the official cultural figures interpreted the old tsarist Russian intellectual tradition, Russian modernism and European intellectual trends in the new Soviet "forum", i.e. how the old ideas were sovietized, and what new connotations they gained in that process, and further, how these ideas became new concepts that started to live their own life in the Soviet cultural consciousness. This is related to a question about what is a peculiar Russian tone and what are the special characteristics of Soviet cultural space or web of symbols and meanings. Furthermore, it endeavors to approach the contemporary Russian musical aesthetics not as an underdeveloped modernism that socialist realism violently interrupted, but as something logically and pluralistically complex with developmental stages and artistic values on a par with those in the western history of art.

4. *Final remarks*

Studies of Soviet musical culture have long been dominated by various individual narrators: ambiguous articles that appeared in the official Soviet press releases, as well as post-Soviet-published memoirs and letters that bemoan the cultural-political situation in which countless artists struggled. As presented above, the social world of Soviet artists was full of strong personalities with their individual creative needs and demands that usually led to conflicts with one other. None of this indicated at all one's moral decadence and loyalty to the Party or disloyalty towards their fellow-colleagues. The social realities of the Soviet people, the symbols and concepts they used, as well as the rituals they practiced, were very complex in terms of interpretation. Asaf'ev is a good example of the overlaps of official and unofficial; and so is Shostakovich. The unofficial (western-oriented and modernist) and official (Soviet and realist) were not clear-cut divisions in that society, but peculiarly interwoven. Still, binary metaphors are important as abstract tools and as one level in understanding the differences between eastern and western cultures, if they are phrased and treated carefully, so as to reveal the paradoxes and conflicting structures of which reality is made.

In the first decade after the 1917 revolution Asaf'ev had all the doors open to him. Even the possibility of his emigration to West is speculated in the letters of Suvchinki and Prokof'ev (see Pol'djaev 1999: 102). At that time, however, Asaf'ev was already deeply involved in developing Soviet musical culture, and he obviously enjoyed his position. He was also a nascent patriot who aimed to put his native musical culture into frames, to write about the peculiarity of Russian artistic thought, and to indicate a new path for the development of Soviet artistic culture. He was apparently ready to make great efforts to help composers in Russia to create new music that he passionately admired. Asaf'ev admitted once that he himself lacked the innate ability as a composer that was present in his friends Mjaskovski and Prokof'ev (Tull 1976: 7). But during the formalist campaign he did not raise his voice in order to help his friends. Yet, was there any chance that Asaf'ev could have saved Mjaskovski and Prokof'ev from formalist accusations during high-Stalinism, even if he had tried to? Asaf'ev the patriot wrote in his memoirs that Russia was his fatherland and if he was to stay there it was his primary responsibility to try to act honestly in order to

fulfill his obligations to it, even though he might not always be able to understand the policies of the government (Asaf'ev 1974: 474, 506).

I understand well why his close friend Pjotr Suvchinski wrote to Maria Yudina in 1960: "I agree with you that Asaf'ev's book on Stravinsky contains many true and sincere thoughts but unfortunately after that he started to write something extraordinary rubbish." In 1961 Suvchinski wrote to the same address: "Thank God! Supposedly the influence of Asaf'ev has come to an end" (in Bretanickaja & Kuznecov 1999: 357). Asaf'ev's philosophy lost its original flavour when it was dogmatized and made into an official doctrine with all its narrow-minded interpretations. This is one of the contradictions that my forthcoming study on Asaf'ev's philosophy of music will illuminate in more detail.

The elimination of the Liar Paradox and a discussion of Gödel's Incompleteness Theorem

This article concludes that the Liar Paradox is a pseudo-paradox. People who regard it as a paradox find in it a self-reference and substitution proposition. Therefore the contradiction is accomplished by substitution. Moreover, the former violates the Law of Identity, and the substitution may result in a possible violation of the Law of Contradiction. Consequently, self-reference and substitution propositions should be prohibited.

This article also indicates the doubly contradictory criteria in the self-reference and substitution propositions which are constructed in Gödel's proof of the Incompleteness Theorem. Hence it is incorrect. "The undecidable propositions" in the conclusion of Gödel's incompleteness theorem are often mistakenly explained in three ways: (1) as an indistinguishable proposition which includes three states: right / wrong / not right and not wrong; (2) as an uncertain but distinguishable proposition which includes two states: right or wrong; (3) as a random proposition A, such that neither A nor not-A are provable. None of these is supported by the proof of Gödel's theorem. Thus, the conclusion of "loss of truth" or "loss of mathematical certainty" cannot be reached on the basis of that theorem.

1. Elimination of the Liar Paradox

Theorem: The Liar Paradox is a pseudo-paradox.

Proof: Let \mathcal{L} denote "the proposition"; \mathcal{U} denotes "the proposition is not true".

\mathcal{T} denotes the set of true propositions. Thus: $\mathcal{U} = (\mathcal{L} \notin \mathcal{T})$

\mathcal{L} and \mathcal{U} here are employed to designate two distinct levels of language, and then no confusion will arise. (The underlining, which is equal to “non-”, is used for ease of typing.)

1.1. The judgment of “The proposition is not true” will not lead to a contradiction:

$$1.1.1 \quad \mathcal{U} \in \mathcal{T} \leftrightarrow (\mathcal{L} \in \mathcal{T}) \in \mathcal{T} \leftrightarrow \mathcal{L} \in \mathcal{T}.$$

Provided that “The proposition is not true” is true: $\mathcal{U} \in \mathcal{T}$; the result is that “the proposition” is not true: $\mathcal{L} \notin \mathcal{T}$. No contradiction will arise between them.

$$1.1.2 \quad \mathcal{U} \notin \mathcal{T} \leftrightarrow (\mathcal{L} \in \mathcal{T}) \notin \mathcal{T} \leftrightarrow \mathcal{L} \in \mathcal{T}.$$

Provided that “The proposition is not true” is not true: $\mathcal{U} \notin \mathcal{T}$; the result is that “the proposition” is true: $\mathcal{L} \in \mathcal{T}$. No contradiction will arise between these either.

Conclusion 1: The Liar Paradox is a pseudo-paradox (cf. Wen 2005).

1.2. Analysis of reasons for the paradox.

The reason is that people confuse different levels of thinking, wrongly formulating the equation: $\mathcal{U} = \mathcal{L}$. And they construct the self-reference and substitution proposition: $\mathcal{U} = (\mathcal{U} \in \mathcal{T})$, which implies that “The proposition” means “The proposition is not true”. Furthermore, in the process of reasoning, the substitution finally leads to contradiction:

$$\mathcal{U} \in \mathcal{T} \leftrightarrow (\mathcal{U} \in \mathcal{T}) \in \mathcal{T} \leftrightarrow \mathcal{U} \notin \mathcal{T}, \quad \mathcal{U} \notin \mathcal{T} \leftrightarrow (\mathcal{U} \in \mathcal{T}) \notin \mathcal{T} \leftrightarrow \mathcal{U} \in \mathcal{T}.$$

So far a clear and detailed explanation has been given for the reasons causing the Liar Paradox.

Conclusion 2: The reasons lie in the construction of self-reference and substitution propositions and the substitution of “the proposition” with “The proposition is not true”, which finally results in the seemingly inexplicable contradiction (Wen 2002).

Note that in the self-reference and substitution proposition, “the proposition” means that “the proposition is not true”. This difference between the former and the latter violates the Law of Identity, and this substitution violates the Law of Contradiction. It should be prohibited; if introduced into reasoning, such an error should be corrected.

2. Discussion of Gödel's Incompleteness Theorem

In 1931, Gödel proved that: an undecidable proposition A exists in any consistent first-order arithmetic formal system, such that neither A nor \underline{A} is provable in this system. (Gödel adopted \bar{u} -constant, later omitted by J. B. Rosser later.)

The inference from this theorem is: for any such system the statement “This system is consistent” is unprovable within the system. It is designated Gödel's second Incompleteness Theorem.

2.1. Gödel's original notation: Analysis and commentary.

Gödel's original notation is hard to understand, and the symbols and proof of it appear confused. Hence an analysis of and commentary on the original text is in order so as to clarify matters.

2.1.1 Gödel defines relations: Let c be any given recursive \bar{c} -consistent class of formulae. It defines the relation: $Q(x,y) \equiv x \bar{B}_c [Sb(y \bar{1}9|z(y))]$.

Notice that Gödel gives a formula used for expression of substitution $Sb(y \bar{1}9|Z(y))$, which means “ $\bar{1}9$ in y can be substituted by $z(y)$ ”. $x \bar{B}_c y$ expresses that x is a provable sequence of y . Meanwhile, Q carries a negative meaning. Because $x \bar{B}_c y$ and $Sb(y \bar{1}9|Z(y))$ are recursive functions, they get the relation-sign q with free variables $\bar{1}7$ and $\bar{1}9$. q is a summary of all relations Q ; it therefore carries a negative meaning as well. Gödel holds that q meets the relations as follows:

$$\bar{x} \bar{B}_c [Sb(y \bar{1}9|Z(y))] \equiv \bar{B}ew_c [Sb(q \bar{1}7|Z(x) \bar{1}9|Z(y))].$$

$$\bar{x} \bar{B}_c [Sb(y \bar{1}9|Z(y))] \equiv \bar{B}ew_c [NegSb(q \bar{1}7|Z(x) \bar{1}9|Z(y))]$$

$\bar{B}ew_c [u]$ denotes that u is a theorem in c . Here Gödel means that if the provable sequence of formula $Sb(y \bar{1}9|z(y))$ in c does not exist, it can be expressed as that even Gödel's number does not exist: $Sb(q \bar{1}7|Z(x) \bar{1}9|Z(y))$. Please notice that q carries a negative meaning. In contrast, if the provable sequence of formula $Sb(y \bar{1}9|z(y))$ exists in c , it can be expressed as “Not every Gödel's number does not exist”: $Neg Sb(q \bar{1}7|Z(x) \bar{1}9|Z(y))$.

2.1.2 Gödel constructs self-reference and substitution propositions:

$$\text{Let: } p = \bar{1}7 \text{ Gen } q; \text{ and } r = Sb(q \bar{1}9|Z(p)) \quad (12)$$

$$\text{From this he gets: } Sb(p \bar{1}9|Z(p)) = Sb([\bar{1}7 \text{ Gen } q] \bar{1}9|z(p)) = \bar{1}7 \text{ Gen } Sb(q \bar{1}9|z(p)) = \bar{1}7 \text{ Gen } r \quad (13)$$

$$\text{And: } Sb(q \bar{1}7|Z(x) \bar{1}9|Z(p)) = Sb(r \bar{1}7|Z(x)) \quad (14)$$

According to (12), if substituting y for p , according to (13) and (14), he gets:

$$\exists B_c(17 \text{ Gen } r) \sqcap \text{Bew}_c[\text{Sb}(r \ 17|Z(x))] \quad (15)$$

$$\exists B_c(17 \text{ Gen } r) \text{Bew}_c[\text{Neg Sb}(r \ 17|Z(x))] \quad (16)$$

Please note that the definition of r derives from the negative meaning of q , so r carries a negative meaning. Through complex defining, Gödel obtains self-reference and substitution propositions: $17 \text{ Gen } r$, which is the generalization of r by means of the variable 17 . $17 \text{ Gen } r$ equals to U in this article, and its meaning is that “all Gödel’s numbers of provable sequences of $17 \text{ Gen } r$ in c do not exist”. Therefore we arrive at (15) and (16), above. If the provable sequence of $17 \text{ Gen } r$ does not exist, it can be expressed as “every Gödel’s number does not exist”, to wit: $\text{Sb}(q \ 17|Z(x) \ 19|Z(y))$. (15)

If the provable sequence of $17 \text{ Gen } r$ exists, it can be expressed as “not every Gödel’s number does not exist”: $\text{Neg Sb}(q \ 17|Z(x) \ 19|Z(y))$ (16).

However, Gödel directly expresses the formulas $\text{Sb}(r \ 17|Z(x))$ and $\text{Neg Sb}(r \ 17|Z(x))$, which represents whether Gödel’s number exists or not, as a theorem in c . Such kind of expressibility owns problems referring to self-reference and substitution propositions, as we have pointed them out.

2.1.3 The proof of theorem by Gödel.

Here we only discuss the proof of the second conclusion. $\text{Neg}(17 \text{ Gen } r)$ is not *c-provable*.

Proofs:

(i) As shown above, $17 \text{ Gen } r$ is not *c-provable*. Viz. according to the first conclusion, $17 \text{ Gen } r$ is not provable in c .

(ii) i.e. (according to 6.1) the following holds: $(n) \neg B_c(17 \text{ Gen } r)$. Viz. any natural number n is not the Gödel’s number of provable sequence of formula $17 \text{ Gen } r$. Please heed that the basis from (i) to (ii) is provable syntactic criteria (I).

(iii) Whence it follows, by (15), that $(n) \text{Bew}_c[\text{Sb}(r \ 17|Z(n))]$. Viz. The formula $\text{Sb}(r \ 17|Z(x))$, which does not exist in Gödel’s number of provable sequence, becomes the theorem in c .

Please note that the step from (ii) to (iii) is wrong for self-reference and substitution propositions, because Gödel’s meaning of $17 \text{ Gen } r$ is $\text{Sb}(r \ 17|Z(x))$. By substituting the meaning of $17 \text{ Gen } r$, “ $17 \text{ Gen } r$ is provable in c ” is obtained. This contradicts precondition (i).

(iv) Which together with $\text{Bew}_c[\text{Neg}(17 \text{ Gen } r)]$ would conflict with the \square -consistency of c .

Viz. According to the Law of Contradiction, it should come first to obtain that $\text{Neg Sb}(r \ 17|Z(x))$ is not a theorem in c . However, Gödel's reasoning bypasses this step and directly obtains that $\text{Neg}(17 \text{ Gen } r)$ is not a theorem in c by using \square -consistent.

(v) $\text{Neg}(17 \text{ Gen } r)$ is not c -provable.

Please note that the step which Gödel bypasses employs the semantic criteria (II), and Gödel substitutes formula $\text{Neg}(17 \text{ Gen } r)$ which is formula \underline{U} in this article; otherwise, he could only obtain that $\text{Neg Sb}(r \ 17|Z(x))$ is not a theorem in c . Apparently, Gödel's proof depends on doubly contradictory criteria and, thus, is wrong.

Furthermore, the symbol system Gödel adopted is complex and hard to understand. Gödel's supporters give a number of explanations under the implicit assumption that the theorem is right, but they still cannot make their story sound plausible. For further understanding, the author introduces some simple and explicit new symbols below.

2.2 Explicit new symbols for analysis (cf. Wen 2006).

2.2.1 General conventions of symbols

Let \mathcal{N} be the first-order arithmetic formal system. \mathcal{L} is any formula in \mathcal{N} . $\mathcal{T}_{\mathcal{N}}$ is the set of theorem in \mathcal{N} .

Set: It is clearly demarcated, whether the formula \mathcal{L} is provable or not,

Thus \mathcal{L} is provable in \mathcal{N} , if and only if, \mathcal{L} is a theorem in \mathcal{N} ; expressible as $\mathcal{L} \in \mathcal{T}_{\mathcal{N}}$;

\mathcal{L} is not provable in \mathcal{N} , if and only if, \mathcal{L} is not a theorem in \mathcal{N} ; expressible as $\mathcal{L} \notin \mathcal{T}_{\mathcal{N}}$.

Gödel has set provable syntactic criteria (I); therefore:

There exists a Gödel's number of provable sequence in \mathcal{L} ; expressible as: $g_{\mathcal{L}}$.

It is clearly demarcated, whether the $g_{\mathcal{L}}$ exists or not.

Assume $g_{\mathcal{L}}$ exists; then it is expressible as $g_{\mathcal{L}} \in \hat{\delta}$.

Assume $g_{\mathcal{L}}$ does not exist; then it is expressible as $g_{\mathcal{L}} \notin \hat{\delta}$.

Therefore, the provable Syntactic criteria (I) are: $\mathcal{L} \in \mathcal{T}_{\mathcal{N}} \leftrightarrow (g_{\mathcal{L}} \in \hat{\delta})$;
 $\mathcal{L} \notin \mathcal{T}_{\mathcal{N}} \leftrightarrow (g_{\mathcal{L}} \notin \hat{\delta})$.

There shall be and must be one of the above two cases.

2.2.2 Self-reference and substitution proposition \mathcal{U} .

Set the meaning of \mathcal{U} as “Gödel’s number $g_{\mathcal{U}}$ does not exist”:

$$\mathcal{U} = (g_{\mathcal{U}} \in \delta)$$

Then the provable semantic criteria (II) is from the meaning of \mathcal{U} :

$$\mathcal{U} \leftrightarrow (g_{\mathcal{U}} \in \delta)$$

However, Gödel has constructed the provable syntactic criteria (I):

$$\mathcal{U} \in \mathcal{T}_{\mathcal{N}} \leftrightarrow (g_{\mathcal{U}} \in \delta)$$

Therefore, there is a negative self-reference and substitution proposition: $\mathcal{U} \leftrightarrow (\mathcal{U} \in \mathcal{T}_{\mathcal{N}})$

However, these double criteria contradict each other.

If $\mathcal{U} \in \mathcal{T}_{\mathcal{N}}$, substituting the meaning of \mathcal{U} , the $(g_{\mathcal{U}} \in \delta) \in \mathcal{T}_{\mathcal{N}} \rightarrow (g_{\mathcal{U}} \in \delta)$ can be obtained. It therefore contradicts with criteria (I). Because Gödel has set $(\mathcal{U} \in \mathcal{T}_{\mathcal{N}}) \leftrightarrow (g_{\mathcal{U}} \in \delta)$,

The meaning of $\underline{\mathcal{U}}$ is not dependent on the judgment of whether Gödel’s number $g_{\underline{\mathcal{U}}}$ exists or not. The author opposes the method of Gödel to construct a negative self-reference and substitution proposition. The reason for this opposition is that such kinds of propositions themselves exist as doubly contradictory criteria.

2.2.3 The proof of conclusion 2 of Gödel’s theorem.

(i) From conclusion 1: $(\mathcal{U} \in \mathcal{T}_{\mathcal{N}})$; i.e., \mathcal{U} is not the theorem in \mathcal{N} .

(ii) From syntactic criteria (I), $(g_{\mathcal{U}} \in \delta)$ is derived; i.e., Gödel’s number $g_{\mathcal{U}}$ does not exist.

(iii) It can be expressed as $(g_{\mathcal{U}} \in \delta) \in \mathcal{T}_{\mathcal{N}}$; i.e., “Gödel’s number $g_{\mathcal{U}}$ does not exist” is a theorem in \mathcal{N} .

(iv) According to the Law of Contradiction, $(g_{\mathcal{U}} \in \delta) \in \mathcal{T}_{\mathcal{N}}$; i.e., “Gödel’s number $g_{\mathcal{U}}$ exist” is not a theorem in \mathcal{N} .

(v) According to semantic criteria (II), the conclusion is $(\underline{\mathcal{U}} \in \mathcal{T}_{\mathcal{N}})$; i.e., $\underline{\mathcal{U}}$ is not a theorem in \mathcal{N} either.

Analysis: Apparently, from (iv) to (v), if only syntactic criteria (I) are adopted, it must first be proved that Gödel’s number $g_{\underline{\mathcal{U}}}$ of provable sequence of $\underline{\mathcal{U}}$ does not exist. $g_{\underline{\mathcal{U}}}$ is completely different from $g_{\mathcal{U}}$. It has never appeared and cannot be judged. Therefore, this step is reasoned according to the meaning of $\underline{\mathcal{U}}$. Viz., semantic criteria (II), which contradict with syntactic criteria (I), are adopted. The reference therefore is wrong.

Furthermore, from (ii) to (iii) – $(g_{\mathcal{U}} \in \delta) \rightarrow (g_{\mathcal{U}} \in \delta) \in \mathcal{T}_{\mathcal{N}}$ – referring to the self-reference and substitution proposition, it is wrong. Because substituting the semantic $\mathcal{U} \leftrightarrow (g_{\mathcal{U}} \in \delta)$ of \mathcal{U} into (iii), $(\mathcal{U} \in \mathcal{T}_{\mathcal{N}})$ is obtained, and

this consequence will contradict with the precondition i) $(\mathcal{U} \in \mathcal{T}_N)$, and this contradiction comes from the self-reference and substitution proposition itself. Let us combine the four steps of the whole reference together:

$$(\mathcal{U} \in \mathcal{T}_N) \leftarrow (\mathbf{g}_U \in \hat{\delta}) \rightarrow (\mathbf{g}_U \in \hat{\delta}) \in \mathcal{T}_N \leftarrow (\mathbf{g}_U \in \hat{\delta}) \in \mathcal{T}_N \leftarrow (\mathcal{U} \in \mathcal{T}_N)$$

The first and fourth steps are according to syntactic criteria I and semantic criteria II, respectively. They contradict each other. The second step gives the wrong expression. Although the self-reference and substitution proposition is adopted, if only one criterion is used, under the condition of clear demarcation of the existence of Gödel's number \mathbf{g}_U , it will be:

$$(\mathcal{U} \in \mathcal{T}_N) \leftrightarrow (\mathbf{g}_U \in \hat{\delta}) \in \mathcal{T}_N \leftrightarrow (\mathbf{g}_U \in \hat{\delta}) \in \mathcal{T}_N \leftrightarrow (\mathcal{U} \in \mathcal{T}_N)$$

In other words, under the same condition, it only be derived as $(\mathcal{U} \in \mathcal{T}_N)$ from $(\mathcal{U} \in \mathcal{T}_N)$.

As to the \square -consistent: it does not relate to the proof of Gödel's theorem, because it is a concept; whereas infinite objects involved and the recursive functions have the convention of infinity. It also can achieve a clear demarcation of the existence of Gödel's number.

The author only uses simple symbols to analyze the proof process of Gödel's theorem. In so doing, the author has explicitly shown that Gödel has accomplished his proof by adopting the contradictory double criteria. Apparently, his proof is wrong.

2.3 Analysis of the conclusion of Gödel's theorem.

Gödel's theorem has been very significant over the history of logic, despite the serious logical problems that exist within the theorem. Why has this error not been rectified during such a long period of time? One of the interesting reasons is: irrespective of the process of proof and only taking the conclusion of the theorem into consideration, we may interpret "undecidable" in an another way, so that Gödel's theorem holds true.

2.3.1 "Undecidable" is often misinterpreted as the indistinguishable third object, which is not right and not wrong.

When categorizing objects, people hope to classify them into two kinds: those which are in this category and whose which are not in this category. However, in reality, some constraints prevent us from doing that. For example, the criterion of classification may not be definite or the criterion may be definite but not feasible in reality. This happens especially when something infinite is involved and the classification can't be finished.

There often exists the third kind of object for which we cannot put into any of the two categories. Those are called “the indistinguishable”.

If “undecidable” is interpreted as “indistinguishable” in the above sense, then neither the positive proposition nor the negative proposition is provable. Under this condition, the conclusion seems to be interpreted as correct.

The most important thing to note is that the proof of the theorem by Gödel doesn’t support the conclusion under this interpretation.

2.3.2 “Undecidable” is often misinterpreted as referring to “uncertain”.

In distinguishable cases, objects must be in the category or not in the category. However, we are not sure whether it is in or not. For example, without knowing the content of “this sentence”, both “this sentence is right” and “this sentence is not right” are unprovable. Furthermore, so far we are only entitled to assert that positive proposition which refers to the “Goldbach conjecture is established”, is not provable. On the other hand, the negative proposition, which refers to the “Goldbach conjecture is not established”, is not provable either. If “undecidable” is interpreted as “it is uncertain whether a proposition belongs to the positive kind or the negative kind”, then the conclusion of Gödel’s incompleteness theorem seems right. In the same vein, note that the proof of the theorem doesn’t support the conclusion under this interpretation.

2.3.3 The “undecidable” propositions in Gödel’s theorem do not refer to arbitrary propositions but only to self-reference and substitution propositions.

Gödel’s incompleteness theorem has only “proved” that the negative self-reference and substitution propositions U and \underline{U} are not provable. Therefore, the “undecidable” propositions in Gödel’s theorem only refer to negative self-reference and substitution propositions. It should not be extended to apply to other propositions. However, now many people interpret it as “There exist other propositions which are not provable”. Apparently this conclusion is not supported by Gödel’s proof. Apart from this, what can Gödel’s theorem explain?

2.3.4 The meaning of “undecidable” in Gödel’s theorem is definite, but the conclusion is utterly wrong.

The meaning of “undecidable” in Gödel’s theorem is definite: neither the proposition U nor the proposition \underline{U} is provable. Moreover, Gödel

number g_U either exists or does not exist. Furthermore, recursive functions are always expressive. Whereupon, the provability of $\mathcal{U} = (\mathcal{U} \in \mathcal{T}_N)$ or the provability of $\underline{\mathcal{U}} = (\mathcal{U} \in \mathcal{T}_N)$ must be one and only one. It is impossible that both of them are unprovable. Obviously the conclusion of Gödel's theorem is wrong. We have already pointed out the reason: the self-reference and substitution propositions constructed violate the Law of Identity and the substitution may lead to a possible violation of the Law of Contradiction.

2.3.5 There is a simple method to check whether the interpretation of “undecidable” complies with Gödel's original meaning.

The assertion in this article – that Gödel's theorem is not correct – is bound to evoke oppositions from many people. A simple way to oppose the author is to adduce a practical example which advocates Gödel's theorem. Here the author would show you a simple method to determine whether we could derive “ $\underline{\mathcal{U}}$ is not provable” from “ \mathcal{U} is not provable”. Furthermore, whether “The Goldbach conjecture is not established is unprovable” and “The Goldbach conjecture is established is unprovable”. If these two conclusions provide evidence that Gödel's Theorem is correct, then please check whether it is possible to derive that “The Goldbach conjecture is established is unprovable” from “The Goldbach conjecture is not established is unprovable”. Apparently, it is impossible to derive one from the other in the examples above. Therefore, they do not support Gödel's theorem. Proofs and explanations of Gödel's theorem are both doubtful and misleading. Apparently, the “loss of truth” and “loss of certainty” purportedly established by the theorem are false (cf. Zhu 1987).

When soundscape becomes music: A semiotic approach to sampling

A *soundscape*, which Murray Schafer (1977: 7) defined as “an acoustic field of study”, can be analyzed from a semiotic perspective just as any other text in society. Filled with narrative, rhetorical, and social conventions, a particular soundscape reflects characteristics of the society that generates it. The activities a community practices define its soundscape, and at the same time it becomes part of the sonic collective memory of that group of persons. Basically, a soundscape can be all the sounds (music included) in a particular place, in a song, or even a virtual environment such as the sound design for film and video games.

But what happens with *schizophonia*, “the split between an original sound and its electroacoustical transmission or reproduction” (ibid.: 90), and the possibilities of recontextualizing and modifying existing sound objects into different contexts? A sound object, as Pierre Schaeffer (1988: 49) defines it, is “what the ear listens to, not the source of the ‘sound’ but the real sound objects, in the same way as the eye doesn’t see the source or the ‘light’ but the luminous objects.” What happens, then, when we mix codes such as the sonical and the musical? Music is part of a soundscape, but it is also built by the soundscape by way of stereotypes, conventions, genre and style.

Sampling, the musical technique that has been defined as “the insertion of previously recorded and traceable sound objects inside a musical composition” (Woodside 2005: 21), answers these questions and helps us to understand how sound objects signify in a society. This technique was officially conceived in the 1940s with the development of magnetic tape and the transmission of a “Concert des bruits” by Pierre Schaeffer in 1948, even though there are similar proposals in the work of John Cage,

Ottorino Respighi, George Antheil. The same ideas of insertion and intertextuality can even be traced in Tchaikovsky's *1812 Overture* and in quodlibets such as those of J. S. Bach. In the end, these are the sound objects, or signs, transposed from a soundscape to a musical context. Hence analysis of sampling both opens paths for studies in sound semiology, and complements musical semiology.

When a soundscape becomes music through sampling we perceive two codes simultaneously, the sonic and the musical. And since music is also part of soundscape, this raises the issue: would it be more appropriate to approach music first as a sound structure with social conventions and then as a musical code? One notion that needs to be considered in this study is that the distinction between "high" and "low" music is useless: in the end, it's all music and sound. Music is a convention of a group of sounds that each individual decides to define as music or not (as now can be demonstrated with the creation of genres like *Glitch* and *Noise*). That is why one should approach its study first as a sound object with musical functions and particular codes, and then as a musical object. For some persons (e.g., in cases of generational differences or a very particular musical encyclopedia) a particular genre can or cannot be considered as music; however, it still keeps sound qualities and a particular structure that the listeners perceive in one way or another.

Studying how composers perceive sound objects and reinterpret them in a musical context through sampling will help explain how music and sound have particular meanings. This is because sampling sources can either be vocal sounds (with a human character), musical sounds (previous musical compositions) or paramusical sounds (any other sound in the soundscape).

Murray Schafer has explained that "the general acoustic environment of a society can be read as an indicator of social conditions which produce it and may tell us much about the trending and evolution of that society" (ibid.: 7). *Ergo*, studying sampling will allow us to do the same through a musical and sonical approach, finding relations, for example, between *Gangster Rap* and *Mexican Narcocorridos* (which both use gunshots and police sirens) or identifying "common sonical places" for a society like "organilleros", "merolicos" and traffic sounds in Mexico's usage of sampling or inserting the sound of kids playing, modified with a delay effect, to represent nostalgia.

Some sound objects have been identified as the basic sonic signs in soundscape and music. But Schafer argues that it is also necessary to identify sounds that are important because of their individuality, numerousness or domination in a soundscape. He calls them *keynotes* and *soundmarks*: “The keynote sounds of a landscape are those created by its geography and climate: water, wind, forests, plains, birds, insects and animals. Many of these sounds may possess archetypal significance” (9–10). He identifies soundmarks as “a community sound which is unique or possesses qualities which make it specially regarded or noticed by the people in that community. Once a soundmark has been identified, it deserves to be protected, for soundmarks make the acoustic life of the community unique” (10). An important thing to be considered is that music, particularly folkloric (but not necessarily) can also be a soundmark because it is found in particular places (or represents those places), as in the case of *Son*, *Mariachi*, *Norteño* and *Huapango* in Mexico, *Tango* in Argentina, *Flamenco* in Spain, or *Tarantella* in Italy (although they are not played throughout the whole country); while some places have characteristic music as part of the soundscape (discotheques, nightclubs, raves, weddings, elevators, etc.). Also the voice of popular characters can be considered soundmarks, like those of politicians and entertainers.

As said before, the source of sampling is soundscape, and it works at the level of sound and music at the same time. Because of its nature, sampling is intertextual. It is the one and only true quote in music and has a very particular aesthetic complexity even though other musical practices (that don't use prerecorded sounds) have similar meanings and uses: quodlibets, leitmotifs, the insertion of “non musical” objects, as occurs in compositions of Tchaikovsky, Respighi, George Antheil and Leroy Anderson; the imitation of or allusion to sound objects in Prokofiev, Messiaen, and King Crimson, which relate to Philip Tagg's “sonic anaphones” (1992, 1994) and the insertion of other compositions inside new ones, like the *Marseillaise* in Tchaikovsky, Debussy and The Beatles. We should not forget the work with noise, gramophones and silence by John Cage and the vocal and sonic explorations of Futurists and Dadaists like Luigi Russollo in the manifesto, *Art of Noises* (1913). All these explorations are related to the “essence” of sampling. So, when a sound object, like a phone ringer, is inserted in a musical composition, or when it is created based on such sound, the listener will decide to give it musical or sonic sense. Although certain rules in

its structure will help one understand if it is inserted as a musical or sonic element, the code in which it is built is nevertheless a musical one.

Different notions and concepts from musical semiology can be applied to sampling, like the anaphones, genre synecdoche, episodic marker and style indicator developed by Phillip Tagg (1992, 1994); moreover, ideas from general semiotics, such as encyclopedia and competence, apply. It is also useful to incorporate concepts developed in other disciplines, such as collective memory (soundmarks are collectively identified) and “orality”: although the sound is recorded, there is an oral experience, which I have elsewhere defined as “registered orality” (Woodside 2007) and which has to do with the recovery of the term “acousmatic” by Pierre Schaeffer (1988: 56). Intertextuality and historicity (keynote sounds and soundmarks change through time) also help us to understand that a soundscape and its insertion in a musical code are both socially influenced.

To sum up the discursive origins of sampling, it can be said that three major artistic movements helped develop its aesthetic values and have a relation with sampling sources (voice, sounds and music):

- Sound Poetry (with Kurt Schwitters’ Audiopoems, Futurist manifestos, Dadaists, and Henri Chopin’s Sound Poetry with magnetic tape).
- Concrete and Electroacoustic Music (which idea can be traced to Russollo’s *Art of Noises* manifesto and later explored in compositions by Pierre Schaeffer, Edgard Varèse, Karlheinz Stockhausen and Steve Reich, just to mention some composers).
- Bastard Music and Musical Collage (which is based on quotation of and reference to other compositions with examples like Bill Buchanan’s and Dickie Goodman’s *The Flying Saucer*, John Cage’s *Imaginary Landscapes*, John Oswald’s “plunderphonics”, electronic music, bootlegs, megamixes, mashups, remixes, medleys, etc.)

Although it is important to understand the origins and motivations of sampling, as well as how to approach it for analysis, the most interesting part of studying soundscape comes when music through this technique exerts all its signifying possibilities and becomes part of a sonic narrative. A sample is a sign, and as any other sign in any text, it can be an icon an index or a symbol. But also because of the complex relation soundscape-music, many different functions have been identified:

Rhetorical Function. A sample can become a metaphor (dogs barking = “persecution”), metonymy (traffic noise representing a city) and even

“sonomusical motifs” (Woodside 2007), which occur when a sound object surpasses its original source and becomes a “commonplace”, like the shrieking violin motif in Alfred Hitchcock’s *Psycho* (1960) or Wagner’s *Ride of the Valkyries*, becoming part of a sonic universe or macro-discourse.

Intertextual Function. As explained before, sampling is the only true quotation in sound and music; other such musical expressions are merely simulations, references and allusions. Analyzing the characteristics of intertextuality can enhance the accumulative meanings; for example, if the source is an audiovisual product, it will stimulate a mental remembrance of the image, recycling, resignifying, recontextualizing and rejuvenating the original meanings inside the sonic macro-discourse, by linking past and present, one generation to another, and various cultures. Music and soundscape have historicity, producing an accumulative stimulation of memory, and they exist side by side with a society.

Mnemotechnical Function. For Maurice Halbwachs, collective memory “extends all the way it can reach thanks to the memory of the groups it’s established by” (quoted in Vázquez 2001). This memory has different characteristics, like the ability of constructing itself in a generational way (Candau 1996), or any other intersubjective form. Studies in collective memory help one to understand how sound conventions are built, in addition to how meanings circulate through a society. Sound and music evoke experiences associated with the source – Pierre Nora’s *lieux de la mémoire* – and sampling modifies the context but stimulates remembrance and accumulative recollections.

Oral Function. Vocal sampling stimulates an oral experience (further than the relation between the loudspeaker and the listener). Walter Ong (2002: 77) explains: “spoken word comes from human interior and makes humans communicate as conscious interiors, as persons. Spoken word helps humans to form tightly united groups”, an idea that Michel Chion defined as “vococentrism” (1999: 5–6). If the possibility of editing the speech is conceived, many different interpretative levels are added, stimulating the recognition either of the orator’s timbre, or at least that it comes from a human source, and also the message itself contained in the speech. In other words, it is important *who* is saying it, *how* he is saying it, and *what* he is saying. And with editing the message can be modified; for example, from “*I-love-you*” to “*You-love-I*”.

Historical Function. A sample, as any quote, is a reference, and can be considered a “mnemotope” or “*lieu de la mémoire*”. The sound object is semiotized, and makes reference to other contexts (it can become an index). At the same time, it is an historical sonic document, because it leaves tangible traces of a sonic temporality and either the modification of the source or its perception can be studied from an historical perspective. As Murray Schafer (1977) did, one can study, for example, the modification of a soundscape by industrial revolution, but one can also identify and trace important historical moments through recordings in music, like the Martin Luther King Jr’s “I have a dream” speech or the impact of technology on the aesthetics of sound. It can be also said that sampling takes and returns meaning through the history of the sonic macro-discourse of a community, helping to build a collective or intersubjective sonic identity (generational, national, cultural, etc.).

Conclusions

Nowadays we are approaching semiotic globalization. Keynote sounds and soundmarks in sampling – like any other sound objects from a soundscape – are signs that composers use to reinforce their sonic identity in more or less explicit forms (like the fusion between electronic or rock and folkloric music), or when a sound object transcends the frontiers of its soundscape and is adopted by different communities around the globe (like Martin Luther King Jr’s or Subcomandante Marcos’s speeches). Some sound objects are recurrent in a community, others become part of History, while others are completely forgotten. But there is still a registry kept in different cultural expressions – film, literature, TV, radio, music – for historians to search out, understand, and trace how a soundscape has evolved through time and imagination.

Sampling is not merely an insertion inside a composition, but an extremely complex sound object that can give a lot to musical semiology as a means of identifying signifying units. It also helps to build what can be called a sonic semiology, which can be applied not only to music, but sound design in audiovisuals, radio and multimedia, besides the now obvious approach of studying a society’s sonic environment. The distinction between what is music, sound and noise is completely subjective, and it is

part of an intersubjective convention (what is noise for some can be music for others).

Some sounds signify more than others do, and there are different ways for identifying them. The study of sampling offers more tools and theoretical fundamentals for the study of music and sound as well as soundscape, while directing the study of musical semiology further away from the score. It should not be forgotten that music is appreciated mostly by a huge majority that doesn't know a thing about composition, but that experiences music in everyday activities, rites and traditions. Musical meaning is given in a specific time and space and is part of a soundscape; music is ephemeral and accumulative, just as History.

Music and sound objects are ephemeral conventions based on constant exposition and accumulative signification. In this regard it is important to remember Pierre Schaeffer's (1989: 61–74) advice to “listen (*écouter*), hear (*ouïr*), understand (*entendre*) and comprehend (*comprendre*)”, rather than look for specific structures and notations.

On language communication from a logical point of view

1. Introduction

Logical pragmatics is not, in general, the study of how people do communication. It does not describe the psychology or the sociology of communication. It pre-describes when sign communication is correct.

What the question about correctness of language communication requires in the first place is the differentiation of the *act of communication* from the *language of communication in general*. The aim of this paper is to outline a logical theory *TLC* of language communication in which the above-mentioned notions of communication are defined and the problem of their logical adequacy is considered. The theory indicates some general conditions of verbal understanding and general causes of verbal miscommunication and misunderstanding.

The theory *TLC* is here outlined in a possibly non-formalized shape. In Section 2 some preliminary assumptions are discussed. In Section 3 foundations of syntax theory are presented and in Section 4 the basis of the theory *TLC* as an expansion of syntax theory into semantic-pragmatic theory is described. The paper ends with Section 5, a summary.

2. Preliminary Assumptions

Although the theory *TLC* will concern communication by means of expressions of any language, it will take into consideration, to a certain degree, the following three aspects:

(i) the cognitive-communicative function of natural language, according to its genesis;

(ii) the so-called functional approach to logical analysis of this language, and, relating to it:

(iii) two understandings of a manner of using and a manner of interpreting language expressions in communication.

Let us expand on these aspects. Concerning (i), the genesis of natural language, one can easily observe that it was formed in the process of cognition and communication between people who made use of material, concrete signs. Accordingly, we make the assumption that the primitive linguistic entities applied in communication acts between their senders and recipients are material creations, e.g., given sounds, written signs, physical objects somehow placed in time and space, concrete objects which have some referents attributed to them, and which are called *tokens*. We assume that sign-examples (tokens) are primitive linguistic entities. According to the well-known *token-type* distinction made by Peirce (1931–1935), we differentiate *token-signs* from *type-signs*, which are abstract, ideal linguistic objects, and whose physical representations are just tokens.

(ii) In order to explain the notion of communicating we have to introduce the terms *using* and *interpreting*, which entail the use of concrete entities, i.e. *tokens*, and the inclusion of situational contexts accompanying them. This shows how *tokens* function in communication acts. Even though we are not going to refer to situational contexts in our theoretical considerations, the context is always present in such acts. In the proposed theory *TLC*, the basic semantic-pragmatic notions, including the notion of *language communication* and related concepts – *meaning* and *interpretation* – are defined by means of *expression-types*, and yet their definitions involve such primitive notions of the theory as *using* and *interpreting expression-tokens*.

Our formal conception of language communication has some connections with the understanding of meaning as a *manner of using* expressions and interpretation as a *manner of interpreting* expressions. Speaking about the functional approach to natural language analysis, we have to take into consideration the manner of using and manner of interpreting language expressions. The latter is a special case of the former.

(iii) After Pelc (1971, 1979), we distinguish two understandings of the terms “manner of using” and “manner of interpreting”. (a) In the first, the *manner of using* (*use*) and the *manner of interpreting* (*int*) occur only in given circumstances, in specific language-situational contexts, and concern

expression-*tokens* only. (b) In the second, the *manner of Using* (*Use*) and the *manner of interpreting* (*Int*) characterize the *meaning* of the expression and the *interpretation* of the expression, respectively; these manners are somehow built into this meaning and this interpretation, respectively. In this case an expression can be treated as isolated, static, out of context, e.g., as an entry in a dictionary. It is then an expression-*type*, a class of its concrete occurrences, a distributive class of expression-*tokens* used either to represent a given object, or in concrete acts of communication in specific linguistic-situational contexts, with reference to only one, broadly conceived object or to more objects of the same kind.

The relation *use* and its sub-relation *int*, as concerning all the relations of physical object-based reference of expression-*tokens* made by users of language, will be primitive notions of the theory proposed here. The relation *Use* (resp. *Int*) is, on the other hand, a relation defined by means of the relation of *use* (resp. *int*) and applied by users of language for expression-*types*. The difference between these relations is explained by the fact that two persons can *Use* the same expression-type by means of its two different tokens.

The notion of “expression” is a syntactic one and must be defined on the basis of a theory of syntax. To this we now turn.

3. Language syntax: Theory *T*

3.1. Two levels of formalization of the syntax of language

Theory of syntax *T* is formalized on two levels: *token*-level and *type*-level. According to the *token-type* distinction by Peirce (1931–1935), any language *L* is characterized as a construct of double ontological nature, both as (a) a language of expression-*tokens* (at the *token*-level) and as (b) a language of expression-*types* (at the *type*-level).

The theory *T* is first formalized on the token-level as the theory of *token*-syntax describing *L* as a language of expression-tokens, and then, on the type-level, as the theory of *type*-syntax describing *L* as a language of expression-*types*. The theory of *type*-syntax is an extension of the theory of *token*-syntax.

Tokens are primitive objects of the theory *T*. They are intuitively understood as concrete, material, empirical objects, enduring through time-

and-space and perceived by sight. They are usually, but do not have to be, inscriptions. They can be on paper, a notice board, a blackboard, a computer screen, a stone, etc. They may be configurations of such things as jigsaw-puzzle pieces, leaves, stones, stars, smoke signals, illuminated advertisements, and so on.

Types are derived objects of theory *T* defined by means of *tokens*. They are understood as sets (classes) of tokens bearing an *identifiability* relation to each other; i.e., *types* are ideal, abstract entities.

3.2. Identifiability of linguistic tokens

The *identifiability relation* of tokens (a primitive notion of theory *T*) is determined by pragmatic factors, not by physical similarity, and it is understood very broadly. Consider, for instance, the following three word-tokens:

HELSINKI	H	e	l	s	i	n	k	i
<i>Helsinki</i>								

Printed in different types but consisting successively of the same letters of the alphabet, these tokens are *identifiable*.

We assume that the *identifiability* of tokens is an equivalence relation.

The *expressions* of language *L* are defined separately on the *token*-level and on the *type*-level. They are suitable *concatenations* of *tokens* or *types*. The *relation of concatenation of tokens* is another primitive notion of the theory *T*.

3.3. Concatenations

Concatenations of tokens are complex words of language *L* obtained from two words of the *vocabulary* of language *L* – the next primitive notion of the theory *T*. Concatenations on the token-level may be, but do not have to be, sequences of two tokens. Intuitively, a concatenation of two written tokens *p* and *q*, for example in a European language, is a written token *r* that is made up by adding the written *token q**, identifiable with *q*, to the token *p**,

identifiable with p , on the right. For example, take the concatenations of the following word-*tokens*:

C	SEMIOTIC
o	
n	
g	
r e s s	

the second and the first, is the name-*token*:

Semiotic Congress

and any name-*token* identifiable with it, in particular the token aligned vertically:

SEMIOTIC
CONGRESS

Thus, the relation of concatenation defined on tokens is not a set-theoretical function, and the relation of identifiability is not a relation of physical similarity. These two relations and the *vocabulary of tokens* are primitive notions of the theory of words which is included in the theory of syntax T . They are formalized on the token-level. All of them satisfy specific axioms of the theory.

3.4. Well-formed expressions

The most important notion of T is the notion of a *well-formed expression* (*wfe*) of language L . The theory T can be built as a theory of language syntax (see Wybraniec-Skardowska 1991). In the latter, all *wfes* are generated by a *categorial grammar*, a notion originated by Ajdukiewicz (1935), shaped by Bar-Hillel (1950, 1953, 1964), and developed by many other authors. On the basis of the theory T we can reconstruct such a grammar.

The notion of a *wfe* is defined first on the *token-level* and then on the *type-level*. Each *wfe-type* P is defined as a non-empty set of *wfe-tokens identifiable* with a *wfe-token* p .

Having the notions of *wfe-tokens* and *types* we can extend the conceptual apparatus of the theory T on some semantic and pragmatic components and outline the theory TLC of language communication.

4. *A theory of language communication – Theory TLC.*

4.1. *Token-level*

4.1.1. *Primitive notions of TLC*

Because the formal theory *TLC* on the token-level should explain, at least to a certain theoretical degree, the phenomenon of language communication among people, its conceptual apparatus has to include the notions of *using* and *interpreting token-expressions* by users of *L*, and the notions of a *communication act* and *understanding* in this act, as well as notions connected with its non-adequacy: *misunderstanding* and *non-understanding*.

Thus, we accept the postulate that in communication acts the sender, in order to send the message, applies the function *use* connected with the object reference of a *wfe-token*, whereas the recipient, in order to receive the message, applies another function – the function *int*.

Primitive notions of the theory *TLC* are: the set *User* of all users of a given language *L*; the set *Ont* of all extra-linguistic objects described by *L*; the *two-place function use* of using the wfe-tokens of *L*; the *two-place function int* of interpreting the wfe-tokens of *L*.

The first two primitive notions are understood very broadly. The set *User* can be composed of current as well as former or future users of the language *L*. We do not make any assumptions about the nature of objects of the set *Ont*. They can be not only material objects, but also, for instance, fictional or abstract creations described by language *L*. Of course, we postulate that the sets *User* and *Ont* are nonempty sets.

We understand the function (relation) *use* as an operation producing, calling, using, exposing or interpreting *wfe-tokens* in order to refer them to corresponding objects of the set *Ont*. We can also call this operation a *function of object reference of wfe-tokens by users of language L*. Formally the operation *use* is a partial set-theoretical function defined on ordered pairs $\langle a \text{ user, a token } \rangle$ with values (*referents*) in the set *Ont*. We assume that every user *uses* at least one *wfe-token* of *L* to refer to an object. Not every *wfe-token* must have a referent.

The operation *int of interpreting tokens* emerges when we speak about communication by means of expression-*tokens*. The function *int* is a restriction of the operation *use*. So, *interpreting tokens* is a particular case of *using tokens*. This is because the pair $\langle a \text{ user, a token } \rangle$, which has a referent, may

have no corresponding *interpretant* when, for instance, this *token* cannot be received or was used with the intention of being interpreted by a recipient, but he/she cannot interpret it. The fact is, however, that each pair that has an interpretant also has the same referent. Of course, we assume that there exists at least one user of L who *uses* and *interprets* a *token* in a given act of communication by means of this *token* as the same object.

4.1.2. Act of communication

An *act of communication* is defined in *TLC* as a triple $\langle s, e, r \rangle$ satisfying the following conditions (see Figure 1): The first element s (*sender*) and the third of its elements r (*recipient*) are users of the set *User*. The second element e is a *wfe-token* of L , and there exist objects o, o' of the set *Ont* such that the sender s of the expression e *uses* the expression e to refer to the object o – the *referent* (i.e. $use(s, e) = o$) and the recipient r of the expression (e) *interprets* this expression as a sign-token of the object o' – the *interpretant* (i.e. $int(r, e) = o'$).

Communication acts can be carried out by means of two different expression-tokens of the same *wfe-type* if the sender *uses* a *token* e and the recipient *interprets* another *token* e' but the *token* of the same expression-type. This is the case in e-mail, microphone or telephone communication. So, the more general definition of an act of communication is in accordance with Figure 2.

COMMUNICATION ACT

Figure 1

COMMUNICATION ACT

Figure 2

It is easy to see that any act of communication by means of one *wfe-token* is also an act of communication by means of two expression-tokens.

Examples of communication acts include: making an announcement, the present paper, a specific question, e.g., in a discussion, etc.

4.1.3. Adequacy of communication acts

The problem of adequacy of an act of communication by means of a *wfe-token* consists in its effectiveness. A communication act is effective if using the *wfe-token* by its sender and interpreting the *token* or a *token* identifiable with that *token* by its recipient are in agreement, i.e. the referent to which the sender *uses* the *token* and the interpretant as an object of interpreting the *token* or a *token* identifiable with that *token* by its recipient, are the same. In other words, a communication act is effective when an *understanding* takes place between its sender and its recipient.

Two definitions of an act of communication by means of *wfe-tokens* will bring us to two definitions of the notion of *understanding*. They are illustrated by means of Figure 3 and Figure 4, respectively.

Figure 3

Figure 4

It is quite obvious that if there exists understanding in the first sense, then there exists understanding in the second sense. It can also be justified by *TLC* that there exist communication acts in both senses, and that there exists at least one user of the language L which takes place in a communication act by means of an *expression-token* simultaneously as the sender and as the recipient and understanding take place in this act. So, we have a corollary: the sets of all acts of communication, in both senses, are non-empty.

4.1.4. Miscommunication

If, in an act of communication by means of a *wfe-token*, understanding does not take place between its sender and its recipient, then the act of communication is not adequate and we may speak about *miscommunication*. The latter occurs if *misunderstanding* takes place in this act or if an attempted act of communication fails because of *non-understanding* between the sender and the recipient.

From two definitions of a communication act, we obtain two definitions of *misunderstanding* and two definitions of *non-understanding*. They are illustrated in Figures 5–6, and Figures 7–8, respectively.

Figure 5.

Figure 6.

Figure 7.

Figure 8.

If the sender of the *wfe-token* *e* uses this expression to refer to an object *o* and the recipient interprets this or another expression-*token* *e'* of the same type as another object *o'*, then there exists a *misunderstanding* between the sender and the recipient in the act of communication by means of the expression *e* (see Figures 5 and 6).

If the sender of the expression e uses e to refer to a referent o but the recipient is unable to interpret the expression e or an expression e' identifiable with that expression, then there follows a non-understanding (see Figures 7 and 8).

4.2. Type-level

4.2.1. Language communication

Empirical communication by means of expression-*tokens* has to be distinguished in a given community of *Users* from communication by means of *wfe-types*. On the *type-level* we expand the conceptual apparatus of the *TLC* with new notions. The most important one is the notion of *language communication by means of wfe-types*. It is determined as a value of an operation communication C defined on expression-*types*. The value $C(E)$ of the function C for every expression-*type* E is called *language communication by means of the expression-type* E .

Communication $C(E)$ by means of the *wfe-type* E is the set consisting of all ordered triples in the form $\langle s, e, r \rangle$ such that the first element s (the sender) uses the *wfe-token* e of E and the third component r (the recipient) interprets a *token* of E in an act of communication. So, communication $C(E)$ by means of the expression-*type* E is the set of all communication acts, in the second sense, by means of expression-*tokens* of the *type* E .

Communication $C(E)$ includes the set of all communication acts by means of only one *token* of the *type* E . Moreover, it follows from earlier corollaries that there exists a *wfe-type* E such that communication $C(E)$ by means of the *type* E is a nonempty set.

4.2.2. Using types and interpreting types

Users that participate in acts of communication belonging to language communication by means of an *wfe-type* E are also *Using* the expression-*type* E : senders *Use* this *type* while recipients *Interpret* it.

The relation *Use* of *Using wfe-types* and its sub-relation *Int* of *Interpreting* expression-*types* are new notions of *TLC*. They are binary relations satisfying some axioms and defined by means of relations *use* and *int* for *tokens*, respectively. They are defined as follows: the user u *Uses* (resp. *Inter-*

pretends) the *wfe-type* E if and only if the user u uses (resp. interprets) a *wfe-token* of the *type* E to refer to some referent (resp. interpretant).

Because the relation *int of interpreting tokens* is included in the relation *use of using tokens*, the relation *Int of interpreting types* is included in the relation *Use of Using types*, however it follows from an axiom in *TLC* that the user who *Uses* a *type* does not need to be the one who *Interprets* it.

Because communication $C(E)$ by means of the *type* E is a nonempty set, the above definitions lead to justification of the first sentence formulated at the beginning of this subsection.

4.2.3. Notions referring to language communication

Adequate, effective, successful communication in a community of *User* by means of the expression-*type* E is based on the agreed *meaning* $\mu(E)$ of the expression-*type* E used by users who are senders of tokens of E in acts of communication, and based on the correlation $\mu(E)$ with the *interpretation* $\iota(E)$ of the expression-*type* E interpreted by users who are recipients of these *tokens* in the acts. A disagreement between the *meaning* and the *interpretation* of the expression-*type* leads to *misunderstanding*, while ignorance of the *interpretation* of the expression-*type* leads to non-understanding.

So, the conceptual apparatus of the theory *TLC* has to be enhanced by incorporating notions concerning *meaning* and *interpretation* of language expression-*types*.

Interpretation indicates the *meaning* or *meanings* of a given *wfe-type* and cannot be identified with its *meaning*.

The notion of *meaning* is defined by means of the relation \cong of *having the same manner of Using wfe-types* and the notion of *interpretation* – by means of the relation \cong_i of *having the same manner of interpreting (understanding) wfe-types*. The definitions of these relations are as follows:

Two *wfe-types* E and E' have the same manner of *Using* (resp. of *Interpreting*) *wfe-types* if and only if every user of language L uses (resp. interprets) the other one every time he/she uses (resp. interprets) either of them, and every object is a referent (resp. an interpretant) of some *token* of the *type* E (used/interpreted by the user) if and only if it is a referent (resp. an interpretant) of some *token* of the other type E' (used/interpreted by the user).

The relation \cong_i is a sub-relation of the relation \cong , and it can easily be proved that it is a nonempty relation. We can also state that the relations \cong and \cong_i are equivalence relations in the set of all *wfe-types*.

Meaning $\mu(E)$ and *interpretation* $\iota(E)$ of the *wfe-type* E is the equivalence class of all expressions having the same manner of *Use* or, respectively, *Interpreting* (*understanding*), as the expression E , and can be intuitively understood as a common property of all *wfe-types* having the same manner of *Using* or, respectively, *Interpreting* as the expression-type E . The property can be called the *manner of using* or, respectively, the *manner of interpreting* of the expression-type E . In this way, we are referring here to ideas originating from Wittgenstein (1953) and Ajdukiewicz (1931, 1934), that is to understanding of the *meaning/interpretation* as a manner of its *Use/Interpreting* (see Wybraniec-Skardowska 2007).

It is easy to prove that the notion of *meaning* is stronger than the notion of *interpretation*. By means of the notions of *meaning* and *interpretation* we can define the notion of *adequacy of language communication*.

4.2.4. Adequacy of language communication

As already mentioned, in language communication, interpretation indicates the meaning or meanings of the expression-type which intermediates in this communication. An expression-type may have more than one meaning. If it has more meanings, they are determined by subtypes of the expression, as for example, for the terms “key” or “logic”.

We adopt the following definition of adequacy of language communication:

If E has n ($n \geq 1$) meanings determined by its subtypes E_1, E_2, \dots, E_n then $C(E)$ is an *adequate language communication* if and only if for every $k = 1, 2, \dots, n$, E_k has determined interpretation and $i(E) = m(E_k)$.

4.2.5. Some conditions for adequate language communication

From the definition of adequacy of communication by means of *wfe-type* we obtain the following corollaries:

Let E be a *wfe-type*. Then

- a. If E has n ($n \geq 1$) meanings determined by its subtypes E_1, E_2, \dots, E_n , then

- $C(E)$ is not an *adequate language communication* if and only if there exist such $k = 1, \dots, n$, that E_k does not have a determined interpretation or $i(E_k) \neq m(E_k)$.
- b. If E has an established meaning and E has a determined interpretation then $C(E)$ is an *adequate language communication* if and only if $i(E) = m(E)$.
- c. If E has an established meaning and E does not have a determined interpretation, then $C(E)$ is not an *adequate language communication*.
- d. If E has an established meaning, E has a determined interpretation and $i(E) \neq m(E)$, then $C(E)$ is not an *adequate communication* (i.e. there holds *misunderstanding*).

We see that the accordance of *meaning* and *interpretation* is a necessary condition of *adequate language communication* by means of expression-type of L . The following theorem of *TLC* provides us with some sufficient condition for adequacy of communication by means of *wfe-types*:

Theorem: If every user of community *User* Uses the *wfe-type* E if and only if he/she Interprets the *wfe-type* E and E has an established meaning and a determined interpretation then $C(E)$ is an adequate language communication.

5. Final remarks

(1) The main objective of the work presented was to provide a conceptual apparatus of a general logical theory of language communication. The outlined axiomatic theory explicates the key notions of contemporary syntax, semantics and pragmatics.

(2) The theory is described on two levels: *token-level* and *type-level*. As such, it takes into account the dual – *token* and *type* – ontological character of linguistic entities.

(3) The basic notions of the theory: *language communication*, *meaning* and *interpretation* are introduced on the second, *type-level* of formalization, and they required prior formalization of some of the notions introduced on the first, *token-level*; among others, the notion of an *act of communication*.

(4) Owing to the theory, it is possible to address problems of adequacy of both empirical acts of communication and of language communication in general.

(5) All the conditions of adequacy of communication, discussed in the presented paper, were shown as if they were valid for one-way communication (sender-recipient); nevertheless, they can also apply to the reverse direction of language communication (recipient-sender). Therefore, they concern the problem of two-way understanding in language communication.

(6) The conceptual apparatus of the theory can be enhanced through the introduction of notions concerning some specific forms of communication, such as discourse and dialog.

The semiotic matrix of politics and power in Singapore

1. Introduction

Ernst Cassirer regarded symbols and myths as the foundation of all knowledge. In the *Myth of the State*, he maintained that myth could take on the role of political action. Cassirer saw in modern political myth a form of thought that could be regulated and organized. It is a means to a concrete political end. On the other hand, human beings often mythologize their political existence rather than embracing a rational basis for the state. The role of myth has been transformed from a passive state to assume an active role, having definite shape and becoming an active process. The technique of myth is rationalized and controlled through the setting of what constitutes knowledge. Political myth is the continual process of work on a common narrative by which the members of a social group can provide significance to their political conditions and experience. Therefore, the complex relations between discourse, power, and politics can be better grasped if myth acts as the vehicle of interpretation. By reconstructing the mechanisms through which this myth works in the Singaporean context, this paper will show how the conceiving of “shared values”¹ and the central political concept of “meritocracy” can turn into a successful political myth. This paper argues that this understanding of political myth can throw light on important aspects of contemporary politics

2. Myth as a vehicle of interpretation

Societies orientate themselves to an imaginary referent rather than to a manifest condition. Indeed, the concept replaces the “reality” in endless reproduction and message intensification. I argue that the concept of myth

is useful in capturing the complexity of the links between discourse and power. Myth is the “vehicle” to specific translation.

I employ, therefore, a specific conception of the nature and role of myth. First, myth is not “irrational”. *Per contra*, “myth”, is a form of hyper-rationality. Second, myth does not mean “untruth”. True myth “presents its images and its imaginary actors, not with the playfulness of fantasy, but with a compelling authority” (Frankfort et al. 1946: 15). Third, myth does not oppose modernity. Modernity has its own exclusionary, powerful, and quasi-religious myths. Indeed, as Blumenberg has argued, “That the course of things proceeded ‘from mythos to logos’ is a dangerous misconception ...” (Blumenberg 1985: 27).² Myth is not merely something borne only in pre-modern theology. Emancipation from divinity has not reduced the pervasion of myth. Myth is basic to the human condition, pervading all societies, so that: “Historically we find no great culture that is not dominated by and pervaded with mythical elements” (Cassirer 1946: 5). Yet this need not imply a crude form of structuralism.

With these in mind, I want to introduce the political philosophy of Ernst Cassirer. In Cassirer we find the first systematic interrogation of the links between language, symbolism, culture and technology, and the centrality of mythical thought in the contemporary world. “Symbolic forms”, he argues, “function as techniques of ordering, setting the parameters of knowledge and identification” (Cassirer 1955a: 190–197). For Cassirer, myth in particular was to be seen as “permanent”. There is no danger, he argues: “... that man will ever forget or renounce the language of myth. For this language is not restricted to a special field; it pervades the whole of man’s life and existence” (Cassirer 1979: 245). Cassirer, therefore, shared the insights of Schelling and Goethe, amongst others. Here, it was argued that: “... language, poetry, art, religion, even metaphysics and science are in their origin bound up with mythical elements and interpenetrated with mythical imagination” (ibid.: 235). This was contrasted with the philosophers of the Enlightenment for whom myth was of the lowest rank. In the modern episteme the triumph of reason was taken to entail the defeat of myth. Man was deemed to have passed from the age of magic to the age of technologies. Cassirer questions this simplistic notion. “Myth”, he writes, “is always there, lurking in the dark and waiting for its hour and opportunity” (Cassirer 1946: 280).

In his later political writings, in particular the *Myth of the State*, his focus shifted from symbolic forms to “modern political myth”. In doing so Cassirer added to the Romanticist notion of “myth” a role for political action. For Cassirer, myth itself had transformed. No longer operative exclusively in the realm of the “unconscious”, Cassirer saw in modern political myth a form of thought that could be regulated and organized: “... adjusted to political needs and used for concrete political ends” (Cassirer 1979: 235). “Magic” had been fused with “technique” in a mix of “deep human emotions” and “social passions” (ibid.: 253). In another sense, however, myth was something more. As Cassirer remarks: “... myth cannot be described as a bare emotion because it is the expression of emotion. The expression of a feeling is not the feeling itself – it is the emotion turned into an image. This very fact implies a radical change. What was vaguely felt assumes a definite shape; what was a passive state becomes an active process” (Cassirer 1946: 43). Defined by Cassirer as the “technique of myth”, this mode of mobilization is similar to the meaning I put to appropriation. The modern political myth was for Cassirer an awakened residual energy. In this sense, even though the myth itself may be “irrational”, the technique of myth is “completely ‘rationalised’” (Cassirer 1979: 236). The production of myth is controlled through the setting of what constitutes knowledge. The modern political myth, therefore, unlike religious struggles of consciousness, works beyond ubiquity. As Cassirer argues, the “myth of the twentieth century ... did not begin with demanding or prohibiting certain actions .. [but] ... undertook to change the men, in order to be able to regulate and control their deeds. The political myths acted in the same way as a serpent that tries to paralyse its victims before attacking them. Men fell victims to them without any serious resistance. They were vanquished and subdued before they had realised what actually happened” (ibid.). In a similar way to Foucault’s conception of governmentality, myth is a dialogue, a circularity. Myth does not dominate the “subject”, because myth is part of the subject. This is not to say that forms of subjectivity do not operate. On the other hand, the forms of subjectivity inherent to myth are more precise for their being from “within the object”. As technologies of the self, myths, in this sense, pervade a multiplicity of social practices and experience. Myth sets the “limits of the possible”. In a Gramscian sense, myth becomes an “historical necessity” to which social formations react. These limits are not “fixed and immutable”, but rather in constant move-

ment, existing temporarily within the context of a given social structure of accumulation, truth, power, and ethics. The modern political myth is a labyrinth of metaphysical meanings, contradistinctions, truisms and meta-beliefs. Therefore, “[a] knowledge, of what the myths contain in the way of details which will actually form part of the history of the future is then of small importance; they are not astrological almanacs; it is even possible that nothing they contain will ever come to pass ... ” (Sorel 1999: 116). What is important to the study of myth is effect. Social myth mobilizes popular consciousness, engineering emotion, fever, and the will to power. For Sorel, “[m]yth must be judged as a means of acting on the present; ... *It is the myth in its entirety which is alone important*: its parts are only of interest in so far as they bring out the main idea” (Sorel 1950: 116–117).

I argue that several elements of this analysis are mirrored in what I understand to be in the semiotic matrix of politics and power. These elements central to my analysis are: conceiving of the five shared values and the central political concept of meritocracy.

3. *The conceiving of shared values*

First conceived in 1988 by the then First Deputy Prime Minister Mr Goh Chok Tong, the “Shared Values” incorporate elements of Singapore’s cultural heritage – attitudes and values that have helped it survive as a nation. It was meant to be a blueprint for the development of a national ideology that all Singaporeans could subscribe to and live by. The five shared values are: (1) Nation before community and society before self; (2) Family as the basic unit of society; (3) Community support and respect for the individual; (4) Consensus, not conflict; (5) Racial and religious harmony.

They are adapted from basic early Confucian values and principles that are not only compatible with democracy, but also well-suited to the basic values of the other ethnic groups in Singapore. Early Confucianism considers “the people’s will” as the direct representative of “Heaven’s will”, with which it legitimizes political power. Confucian theory of “human nature is good” endorses equal potential good for every man. These principles can be used in reasoning towards a system of democracy. In terms of decision-making, the Confucian “Doctrine of the Mean” accords with certain democratic principles. The independent personality and committed individualism advocated by early Confucianism is a required civic merit

in a democratic society. These fundamental Confucian principles, through contemporary hermeneutics, may provide a philosophic grounding for democracy and support the construction of a democratic system with an Asian-Chinese dimension. The “technique of myth” is placed into appropriation by the specification of the five values.

4. *The central political concept of meritocracy*

Meritocracy is a central political concept since Singapore’s independence, with its emphasis on identifying and grooming bright young citizens for positions of leadership. There is also a strong emphasis on academic credentials; these are seen as objective measures of both *intelligence* and *effort*. However, not all elites in the Singaporean case take an academic route. Some travel a different road. And examples include entrepreneurs Ron Sim, Elim Chew, and George Quek, and film-maker Jack Neo. The Prime Minister said that if the elites have a sense of mission and social responsibility, and use their talents and power to promote the interests of the country as a whole, then the society will prosper.

However, he also warns that the society must also guard against the elite entrenching themselves and, over time, becoming exclusive. If not, tensions would develop and the social order would break down. Ostentation in lifestyle, dress and social norms should be discouraged. The political leaders set the tone – they dress down and eat in hawker centers. An informal tone must be maintained in order to keep Singapore an egalitarian society. On March 19, 2005, in a speech by Prime Minister Lee Hsien Loong at the National University of Singapore Society, entitled “An Elite Dedicated to Serving One and All” (*The Straits Times*, March 21, 2005), he defines the role of elite in the Singaporean society. His definition of the elite here: an inclusive group with members from all walks of life, regardless of social and family background, and from a wide spectrum – be it business, sports or government. He defined them as “a core group of people who occupy key positions of power and influence, and set the direction for the whole society and country”. Singapore’s future depended on renewing and enlarging their numbers, and ensuring they continue to see themselves as being responsible for the whole society.

Now we know that in sociology as in general usage, the elite refers to a relatively small, dominant group within a larger society; as such, the elite

enjoys a privileged status which is upheld by individuals of lower social status within the structure of a group. Elite are the result of economic and political forces within a social structure. Upon formation, societies have always had the tendency to stratify due to a combination of politics and ability. The position of elite at the top of the social strata almost invariably puts it in a position of leadership and often subjects the holders of elite status to pressure to maintain their position as part of the elite. In spite of the pressures borne by its members, however, the existence of the elite in the social strata is usually unchanged.

Therefore, to belong to the elite is to exclude. This is contrary to the idea of openness and inclusiveness. The significance of the issue of the elite is more controversial if we were to look in retrospect. This is because meritocracy is a central political concept in Singapore. Specifically, Singapore is seen to have been “expelled” from neighboring Malaysia in 1965 as a result of the unwillingness of its majority immigrant groups (especially the ethnic Chinese) to accept the special position of the indigenous communities (especially the Malays). The Federal Malaysian government had argued for a system which would give special privileges to the Malays as part of their birthright as an indigenous people. In time, the federal government came to implement an affirmative action policy that favoured the numerically preponderant but economically backward indigenous groups.

The Singapore government led by the present Prime Minister’s father, Lee Kuan Yew, argued for the equality of all citizens of Malaysia, with places in universities, government contracts, political appointments, etc., going to the most deserving candidate, rather than to one chosen on the basis of connections or ethnic background. In the ensuing conflict between State and Federal governments, Singapore was expelled, and became an independent country. Therefore, the Singaporean government can be viewed as adopting an “anti-elitist policy” right from the start of nation-building. If we look, however, at how the dichotomy of exclusion and inclusion is resolved in the debate, we find that: first, “elite” is redefined. It functions as the technique of ordering, setting the parameters of knowledge and identification. Second, “elite” is redefined as an “inclusive elite” which the adjective “inclusive” modifies “elite” not to create a paradox but to neutralize the dichotomy of exclusion and inclusion. The inclusive nature of meritocracy promotes merit as a route to the elite. This is a form of mythical imagination. In this sense, even though the myth itself

may be “irrational”, the “technique of myth” is completely rationalized. It is controlled through the definition of “elite” in the Singaporean context and constitutes knowledge.

Prime Minister Lee Hsien Loong has been addressing these issues at length. His vision of “a land of opportunity” includes “a nation where each citizen has a part to play, and everyone, rich or poor can live with dignity and fulfillment”. Thus, the touchstones of inclusiveness and participation are being applied to more and more public sector endeavors. Realists would not have been under any illusions that Singapore is on the threshold of becoming a liberal democracy, or a classless society. Mr. Lee addressed this point squarely, explaining why certain fundamentals will not change. His theory of democratic elitism argues that ordinary citizens’ minds are better equipped to deal with certain issues than others, which are best left to professionals. The future of democracy depended on societies being realistic about their capacities.

5. Conclusion: Mythical thought as a latent force in the political matrix

To illustrate the relation between myth and the political power, we may perhaps view it as a fight in a dreadful combat in the beginning. The battle is won by political power by vanquishing and subjugating myth to give order. The order is enforced and practiced, creating a harmonious society. This social order could not arise until the darkness is fought and overcome. Still, the forces of myth are not entirely destroyed. They are checked and subdued by superior forces. As long as intellectual, ethical, artistic forces, etc., are in full strength, myth is tamed and subdued. But once they begin to lose their strength, chaos returns. Mythical thought then starts to rise anew and to pervade the whole of man’s cultural and social life.

Singaporean society is at that crossroads where it can no longer deny the fact of growing income disparity as an inescapable cost of globalization and advanced capitalism. That reality is reflected in the stories in the newspapers that carry as a mirror to the community it serves. In Singapore, the Government has always insisted that nobody should be confused about who’s in charge of the national agenda. Even as the elite becomes less monolithic, therefore, it is unlikely that the political executive will be content with being just one of a number of competing elites. The politi-

cal elite will need to resist the tendency to ossify, and to work instead for the larger good. However it is achieved, Singapore's challenge is to ensure that it gets those with ability and talent to rise, while resisting a culture of exclusivity or entitlement.

The key to diffusing conflict is to reach a consensus that is congruent with the national ideology of Singapore to establish a harmonious multiracial, multicultural, and multilingual society, one of "consensus not conflict", which is one of the five shared values of Singapore. As Singapore matures politically as well as economically, the need arises for a broad understanding of what democratic participation can and should mean in the context of an unequal society.

Notes

1. First conceived in 1988 by the then First Deputy Prime Minister Mr Goh Chok Tong, the "Shared Values" incorporate elements of Singapore's cultural heritage – attitudes and values that have helped it survive as a nation. It was meant to be a blueprint for the development of a national ideology that all Singaporeans could subscribe to and live by.
2. Vernant (1990: 204) has argued that the supposed opposition between mythos and logos is itself a historical construction whose origins lie in a "multiplicity of differentiations, breaks, and internal tensions within the mental universe of the Greeks" between the eighth and fourth centuries B.C.

Igor M. Zatsman

A three-level communication model for electronic filing

1. Introduction

Information and communication technologies (ICT) are the pivot for the knowledge-based society. To bring ICT closer to people the technology must be functional, easy to use, available and affordable; new solutions must be found and services must be reliable and adaptable to multiple users' contexts. The Seventh Framework Programme of the European Community (7FP) defines top priorities for ICT design and development as: semantic systems; *capturing and exploiting knowledge*; bio-inspired artificial systems that perceive, understand, learn and evolve, and act autonomously; learning by convivial machines and humans based on a better understanding of human cognition (Decision 2006: 14–15).

The development of future and emerging ICT requires new approaches to provide reliable access to knowledge assets, in which *knowledge parts are produced locally, but exploited globally*. More than that, they must be endowed with “a sense of time and context” to make them robust against aging, diversity of use, and *evolving semantics* (Work Programme 2007: 63).

The design of future and emerging ICT meant for capturing knowledge parts produced locally and exploiting globally requires semiotics to invent new communication models and sign-like twofold entities for personal knowledge representations and their conventional integration in the computer network medium. In this paper the following two sign-like entities will be described:

- a *semcode* integrating a concept and a coupled digital object;
- a *formcode* integrating an information object and a coupled digital object.

The semcode and formcode are in some respects analogous to the sign viewed as a twofold entity. However, according to McArthur, “there is a general trend amongst scholars and experts to equate sign-use and social communication [...] it is more useful to think that the sign (and sign-like twofold entities – *I.Z.*) can have a range of functions, social communication being only one of these functions” (McArthur 1997: ix).

For future and emerging ICT an essential function of the sign and sign-like twofold entities is to represent knowledge in a computer network medium. Thus it is necessary to make a distinction between social communication and electronic communication domains. A content plane (the first level) and an information expression plane (the second level) characterize social communication between humans. The information expression plane contains sign forms of knowledge representations that are sensory perceived and comprehended by humans. Electronic communication between humans has a content plane (the first level) and two expression planes – an information one in a social network medium (the second level) and a digital one in a computer network medium (the third level). The digital expression plane consists of digital objects. Humans cannot straightforwardly perceive digital objects. However, they can see their representations in an information expression plane. Consequently, in electronic communication technologies, special attention should be paid to the valid transition from digital objects to screen-oriented or/and paper-based documents in a social network medium and vice versa.

To find good solutions for knowledge representations in a computer network media, the relationships between human knowledge, information, and digital objects must be thoroughly studied. First, we should specify some terms. Everywhere, where the notion of knowledge activities occurs, if not specified otherwise, it is interpreted as a human ability to cognize material and ideal objects, and to create *concepts*. In a social network medium, the notion of *information objects* is proposed to be interpreted as verbal and/or non-verbal forms of knowledge representations. In a social or institutional system, the notion of *sign* is considered in terms of the dyadic model as a conventional twofold entity integrating expression (signifier) and meaning (signified). Humans create signifiers to exchange information in a social network medium including sensor perception and human comprehension of signifiers.

The notion of the *digital object* is defined as a computer equivalent of binary digits. As mentioned by McArthur (1997: 86), the computer equivalent of a binary digit can be magnetism/non-magnetism, electric current or absence of electric current, reflection of light or non-reflection of light, etc. depending upon the nature of the computer.

Concepts, information objects, and digital objects constitute the following three planes for each sign system:

- *a content plane* in a knowledge medium;
- *an information expression plane* in a social network medium;
- *a digital expression plane* in the computer network medium.

This paper proposes a new framework within which a digital expression plane for each sign system can be studied. The structure of the paper is as follows. Section 2 describes the interfaces and the main processes of an electronic communication. A digital semiotic triangle for ICT is defined in Section 3. Section 4 discusses social functions of digital objects as well as their electronic communication functions, followed by conclusions in Section 5.

2. Interfaces and processes of electronic communication

Figure 1 shows knowledge, social network, and computer network mediums. These three mediums have two interfaces: “concepts – information objects” and “information objects – digital objects”. In future and emerging ICT there are two major categories of digital objects in electronic communication (Zatsman 2003: 48–52):

- *digital codes* applied only to *electronic communication* entities that have a human emitter;
- *digital data* applied only to communication entities that do not have a human emitter.

Digital codes are divided into three types: the first type stands for digital objects linked with signifiers, the second type stands for digital objects linked with signifieds, and the third type stands for digital objects linked with denotata. The notion of digital data can be applied to electronic communication entities generated by automatic gauges, etc.

In this section, our purpose is to couple digital codes in the computer network medium with signifiers in the social network medium. The analysis of such elementary concepts as signifieds, elementary information

objects as signifiers, and digital codes as elementary information object representations in the computer network medium is restricted (Figure 1). Thus we simplify the analysis and consider any screen-oriented or/and paper-based message as a set of sign forms (signifiers) while the significance of the paper-based message is qualified as a set of elementary concepts (signifieds), and any digital messages from humans are characterized as sets of digital codes.

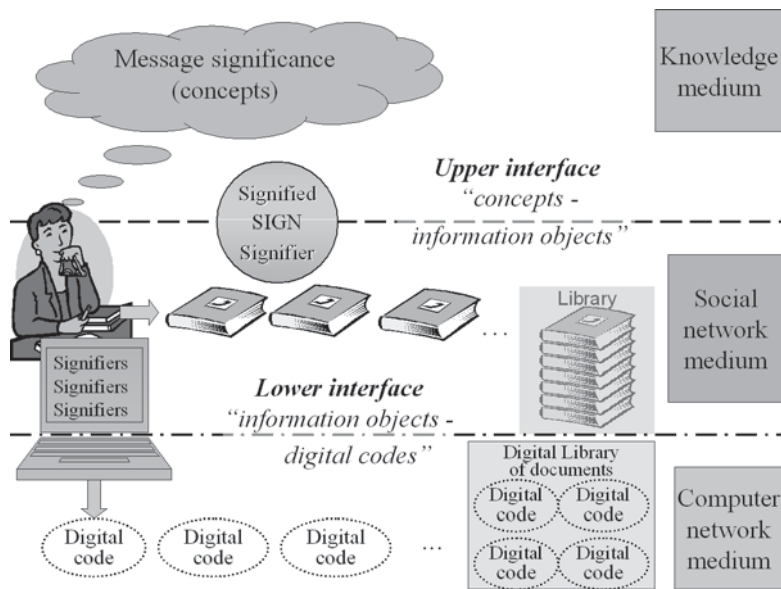

Figure 1. Two interfaces: “concepts – information objects” and “information objects – digital codes”.

The interface “concepts – information objects” is studied in virtually all the disciplines of the humanities and social sciences. Signs are essential to explore this interface. The ‘information objects – digital codes’ interface is studied in computer science. The twofold entity coupling a signifier and its digital code has still been largely ignored. Therefore, this twofold entity has no conventional name yet. It was proposed to be called *formcode* (Zatsman 2003: 107–120).

Rules for coupling any signifier with a digital code must meet the legal requirements of an institutional system based on electronic communica-

tion. An example of such requirements for information objects being concatenations of letters can be found in the Decision of the President of the European Patent Office dated 7 December 2000. Article 2 of this Decision has brought in the technical standard which defines tables of coding system based on international standard ISO/IEC 10646:2000 (Decision 2001: 23–30). It should be stressed that this Decision defines encoding of letters only. However, a concatenation of letter codes can be considered as a code of the information object being concatenation of these letters.

In terms of computer science, any digital code can be attached to a signifier. The formcodes differ from these attachments by the following features:

(1) Any formcode can be defined as an identical and stable interconvertible relationship between a digital code and a signifier in different computers of an institutional system using electronic communication/

(2) There must be a long-term access to the formcodes of the institutional system.

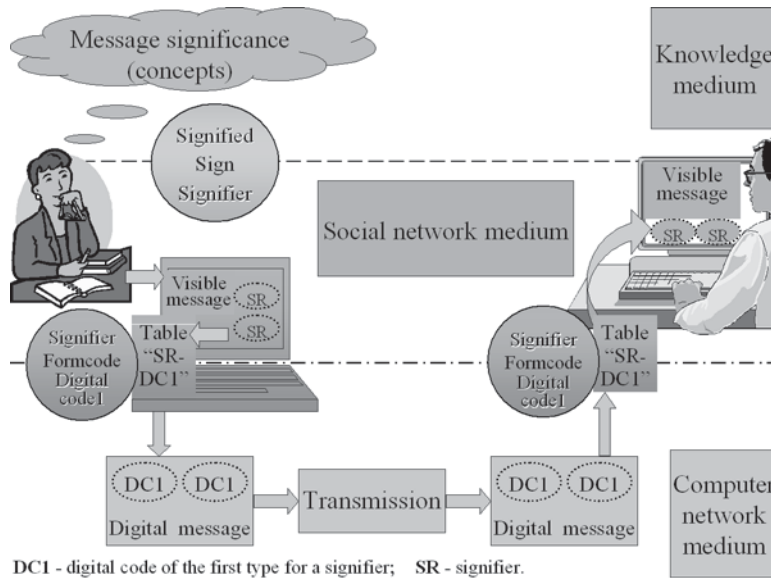

(3) There are legal requirements for formcode retention under any computer system changes.

(4) Any formcode is an element of the formcode system with an explicit rule for coupling any signifier with a digital code in any computer of the institutional system.

A three-level communication model (3LCM) with a formcode system for electronic communication between a human emitter and a receiver will be described below.

Figure 2 shows three mediums, two interface lines (dashed and dot-and-dashed lines), an emitter and a receiver. The emitter creates a screen-oriented visible message, then converts it into a digital form, and after it sends the digital message to a receiver.

The operation of creating digital codes of the first type is designated on the left side of Figure 2. The creation of digital messages is based on a formcode system. Digital codes of the first type (i.e. formcode digital codes) may be received from a table “SR ↔ DC1”. In the middle of the bottom of the figure, we can see a transmission of digital messages. The reconstruction of the visible message containing signifiers is designated on the right side of the figure. The operation reconstruction of visible messages is also based on the formcode system.

DC1 - digital code of the first type for a signifier; SR - signifier.

Figure 2. Illustration of 3LCM with a formcode system.

Formcodes must ensure that the emitted and received visible messages are equal and transitions from information objects in the social network medium to digital codes in the computer network medium and vice versa are interconvertible. It must be emphasized that the receiver's semantic interpretation of a received visible message need not correspond to the emitter's concepts represented in a screen-oriented visible message in the 3LCM with a formcode system.

2.1. The digital semiotic triangle

Figures 1 and 2 show three mediums and two interfaces. However, the three mediums generate the following three interfaces: "concepts – information objects", "information objects – digital codes" and "concepts – digital objects" (Figure 3). A new twofold entity, referred to as *semcode*, was proposed. The semcode is meant for coupling a signified and a digital code (Zatsman 2003: 107–120). This twofold entity was suggested for the study of the interface "concepts – digital objects" between the knowledge medium and the computer network medium. Signs and new twofold enti-

ties (formcodes and semcodes) can be very helpful in studying future and emerging ICT.

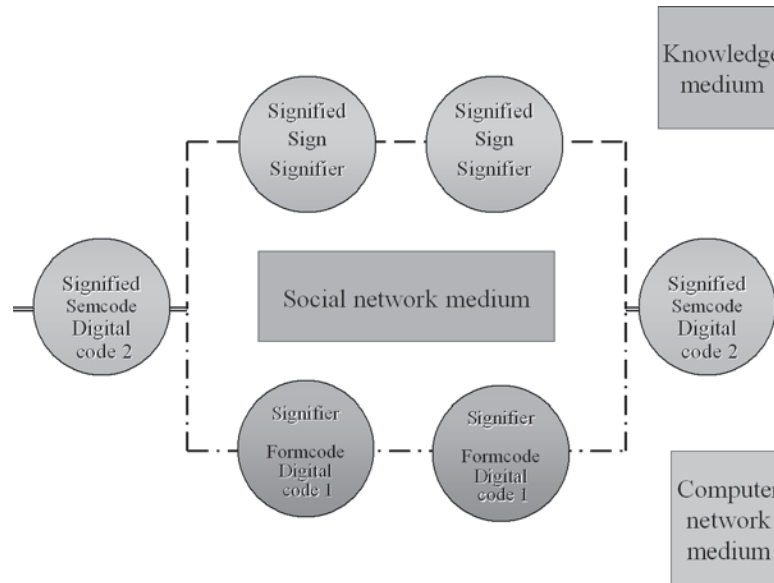

Figure 3. Signs, formcodes, and semcodes.

Formcodes and semcodes help us to define a new concept of a digital semiotic triangle (Figure 4). The triangle that will be described below is different from the classical semiotic triangle. The point is that in the digital semiotic triangle all three vertices belong to the computer network medium.

The formcode function is evoked when a signifier is coupled to a digital code of the first type. As it was stated above, in the computer network medium, digital codes of the first type stand for signifiers. Both coupled entities are placed in different mediums: either the social network medium or the computer network one.

The semcode function is evoked when a signified is coupled to a digital code of the second type. Digital codes of the second type stand for signifieds in the computer network medium. Both coupled entities are placed in different mediums: either the knowledge or the computer network one. Digital codes of the third type stand for denotata. Three digital codes for

a signifier, a signified and a denotatum compose a triangle in the computer network medium.

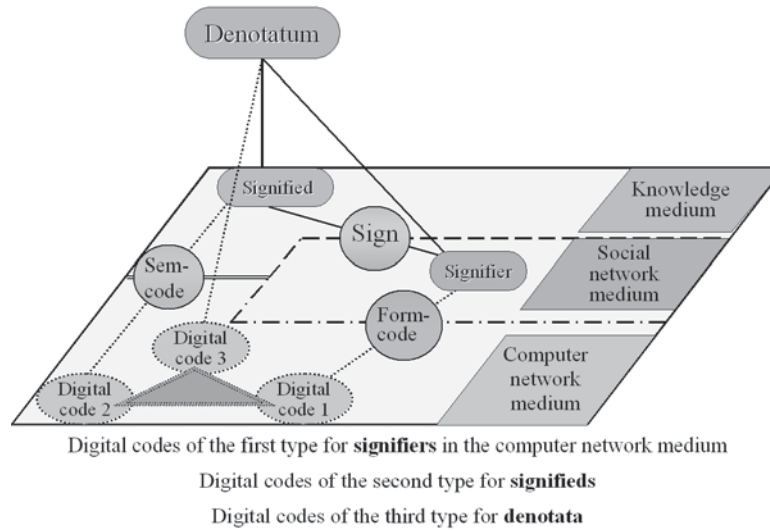

Figure 4. Digital semiotic triangle.

The 3LCM with formcode and semcode systems for electronic communication between the human emitter and the receiver is described below.

Figure 5 shows three mediums, three interfaces (dashed, dot-and-dashed and double lines), an emitter and a receiver. The lady creates a screen-oriented visible message, then she converts it into a digital form, after it she sends the digital message to the receiver. The process of creating digital messages that contain digital codes is designated on the left side of Figure 5. The creation of digital messages is based on formcodes and semcodes. Formcode digital codes may be received from the table “SR ↔ DC₁” (see Figure 2). Digital codes of the second type may be received from a thesaurus as identification numbers of descriptors. Consequently, digital messages contain digital codes of two types. The table “SR ↔ DC₁” is not shown on Figure 5.

In the middle of the bottom of the figure, we can see a transmission of digital messages. After the transmission digital codes of the first type are withdrawn from digital messages. The reconstruction of the visible message with signifiers is designated on the right side of the figure. The recon-

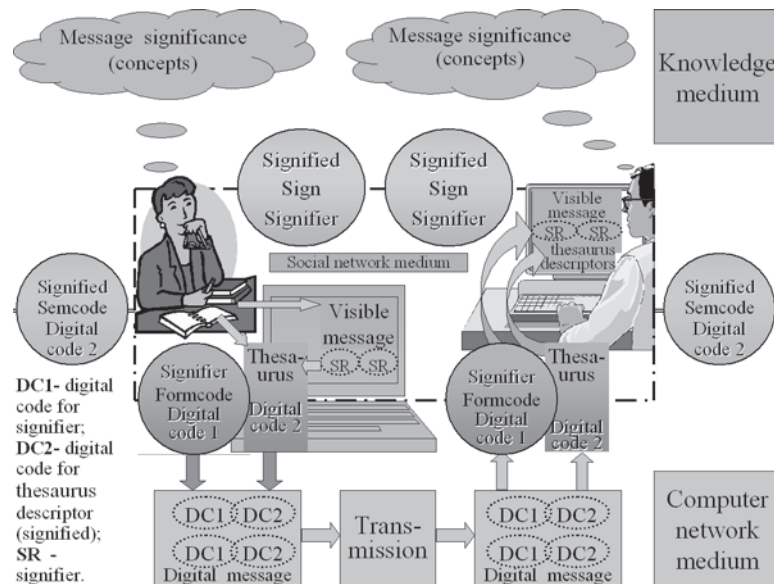

Figure 5. Illustration of 3LCM with a formcode and semcode systems.

struction of visible messages is also based on digital codes of the first type (formcode digital codes). Formcodes must ensure that the emitted and received visible messages are equal and transitions from visible messages in the social network medium to digital messages in the computer network medium and vice versa are interconvertible.

Digital codes of the second type are also withdrawn from digital messages. As it was stated above, these digital codes stand for signifieds as identification numbers of thesaurus descriptors. For the visible message, the receiver implements the operation of semantic interpretation. However, the receiver can also access the thesaurus. To understand an emitter's interpretation of the visible message, the receiver can obtain the same descriptors from the thesaurus, which the emitter has used. Now two important details must be noted.

First, as stated above, we simplify the analysis and consider any screen-oriented message as a set of sign forms (signifiers), the significance of a message as a set of elementary concepts (signifieds), and any digital message as a set of digital codes. Thus we reduce the semantic diversity of relationships between signifiers, signifieds and their digital codes.

Second, in future and emerging ICT based on the 3LCM with a form-code and semcode systems, the receiver can accept the same descriptors from a thesaurus that the emitter has used. These descriptors allow the receiver to understand the emitter's interpretation of visible messages.

2.2 Social functions of digital objects

The design and development of future and emerging ICT require a deep understanding of relationships between concepts as human knowledge representation and articulation, information objects in the social network medium and digital objects in the computer network medium. In other words, it is necessary to study the relationships between entities of one content and two expression planes.

Digital expression planes contain digital objects, which began to fulfill some economically and socially important functions after a legal framework for electronic signatures had been adopted and introduced into practice. For example, Directive 1999/93/EC of the European Parliament and of the Council asserts the following:

Electronic signatures will be used in the public sector within national and Community administrations and in communications between such administrations and with citizens and economic operators, for example in the public procurement, taxation, social security, health and justice systems; ... Member States shall ensure that advanced electronic signatures ... satisfy the legal requirements of a signature in relation to data in electronic form in the same manner as a hand-written signature satisfies those requirements in relation to paper-based data; ... (Directive 2000: 12–20)

Hence, human interests, jobs, rights, and duties may be connected with such digital objects as signed data in an electronic form. An important point here is the perceptive demarcation between signed data in an electronic form in the computer network medium and signed paper-based data in the social network medium. Electronic signatures may satisfy the legal requirements of a signature in relation to data in an electronic form, but humans are not directly capable to perceive these digital objects in a sensory way. This conclusion holds true for any types of digital objects. Consequently, special attention should be paid to the transition from

visible messages in the social network medium to digital messages in the computer network medium and vice versa.

As Eco (1976: 20–21) has noted:

The proper objects of a theory of information are not signs but rather units of transmission [including digital objects – *I. Z.*] which can be computed quantitatively irrespective of their possible meaning, and which therefore must properly be called “signals” and not “sign”. To assert that these *signals* [or digital objects – *I.Z.*] are of no importance for a semiotic approach would be rather hasty. One would then be unable to take into account the various features of the linguistic “*significant*” face of a sign, which, although strictly organized and competitively detectable, can be independent of its meaning and only possesses an opposition value.

This conclusion is important for all types of ICT including electronic filing. The main problem is how to organize electronic communication within which the specified digital objects can possess sign forms and their meanings? We suggest that these electronic communication technologies should be based on the 3LCM with formcode and semcode systems. In an institutional system, formcodes and semcodes can possess sign forms and their meanings respectively.

Below we describe the 3LCM with a formcode systems of electronic filing technologies for patent applications (Figure 6). In electronic filing technologies, applicant’s interests and rights are closely connected with digitally signed patent applications. Applicants of inventions cannot straightforwardly perceive digital codes of digital patent applications in a sensory way. However, applicants can see their representations in screen-oriented applications. The creation of a screen-oriented visible application and a digital patent application with an electronic signature is designated on the left side of Figure 6. The creation of the digital patent application is based on formcodes.

At the bottom of Figure 6 we can see a transmission of the digital patent application with an electronic signature. After the transmission the receiver checks whether the electronic signature is valid. If it is valid and the formcode system on the right side equals the formcode system on the left side, then the visible application on the right is identical with the visible application on the left.

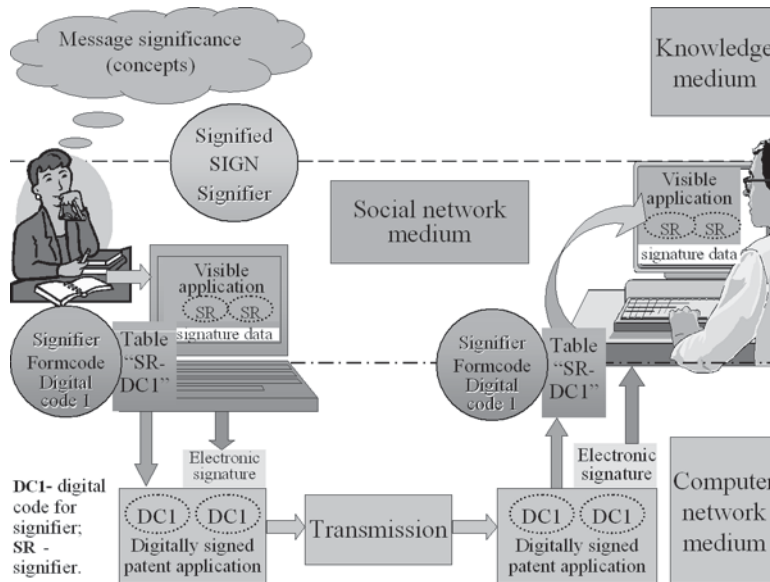

Figure 6. Illustration of 3LCM with a formcode system for electronic filing technologies.

However, if the electronic signature is valid, but the formcode system on the left side isn't equal to the formcode system on the right side, then the visible application on the right need not be identical with the visible application on the left. In other words, on the right side of Figure 6 we can receive a *wrong reconstruction of the visible application*. Consequently, the *valid transmission of the digital patent application with an electronic signature* doesn't guaranty the *correct reconstruction of the visible application* on the receiver's computer.

3. Conclusion

We conclude this paper with the following basic remarks. First, electronic signatures will be used in the public sector more and more. Human interests, jobs, rights and duties will be connected with signed digital messages in the public procurement, taxation, social security, health and justice systems on a social or institutional time scale and not within a computer system life-cycle.

Second, electronic signatures will satisfy the legal requirements for an electronic signature in relation to digital messages. However, humans are not capable to perceive these directly. This conclusion holds true for any digital message. Consequently, special attention should be paid to a thorough study of the transition from visible messages in the social network medium to digital messages in the computer network medium and vice versa.

Third, the essential function of signs and sign-like twofold entities is to represent knowledge in the computer network medium. As exemplified by our study of the digital semiotic triangle and the $\mathfrak{3}$ LCM with two expression planes, a creation of economically and socially important technologies and systems require a new semiotic framework to research and develop future and emerging ICT.

Jörg Zeller

The Danish Mohammed cartoons

Freedom of speech or communication terror?

... practical discourses like all argumentation equal islands in the sea of practice threatened by inundation where the pattern of consensual settlement of practical conflicts doesn't dominate. The means of understanding become again and again superseded by instruments of violence.

– Habermas 1983: 116

1. Information exchange versus communication

The basic idea of my paper is that the Mohammed cartoons of the Danish newspaper *Jyllands Posten* from September 30, 2005 are part of a degenerate form of communication that I call *information exchange*. Participants in this kind of communication don't want to give each other a share in or to participate in each other's beliefs or attitudes. They only want to inform each other about their view of things.

Representatives of the right-wing political scene in Denmark pronounce in the cartoon campaign their idiosyncratic interpretation of the democratic right of freedom of speech. In short, they claim that freedom of speech is only realized if it is applied ruthlessly towards the addressee of its application. The violent Muslim reactions to the cartoons, culminating in the boycott of Danish commodities in Islamic countries and the burning of the Danish embassy in Damascus and the consulate in Beirut in February 2006, are also transmissions of messages of a *demonstrative* rather than a *communicative* kind.

Communication of any kind, however, is an exchange of meaning between a sender and a receiver. The sender encodes an idea or a thought in a (structure of) sign(s); the receiver decodes the (structure of) sign(s) as

meaning a certain idea or thought. Meaning formation and meaning re-formation or interpretation can be more or less complex, divisible into three layers of complexity: syntax, semantics and pragmatics. Syntax provides recognizable sign structures; semantics is responsible for understandable meaning-relations; pragmatics furnishes a basis for rational, i.e. justifiable, interpretations.

My claim is that degenerate communication confines itself to the syntactic and semantic dimensions of meaning formation and re-formation, and suppresses the pragmatic dimension. As a consequence, this kind of restricted communication operates with standardised or stereotyped forms of meaning. Standards and stereotypes are immunized against alternative interpretations – i.e. the unlimited process of semiosis, as Peirce 1994 called it. Especially, degenerate communication impedes or prohibits the moral interpretation of the exchanged information. Let's therefore have a look at the moral background of the Danish Mohammed-cartoons, an example of which follows here:

2. *Moral background of the Mohammed cartoons*

This background is liberalistic and says that a natural right to freedom should conduct man's actions. The Danish Prime Minister since 2001, Anders Fogh Rasmussen, leader of the Danish liberal party, formulated this right to freedom in his programmatic, neoliberal book, *From Social State to Minimal State*, in this way:

Liberalism is not an ism-ideology. ... It is not a time-conditioned or time-dependent ideology that becomes outdated because of changes in technol-

ogy, worldview or way of life. The sociological view that man is doing fine if everyone takes responsibility for his own life is grounded on a view of man that is timeless and thus essential for all times and under all circumstances. (Rasmussen 1993: 9, my translation)

By naturalizing freedom Rasmussen immunizes the concept of liberal moral and politics against any challenge of its fundamental status. The natural cannot be doubted.

The minor partner in the Danish ruling coalition, the conservative party, represents traditional middle class politics, i.e. essentially a worldview governed by capitalist market economy and traditional bourgeois values. The ruling coalition's support-party, the Danish People Party, supplements the liberal and conservative trait of the Danish government. The success of this right-wing party, founded in 1995, is based on its populist play with xenophobic resentments. The main target of this xenophobia – not surprisingly against the background of Islam-fundamentalist terrorism in the recent years – are Muslim immigrants. Generally speaking, xenophobic propaganda claims that immigrants threaten the native people's welfare and cultural identity. In the case of Muslim immigrants this native fear of economic and cultural loss is deepened by the ideologically fuelled fear of fundamentalist terrorism and alleged Islamic intentions to re-establish the Caliphate, i.e. a worldwide Islamic empire (cf. Jespersen & Pittelkow 2006).

Against this ideological background and in the wake of the US-President Bush's "War against terror", which the Danish government felt called upon to support militarily, politicians and other public representatives of the Danish bourgeois and right-wing mentality understand themselves as defenders of human rights and democracy. Xenophobic resentment and the rich world's war of terror against the poor's reactions to oppression and disdain thus become reinterpreted as a fearless defense of freedom and basic democratic values.

The ideological stance of the newspaper *Jyllands Posten* is in agreement with the politics of the ruling parties and their right-wing support-party in Denmark. In the fall of 2005, the features editor of that newspaper, Flemming Rose, had the bright idea to support the Danish government's fight against the enemies of western free-enterprise democracy by starting a campaign against Islam-fundamentalist oppression of free speech. Rose

invited 40 Danish newspaper cartoonists to draw cartoons visualizing the prophet “Mohammed’s appearance”. Rose informed the cartoonists that it was his intention to publish those cartoons in the *Jyllands Posten* under that heading. In this way, wrote Rose (2005), he wanted to demonstrate the newspaper’s full backing of the democratic right of freedom of speech.

Twelve cartoonists answered the invitation. The rest, as Rose informed the readers of the *Jyllands Posten* in the article accompanying the publication of the 12 cartoons (September 30, 2005), either didn’t answer at all or excused themselves by referring to other, urgent jobs.

The basic idea of the cartoon publication comments on the well-known Islamic prohibition of making any image of Allah or the prophet Mohammed. According to Islamic law, visualizing the holy is blasphemy and one of the heaviest violations of the divine commands revealed in the Koran. These commands are in turn the foundation of the whole system of Islamic ethics and juridical system. To disdain the prohibition against visually representing the prophet Mohammed thus means to disdain the ethical basis of Muslim identity and dignity. It is very unlikely that Flemming Rose and the twelve cartoonists did not know that they were going to demonstrate their contempt of one of the most basic ethical principles in Islam.

Of course, it is questionable why the allegedly most important things or persons in the world should be disguised. But this is a question about how to interpret the world and not how to treat other people. In my opinion Flemming Rose and the twelve cartoonists confused two things: their personal disagreement with the Islamic worldview and the ethical question of how to treat people with of an ethnic and cultural background different from one’s own. It is the latter question that is critical for any chance of men living together – despite ethnic and cultural differences – in peace.

In other words, the Mohammed cartoons – understood as part of the ongoing global communication between different social systems and cultures – are a demonstration of the initiator’s xenophobic motives rather than a morally justifiable communication about different worldviews and ways of life. The Danish neo-liberal, neo-conservative and neo-nationalist defenders of democratic values don’t want to *communicate* with people of different ethnic or cultural background; rather, they want to show the superiority of their own world-view and way of life. In order to make my point more clear I will make several propositions in the next section.

3. *The natural right of freedom:
A confusion of right and ability*

The earlier noted confusion of informing *versus* communicating is based on another, deeper confusion of two concepts: the *right* and the *ability* to act in a certain way. A right presupposes ability, but not the other way round. We can be able to act in a certain way without a right to do so. This is important because the confusion is about natural and moral law. A moral law allows or prohibits acting in a certain way. A right is something a human community grants to its members by law. I will argue that there are no such things as *natural rights*. Especially there is no natural right of freedom.

My argument runs as follows: If the freedom to act as the actor likes to do would be a natural *right*, then there has to exist a “natural” moral authority with the power of granting or denying this right to the actor. But a “natural moral authority” is an absurdity. Morality is bound to conscious beings, i.e., beings equipped with sensitivity, sensibility, memory, imagination, rationality, and the ability to act. In short, morality is bound to *subjects or persons*. “Nature” as understood in the framework of modern, scientific ontology since the Renaissance has been defined as a “purposeless spatio-temporal world of extended, material bodies dominated by a number of universal laws” (Lübcke 1996: 306). Nature in this sense is no person and not able to think up practical laws or to grant rights to anybody. Practical laws and rights presuppose the existence of conscious beings able to imagine and choose between alternative possibilities to act. To act freely presupposes actors equipped with the *ability* to act freely.

Humans thus have no natural right of freedom, but they do have a natural ability to imagine alternative possibilities to act, and to consider which possibility is the best to achieve a wanted end, and to decide to realize this possibility by action. This ability is, if you like, the natural basis of morality and of moral laws and rights of whatever kind.

Human rights thus presuppose the ability of free will. On the basis of this ability a human community can consider and decide which actions shall be allowed and which shall be forbidden to the members of this community. The community can grant or deny rights to individual members, specific groups, or all of its members. From this point of view, rights are something the community agrees on to grant or deny its members. If

“community” is understood as the totality of its members, then rights are something the members of the community agree on to grant or deny to each other. Rights presuppose therefore a consensus between the members of a community. To grant a person a specific right means to accept that this person freely decides to use or not to use this right on a certain occasion.

To summarize: it is not the nature of man but the different communities of interacting and communicating men that decide what is right or wrong. There is no “natural right of freedom”, i.e., no objective freedom, but only different laws and codes that different communities grant or deny their members.

4. *The incommensurability of morals*

Another assumption concerns the difference between values and rights. Habermas (1983: 113) distinguishes between the good, or valuable, and the right, or just. The former asks for evaluation and the latter for justification. On this background he argues that cultural values, being connected with particular ways of life, cannot claim normative (i.e., universal) practical validity. As a consequence values (goods) cannot (directly) be transferred from one culture to another. Values are *incommensurable* between different cultures.¹

The same, however, doesn't hold for norms – they are transferable from one culture to another. Norms are rules of action, i.e., action *models* or *prototypes*. If I want to ride a bicycle I have to do certain things, no matter where and when and under which circumstances I try to do these things.

Applied to my case, the Mohammed cartoons, this means that it is a bad moral strategy to argue about the values of the cultures in question (western and Islamic). It is, however, a good moral strategy to argue about the normative preliminaries for communication and interaction between different cultures.

If the initiators of the cartoons had wanted to prove that freedom of speech is a better moral basis for interaction and communication among men than are the commands of an invisible and unquestionable moral authority, then they should have applied the principle of freedom of speech to Danish, or more generally, the western system of values; for example, by questioning the moral basis for the co-existence of Christian charity and a free-enterprise economy.

To declare freedom as a natural and thus unquestionable right of man is to allow man to act inconsiderately towards other men or living beings. Freedom understood as the founding moral principle of liberal politics and values is unethical. Only the combination of free action with its considerate performance towards other human and living beings – as for example, formulated in Kant’s categorical imperative – supplies the formal rationality of free will with an ethical, i.e. existential and social, meaning or content. As a consequence, to apply the unconstrained, liberal principle of freedom to a system of values that is morally constrained to the commands of a divine moral authority, as in Islamic societies, is to claim that all systems of values (morals) should be the same as the “unholy” liberal combination of Christian charity and free enterprise in western societies.

On the other hand, as exemplified by the Islam fundamentalist-governed reactions to the Danish cartoon campaign, the founding of existential and social values on the alleged commands of an imperceptible and unquestionable moral authority is to incapacitate man as a moral being. If people are not allowed to ask and to search for reasons why to act in a certain way, then their ability to think rationally and act freely is denied. As a consequence, the members of a fundamentalist culture – from a moral point of view – never act on behalf of themselves. They act in a certain way because they have the duty or the permission to act in this way, i.e., because the community, on behalf of a “higher authority”, claims or allows acting this way. Let us call such communities *authoritarian*. Anyone who is bound to do what an unquestionable moral authority – human or allegedly divine – demands is in an ethical sense not free. As a consequence, people in fundamentalist cultures and political systems are prone to not feeling responsible for the actions they perform on behalf of an authoritarian community.

The morals and values of a human community are the historical result of how that community has tried to make the existence of its members meaningful and valuable. Morals guide the real life of a community – by defining the best its members have been able to make out of their lives. The identity and dignity of the members of a culture are based on the habits, customs and traditions operative in this culture. To question the system of values of a culture is to question the identity and dignity of its members. To do this is certainly not to communicate with the members of this cul-

ture about the most rational and responsible ways men are able to discover in order to realize purposes desirable for all men.

I summarize: Relying on Habermas's 1983 considerations about the difference between morality and morals, it seems that different human systems of values or cultures are incommensurable. You can't (directly) translate or transfer one system of values to another. Instead of being translated, one system of values can be *adapted* to another system of values. That way, it is possible for different cultures to learn from and enrich each other. The concept of integration of immigrants from another culture into a new culture has to take this into account. All the conflicts about Muslim women wearing a veil and headscarf in non-Islamic countries are idle if both cultures are unable or unwilling to understand the incommensurability of values.

5. *The commensurability of morality*

On the other hand, the incommensurability of cultures doesn't imply the incommensurability of different systems of morality. Morality – the ability to act responsibly – is a human universal. It is, according to Blackburn, “a property or relation that can be instanced, or instantiated, by a number of different particular things” (1996: 387). Man, defined as a rational animal, is that living being that is able to sense, feel, remember, imagine, think, and, on the background of these abilities, to act freely. Morality, then, consists of the ability to act rationally, i.e., to act on the basis of considerations about the most purposeful and, at the same time, the most responsible way, in relation to other people and living beings, to reach a wanted end. However, rationality, the ability to draw conclusions from premises, is not an isolated faculty of the human mind. It works only in cooperation with all the other functions of consciousness – sensation, memory, imagination, feeling, and the ability to connect the experience of one thing with the experience of something other. Let us call this ability to operate an *interpretant*, as Peirce 1994 called it, or an intention within semiosis. However, the intentional or semiotic formation of meaning is, according to Wittgenstein, not a job that can be accomplished by consciousness in privacy. To be sure we mean what we believe to mean, we have to *communicate* with other people.

In other words, man, the rational and moral being, is a communicating being. Human communication, the sign-based exchange of messages between communication partners, is a way of human action. As all kinds of human action, it is sensitive to moral considerations.

Final summary: if humans in community with other humans and living beings are to make their existence, on the background of evolution and history, as meaningful and valuable as possible for as many people and living beings as possible, then they have to communicate with other people and living beings. And “communicate” means to participate in other people’s way of making life meaningful and valuable and to allow other people to participate in one’s own way of making life meaningful and valuable. It means not to question morals, i.e. the freedom of humans to create values and to find meaningful ways of life, but to question the morality of one’s own as well as other people’s morals. Morality is about the reasons why we act as we act.

If I am right in my analysis of the morality of the publication of the Danish Mohammed cartoons and of the violent reactions of offended Islamic fundamentalists, then neither the former nor the latter represented a morally justifiable contribution to communication between western and Islamic cultures. Neither was the publication of the cartoons a meaningful defense of fundamental democratic values; nor were the violent demonstrations of Islamic offense-taking a morally justifiable attack against western recklessness. Both attitudes toward communication between different cultures show, in my opinion, clear signs of misunderstanding of human rights and values on the one hand, and human abilities to think rationally and act freely on the other hand.

The religious fundamentalist physical terror that burns down a Danish embassy corresponds thus – from a communicative and moral point of view – to the communication terror of a fundamentally misunderstood moral liberalism that misuses democratic freedom of speech in order to offend people of Islamic cultural background.

Note

1. Habermas, by the way, specifies his consideration about the non-transferability of values. The latter, he says (114), may be suggested as *candidates* for their incorporation in norms of general interest.
